This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

INDEX OF CONTENTS.

JANUARY TO JUNE, 1899.

A

ABERDEEN, the Cruickshank Botanic Garden for, 219 ; the Duthie Park at, 124, 138
Abutilon Sawitzii, 276
Acacia dealbata, 189
Acalypha hispida, 27
Aconite, the Winter, 62, 93, 157 ; flowering of, and other early-blooming plants, 42, 43 ; flowering badly, 189
Acrophyllum venosum, 354
Adiantum tenerum Farleyense alcicorne, 133 ; origin of, 153, 158
Adiantums, choice, 260
Æcidium grossulariæ, 355, 359
African notes, South, 292, 321, 332, 367, 407
Agapanthus umbellatus, 293
Alaska, agriculture and gardening in, 334
Alder destroying fungus, 392
Alocasias, 293
Alpine garden, the, 100, 117, 370
Altai, the flora of the South-western, 248
Alyssum saxatile Tom Thumb, 374
Amaryllis Belladonna in Guernsey, 45
America, cold in, 153 ; warm weather in, 320 ; winter damage in, 211
American blight treated with fire, 401, 413
American notes, 5, 74, 124, 149, 211, 375
Anemone albana, 370 ; A. apennina in Mr. Crowley's garden, 407 ; A. nemorosa Alleni, 374 ; A. narcissiflora, 374
Apiary, the, 7, 39, 71, 119, 167, 206, 215, 247, 279, 297, 317, 337, 377, 395
Apple, Allen's Everlasting, 222, 266, 304 ; Barnack Beauty, 252 ; Ben Davis, 250 ; Mannington's Pearmain, 204 ; Pomme de Deux Années, 93 ; Smart's Prince Arthur, 122 ; tree roots and stocks, 264 ; trees, affected by grubs, 270 ; twigs, diseased, 125 ; Warner's King, *alias* D. T. Fish, 91
Apple canker, 266 ; in America, 212
Apple-graft variation, 159
Apples from the Antipodes, 186, 218, 250, 282, 301
Arabis alpina, a double-flowered variety of, 250, 266
Araucarias at Duns Castle, 107
Archontophœnix Cunninghamiana, 93
Ard Cairn, Cork, bloom at, 122
Arum, triple-spathed, 121
Arundinaria Falconeri, 24 ; A. nobilis, 2
Aster nanshanicus (*nomen nudum*), 330
Asters, a new race of, 196
Aucubas, 252
Auricula, the florist's, 60, 68, 180
Auriculas, alpine, mildewed, 270 ; at Bracknell, 314 ; in pots, 372
Australia, amateur gardeners' rights in, 26
Australian fruit, 91
Avenue trees, 172
Azaleas, 234

B

BAKER, Mr. J. G., presentation to, 74 ; presented with the Linnean Society's Medal, 339
Bamboo, seeding of the great (Bambusa arundinacea), 34
Bambusa vulgaris, in flower, 390
Barber, Mr. C. A., appointed Madras Government Botanist, 201
Bean, the Velvet, 375
Beans, French, 276 ; Haricot, 13 ; the new French climbing, 253
Bees, 14
Beet-root, 30
Begonia Gloire de Lorraine, 13, 44, 62, 76, 93, 107, 139, 149, 157 ; hermaphrodite, flower of, 408
Begonia × Moonlight and others, 122
Begonias from China, 82 ; tuberous-rooted, 68
Belgium on the Congo, 170
Benevolent Institution, Gardeners' Royal, 40, 73, 104, 152, 172, 339 ; annual meeting and election of pensioners, 43 ; Samaritan Fund, 58
Berberis Andreana, 21
Bermuda Juniper, the, 176
Betula nigra, 21
Bifrenaria Harrisoniæ alba, 370
Birds and fruit-trees, 268, 285, 304
Blackberry, the, as a profitable fruit, 172
Blackbird's nest, a, in a pony's boot, 253

BOOKS, NOTICES OF:—Agricultural Year-book of the United States Government, 399 ; An Elementary Text-book of Botany (*Sidney Vines, M.A.*), 11 ; An Encyclopædia of Gardening, Ed. iii. (*T. W. Sanders*), 380 ; A Text-book of Agricultural Zoology (*F. V. Theobald, M.A.*), 247 ; Botanical Magazine, 25, 170, 233, 282, 398 ; Buds and Stipules (*Sir John Lubbock*), 232 ; Bulletin de la Société Française d'Horticulture des Londres, 212 ; Bush Fruits (*F. W. Card*), 155 ; Cypripedium, Selenipedium and Uropedium (*F. Desbois*), 91 ; Dictionnaire Pratique d'Horticulture, 11 ; Die Bäume und Sträucher des Waldes (*Von Gustave Hempel and Karl Wilhelm*), 122 ; Die Vegetation der Erde (*Profs. Engler & Drude*), 266 ; Edible and Poisoning Fungi of Japan (*Mr. Sakamoto*), 341 ; European Orchids, sixty octavo plates of, announced (*M. Correvon*), 58 ; Flora of Kent (*by Fred. J. Hanbury*), 351 ; Florilegium Haarlemense, 25 ; Flowering Plants of Great Britain (*Anne Pratt*), 266 ; Flowers and Flower-culture (*H. W. Ward*), 411 ; Führer durch den Königliche Botanischen Garten in München (*Dr. K. Gœbel*), 341 ; Gesammtbeschreibung der Kacteen, Cactaceæ (*Dr. Schumann*), 154 ; Hardy Fruits for the Midland Counties (*A. H. Pearson*), 398 ; History of European Botanical Discoveries in China (*Dr. Bretchsneider*), 32 ; Hooker's Icones Plantarum, 202 ; Illustrations du Flore du Congo (*MM. de Wildeman & Durand*), 138 ; Journal of the Royal Horticultural Society, 10 ; Les Cypripediums, leur Monographie (*F. Desbois*), 91 ; My Roses, and how I grew them (*Helen Milman*), 380 ; One and All Gardening (*E. O. Greening*), 91 ; Our Gardens (*S. Reynolds Hole*), 386 ; Publications Received, 12, 27, 58, 91, 106, 122, 155, 170, 202, 234, 267, 301, 334, 359, 382, 412 ; Recherches Anatomiques et Physiologiques sur le Tradescantia virginica (*A. Gravis*), 58 ; Rhodora (New American Journal), 42 ; Roses in Pots (*W. Paul*), ed. viii., 234 ; Sketch of the Evolution of our Native Fruits (*L. H. Bailey*), 120 ; Smithsonian report, 187 ; The Ambulator ; or a Pocket Companion in a Tour round London, &c., 1796, 113 ; The Botanical Gazette, 153 ; The Culture of the Chrysanthemum (*W. Wells*), 206 ; The Development of Cyprus (*Col. Fyler*), 250 ; The Fern Bulletin, 90 ; The Flora of Cheshire (*the late Lord de Tabley*), 400, 411 ; The Flora of Kent, 337 ; The Garden Annual, 11 ; The Gooseberry Growers' Register, 122 ; The Guernsey Growers' Gazette, 153 ; The Horticultural Directory, 11 ; The House Sparrow *W. B. Tegetmeier*), 267 ; The Municipal Parks, Gardens, and Open Spaces of London, their History and Associations (*Lieut.-Col. Sexby, V.D.*), 164 ; The New Gulliver, or, Travels in Athomia (*C. T. Druery*), 11 ; The Silva of North America, vol. xii. (*Prof. Sargent*), 184 ; The Pests and Blights of the Tea Plant (*Geo. Watt, M.B.*), 212 ; The Pond-weeds of the British Isles (*Alfred Fryer*), 11 ; The Principles of Agriculture (*L. H. Bailey*), 206 ; The Romance of Wild Flowers (*Ed. Step*), 266 ; The Rosarian's Year Book, 24 ; Transactions of the English Arboricultural Society, 154 ; Weizen und Tulpe und deren Geschichte (*Von H. Grafen zu Solms-Laubach*, 257, 274, 290 ; Welwitsch's African Plants, part iv., 153 ; Willing's Press Guide, 186 ; Wood and Garden : Notes and Thoughts of a Working Amateur (*Gertrude Jekyll*), 155 ; Year Book of the Department of Agriculture for 1897 (U.S.A), 209

Botanic Gardens, New York, 74
Botanical nomenclature, 396
Breeding plants through bud selection, 129
Briscoe-Ironside, Mr., commences a Chrysanthemum business, 10
Broccoli, good, 304, 375 ; trade in Cornwall, the, 294
Broom-witches on a Scots Fir, 270
Bud variations, 129
Buds and stipules, 232
Bulb cultivation in Ireland, 382
Bulgaria, importation of plants into, 27
Burford, Dorking, the gardens at, 273 ; a spray of Lapageria flowers from, 45

C

CALADIUMS, the cultivation of, 66
Calanthes, deciduous, 244 ; well cultivated, 123
California, landscape gardening in, 294
Cambridge Botanic Garden, 329
Camellia, out-of-doors, in Essex, the, 220
Camellias, a few good, 221 ; the cultivation of, 262, 269, 284
Cape, Plums from the, 74
Caper-bush, the, 158
Capparis spinosa, 92
Carnation, American methods of judging the, 235 ; C. Mrs. Thos. W. Lawson in England, 283 ; C. Princess May for winter flowering, 20 ; thirty thousand dollars for a new, 74
Carnations and Picotees in frames, 84
Carnations attacked by Acarus, 270 ; diseased Malmaison, 280 ; eaten by sparrows, 204 ; in America, 170 ; seedling, 32 ; shrew-mice and sparrows, 270 ; C. Souvenir de la Malmaison, 158
Cattleya, abnormal, 406 ; C. Lawrenciana, with lateral petals adherent to column, 405 ; C. Luddemanniana, 161 ; C. Mendeli, 370 ; C. Mossiæ var. Lily Duchess of Marlborough, fine plant of, 411 ; C. Percivaliana, 98 ; C. Trianæi gigantea, Harefield Hall var., 193 ; C. T. Mrs. W. H. Cannon, 98 ; C. T. West Bank House variety, 130
Cattleyas, &c., at New-Hall-Hey, 101
Causley's folding Protectors, 261
Cedar avenue, the Lebanon, at Dropmore, 138 ; transplanting a large, at Southsea, 42 ; with aërial roots, 126
Cedrus Deodara nivea, 399
Celery attacked by grubs, 159

CERTIFICATED FRUITS: — Apple Allen's Everlasting 174 ; A. Barnack Beauty, 174 ; A. Lady Pilkington, 79 ; A. Sanspareil, 109 ; Pea, Carter's Early Morn, 255 ; Pear, Winter Orange, 208 ; Tomato, Winter Beauty, 255

CERTIFICATED PLANTS:—Acalypha Godseffiana, 77 ; Acer pseudo-platanus var. elegantissima variegata, 365 ; Anemone blanda var. Cypriana. 254 ; A. sylvestris, fl.-pl., 365 ; Angræcum × Veitchi, 31 ; Anthurium × Perfection, 254 ; Auricula Abram Barker, 306 ; A. Myra, 256 ; Azalea Betsy de Bruin, 207 ; A. Purity, 174 ; Barkeria Lindleyana, 31 ; Bartholina pectinata. 403 ; Begonia Miss Barbara Roy, 365 ; B. Bella Tait, 365 ; B. Mary Pope, 365 ; B. Duke of Devonshire, 365 ; Bulbophyllum modestum,

Passiflora racemosa, 172; syn. princeps, 203
Pasture problem, a, 391
Pathology, vegetable, 300
Pavetta borbonica, 69
Pea, Carters' Forcing, 30; Gradus, 62
Peach and Nectarine-trees, retarding, 354
Peach, diseased, 415
Pear-blossom, abnormal, 359
Pear Doyenné à Cinq Pans, 132; Frau Louise Goethe, 132; Midge, the, 342; tree with caterpillar, 126
Pears, cracking of, 218; notes on some late winter, 140
Pelargonium crithmifolium, 19; P. Ivy-leaved, Mrs. Hawley, 394; P., zonal, Gloire de France, 401
Peloriate Dendrobium, 305
Pencils, and of what they are made, 302
Penge recreation ground, succulents bedded out in the, 41
Peridermium Plowrighti, experiments with, 415
Petersham Common, scheme respecting, 11
Petunia, a malformed double, 416
Phaius, a new hybrid, 115; × P. Cooksoniæ, 349
Phalænopsis Mrs. J. H. Veitch, 114; P. tetraspis, 382
Phormium tenax, 139
Photographing flowers, 356
Physic garden at Chelsea, the, 24
Pine-needles, decayed two-year-old, 411
Pinus Merkusii, 351; P. Montezumæ, 146; P. sylvestris, proliferous buds of, 406
Plantago uniflora, 100
Plants, novelties in, 144

Plant Portraits: Acacia alata, 219; A. longifolia var. Sophoræ, 360; Acalypha Chantrieri, 360; A. hispida, 25; Alnus nitida, 282; Ampelopsis Graebneri, 360; Angræcum superbum, 146; Apple Reinette de Caux, 360; Azalea indica, 219; Beaumontia purpurea, 27; Begonia venosa, 398; Bessera elegans, 27; Bignonia buccinatoria, 12; Bomarea Carderi, 219; Catananche cœrulea, 398; Cattleya labiata, 27; C. Mendeli var. Princess Clementine, 146; C. Trianæi, var. Hofgärtner Wundel, 122; Ceanothus integerrimus, 90; Cereus Paxtonianus, 233; Chrysanthemum nipponicum, 398; C. Souvenir de Madame Helène de Reydellet, 382; Cienkowskya Kirki, 301; Cirropetalum guttatum, 146; C. ornatissimum, 146; Cœlogyne speciosa, 146; Crinum fimbriatum, 133; Cycnoches chlorochilon, 122; Cypella Herberti, 122; Cypripedium aureum, 146; C. Calypso ×, 146; C. T. W. Bond, 146; C. Wiertzianum ×, 146; Cyrtanthus parviflorus, 282; Dahlia Maximiliana, 282; Dendrobium capillipes, 90; D. nobile, 146; Diervilla Wagneri ×, 301; Dioon edule var., 219; Dryandra calophylla, 170; Echinocactus Whipplei, 219; Eleagnus macrophylla, 90; Epilobium obcordatum, 90; Erodium Manescavi, 382; Fendlera rupicola, 219; Fuchsia corymbiflora, 133; F. Monarch, 27; Gaultheria trichophylla, 26; Gentiana Burseri, 90; Gladiolus Quartinianus superbus, 412; Gynopleura humilis, 170; Habenaria Susannæ, 146; Helenium autumnale superbum, 301; Helianthus mollis, 219; Herbertia pulchella, 122; Hibiscus cannabinus, 382; Hyacinth Chas. Dickens, 219; H. Mont Blanc, 25; Incarvillea grandiflora, 27; I. variabilis, 233; Impatiens Roylei var. pallidiflora, 233; Iris Delavayi, 398; I. hispanica, varieties of, 25; Kleinia pendula, 398; Kniphofia Nelsoni, 219; K. Tucki, 170; Lælia prestans var. Luciani, 146; Lewisia Tweedyi, 25; Liatris pycnostachya, 382; Ligustrum japonicum variegatum, 219; Lilium rubellum, 26; Lissochilus Græfii, 219; Lobelia Rivoirei ×, 133; Magnolia Watsoni, 219; Masdevallia Harryana, 146; Meconopsis heterophylla, 26; Miltonia vexillaria var. Memoria Lindeni, 146; Moræa sulphurea, 398; Milla biflora, 27; Narcissus, varieties of, 219; Nerine undulata, 27; Nicotiana sylvestris, 282; Odontoglossum crispum var. La Merveille, 146; O. Rolfeæ, 146; O. Schlieperianum var. xanthina, 146; Oncidium Jonesianum, 146; Pæonies Margaret Attwood and the Mikado, 27; Passiflora amabilis, 382; P. incarnata, 133; P. pruinosa, 170; Pear Doyenné d'Alençon, 301; P. Petite Marguerite, 12; Phacelia campanularia, 122; Plum Gloire d'Epinay, 219; P. satsuma, 219; Phygelius capensis, 122; Primulas, Chinese, fringed petalled varieties of, 133; Prunus Myrobalana roseo-plena, 122; Rhododendron diversifolium ×, 301; Rosa acicularis, 170; Rose Antoine Rivoire, 122; R. Countess de Turenne, 398; R. Mrs. W. J. Grant, 219; Rose Souvenir de Pierre Notting, 412; Russelia sarmentosa, 219; Salvia Goudoti, 412; Scilla campanulata, 122; Silene Fortunei, 233; Solidago nemoralis, 301; Sophronitis cernua, 146; Sorbus aucuparia dulcis, 382; Statice Suworowi, 382; Tremandra ericoides var. hirsuta, 412; Tulips Joost van der Vondel, 25; T., varieties of, 219; Veronica Dieffenbachi, 282; Yucca elata, 233

Plants, new, of, 1898, 2, 9, 33

Plants, New and Noteworthy:— Arundinaria nobilis at Menabilly, 2; Ceanothus integerrimus, 90; Dendrobium capillipes, 90; Elæagnus macrophylla, 90; Epilobium obcordatum, 90; Gentiana Burseri, 90; Iris Tubergeniana, 225; Mina cordata, 114; Paphiopedium barbato-Charlesworthi ×, 3; Passiflora "Margaret Wilson," 81; Pyrus Thianschanica, 389; Thamnochortus insignis, 242

Plants under glass, 7, 22, 39, 54, 70, 87, 103, 119, 134, 151, 166, 182, 198, 214, 231, 246, 263, 279, 297, 316, 337, 357, 377, 395, 408
Plants, where are some old?, 400
Platyceriums at Kew, 232
Platycodon glaucum, 100
Plum, the, in market gardening, 242
Plums, hybrid, in America, 124
Podophyllums, 203
Poppies, spontaneous hybrids in, 260
Poppy, Shirley, seeds of, gradually becoming grey, 159
Porphyrocoma lanceolata. See Dianthera.
Post, the Colonial parcel, 10
Potash as a dressing for land under fruit-trees, 48
Potato-disease, stamping out, 146
Potato, experiments by the Wilts County Council, 138; grafting, remarkable result of, 187; in France, 1781, A.D., the, 177; new and old varieties of the, 203; P. Woodstock Kidney, 107
Potatos, early, 236; experiments on cross-breeding, 78; Mr. Dibben's, 172; Syon House Prolific, 203
Potentilla alchemilloides, 18
Powis Castle Gardens, 353
Primula, the Chinese, 179; P. obconica and P. sinensis, causing irritation to skin, 12, 36, 171, 204, 220, 252, 268, 305
Primulas at Reading, 75; P. floribunda and verticillata, 350
Priority, the law of, 233
Protea cynaroides, 382
Protector, a new, for fruits whilst ripening, 173
Protectors, Causley's Folding, 261
Pruning competition, a, 130
Pruning, Roses, 116; shrubs, 157
Prunus Pissardi in late winter, 139
Pulmonaria rubra, 100
Pycnostachys urticifolia, 82, 123
Pyrethrum Starckianum, 100
Pyrus coronaria, fl.-pl., 397

Q

Queen, an Oak-tree planted by the, 339
Queen's birthday honours, 380
Queen's birthday, tree planted at Carlisle, 358
Queensland, fruits and flowers in, 196

R

Rail, garden products by, 380
Railway rates, 153; ruinous, 121

THE
Gardeners' Chronicle
SATURDAY, JANUARY 7, 1899.

ROME.

ON the first morning after my arrival in Rome, when I looked out of the window on the fourth storey of a tall house in the Piazza di Spagna, I was very much surprised to see a huge Eucalyptus tree looking in upon me, and quite overshadowing the room, and also towering towards the sky, and far above over the house. It happened to be one of the largest in the place, and I had seen them in numbers all along the road as we came in by the railway, but I did not expect such an apparition as this in the heart of the city. I soon found out that Eucalypti are grown here in large numbers, and the belief in their efficacy for good must be very general, for you meet with them everywhere.

A few days after this I was so fortunate as to get an introduction to Cavaliere Palice, Direttore dei Pubblici Giardini di Roma, and I was glad of it, because I wished, among other things, to be enlightened by him about these Eucalypti from two or three different points of view. So far as I remember, one of the principal things which he said to me was, that the best species all round for common use is E. resinifera, and that it is much to be preferred to E. Globulus; or, indeed, to any other. I do not remember to have heard this before, though I know that in point of hardiness some few are better than the rest. E. resinifera, he says, is quite the most valuable of them all, if you can be content with it growing slowly, and also with it never arriving at the height which some others can reach. E. Globulus is far behind it in point of trustworthiness, though it quickly makes a great show and promises wonders. No doubt this is the very reason why E. resinifera has much the best character of the two for general purposes. Slow and sure, is its motto, as it is of many other good things. Cavaliere Palice especially emphasised one point: a Eucalyptus tree hates wind, and it stands frost very much better. The reason, he said, why the large tree in the Piazza di Spagna, to which I have referred above, is doing so well, is merely because it is sheltered from the north, and no strong blasts can affect it; but, he added, if you are at all interested in the question of these Eucalypti, you should visit the Trappist Fathers at the Monastery of St. Paul-trois-Fontaines, and hear all which they have to tell, and see their enormous grove.

THE EUCALYPTUS GROVE AT TRE FONTANE.

As there is no great difficulty about this expedition, I availed myself of the first fine day to take it. But I may as well say here, that these Trappist monks have some peculiarities of their own. They are strict vegetarians, and would not touch meat on any account. But they differ from other religious bodies principally in the way in which absolute silence is enforced among themselves: when one monk happens to come across another monk in the course of ordinary life he has nothing whatever to say to him, by the rules of his Order, except "*Memento mori.*" I could not but think, as I was walking towards the Monastery, which is about a mile or a mile-and-a-quarter beyond St. Paul's Church, which itself is some little way outside of the walls of the city, that I must be going to a very odd place for enlightenment about horticultural matters, if they are likely to treat me in that sort of way. But I soon found out on arrival that all this is provided for, and that some two or three of the Fathers, of whom there are twenty-five in the place, are always told off, whether temporarily or in perpetuity I do not know, for communication with the outside world, without which, of course, no business can be carried on. One of these select few kindly offered his services to me, and during a rather long morning he showed me everything there was to be seen, and told me everything I wanted to know. I did not find that his tongue had suffered in the least from disuse, but he rattled on as though glad, perhaps, of the opportunity for talking to a fellow-man.

Let me just give a few words of description of this extraordinary place, which is taken from Mrs. Jameson's work on *Sacred Art*. She wrote some years ago, that "in all the melancholy vicinity of Rome, there is not a more melancholy spot than the Tre Fontane. A splendid monastery, rich with all the offerings of Christendom, once existed there; the ravages of that mysterious scourge of the Campagna—the malaria—have rendered it a desert. Three churches and some ruins still exist, and a few pale monks wander about the dismal confines of the hollow in which they stand. In winter, you approach them through a quagmire; in summer, you dare not breathe in their pestilential vicinity, and yet there is a sort of dead beauty about the place—something hallowed as well as sad which seizes on the fancy."

But all this in recent years has been altered for the better by the introduction of Eucalyptus trees from Australia. It is a fact that the monks live now during the greater part, if not the whole round, of the year where once they were quite unable to live at all; certainly, they have had a unique experience in this matter, from which others may profit. They cultivate only some six or seven species of Eucalyptus in all, and out of the number my informant declared that in his opinion E. Globulus and E. resinifera are the two best; one is as good as the other, he said, and E. Globulus makes such a fine tree—but that is, I am sure, from the point of view of a resident in Italy. Where conditions are so favourable as they are here to the growth of Eucalypti, it may be difficult to choose between these two; but where greater difficulties are known than is the case here, the value of E. resinifera will very much exceed the value of E. Globulus, which in England is worth very little indeed. At any rate, E. resinifera is very high up, and comes second in the affections of the monk. He told me one thing which I had never heard before, and which has some little interest about it.

The origin of the marvellous growth of these trees in and about Rome was the following. When the Œcumenical Council was held here in the year 1869, some of the Australian bishops who took part in it saw that they could benefit Italy by sending trees from Australia, and they promised that, in their return to their own land, they would forward a consignment of them. The bishops were as good as their word, and the Eucalypti arrived in due course of time, and were well taken care of at the monastery. Now they are grown from seed by hundreds and thousands, but at first some young specimens from Australia were all they had to depend upon. The grove of Eucalypti—or, as it might be called, the forest—stretches far into the Campagna. I asked my friend if he had any idea of the extent of the area which the Fathers had under cultivation for this purpose, and his answer was, that he did not know at all; but he said "I can tell you something—we have planted to our certain knowledge 200,000 of these trees near to and about the monastery;" and I should be very unwilling to dispute the assertion. The grove seems to stretch in and on where these huge giants are growing; they tower up already to the height of some 75 or 80 feet above the ground, and no one can tell what they will eventually come to, or even what they will come to in a term say of twenty or twenty-five years. I said to my guide, "I have heard of these trees attaining to the height of 200 or 300 feet—will yours ever do the like?" He replied, "I have heard of their attaining to a height of 500 or 600 feet, but I do not think they will do that." Nevertheless, I believe he has very great expectations about their future, and there may always be a miracle in reserve to assist them if they do not get on well enough of themselves. The whole place is redolent of the miraculous, according to common idea. The scene was weird and strange in the very extreme. One felt carried out of England, and out of Italy also, and as though for a few hours a visit were being paid to the southern hemisphere itself. Utter silence seemed to reign in the place, and the very birds themselves might have been Trappists so far as any songs from them are concerned; but I fear there is a deeper reason for the intense silence than this—they think very little about the balance of Nature in this part of the world, and birds of all sorts are exterminated in a very ruthless way.

The huge trunks, smooth in some places, and with bark hanging down in others, the sort of sickle-shaped, glaucous foliage, the blossoms, which are unlike any others I have seen, formed a strange sort of surrounding with which the monks are very congenial, but which is as unlike an English landscape as anything could be—gloomy, severe, unattractive are the sort of adjectives I should use with regard to it, and I should be very sorry to exchange our delightful English woods for an Australian grove of Eucalypti.

I wanted to know the girth of one of these extraordinary trees, and the monk declared it to be, after careful measurement, between 4 and 5 feet. A word may perhaps be in place here about the cultural directions, of which my companion was full. Monks have for centuries past been famous as gardeners, and I think my friends of the Monastery of the Three Fountains bring no disgrace to their order.

As I have said above, hundreds and thousands of Eucalypti are now raised from seed. I was privileged to go into a large glass building (or shabby, tumble-down greenhouse it might be called), and there it was pointed out to me how numbers of young Eucalypti were coming on in a most flourishing way. This was a sort of second stage of their existence, and the rules which are laid down for their previous history are certainly sensible enough.

According to the monks, the seed is to be sown thinly in September or October, in boxes filled with common soil, light, and mixed with a little decomposed manure. It is to be very lightly covered over with soil, and watered with great precaution. It is to be kept just moist, and to be deprived of light for some days till germination has taken place. It is to be very carefully guarded against frost for the first winter; in the ensuing spring the plants are to be stationed at distances of about 1½ yard from each other, and with a southern exposure. They are to be watered abundantly every week during the following summer, and specially so if the ground in which they are planted is not naturally humid, &c.

I think you will say that these instructions are sensible enough, and the monks can now point to

200,000 witnesses to the desirability of the practice which they enjoin. I suppose that this Trappist monastery will be a kind of emporium for Eucalypti for all Italy, and, indeed, for Europe also, so far as they are anywhere required. But in some respects the monks are too sanguine to be believed; they attribute some very efficacious virtues to their Eucalyptus-oil. It is, in their opinion, an elixir which stands quite by itself. Their flourish of trumpets goes on in the following strain:—"Il est éminemment hygiénique et febrifuge; c'est aussi un antiseptique remarquable, un vulnéraire, un cicatriciel, très énergique un désinfectant préferé par beaucoup de praticiens a l'acide phénique dont il n'a pas l'âcreté, ni l'odeur repoussante—il est utilement employé dans les affections aiguës et chroniques du larynx et des bronches; la tuberculose pulmonaire, les fièvres de toutes nature; les expectorations fétides, &c." But all this must be taken for what it is worth, and "credat Judæus" expresses the sort of feeling which is entertained by many who are able to judge.

They are on much more solid ground when they descant on the efficacy of their trees for draining purposes, and their self-glorification can be contradicted by no one when they say, "Nous avons transformé ce desert malsain en une oasis, et depuis longtemps nous y habitons toute l'année."

A little notice hangs up proudly in their bureau, or whatever it may be called, and which runs to this effect: "Il a été decerné au Frère Gildas pour l'introduction de l'Eucalyptus à Rome une médaille de seconde classe dans la séance publique du 7 Mai, 1875. Le Président Drouyn de Lhuys, Société d'Acclimatation." *H. Ewbank* (*Rev.*), *Rome*, *Christmas Eve*, 1898.

(*To be continued.*)

NOVELTIES OF 1898.

An annual review of the novelties and re-introductions of plants of the past year is always interesting. For some years past the chief novelties in flowering and ornamental greenhouse and stove-plants have been furnished by the hybridist at home, and the plant-collector who, in his search for Orchids often wandered in lands replete with interesting new plants, but very rarely sent one home unless it were an Orchid. In the immediate past, however, our suggestions seem to have been acted on, especially by Messrs. F. Sander & Co., with the result that at the last great Quinquennial show at Ghent, and on other occasions in Great Britain, they have made displays of new stove and greenhouse-plants, and especially of Palms, imported by them, which have been very gratifying to the plantsman. Some of these new plants have had to be provisionally named, and the names under which they are now known may not withstand the test of comparison with known species in herbaria, but that is of little consequence to the gardener, for they are new to gardens.

The Orchids.

The hybrid Orchids still continue to more than divide the interest of the Orchid specialist with the fine varieties of previously-known imported species. But as with dress, so with flowers, fickle fashion holds unreasoning sway. Hence the great tribe of Cypripediums, which, until quite recently absorbed the greatest interest, have given place to the showy and useful hybrid Cattleyas, Lælias, and Lælio-Cattleyas, until some new combination can be got to give them a fresh interest.

In the matter of fine varieties of imported species, they more than hold their own in point of value, as witness the peculiar form of Cattleya labiata for which Messrs. Protheroe & Morris by fair competition succeeded in getting 130 guis. about a month ago; and the evidence that when any portion of a pedigree plant is on sale, its value is found to have risen rather than fallen. In every branch of Orchid-culture we still look to the fine collection of Sir Trevor Lawrence, Bart., of Burford, under the skilful management of Mr. W. H. White, as the keystone of the Orchid interests in Europe.

Last year, if we may say so, the principal novelty in Sir Trevor Lawrence's collection was the gigantic Grammatophyllum speciosum, well known to science; and this year the equally noble, and still more beautiful, Eulophiella Peetersiana, producing its gorgeous spike of rose-purple flowers at Burford for the first time, is a parallel case. Chief among the many fine things among those flowered at Burford during 1898 must be noted the remarkable Stanhopea Rodigasiana, which not only displayed a very singular departure from the general run of the genus, but demonstrated that a Stanhopea could still command a First-class Certificate; the blood-red Dendrobium sanguineum, which had been less perfectly flowered the previous year; the pretty and distinct natural hybrids Miltonia × Binoti and M. × leucoglossa; and among the Burford-raised hybrids, Cypripedium × Olenus, Burford variety, the largest and handsomest of the C. bellatulum crosses; C. × argo-Morganiæ, Dendrobium × formoso-Lowi; and two bright additions to the Burford hybrid Calanthes viz., C. × labrosior and C. × revertens; while among the many botanical novelties the singular Cirrhopetalum appendiculatum is specially interesting as giving the first instance of its section to flower under cultivation; also the singular Masdevallia ventricularia, and other new species.

Baron Sir H. Schroder, who still maintains his great interest not only in his own magnificent collection, but in all that pertains to Orchids and Orchid growing, has flowered many superb things, especially among the Odontoglossums, and among those which have received Certificates at the Royal Horticultural Society are Odontoglossum crispum Baroness Schroder, which is one of the finest of crimson-blotched varieties; O. c. Princess Christian, a noble flower; O. × elegantius Baroness Schroder, a bright and elegant form of the pretty O. Pescatorei, natural hybrid; and the new Sobralia Sanderiana, imported by Messrs. F. Sander & Co.

Elijah Ashworth, Esq., of Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), from his noted collection, has received awards for Cypripedium insigne, Harefield Hall variety, a veritable giant, and a handsome one to boot. As a standard variety, its distinctness will cause it to rank with C. i. Sanderæ, and always maintain good actual value. Cattleya Mendeli, Beatrice Ashworth, a delicately-tinted white variety; C. Schroderæ, Harefield Hall variety; the first true albino of D. nobile Ashworthianum; and a singular rose-tinted hybrid Odontoglossum near to O. aspersum in O. hybridum Ashworthianum.

Norman C. Cookson, Esq., Oakwood, Wylam, Northumberland, the famous amateur hybridist (gr., Mr. Wm. Murray), has from his collection raised and exhibited several good things as well as by home-raised seedlings, proving the record of natural hybrids, such as Cattleya × Hardyana, &c. Formerly, we recorded the fact that Mr. Cookson had succeeded in raising true, and also by that means succeeded in improving on, Cypripedium Lawranceanum Hyeanum by seeds obtained by fertilising the plant with its own pollen. The first eight or ten plants to flower were all true in the suppression of colour, and better than the original in size. Last year one flowered out of the same batch, which proved to be only a poor form of the common type of C. Lawrenceanum. This shows that the variation may be perpetuated by true seeds, though on securing plants the raiser must not conclude that they are true until he has seen the flowers. Of Mr. Cookson's best things shown last year are Calanthe × splendens, brilliant in colour; Phaio-Calanthe × grandis, the showiest Phaio-Calanthe yet raised, and some very handsome varieties of his Phaius × Norman, the showiest and freest to flower of all the hybrid Phaius, and on that account quite a florists' flower.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), who cultivates principally Odontoglossums, Cattleyas, Lælias, &c., and is not content unless he secures the best, has certainly succeeded in his object in Odontoglossum × Wilckeanum Pittiæ, and O. × W. Pitt's variety, the two best which have yet appeared, and worthy companions to each other. Both secured First-class Certificates, and the latter was illustrated in the *Gardeners' Chronicle*, May 7, p. 274. Other very fine varieties shown by Mr. Pitt are Odontoglossum grande Pittianum, a splendid form with flowers wholly of two shades of yellow; and O. × excellens, Rosslyn variety, a perfectly-formed flower.

Other noteworthy productions of amateurs during 1898 are Cattleya Trianæi, Broome's var., of Joseph Broome, Esq., of Llandudno (gr., Mr. Axtell); C. T. Chardwar var., of G. F. Moore, Esq.; and the finely-formed white C. T. albida of G. W. Law-Schofield, Esq., Rawtenstall (gr., Mr. Shill), who also flowered the pretty ruby-crimson-spotted Odontoglossum crispum Lehmanni, Schofield's variety; Cattleya Mendeli Amelia, of W. P. Burkinshaw, Esq.; Miltonia × Bleuana rosea gigantea, of Mr. Jules Hye-Leysen, of Ghent, which, with the others of his select group shown at the last Temple Show, vanished in the most unaccountable manner; Lælia anceps Amesiana, Crawshay's variety, of De B. Crawshay, Esq., a specialist in L. anceps and Odontoglossums; Cattleya × Sedeni and Lælio-Cattleya × Fascinator, of C. L. N. Ingram, Esq. (gr., Mr. T. W. Bond); the pretty lavender-tinted Cattleya × Bowringiana Lady Wigan, the pale lavender-tinted Lælia Perrini leucophœa, and the showy Lælio-Cattleya × Joyce Wigan, of Sir Frederick Wigan, Bart. (gr., Mr. W. H. Young); Lælio-Cattleya × Schilleriana, Cambridge Lodge variety, Lælia purpurata Ernesti, and Cypripedium × Wottoni, of R. I. Measures, Esq. (gr., Mr. H. J Chapman); Odontoglossum Hunnewellianum majus of Henry Greenwood, Esq.; O. Pescatorei Duchess of Westminster, from the Duke of Westminster; Sophro-Cattleya × Geo. Hardy, from Fred. Hardy, Esq. (gr., Mr. T. Stafford); Cattleya intermedia, Fowler's variety, of J. Gurney Fowler, Esq. (gr., Mr. Davis); and Lælia pumila Colmani, of Jeremiah Colman, Esq. (gr., Mr. King).

(*To be continued.*)

NEW OR NOTEWORTHY PLANTS.

ARUNDINARIA NOBILIS.[*]

Mr. Rashleigh, of Menabilly, obligingly forwards us a photograph of the fine Bamboo which he grows in his Cornish garden under this name. It forms clumps 23 feet in height, and is one of the most striking of the hardy Bamboos. Its origin and specific name are alike doubtful. Mr. Rashleigh is of opinion that it may have come from China, and Mr. Freeman-Mitford, in his charming *Bamboo Garden*, is of the same opinion. Being unable to identify it with any of the Indian species, Mr. Mitford has described it in the work cited as A. nobilis, and the illustration (fig. 4, p. 9) will show that the name has been well chosen. It is met with in cultivation under the names Arundinaria falcata, Thamnocalamus Falconeri, and Arundinaria khasiana, but it differs from each and all by characters which are given in the work cited. It is more hardy than either A. falcata or Thamnocalamus Falconeri, the only other two Bamboos with striated leaves which are grown in our gardens. In ordinary winters the culms do not die, though the leaves may be shed. In severe winters the culms may be killed to the ground, but the roots are uninjured. "In the Midlands," says Mr. Mitford, "we may regard Arundinaria nobilis as a deciduous Bamboo, and to that extent hardy. Its gigantic stature, beauty of colouring, and elegance of form, give it an ornamental value, as to which there cannot be two opinions."

---

[*] Arundinaria nobilis, Freeman-Mitford, *Bamboo Garden* (1896), p. 179.

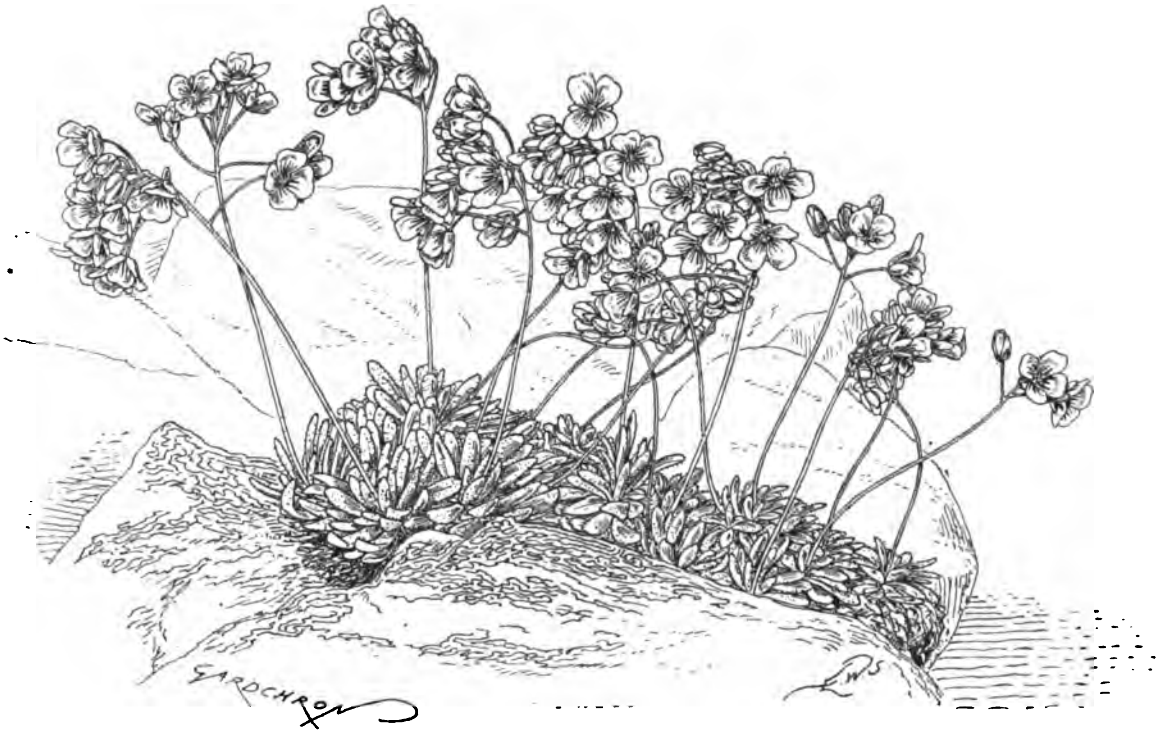

FIG. 1.—DRABA ELEGANS: COLOUR OF THE FLOWERS SULPHUR-YELLOW.

CYPRIPEDIUM (PAPHIOPEDIUM) BARBATO-CHARLESWORTHI, *new gard. hyb.* (BARBATUM WARNERIANUM ♀, CHARLESWORTHI ♂).

This, the first C. Charlesworthi cross which I have seen, has been forwarded by Mr. G. W. Cummins, gr. to W. H. Lumsden, Esq., Balmedie, Aberdeen, N.B., in whose gardens a small batch of this cross has been raised from seeds. It is a very pretty flower, approaching C. Charlesworthi in general appearance, though on examination its characteristics are found to be quite intermediate between those of the two parents.

The leaves (which I have not seen) are said to correspond with those of C. Charlesworthi, but with the variegation of C. barbatum. The scape is purple and downy, bract green, spotted with purple, and about half as long as the ovary.

The flower has the upper sepal flatly displayed, the margin being slightly incurved. The lower half is of a bright rosy-purple colour, with indistinct green lines radiating from the base; the upper half being white with the rose-purple colour of the base continued through it in reticulation following the veining, and growing lighter towards the tip. The lower sepals are greenish-white with bright-green lines, a rosy tinge suffusing the back surface. The petals are slightly deflexed (much more horizontally extended than in C. Charlesworthi), distinctly ciliate on the upper, and less so on the lower margin, neither bearing any traces of the wart-like formations seen in C. barbatum. Their colour is whitish, veined and tinged with dull rose. The lip is of a greenish-white with darker veining, and a brownish-purple tinge on the face; staminode pale lilac, with greenish-yellow keel in the centre. Although it is not a startling novelty, yet its brightness of colour will make it always worth its place, in the same manner as a similar colour has constituted C. œnanthum a general favourite. *James O'Brien.*

DRABA ELEGANS.

THIS rare, pretty-looking Draba was found by Mr. Siehe, of Mersina, growing on rocks of the Cilician Taurus, 1000 mètres above sea level. Our illustration (fig. 1) shows the plant in its natural position, and of its natural size. The flowers are clear sulphur yellow colour, and they appear at the beginning of April. It greatly resembles Draba olympica (bruniæfolia). *U. Dammer.*

COLONIAL NOTES.

CEYLON.

SOME of your readers may be interested to know that the following objects of interest may now be seen in convenient parts of these gardens, viz., a Victoria regia, the Giant Water-Lily, in bloom in the lake. A Cannon-ball fruit-tree, a member of the "monkey-pot" order (Lecythidaceæ), and native of tropical America, bearing three globular fruits suspended by straggling flowering branches issuing from the trunk at a height of 12 ft. from the ground. The fruit, the pulp of which is relished by the natives where it grows, is appropriately named, being about the size of a man's head, the largest at present measuring 11 inches in circumference, and is still growing. The tree itself, introduced in 1881, and probably the only one in the East which has as yet borne fruit, is one of a row of the same species planted along the East river-drive, all apparently of the same age, viz., 17 years, and averaging about 55 feet in height.

In close proximity to these is a handsome specimen of a Talipot Palm in flower, and which has been found to be of the following dimensions:—Height of trunk to inflorescence, 73 feet; height from this to top of inflorescence, 30 feet—total height, 103 feet; girth of trunk at base, 13 feet. The inflorescence, which tapers to the top, consists of fifty main branches, one of which has been found to measure 15 feet in length, having twenty-six "branchlets," averaging 2 feet in length. The branch measured required three strong coolies to carry it; thus, making allowance for smaller branches at top, quite 100 coolies would be required to carry the whole inflorescence. The Talipot "flower" collectively is therefore by far the largest in the vegetable kingdom. The individual flowers are inconspicuous, greenish-white, unpleasantly scented, and are blown about by the wind, giving a snowy appearance to the ground underneath. Estimating by the number counted on one spike, the whole inflorescence contains over 60,000,000 flowers. *H. F. Macmillan, Curator, R. B. Gardens, Peradeniya.*

[A figure of a Talipot Palm in flower was given in our columns March 22, 1873, p. 401, the photograph having been sent us by our friend the late Dr. Trimen. The Cannon-ball-tree was also figured August 5, 1882, p. 177. ED.]

CULTURAL MEMORANDA.

SOLANUM CAPSICASTRUM.

IF this plant be well grown and an abundant crop of highly-coloured berries obtained, it remains unsurpassed in its effectiveness as a decorative plant during the Christmas season. In the shortest days of winter these bright berry-bearing plants are especially appreciated in the dwelling-house, where they introduce a desirable change from the type of plants used for furnishing the vases during other portions of the year. There could hardly be a class of winter decorative plants that could withstand the close, dry atmosphere of living rooms so satisfactorily as this Solanum; moreover, it is easy of propagation and cultivation. At the present time I have a batch of plants in 6 and 7-inch pots, and they individually carry as many as two hundred berries of a brilliant scarlet colour. These plants are about three years old, and we find them of inestimable value for furnishing tables and for the decoration of ball-rooms at the Christmas season. Fortunately, the plants lose nothing in effectiveness when seen under artificial light. The system of culture we practise in the case of Solanum Capsicastrum is as follows:—The seed, so soon as it is ripe, is sown in a pan containing a sifted compost of loam and leaf-soil in equal parts, and silver-sand. It is placed in a temperature of about 65°; if plunged in a propagating-bed, the seeds will germinate more quickly. When the young plants are large enough, remove them singly into 2½-inch pots, and place them on a shelf near the glass in a rather warm and genial atmosphere. Pinch the shoots and repot the plants as frequently as is necessary, always exposing them to the greatest amount of light possible, to induce a stocky, robust habit. An occasional application of clear liquid-manure should be afforded as the plants gain strength, the aim being to obtain a many-branched, healthy plant in as short a time as possible, so that by the month of June they may be planted out in an open sunny border. Due attention to affording necessary root waterings, and to keeping the surface of the soil free from weeds, will be all that is needed until the latter part of the month of September, when the plants should be lifted and potted up into pots of suitable sizes. A shady spot out-of-doors should then be chosen for the plants, and frequent overhead syringings will be necessary for a few days. In a week remove the plants to a light, airy house, where the berries will soon become coloured. At the time of housing the plants, it is good practice to shorten the growths beyond the topmost berry in order to concentrate the whole energies of the plant into the swelling berries. For early fruiting we find the older plants more valuable, as the wood of these naturally becomes matured earlier than the young plants. The Solanum Capsicastrum is subject to attacks of aphis, red-spider, and thrips; these can easily be kept in check by periodical syringings with an insecticide, or by occasional fumigation.

Cyperus natalensis.

For use in dwelling-rooms, and for general decorative purposes, this Cyperus is invaluable, and it may be propagated and cultivated with comparative ease. I know of no plant better suited for furnishing small vases, or for use as a "dot" plant upon the dinner-table. For the latter purpose we turn the plants out of the pots (generally small 60's), and neatly cover the ball of soil with living moss, procured from the woods. No matter what the design, these little plants, with their bright green foliage, always present a pleasing appearance upon the table.

The best method of propagation is to sow seeds at intervals throughout the year. In our case we sow a pinch of seed once a month in a 5-inch pot, and if the seed has been properly ripened before gathering, germination will take place very quickly and freely. When the young plants are about an inch high, they are potted-up into 2½-inch or 3-inch pots, using a compost of equal parts loam and leaf-soil, with an admixture of silver-sand. Small clumps of the seedlings are lifted from the seed-pot with a pointed stick or label, and inserted in the centre of the small pots, pressing them fairly firmly with the fingers. No more shifting will be required, for the foliage presents a much more elegant appearance when grown in this way than if planted sparsely, and given more liberal cultivation. Half-a-dozen plants or so are annually potted on into 6-inch pots, and if due attention be given them during the autumn by placing them in a sunny and airy position, they will furnish an abundance of good seed. Copious supplies of water to the small plants at all times, when they have become established, is essential. The cultivator can well afford to sacrifice those plants that have done duty several times and have become shabby, as others may be raised with so little trouble. *H. T. M., Stoneleigh.*

THE HARDY HEATHS.

(Continued from vol. xxiv., p. 454.)

E. multiflora.—Among hardy Heaths the nearest ally of this species is our British E. vagans. It is, indeed, sent out by some nurserymen under that name. It differs, however, in its denser, much more compact habit, and in its shorter flower-spikes; neither is it a native of Britain. It is widely spread over South Europe, extending along the Mediterranean region from Spain and France to Greece. It grows from 12 inches to 18 inches high, forming close, rounded tufts. The shape and arrangement of the leaves are the same as in E. vagans. The flowers are also of the same pinkish hue, but the racemes are only 1 inch to 2 inches long—about one-third the length of those of E. vagans. With us E. multiflora flowers from August to October.

E. scoparia.—Although one of the species from the Mediterranean region (the western part), this Heath is quite hardy near London. Winters like that of 1894–95 cause the upper and more exposed stems to split, but the main body of the plant is not seriously injured. At Kew it has stood for many years in a place not particularly sheltered, and is now 6 feet to 9 feet high. It grows erect, and is of a rather uneven, straggling, but still picturesque habit. The leaves are deep-green, and arranged in threes, the whorls being further apart than in most Heaths. The wood is glabrous, and the small, greenish-white, crowded flowers are borne in the leaf-axils, on several inches of the terminal portions of the long slender twigs. Compared with the other tall South European Heaths, it differs from E. arborea and E. lusitanica in its smooth stems, and from E. australis and E. stricta in its axillary flowers. It blossoms in June.

E. stricta.—Like the species just described, this ranks as one of the hardest of South European Heaths. The winter of 1894–95 did not affect it even so much as E. scoparia. I do not know the largest size to which it grows; the tallest plants I have seen are about 5 feet high. It is of sturdy habit, and its leaves (which are green, not glaucous beneath, as in so many Heaths) vary in the number at each whorl from four to six. The flowers are borne in terminal clusters, which on the majority of the shoots are umbels, but on the stronger ones may be termed short racemes. The flower is a quarter-of-an-inch long, pale purple, and cylindrical, being almost as wide near the mouth as at the base. It commences to flower in June and July, and blossoms may be gathered as late as November.

E. Tetralix (Cross-leaved Heath).—Of the true Heaths (that is, not including Calluna), this is probably the commonest in Britain, being widely spread over the three kingdoms. Four leaves occur at each node, and they are arranged cross-wise. The plant grows 12 to 18 inches high, and is downy in almost all its parts, especially the young shoots, leaves, and sepals. The flowers are in terminal umbels, the corolla a quarter-of-an-inch long, very much contracted at the mouth, and bright rose. It blossoms in late summer and autumn. It is a variable plant, especially in the degree and character of its pubescence, which in some instances becomes almost bristly hairs. Two varieties are cultivated—alba, with white flowers; and rubra, in which they are more distinctly red than in the type.

E. vagans (Cornish Heath).—Probably the most vigorous of the dwarf Heaths, this is also one of the most attractive hardy shrubs flowering in late summer and autumn. It is a native of Cornwall, and is also found on the coast of Waterford in Ireland. It is a glabrous shrub, 1 foot to 2 feet high, its lower branches spreading and prostrate. Under cultivation, where the soil is too moist and rich, it is apt to become sprawling and ungainly after a few years. The flowers are borne, two or three together, in the leaf-axils towards the top of the branch, on very slender stalks of unusual length. They are cup-shaped, almost globular, and pinkish-purple, with the dark purple anthers well protruded. The whole raceme is 4 inches to 6 inches long. The leaves are four, sometimes five, together in the whorl, and are a quarter of an inch to half an inch long. The following varieties, whose names sufficiently denote their distinctive characters, are in cultivation: Var. alba, var. rubra, and var. grandiflora.

E. Watsoni ×.—This is most probably a natural hybrid between E. ciliaris and E. Tetralix, and was first found on a heath near Truro by Mr. H. C. Watson, after whom it was named by Bentham. It has an inflorescence intermediate between the capitate one of E. Tetralix and the elongated raceme of E. ciliaris. The leaves are ciliate, but narrower and more revolute at the margin than in E. ciliaris. The flowers are rosy-crimson. *W. J. Bean, Arboretum, Kew.*

REMOVAL OF RHODODENDRONS FROM THE GARDENS OF D. HENRY SHILSON, ESQ., TREMOUGH, FOR KEW.

An interesting event recently took place at Tremough, Penryn, Cornwall, in the removal to the Royal Botanic Gardens, Kew, of a collection of Himalayan Rhododendrons, presented to the Gardens by D. Henry Shilson, Esq., the owner of Tremough.

There has lately been added a wing to the Temperate-house at Kew, this, we understand, is to be largely occupied by Rhododendrons, and the plants removed from Tremough will be planted therein. They comprise such species as Falconeri, Thompsoni, barbatum, niveum, Aucklandi, ciliatum, and arboreum, in several varieties, including that triumph of hybridisation, to which the name of Shilsoni has been appropriately given. This gem was raised by the late Mr. Wm. Shilson, by crossing R. Thompsoni with barbatum. Kew already possessed a plant of this much-coveted variety, but it is a pigmy compared with the one now sent, for so large was this plant that it was found necessary to allot it a separate railway truck to itself, and, to ensure its safe passage under the arches, was packed lying on its side. Several of the plants were noble looking specimens, ranging from 12 to 15 feet high, and of nearly two tons in weight.

Tremough ranks as the Rhododendron Garden of Cornwall, and here, if anywhere, the cultivation of these beautiful plants has reached the acme of perfection—climate, soil, and situation suiting them admirably (see fig. 2, p. 5).

The late Mr. Shilson was one of the first in this country to take up the cultivation of these noble plants, and at Tremough there may be seen some of the most wonderful Himalayan Rhododendrons in the country.

Mr. Watson, of Kew, superintended their packing and removal, and his name was a sufficient guarantee that they would arrive safely at their destination. *R. Gill, Tremough.*

THE OLEANDER.

In another place the magnificent plants of Nerium Oleander existing at the Luxembourg Palace in Paris are alluded to. A few memoranda as to the cultivation of the plant may not be amiss, so little success attending the amateur gardener in this direction.

The flowers are produced on the wood of the previous year, if it be well matured, and they appear on such shoots for two successive years. Hence a plant of Oleander must not be cut down, or even much pruned, beyond thinning out some of the weak or redundant shoots. Its habit is to produce flowers at the upper part of the head, and any endeavour by pruning to get flowers low down ends in failure, and a mass of flowerless shoots near the ground-level. It is due to this habit of flowering at the top that large examples, when observed in full bloom, resemble miniature flower-beds. The plant grows well under semi-aquatic conditions, as does the Willow, which in its habit of growth it greatly resembles. It requires a stiffish loamy soil, well enriched with manure, and above all, perfect drainage, for, notwithstanding that the large quantities of moisture demanded in the growing season, it dislikes water stagnant in the soil. Repotting or tubbing should not occur oftener than once in four or five years, although top-dressing with rich compost may be performed annually. The best month to repot, &c., is May, and in the case of plants that have reached a good size, large shifts should not be afforded, a 2-inch space all round the ball being sufficient—that is, after loosening the outer roots and soil.

The plant should remain out-of-doors from the end of the month mentioned till the first week in October, and in the sunniest spot at command. In the latter month, after taking away any of the top-dressing of manure that may have been afforded, and tickling the surface with a pointed stick to make it permeable to water and air, for the plant must have water afforded three or four times during the winter. Any semi-dark, dry, frost-proof place, where the temperature does not fall below 40°, will suit the plants from October till March.

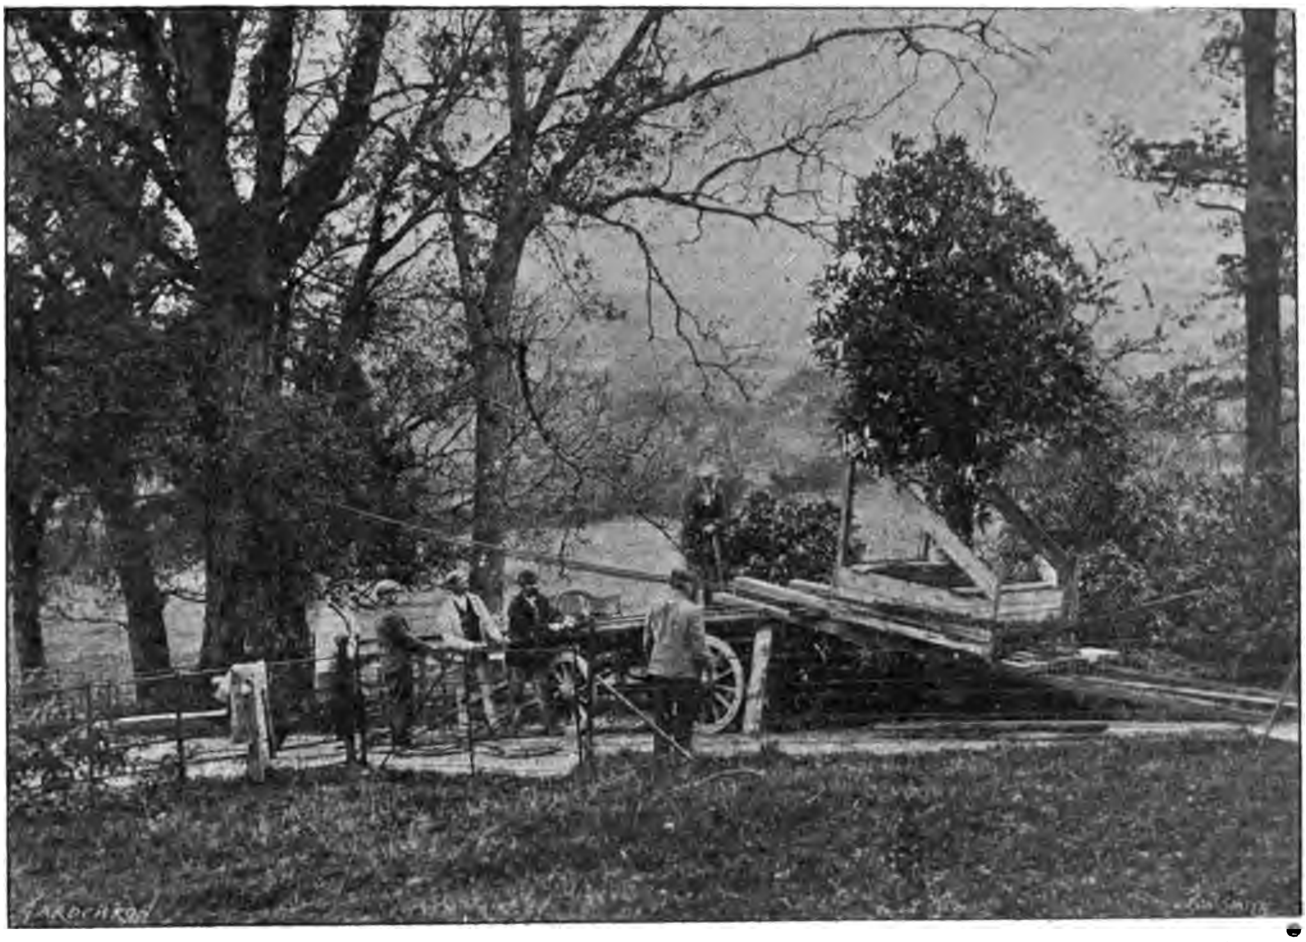

FIG. 2.—REMOVAL OF SPECIMEN RHODODENDRONS FROM THE GARDENS OF D. HENRY SHILSON, ESQ., TREMOUGH, PENRYN, CORNWALL, TO THE ROYAL GARDENS, KEW. (SEE P. 4.)

(Photographed by Mr. Arthur H Huss.)

AMERICAN NOTES.

CLEMATIS PANICULATA.

THIS fine climber promises to become one of the most popular climbing flowering-plant in America. Last spring the very large supply was not equal to the demand, and the stock was exhausted before the planting season was over. It seems to be an ideal climber for covering walls, piazzas, columns, or any object in a sunny position. It is unique when grown as a large single plant, with a light frame to scramble over, or, when tied to several centrally-placed stakes, which will allow the laterals to droop around, and which, when covered with their wealth of white, sweet-scented flowers, present a picture of great beauty. Its perfume is like that of the Daphne, penetrating and sweet. It commences to bloom here in the latter part of August, and continues for a period of six weeks. It is a strong grower, and makes shoots from 18 to 20 feet in length in a season. A writer recently said in the *Gardeners' Chronicle* that, owing to the fact of its not ripening its wood, the plant does not do so well in England (see vol. xxiv., p. 268). We do not think this is the cause, and treat the plants ourselves as perennials, cutting them down each winter.

We enclose a photograph of a specimen planted three years ago in good rich soil in the kitchen-piazza of our residence. This plant we cut down to within 6 or 8 inches of the ground each winter. We have examined the ripe wood this morning, December 5, 1898, and find no canes ripe over 4 and 5 feet of their growth, although they grew to lengths of 16 to 18 feet, and we expect this plant to do equally well next season. Its growth during early summer is rapid, requiring its young shoots to be frequently tied-in, so as to cover all the space desired. Like all other Clematis, we find a good mulch of rotten manure is very beneficial to it if applied in the fall. This may be allowed to remain during summer, as it will then help to keep the soil cool and moist during hot weather. The plant here is entirely free from insect pests and diseases, and although as hardy as an Oak-tree, we do not think it will give satisfaction if planted in shade. The climber on the right hand and on the walls above it in the photograph is Ampelopsis Veitchi, and we take great pride in pointing to the fact that we were the first to offer this plant in America. It has been planted very extensively all over this country, and is still growing in popularity. *John Charlton & Sons, Rochester, N.Y., U.S.A.* [The photograph mentioned is not suitable for reproduction. ED.]

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Description of Houses.—In order to cultivate a fairly representative collection, three houses at least are necessary, and it will be an advantage if these can be sub-divided. In that case the requisite shading, airing, and damping of the different species, may be performed with greater benefit to the plants. One of the houses may be called the "East Indian" or "tropical" stove, and this will be devoted to plants from low elevations in the tropics of both hemispheres, though mainly to those from the eastern hemisphere. A division is generally necessary, because the genera are so diverse as Dendrobium and Cypripedium—the former requiring strong light and the latter comparative shade. The second is known as the "Cattleya" house; but there are many other genera that may be grown in it, including most plants that are indigenous to the lower mountainous regions of the tropics. Sub-division is not absolutely essential in this case, but is an aid to the better cultivation of the so-called Mexican Lælias, which in many localities can be grown without any artificial shading. The third house will be the cool-house, for the cultivation of the various genera and species found that grow in cool temperatures in the Orchid world, latitude and altitude both bearing considerably upon the conditions they require. Sub-division of this house is an absolute necessity, not so much from the point of view of temperature as for those of shading and damping. It is a much debated question whether this house should be built against a wall facing north or in the open. No doubt the former has its advantages during the summer-time, but I think these are discounted by certain disadvantages during the winter, and I am inclined to favour a more open position, as ordinary shading is far easier to remove than brick walls.

Temperatures will be more or less of an artificial nature for some time to come, but the more we can can dispense with artificial heat the better. The hot-water pipes in any house should be more than sufficient to maintain the requisite temperature without heating them (the pipes) to a great extent. The sides, ends, and roofs of the houses may be covered at night with some suitable material, which will lessen the amount of fire-heat required. The lath-roller blinds, now so commonly used, are excellent for keeping frost off the roof, and can be pulled up in the morning without tearing, as canvas blinds frequently do when used for the purpose. The temperatures should be as follows: East Indian-house, 70° by day, receding during the night to 65°; Cattleya-house, by day 65°, by night 60°; and the Mexican division, being at the cooler end, will be a degree or two lower at night. The warmer division of the cool-house should be 58° by day and 53° at night, and the cooler end 50° by day and 45° at night. The day temperatures will vary considerably, according to the conditions outside; but the above figures denote the degree of warmth to be maintained by artificial means. In the event of very severe weather, the temperatures may be allowed to drop a few degrees lower than those given, and will be less hurtful than the extra fire-heat that would otherwise be required. The thermometer inside may register 1° less for every fall of 8° outside, or *vice versâ*.

Ventilation.—The East Indian and Cattleya divisions should be given no air through the top ventilators during the three winter months, but the bottom ventilators may be used on all occasions when there is no frost near them, and in the Cattleya-house they may be opened very slightly at night when the temperature is above freezing point. On mild, open days the cool-houses will require the use of the top ventilators as well as those in the brickwork of the house; but where they are situated on both sides of the house, those on the leeward side only should be employed. Until a week before Christmas the top ventilators of our Odontoglossum-house were open at night about 3 inches the full length of the house.

Watering and Damping.—In the cultivation of Orchids, with few exceptions, it is safer to let the potting material remain dry for a few days than to give water to the plant before it actually needs it. There may generally be found, however, some indication that a plant is in need of water, such as a tendency in the bulbs to shrivel, or a limpness in the leaves of species having no pseudo-bulbs or stems. To prevent these conditions developing to an injurious extent, frequent and careful examination is necessary.

Moisture in the air is very necessary to the plants, but a saturated atmosphere, in conjunction with a low temperature, is as unsatisfactory as an exceedingly high temperature without moisture.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

Planting.—By this date, with the mild weather that we have been avoured with, most of the planting of trees and shrubs will have been completed. It will now be necessary to have all of these trees and shrubs carefully staked without loss of time, in order to prevent wind-waving. The stakes, both long and short, should be driven into the ground firmly in a slightly slanting position, using plenty of bast round and between stake and stem, and not binding too tightly. Do not allow the base of the stems to be buried with soil for any length of time, but make the ground around either level or sloping away from the stem—excepting in very light or shallow soil, when the ground may slope towards the stem slightly.

Keeping.—All tree leaves that are likely to be blown about should be raked and swept up, either burying them in the shrubberies or taking them to the leaf-heap to decay and to be returned to the soil as leaf-mould. Let the land be forked over lightly between young shrubs, burying weeds, &c., but not digging so deeply as to injure the roots. The digging will tend to aerate the soil and make it permeable to water. Where large roots and suckers from the same have come through the surface of the lawn, the turf should be lifted and the suckers dug up; and in the case of roots, soil must be added so as to cover them and prevent damage to the mowing-machine.

The Flower-beds.—All vacant flower-beds may now be dug, leaving the surface rough so as to allow of the frost penetrating and pulverising it, leaving what soil or manure is to be added till the second digging a few weeks hence. All large beds used for sub-tropical plants such as Cannas, Ricinus, &c., should be trenched eighteen inches deep, placing a good spit of farmyard manure in the bottom of each trench.

Kniphofias, commonly known as Tritomas, should have a small stake driven down towards the centre of each plant, and the foliage twisted round the same and secured with bast, then coal ashes should be placed round the crowns as a safeguard against frost.

Half-hardy Plants.—Violas, Calceolarias, Gazanias, and other half-hardy plants standing in frames, should have abundance of air during mild days in order to enable the plants to withstand confinement and lack of light during periods of frosty weather that may occur.

Flower-sticks.—This seems a small matter, but it is one that should have attention at this season, when, owing to bad weather, the men cannot work outside. Privet and young Hazel shoots make good neat flower-sticks, and these should be secured, and after sizing them, be tied in bundles tightly, and placed in a dry place. Stakes of all kinds may be made or repointed, also layering-pegs made and put away in readiness for use. Every day will now add to the cares of the gardener, and nothing should be left over that can now be done till a more busy time arrives.

Bulbs.—Any of these which are now pushing through the soil, such as Narcissus, Tulips, Crocus, and Spanish Iris should have a slight sprinkling of soot, using that which has been stored for some time. This will prevent worms drawing the leaves into the ground, and afford a slight check to the ravages of mice. Examine the beds daily, and if there are any signs of mice having got at the bulbs, set traps forthwith. The "figure 4" trap baited with cheese is one of the best.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge.

Pot Vines.—Where the forcing of these commenced some weeks since, the temperatures must not be unduly increased while the days are so short, but rather let a genial condition be maintained by the aid of moderate firing and damping of the border morning and afternoon, and when there is sunshine light syringing is beneficial once during the morning. If the pots are stood over or near the hot-water pipes, a careful study must be made daily of the need for watering, or much mischief may result from injury to the roots. Every effort should be made to maintain an equable condition in the soil, not giving an excess of water at one time, and allowing the other extreme to occur at another. If bottom heat is generated by fermenting materials, this should be periodically examined and restored by the addition of some fresh materials mixed with that already in use. Tepid water only should be afforded, and, until growth is well advanced, stimulants in liquid form should be applied sparingly, if at all. Ventilation will be necessary only when there is sunshine to raise the temperature above 70°, and then it must be given with caution if the winds should be cold or frosty. Close early so as to husband as much solar warmth as possible, which is infinitely more invigorating than that obtained from the hot-water pipes.

The Early Vinery.—Where the earliest Grapes are obtained from planted-out Vines, these will have been duly prepared, if not actually started, prior to this date; this being so, much the same cultural conditions apply to these as are advised for pot Vines. See that the border is not in a dry state, but on the other hand, it is decidedly unadvisable to lower its temperature by heavy applications of water until there is some indication of root activity. Outside borders, where they exist in early Vineries, should have a covering of stable-manure and tree-leaves, sufficient to afford a slight warmth to the soil. When there is a tendency in the Vines to break unevenly, let the rods be bent in curvilinear manner, or tie them horizontally to the trellis along the front of the house.

The Early Peach-house.—Where the trees planted are those of Early Waterloo and Alexander, there should be no attempt made to unduly force them, or failure, more or less great, will be sure to result in premature bud dropping. These varieties must be allowed to advance up to and through the flowering period under slowly progressive treatment. After that time they can be hurried forward if necessary. Trees of these varieties, and the Early Rivers Nectarine, started the first week in January, will furnish ripe fruits at the end of April and early in May. Temperature for these should not exceed 45° at night, and but slight heat allowed from fire. Ventilate, too, on bright mornings, so as to maintain a buoyant atmosphere, and to prevent any undue excitement in sap movement. Main-crop varieties that do duty for early work will endure a few degrees higher temperature, and need it to bring them on early in the summer, but the effort should always be to avoid extremes from any and every cause. Uniformity of temperature, and also of root and atmospheric moisture, should be the guiding rule. A light syringing in the tepid water once or twice daily, will greatly assist the swelling buds. Pot-grown trees standing outdoors should now be brought in if they are intended as a first crop, or as a supplement to those established indoors. As their roots have been previously attended to, there will be nothing further needed. The condition of the soil and roots is more uniform if the pots are either plunged in the border or sunk in a bed of tree-leaves and litter. Trees that were infested with red spider or scale last season, should be dressed with some approved insecticide, to which is added some clay and sulphur, reduced with water to the consistency of paint. Sulphur is excellent for destroying scale or spider, used in sufficient quantity, and applied with a small painter's brush.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to Lady LOUISA FORTESCUE, Dropmore, Maidenhead.

Planting Fruit Trees.—The very mild and open weather which has prevailed throughout the winter, with the exception only of a day or two in December, has been most favourable for all planting operations in connection with the outside fruit garden, and work of this kind will be in a generally forward condition. Where not already completed, planting may yet be successfully carried on in open weather, but the sooner, now, that is finished the better chances the trees will have to become settled in the ground and ready to start into growth in the spring. Assuming that the ground has been properly prepared, the trees, if obtained from the trade, should have the roots thoroughly moistened if they are found to be in a dry condition, trimming off any broken portions or shortening others that are unduly long, and then embed them into moist soil till they are planted. Should the soil be rather wet when this is done, a few shovelfuls of a mixture of dry earth, wood ashes, and sandy road-scrapings should be afforded each tree in order to facilitate the planting and the production of young roots. Let this kind of material be well worked in about the roots, which should be laid out in a horizontal radiating position, giving the tree a slight upward and downward shake when about half the operation of filling-in is finished, and press the soil moderately firmly about the roots. Finish off with a mulching of littery or slightly rotten manure, with a view to excluding frost, encouraging root action, and, later, conserving the moisture in the soil.

Fastening Trees.—Standard and bush-headed trees should be secured to stakes placed firmly in the ground, the trees being fastened temporarily until well-settled in the soil. Wall trees may be secured from harm by gathering the branches together loosely with matting, and tying these temporarily to the wall from a nail on either side, leaving the training to be done later on. In planting wall-trees, due allowance must also be made for the swelling of the stems, by planting six inches or more from the base of the wall, and sloping the stem upwards against the latter; and Pear-trees especially need this attention, as their stems swell to a considerable size. Apricots, too, canker and gum, and lose branches from a too severe pressure of the stem against the wall at the first point of contact. An important item with newly-planted trees is to properly label them before the nursery labels are lost; and for this purpose the Acme or Stratford labels, in various shapes, are both cheap and durable.

Pruning and Cleaning Orchard Trees.—Orchards of Apple and Pear-trees are often left pretty much to look after themselves, excepting at fruit-gathering time, and consequently orchards in a bad condition are rather common, although much has been written and done in recent years, and a great improvement in this respect has resulted. The present is a suitable time for a judicious thinning and pruning of neglected standard-trees. Where the crowns have been much neglected, with the result that the branches are crowded, the pruning should be carried out gradually in order that no considerable check be given to the tree, the thinning in such cases being extended over two or three seasons. Begin by removing the innermost branches, and those that cross each other a few at a time at each winter's pruning. After sawing-off a branch, the wound should be smoothed over with a sharp pruning-knife, and if very large painted over with lead colour.

Dressing for Trees.—Trees infested with lichen should be cleansed, and moss or other growing rubbish removed from the base of the tree. The main branches may be brushed over with lime-wash made from freshly-slaked lime, or fresh lime in powder may be scattered over them when moist. One of the best and simplest winter-dressings for fruit-trees of all kinds I have yet tried is that made from an American recipe that appeared a few years since in a contemporary. It consists of caustic soda and potash in equal quantities. The proportions as follows:—1lb. of caustic soda, 1lb. of crude commercial potash, to be dissolved in a little hot water, adding to this sufficient clear soft water to make 10 gallons, or if more or less be required in similar proportions. If the preparation be used at a temperature of about 120°, it is the more effectual. This wash will remove moss and other parasites, and also kill most kinds of insects and their eggs, and leave the trees in a clean and healthy-looking condition. If used for Peach and Apricot-trees the above quantities should be diluted with 12 gallons of water, and be used only while the buds are in a somewhat dormant state.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Preparation of the Land.—The principal work in the vegetable garden at the present time consists of simple digging or trenching, either two, three, or four spits deep, the land being heavily or lightly dressed with manure according to its requirement and the special needs of the various crops to be grown thereon. Fresh manure from the stock-yard may be advantageously used where early digging is practised, and where no immediate planting has to be done, as also for turning into the trenches when land is dug two or more spits deep. For the crops of Potatos, manure should be well decayed if it be put near the top or close to the sets. Dig deeply land which is light, affording it plenty of manure at a good depth, so that the roots of the plants grown thereon will find their way down and be less liable to suffer from drought. [Some cultivators object to the early digging of light land, preferring to wait a few days before sowing or planting under the idea that more moisture is lost by such land when dug early, but this objection seems to us to apply more to summer than winter digging. Ed.] Do not dig land in sloppy weather, neither when it is much frozen, but wheel manure on to any piece of land which has yet to be dug.

Peas.—If a snug warm border exists in the kitchen-garden, and if no Peas have as yet been sown, make forthwith a sowing of such dwarf varieties as Chelsea Gem, W. Hurst, and American Wonder, especially the first named. Let the seed be sown somewhat thickly in rows about two feet apart; and to make them distasteful to mice, first damp the seeds and then roll them in red-lead powder. It may be advisable to make a good sowing in small pots at the same date, to be planted out. The seeds sown in pots may be stood in a cold frame and grown sturdily, with plenty of air admitted. Peas may be forced for an extra early supply of pods, but the plants will not stand a high temperature before the pods are formed. Peas should occupy a position near the glass, and where air can be freely admitted at all times without causing draughts. Bijou, or any other of the dwarf type, may be chosen. Attend to Peas just peeping through the ground, scattering some finely sifted leaf-mould or coal-ashes amongst them and alongside the rows, and letting them be staked early, and place evergreen twigs along the side of the rows as a protection against wind and frost. The Pea-sticks of last year should be overhauled and repointed if worth it, and then be bundled up in their various sizes. What will be required in the way of new Pea-sticks and Bean-stakes, &c., should be obtained and made ready for use.

Globe Artichokes.—If not done already, the Globe Artichokes should be protected from injury by frost by packing a fairly good thickness of litter over the roots and around the plants, keeping it in its place with a few spadefuls of soil. In the meantime a piece of land may be prepared for a fresh plantation, the planting being done in March. The new plantation always affords a crop of heads in succession to the old.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Hippeastrums (Amaryllis).—Old bulbs should at this season be quite at rest and dry at the root. They winter quite safely in a temperature of 45°. Seedlings which have not flowered should not be rested, but should be kept growing in the stove, or any other well-lighted glass-house where a temperature of about 60° can be maintained. A proportion of the strongest bulbs raised from seed sown during the summer of 1897 will flower during the coming months of April and May, and the remainder in the autumn and following spring. Seedlings which have been raised from seed sown last July should have been potted a month ago into 3-inch pots, and afforded a compost consisting of two parts loam and one part leaf-soil, with a liberal allowance of silver-sand, and should be placed in the stove as near to the roof, or in as light a part as possible. Hippeastrums may be grown successfully without the aid of bottom heat during any part of their growth.

Chrysanthemums.—The cuttings recently inserted should be examined at frequent intervals, and those which are rooted promptly removed from the close frame or hand-light in which they have been struck, or otherwise they will become drawn and weakened. They must be gradually hardened off, and in the first instance may be placed outside the frame in the same house, where the night temperature is not lower than 45°, air being admitted sparingly at the first, otherwise flagging of the foliage will result. The unrooted cuttings must be prevented from damping by removing the light from the frame early each morning for an hour, so as to let the moisture in the air evaporate and the leaves to become dry, at the same time wiping the condensed moisture from the inside of the light.

Caladiums, Tydeas, Achimenes, Gloxinias.—Examine the pots of these from time to time which are being rested under the stages and other out-of-the-way places, in order to make sure that they are dry and not exposed to drip from the stages, &c., otherwise the bulbs and corms may decay, or start prematurely into growth.

Euphorbia (Poinsettia) pulcherrima and E. Jacquiniæflora.—As soon as the plants of the first-named go out of flower, or rather when the bracts fall, water should be gradually withheld, and, when the soil is dry, they may be rested in a temperature of 50° to 55°, or at the cooler part of the stove. Euphorbia Jacquiniæflora may be rested in the same way, but it should not be dried off to the same extent.

Richardia (Calla) Elliottiana.—New seed of this yellow Aroid germinates freely, and those who contemplate purchasing seed should procure it at once from a trustworthy source. The seed may be placed singly in thumb-pots, or sown in a 5-inch or 6-inch pot, according to the number of seeds. A compost of loam, leaf-soil, and sand will be suitable in either case. The seed should be covered by half-an-inch of soil, and the pots placed in the stove or propagating-case. A good watering should be afforded in the first place, and the soil should afterwards be kept moist, when germination will take place in about a month.

THE APIARY.

By Expert.

Preparing Bees for Winter.—In a previous article I stated, as a *sine quâ non* that a colony, to winter well, should contain a sufficient number of bees. I am now reminded that I did not say what this number should be. It surely would be very difficult to state this in thousands or tens of thousands, and if I could do this it would be no better than hieroglyphics to most of my readers—I might say to all of them, for no one can make even an approximate guess at the number of bees a hive contains. It will be much easier to say that I would have bees on not less than five combs when they are clustered or imbricated together on a frosty morning, and the clusters should extend for over one half of the length of the combs. A strong colony, in a very good season, often covers the greater part of its combs below the honey, and it is a very good sign when you raise the super, or the cloth, or the honey-board, from the body, to see the bees clustered a little way down from the top of the combs. At the bottom they will, if healthy, reach clear down to the alighting-board, and will be on the alert at a minute's notice. The hive should be reduced to the size of the colony, for it is worse than useless to have empty comb, perhaps containing neither bees nor honey, at one side or the other. For this reason, with the large hives that we use, we always have a division-board, or dummy, which may be moved up when the useless combs are removed, so as to reduce the size of the hive, if needed, to a size proportionate to the strength of the colony. The dry combs are removed to the honey-house, and put away for future use, and the empty space on the side is filled with warmth-retaining moisture—absorbing materials. If we cannot increase the strength of our colony, it is at least a good plan to reduce the size of the hive to fit it, in such a way as this. But the strong colonies, covering every comb, are much to be preferred.

Food for Bees.—Now comes the question of food. If a sufficient number of bees is absolutely necessary to a safe wintering, it is equally evident that enough food must be had, and in an available position in reach of the bees; 25 lb. of honey is considered sufficient, in an ordinary winter, for the needs of a colony. With large hives, we would place this amount as a minimum, and would say 25 lb. to 40 lb. A much smaller amount may suffice, and we have reliable reports from experts showing that a colony, wintered in the cellar, may be brought through with as little as 5 lb. or 6 lb.; but I would counsel no one to try. First, the trials that have been made and have resulted in so light a consumption were only for the time which the bees passed in the cellar. The hives and bees were weighed at the moment of cellaring, and again weighed when removed, but they had more honey than the quantity mentioned as consumed; and if it had been otherwise, some of the bees might have been out of the reach of the scant supply, and their loss would have entailed the loss of the colony. Besides, these colonies have already passed through a couple of months of autumn weather when put away, which necessitated some food, and this amount should be computed, as well as the amount which they would consume when taken out of the cellar between that and the time of the honey-flow; and this amount would be very much greater than either the autumnal consumption or even the cellar consumption, for in the spring they need food, not only for the adult bees, that consume but little, but mainly for the young brood, which requires a very great amount of food to reach the adult state—and this brood-rearing must not be restrained under penalty of having but a weak colony at the opening of the harvest, and a consequent light flow of nectar.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	JAN. 10	Royal Hort. Soc. Committees. Scottish Hort. Assoc. Meeting. Roy. Hort. Soc. of Ireland Meeting.
SATURDAY,	JAN. 14	—Royal Botanic Society Meeting.

SALES.

MONDAY,	JAN. 9	Roses, Hardy Border Plants, Carnations, &c., at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 10	Lilies, Pæonies, Hardy Perennials, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 11	Lilium auratum, Tuberoses, Greenhouse Plants, Gladioli, &c., at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 12	Hardy Border and Herbaceous Plants and Bulbs in variety, at Protheroe & Morris Rooms.
FRIDAY,	JAN. 13	Spiræas, Gloxinias, Iris, Roses, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, by order of Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—36·4°.

ACTUAL TEMPERATURES:—

LONDON.—*January* 4 (6 P.M.): Max., 55°; Min., 43°.

PROVINCES.—*January* 4 (6 P.M.): Max., 51°, S.E. and S. counties; Min., 40°, Shetland.

Sir W. T. Thiselton Dyer.

AMONG the honours recently conferred upon men of eminence in their several departments, we note with gratification the name of Mr. W. T. THISELTON DYER. The official notification runs as follows:—

> Chancery of the Order of St. Michael and St. George, Downing Street, Jan. 2, 1899.
>
> The QUEEN has been graciously pleased to give directions for the following promotion in, and appointment to, the Most Distinguished Order of St. Michael and St. George:—
>
> To be [an] Ordinary Member of the Second Class, or Knight Commander of the said most distinguished Order—
>
> WILLIAM TURNER THISELTON DYER, Esq., C.M.G., C.I.E., Director of the Royal Botanic Gardens, Kew, in recognition of services rendered to Colonial Governments.

Of course, it is in his capacity of Director of the Royal Gardens, Kew, that Sir W. T. THISELTON DYER, K.C.M.G., has been enabled, like his predecessors, to render such signal services to the colonies. The honour conferred may thus be considered as an official acknowledgment of the conspicuous zeal and ability with which the gardens have been administered, and by which the colonies have profited in common with the rest of the nation.

Apart from any satisfaction on personal grounds, we note with pleasure in this appointment a recognition of the claims of horticulture and botany on the consideration of the Government.

The honour conferred on Sir W. T. THISELTON DYER is timely and appropriate, as it coincides with the completion of the great Temperate-house in the Royal Gardens.

SIR W. T. THISELTON DYER, K.C.M.G.

(DIRECTOR, ROYAL GARDENS, KEW.)

1899.

THE first number of the New Year affords a fitting opportunity for looking ahead in order to note what is likely to take place in the coming months. We have lately had the opportunity of noting the progress of our art and of our science, and the great extension of horticultural pursuits that is taking place. There are, it is true, if we except Orchids, fewer plant-lovers and fewer plant-collections in proportion than there used to be. Now-a-days the tendency is to value plants almost exclusively for their decorative effects or for their utilitarian purposes. The consequence is, that collections have become less interesting and more monotonous, owing to the cultivation of large numbers of one or of a few things. At the same time the number of persons interested in horticulture has largely increased; the taste, at one time principally confined to the well-to-do few, is now generally diffused, and the artisan and the allotment-holder often get more personal pleasure out of their garden than do the owners of more pretentious establishments.

One circumstance, small in itself, shows the general drift. The committee meetings of the Royal Horticultural Society were wont to be held at fortnightly intervals all through the spring, summer, and autumn; whilst in the three winter months a meeting once in four or five weeks sufficed. Now this is not considered adequate; and, somewhat to the disrelish of the caterers for the press, the meetings in question will be held regularly once a fortnight throughout the year. The Temple Show and the Great Fruit Show at the Crystal Palace will

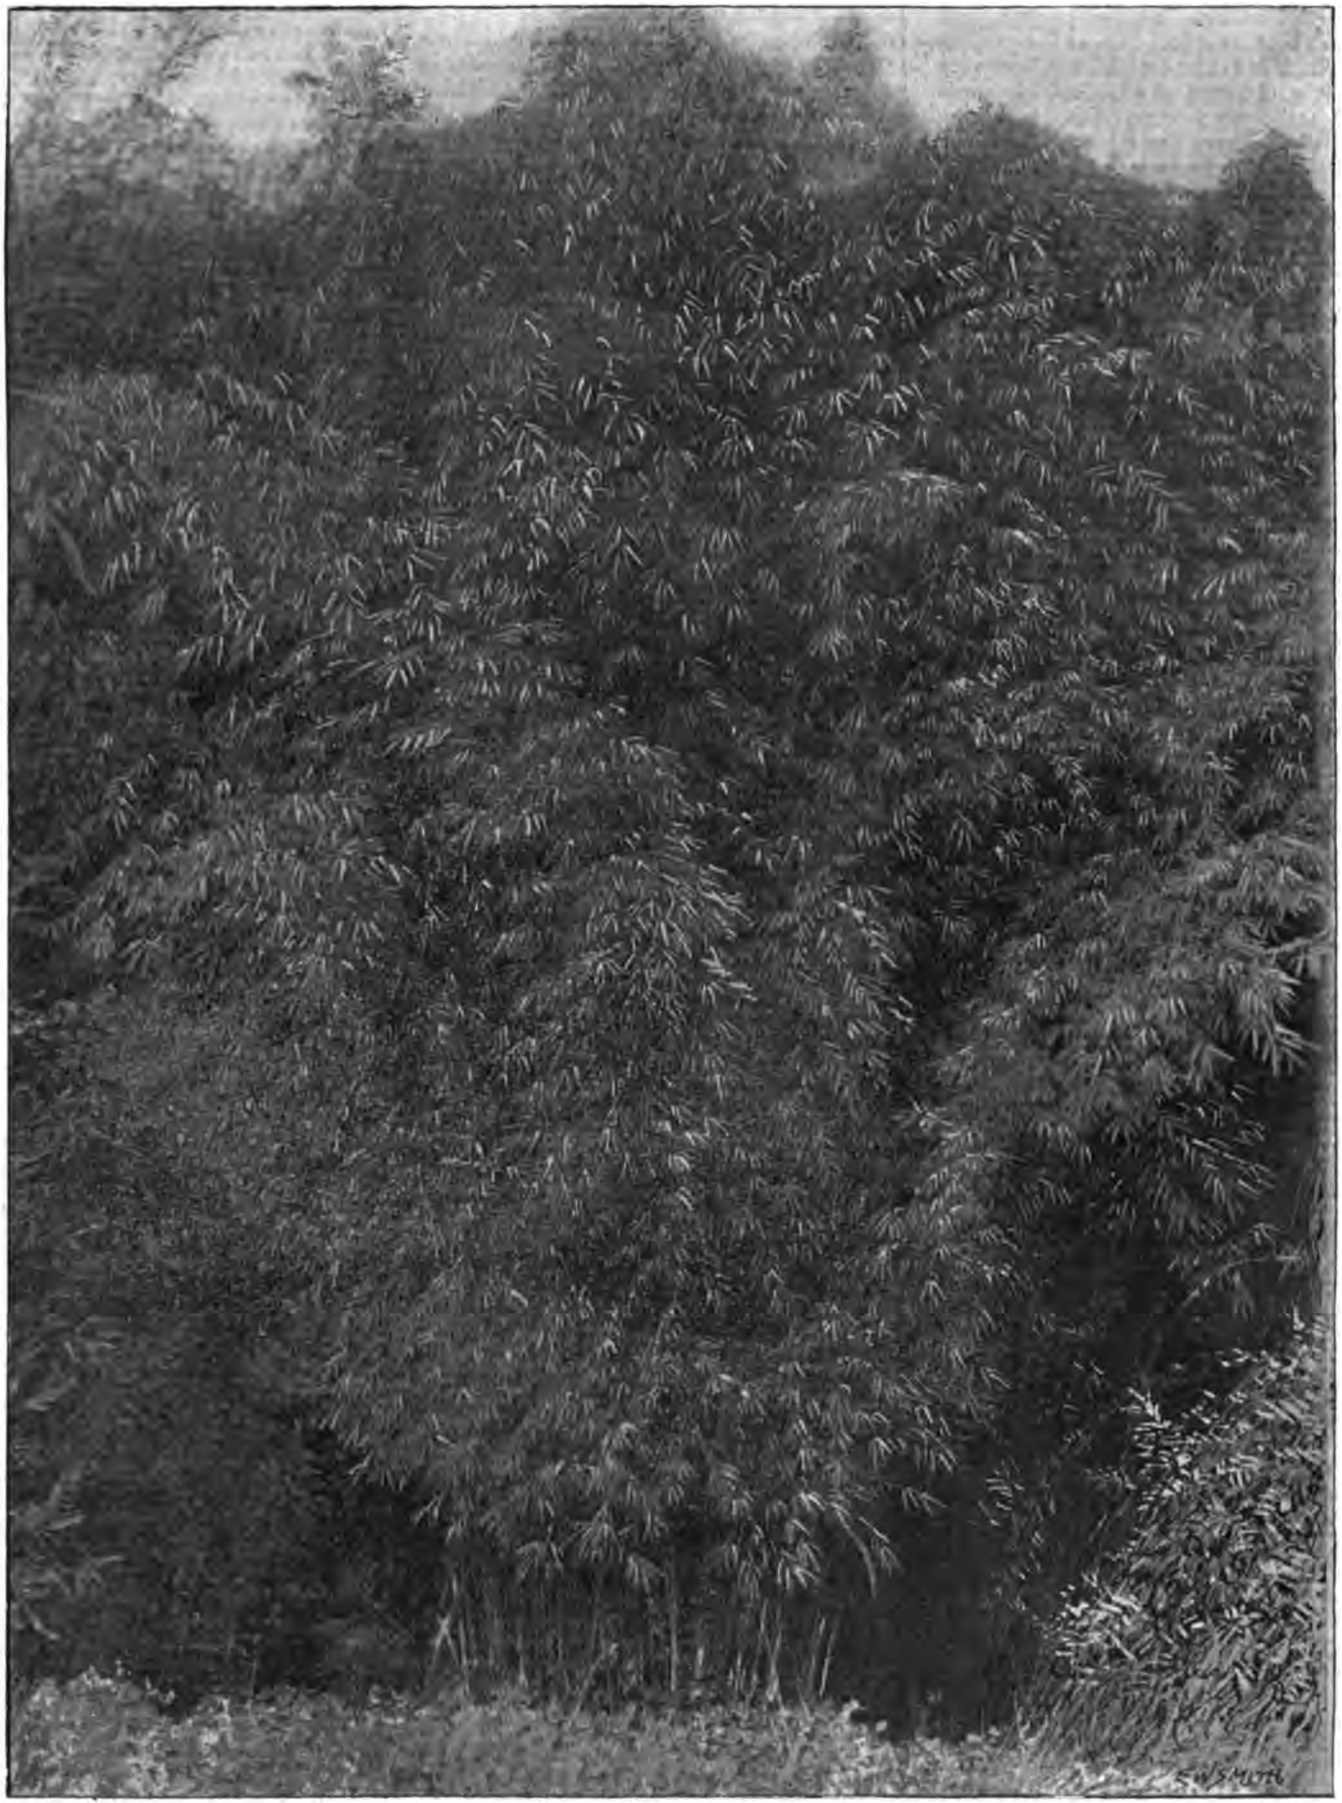

FIG. 4.—ARUNDINARIA NOBILIS (HEIGHT 23 FEET), FROM THE GARDEN OF J. RASHLEIGH, ESQ., MENABILLY. (SEE P. 2.)

take place as usual. At Chiswick, the Council of the Royal Horticultural Society propose to hold a Conference on the very important subject of Hybridisation. At the present time nothing can be more appropriate, as the progress of horticulture has of late manifested itself very much in the direction of experimental cross-breeding, and there is every reason to expect that the importance of the subject, whether as regards its scientific or its practical aspect, will largely increase. In due time we shall be in a position to lay before our readers further details; in the meantime, we may record our satisfaction that the series of Conferences which have been so very helpful in the accumulation and digestion of facts is to be continued, and that one, at least, is to be held in the old garden at Chiswick.

Our Almanac, published with the present issue, shows that the number of exhibitions to be held in London and the Provinces will be very large, especially in the Chrysanthemum season. We have to thank the secretaries of many of these societies for their kindness in sending us intimation of the dates fixed for their meetings. Some of the societies have not yet decided on the time of their exhibitions, and other records may be subject to alteration. Our list, notwithstanding, is as complete and up-to-date as we can make it in the space at our disposal.

On the Continent, there will be the usual great shows of the Société Nationale d'Horticulture in Paris, in which city the preparations for the great exhibition of 1900 will naturally occupy much attention.

St. Petersburg also is to have an International Exhibition, but we fear that visitors from England will be few, and exhibits fewer still. Another WARNER to take over a fine collection of Orchids is hardly likely to be found; nevertheless, we trust that our fruit-growers will uphold the honour of their country, both in Paris and in St. Petersburg. We do not think our foreign friends are at all generally aware of our superiority in fruit culture.

Ghent is not exhausted with its efforts of last year, and is not going to wait for another quinquennium before asserting itself. The State School of Horticulture was established fifty years ago, at first in connection with the famous establishment of LOUIS VAN HOUTTE. It has had among its professors, PLANCHON, CRÉPIN, KICKX. It still numbers our excellent friends and colleagues RODIGAS, the Director, PYNAERT and others, well known and highly esteemed in this country. A large number of youths have passed through the curriculum, and many of them are now filling posts of great responsibility in various quarters of the globe. Some of our nurserymen and others have sent their sons to obtain the benefit of the training in scientific and practical horticulture, which they could not, till recently, get at home. Our Belgian friends never miss the opportunity of a "*fête;*" and we have no doubt that their celebration of the Jubilee of their School of Horticulture will be a great success, and bring together a number of the old pupils to meet and encourage their successors. An exhibition is to be held, various meetings for the discussion of affairs in general are planned, and, of course, the inevitable banquet.

Another "Grande Exposition Internationale" is announced to be held in the same city from April 30 to May 9. The Exhibition is to be held in the grounds of M. VAN IMSCHOOT. The schedule comprises no fewer than eight hundred and fifty-eight classes.

At Kew, the completion of the Temperate-house places that establishment even more ahead of all other similar establishments than it was before—truly it is an establishment to be proud of. The opening up of the grounds round the Queen's cottage, the devotion to the purposes of the garden of the Kew Palace, the new offices, with their excellent accommodation for the young gardeners—all these matters afford a guarantee that the future of our great national horticultural establishment will be as brilliant in the future as it has been in the past, and its utility even greater.

The mention of Kew reminds us that horticultural botany suffers a great loss by the retirement of Mr. J. G. BAKER from his post as Curator of the Herbarium, in accordance with the regulations relating to age laid down by the Civil Service Commissioners. Our columns amply testify to the unwearied patience and skill exercised by Mr. BAKER, and very many of our readers have had, as we know, reason to appreciate, like ourselves, the knowledge, the urbanity, and the ever-manifest willingness to oblige, which have been such marked characteristics in the career of Mr. BAKER.

We believe that Mr. HEMSLEY will take up Mr. BAKER'S duties, and that being the case, we may be sure that whilst the interests of botany will not suffer, the claims of horticulture will meet with the fullest recognition.

Lastly, as the annual meetings will shortly be held, we may make a passing allusion to our garden charities. They are amply worth all the assistance and support that our readers can give them, as in spite of an antiquated, and as we think, vicious system of voting, they give great advantages at a minimum of cost.

The objections sometimes raised to the Gardeners' Royal Benevolent by reason of the occasional preference of candidates who have contributed nothing whilst they had the means of doing so, has been met by the establishment of the Victoria Fund, which ensures to those candidates who have contributed to the society a measure of assistance during the time that they are waiting for the full fruition of the pension. In any case, if one candidate gets in whilst another has to wait, the circumstance is inevitable under the present system of voting, and the fault, if fault it be, lies with the voters, and with those who refrain from giving their support to the Institution.

The Gardeners' Orphan Fund also does not receive so much support from the gardeners as it ought to do; and it is said, though we do not like to believe it, that Scotland and Scottish gardeners are remiss in this particular. If this be so, we hope that our friends across the border will see to it that 1899 does not pass away without a vigorous effort being made to put things on a more satisfactory footing. The announced retirement of Mr. BARRON from the post of Secretary will be received with the greatest concern. Probably no one thing in his long and useful career has given him more satisfaction than his labours on behalf of the Orphan Fund. In his retirement he will retain the sympathy and affectionate regard of all those with whom he has been associated.

ROYAL HORTICULTURAL SOCIETY.—The first meeting of the Committees of the Royal Horticultural Society in 1899 will be held as usual in the Drill Hall, James Street, Westminster, on Tuesday, January 10, from 1 to 4 P.M. The Scientific Committe will meet in the library on the same day, at 4 P.M.

THE "JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The part just issued is one of even greater interest than usual. Mr. SHERWOOD'S paper on the history of garden Peas is very interesting from many points of view. The extent to which variation has been carried may be judged from the circumstance here mentioned, that Messrs. HURST had last season nearly 700 rows of Peas for comparison. Of course, a considerable proportion of these were distinct only in name, but, in any case, the amount of variation and the progressive improvement that have been secured are very noteworthy. Mr. FREEMAN-MITFORD'S paper on the economic uses of the Bamboo is an apt complement to his former memoir on this subject. M. LATOUR MARLIAC'S paper on hardy Water Lilies will be read with interest by those who cultivate these lovely plants. Twenty-seven varieties are described, and seven more are promised. Mr. HUDSON'S paper narrates the experience of that skilful cultivator in dealing with these plants in the vicinity of London. Perpetual Strawberries appeal to the general public as well as to the gardener, and M. DE VILMORIN'S paper will in consequence be read with eager interest. Mr. ROUPELL'S paper on fruit-growing near London is very suggestive. The reports on the Chiswick trials of Cannas, Pelargoniums, Violas, and other plants are useful as far as they go, but it is to be regretted that so much good material for scientific investigation is allowed to pass unutilised, with the result that progress in consequence is delayed unnecessarily.

THE ROYAL ACADEMY OF SCIENCES founded in Paris in 1666, held its first public meeting on April 29, 1699.

LIÈGE: THE BOTANICAL INSTITUTE.—Under the auspices of the University of Liège, the Botanical Institute has now issued the first volume of its *Archives*. It consists of a record of certain researches made by the pupils under the direction of Professor GRAVIS. The aim of the Professor is to investigate the minute anatomy of the several orders on a definite plan, so as to permit of comparison being made, as is done in the case of systematic botany. Much of the work done in modern botanical laboratories is defective in this particular. Very little pains are taken to ascertain the correctness of the name of the plant selected for examination, and hitherto but little has been done save by VESQUE, RADLKOFER, and a few others, to treat histological characters in exactly the same way that ordinary "naked-eye" appearances are dealt with by systematic botanists. In other words, comparison, discrimination, and judgment are, to the full, as necessary in the study of minute anatomy as they are in that of external morphology. The anatomy of certain genera of Ranunculaceæ, such as Delphinium, Thalictrum, and Clematis, is dealt with in detail by MM. LENFANT, MANSION, and STERCKX. Numerous illustrations are given, so that the value of these communications to the future historian of the order will be incalculable.

FRENCH HORTICULTURAL SOCIETY OF LONDON.—We are informed that the annual dinner of the French Horticultural Society of London will take place on Saturday, the 14th inst., at the Imperial Restaurant, Strand.

MR. BRISCOE-IRONSIDE.—Chrysanthemum-growers who remember Mr. BRISCOE-IRONSIDE, or who have grown some of his novelties, will be interested to learn that henceforth that gentleman will leave the ranks of the amateur and take to Chrysanthemum culture professionally. In conjunction with an Italian amateur cultivator of the popular autumn flower, Dr. STROPPA, we learn that Mr. BRISCOE-IRONSIDE intends to start a nursery close to Milan, where special attention will be given to the flower in every phase. The style of the new firm is Messrs. STROPPA & BRISCOE-IRONSIDE, Chrysanthemum Specialists, Tradate, Lombardy, Italy.

COLONIAL PARCEL POST.—On and after January 1, 1899, the postage to be prepaid on parcels for the under-mentioned places will be, for each parcel weighing not over 3 lb., 1*s.*; over 3 lb., but not over 7 lb., 2*s.*; over 7 lb., but not over 11 lb., 3*s.*:—Antigua, Ascension, Bahamas, Barbados, British East Africa, British Honduras, Beyrout, Ceylon, Constantinople (by direct steamer), Cyprus, Dominica, Falkland Islands, Gambia, Gibraltar, Gold Coast Colony, Grenada, Johore (viâ Singapore), Lagos (Africa), Malta (by direct steamer), Montserrat, Nevis, Newfoundland, Niger Coast Protectorate, Niger Territory, St. Helena, St. Kitts, St. Lucia, St. Vincent (West Indies), Sarawak, Seychelles, Sierra Leone, Smyrna (by direct steamer), Straits Settlements, Tobago, Tortola, Trinidad. A similar change will be made in the postage on parcels from these places for the United Kingdom. The parcel-postage to and from other British possessions, protectorates, &c., will remain unchanged.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE."—This is now approaching completion, and should find a place in every garden-library where the French language forms no bar to its use. One very useful feature in the part before us, and one which found no place in the English edition, is a complete list arranged according to the natural orders of the genera described in the book. It often happens that the gardener knows the natural order of a particular plant, but that the genera are so numerous, that even a professed botanist cannot, without the aid of a herbarium, and the expenditure of much time, ascertain to what genus his plant belongs. A list such as is now given us of those genera only which are in cultivation reduces the difficulty very materially, and will supply many a hint to anyone who knows the principal natural orders at sight. The *Dictionnaire* is published by Mr. OCTAVE DOIN, 8, Place l'Odéon, Paris.

PRESENTATION.—Mr. GEORGE WALL, for the past twelve years head gardener to W. S. GILBERT, Esq., Grims Dyke, Harrow Weald, was the recipient last week of a handsome silver inkstand, presented by the garden staff on the occasion of his resigning the charge of the garden at Grims Dyke. Mr. WALL carries with him from the neighbourhood the best wishes of a large circle of gardening friends, to whom he has endeared himself by his ability as a gardener, and his courtesy.

SEA-WATER, AND ITS EFFECTS ON VEGETATION.—Should sea-water be brought to London under the London Sea-water Company's Act (59 & 60 Vict. c. 158), and the water be employed for street watering, we fear that, unless some means are taken to prevent its ingress to the soil in which our roadside trees are growing, that these will eventually be destroyed. Where wood-paving is used, the stratum of concrete beneath the wood-blocks may act as a preventative of the penetration of the water, and the same holds good of asphalte roads. The chief danger lies where macadam or ordinary stone pitching are the materials forming the road, and beneath which the roots of the trees lining the road or standing in adjacent forecourts and gardens are found in considerable numbers. Those responsible for the watering of such roads and streets should be empowered to use only water taken from the existing fresh-water mains, otherwise irreparable injury will be done to the admirable arboreal vegetation bordering some of our finest thoroughfares.

THE LUXEMBOURG GARDEN.—It is proposed to erect in this charming Parisian garden a statue to DAUDET, not far from that of WATTEAU. The gardens themselves have, under a succession of architect-directors unacquainted with horticulture, and with no feeling for the beauties of plants, acquired many undesirable and useless features, but enough remains to fill the lover of a garden with delight. It was once the richer for a large collection of Roses and of Vines, but the latter were removed many years ago to the Jardin d'Acclimatation, and it now contains an excellent collection of Orchids and Camellias, and a large number of Oleanders, grown in big tubs; the latter, being of great size, make splendid objects when in bloom. The success attending the culture of the Oleander in Paris is probably due to the early formation and ripening of the wood, and the complete rest obtained in the orangery in the winter.

WALTHAM CROSS ROSES.—We have received a volume including, in chronological order, the catalogues of the Roses cultivated and sent out by Messrs. WILLIAM PAUL & SON, of Waltham Cross, Herts, from 1883 to 1897. It forms a wonderful record of gardening work during these fourteen years, and is likely to be constantly referred to by rosarians. The lists of varieties are well arranged, and there are many illustrations; some in black and white, others brightly coloured. The uninitiated will be astonished to see so large a catalogue of known and named Roses, all so beautiful as to render selection difficult. It is not wonderful that Mr. WILLIAM PAUL is "famous for his Roses all over the world," since the share he has taken in their cultivation has been largely instrumental in bringing them to such a high degree of perfection.

THE NEW GULLIVER; OR, TRAVELS IN ATHOMIA, by CHAS. T. DRUERY, F.L.S., V.M.H.—We are asked to state that owing to the failure of his publishers, the author has determined to issue this book himself, from his address, 11, Shac Road, Acton, W.

"THE POND-WEEDS OF THE BRITISH ISLES."—Mr. ALFRED FRYER, with the assistance of Mr. ROBERT MORGAN, as artist, has had the boldness to undertake, and what is more to publish, a monograph of the species and varieties of Potamogeton native to the British Isles. The work is published in parts, of which six are now before us. Each species is described at length, and forms the subject of a royal 4to coloured plate. The pond-weeds are subject to a large amount of variation according to the age of the plant, and the conditions under which it is growing. This fact of itself accounts for much of the difficulty in determining and delineating the species. A greater source of difficulty arises from the frequent occurrence of hybrids. Mr. FRYER has not been contented solely with examining the plants in their wild state, but he has cultivated them and watched them during growth, thus ascertaining what variations are mere stages of growth, and also witnessing the gradual reversion of many of the so-called varieties to the original type. Some of the hybrids are sterile, others are fertile, while others show evidence of multiple parentage. The evidences of hybridisation in this genus seem to be all indirect or inferential; possibly, later on, we may be favoured with the results of the author's experiments with the plants under cultivation, and he may produce artificially the same hybrid forms which he meets with naturally—as has been done in the case of numerous Orchids. In any case, botanists and students of variation are under great obligations to Mr. FRYER for the production of this very interesting monograph. The publishers are Messrs. LOVELL REEVE & Co., Henrietta Street, Covent Garden.

THE SEMAINE HORTICOLE.—This newly-established journal is now entering upon its third year. Founded and managed by M. LUCIEN LINDEN, it is now about to be transferred to a company, and is to be conducted entirely on an independent basis. Its scope is to be extended so as to include matters relating to colonial agriculture, especially in reference to the Congo State. For this reason the *Semaine Horticole* will add to its title that of *Revue des Cultures Coloniales.* More attention than hitherto will be given to fruit culture and market-gardening. We wish it every success.

OPEN SPACES: PETERSHAM COMMON.—The Board of Agriculture, in response to a memorial addressed to them, have drawn up a scheme, in pursuance of the Metropolitan Commons Acts, 1886–98, in respect of Petersham Common. The scheme provides that the common shall be regulated and managed by the Corporation of Richmond, who are empowered to execute drainage and other improvements, to plant trees and shrubs, and render the ground more pleasant for recreation and exercise, but are inhibited from doing anything that shall otherwise alter its natural features, or interfere with free access to every part. The Richmond Town Council are also deputed to frame bye-laws for the prevention of nuisances, trespasses, or injury to the common, and for the regulation of games and of assemblages of persons thereon.

GARDEN YEAR-BOOKS.—THE HORTICULTURAL DIRECTORY (12, Mitre Court Chambers, Fleet Street).—Forty years of experience afford sufficiently satisfactory evidence that this unpretending little volume is just what the gardener wants. The directions for preparing the Bordeaux Mixture might be more explicit with advantage; and the list of commission-agents and salesmen in Covent Garden might be considerably extended. The new postal regulations are included, and every attempt has been made to bring this useful publication up to date.

THE GARDEN ANNUAL (37, Southampton Street) necessarily covers much the same ground as its older competitor. More space is allotted to seasonable work, and the adoption of black-faced type in some parts of the book is an advantage. A list, by no means a complete one, is given of some of the principal public parks and gardens. In the postal regulations we fail to find mention of the recent changes, or of the rates for foreign postage; but, on the other hand, there is a very useful note relating to the Parcel-post for plants. Gardeners will find this a very serviceable "annual."

A NEW TEXT-BOOK OF BOTANY.—An Elementary Text-book of Botany, by SYDNEY VINES, M.A. This work is issued to meet a demand for a less bulky volume than the author's *Students' Text-book of Botany.* It is intended as a book of reference for the student, and hence does not include any accounts of the methods of examining plants, either as to their external morphology, or their minute anatomy. Nor are the subjects of fossil botany and the distribution of plants throughout the various regions of the globe touched upon. It deals with morphology, minute anatomy, physiology, and classification, and thus supplies a more complete view of the science than do most modern text-books. It is matter for surprise that Prof. Vines has been enabled to comprise so much within the compass of some 600 pages. Needless to say, the information is accurate and up to date; whilst the style is clear, and the convenience of the student is considered by the inclusion of two indexes and a table of contents. The work is one to be strongly commended. It may be had from Messrs. SWAN, SONNENSCHEIN & Co.

LILIUM HENRYI.—Although perfectly hardy at Kew, this species has thriven in the large Temperate-house ever since its introduction, the stems attaining a height from 8 to 10 feet. A bulb grown in this house and recently lifted weighed, after being washed and divested of roots, 2¼ lb., and measured 18 inches in girth. The scales are dull vinous purple in colour. This bulb is about six years old.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* will take place at the Hotel Windsor, Victoria Street, S.W., on Tuesday, January 10, at 6 P.M. The subject for discussion will be "A Chat about Chrysanthemums," to be opened by Mr. C. E. SHEA.

NATIONAL ROSE SOCIETY.—A meeting of the General Purposes Committee will be held at the Rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 10th inst., at 2 P.M. H. HONYWOOD DOMBRAIN, EDWARD MAWLEY, Hon. Secretaries.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. C. J. INGRAM, Secretary, desires us to inform the friends of the Institution that the annual friendly supper will take place on Thursday, January 19, at 6 o'clock sharp, at "Simpson's," 101, Strand, W.C., George Monro, Esq. (of Covent Garden) in the chair.

Sherborne Castle Gardens.—A successor to the late Mr. Pragnell, the well-known gardener at this place, has been found, in one not less known, and not less worthy, in the person of Mr. Thomas Turton, who has for twenty years been head gardener at Maiden Erlegh, Reading. Mr. Turton has so long been well known as an excellent gardener, energetic and enthusiastic, that his retirement from Reading will be a great loss. Sincerely esteemed and respected by all brought into contact with him, his fellow-gardeners have shown their confidence by making him during the present year the chairman of their Mutual Improvement Association. He has been actively associated with the local horticultural societies for many years. One of the late Wildsmith's young men at Heckfield Place, he has, in common with so many others who went from Heckfield, done ample justice to the training he received whilst working there.

Publications Received.—*Journal of the Essex Technical Laboratories*, vol. iii. (1897). Edited by David Houston, F.L.S. This monthly bulletin includes papers upon: Essential Soil Constituents, by T. S. Dymond; Poisonous Plants of Essex, by J. C. Shenstone; Pruning Orchard Trees, C. Wakely; Propagation of Plants, C. Wakely; Prevention of Potato Disease, W. G. Watkins; and other horticultural and agricultural matters.—*The Chrysanthemum*, H. J. Jones. A cheap useful pamphlet, published by Biggs & Son, Salisbury Court, E.C., giving brief notes on the history and cultivation of the Chrysanthemum, and lists of the best varieties of different forms.—*Bulletin of the Botanical Department, Jamaica*, November, 1898. Contains notes upon Ginger in Jamaica, Tobacco in the United States, Cotton-seed Oil Industry, and Gas-lime in Agriculture.—*Genossenschaft "Flora," Gesellschaft für Botanik und Gartenbau zu Dresden.* Sitzungsberichte und Abhandlungen, 1897-1898. (*Transactions of the Botanical and Horticultural Society of Dresden.*) Contains an important paper upon the Cynipidæ of Saxony and their Galls, by Max Riedel, Dresden.—Davenport's (Brewery, Ltd., Birmingham), *Pocket Book and Diary for* 1889, a useful well got-up publication, with much of the usual kind of information in request every day, together with matters connected with sport.—*My Garden Diary for* 1899: Messrs. Sutton & Sons, Reading. A tastefully got up little manual, furnished with a calendar of the month on the right-hand pages, together with space for making memoranda. The left-hand pages contain directions for the gardener during the month.

PLANT PORTRAITS.

Bignonia buccinatoria, a magnificent creeper, hardy in the Riviera; flowers 3½ inches long, scarlet-crimson. *Revue Horticole*, December 16.

Pear Petite Marguerite.—Little Margaret is a Pear of much excellence, ripe at the end of August. *Gartenflora*, t. 1457.

HOME CORRESPONDENCE.

MR. EDWARD WHITTALL.—Those who understood that the Mr. Edward Whittall who was captured by brigands was the good friend who has been the means of introducing so many new bulbs from the Smyrna district, will be gratified to know that this is not so. The sufferer was a nephew of Mr. Whittall, who, fortunately, was young and athletic, and is none the worse for his experiences. What has occurred will, however, make us realise more than we have hitherto done the earnestness of our kind friend in his plant-hunting expeditions, and the risks they bring. The brighter side of the picture is seen in a letter from Mr. Whittall, dated December 21, in which he speaks of the glorious weather they have had up to that date, and of the sunlit, balmy days, with gardens bright with winter and summer flowers all in full bloom. I take the liberty of quoting a few words from his letter:—"Just picture to yourself a beautiful white Camellia, with a background of red Geraniums and many-coloured Cannas, or else a bank of Rose-trees, with a foreground of Heliotrope and white Hyacinths. Such are the sights we have before us to-day, and wonderful are the effects alongside of the autumn tints of the tree-foliage. I have never seen such a thing before." *S. Arnott, Carsethorn, by Dumfries, N.B.*

INCOME-TAX REPAYMENTS.—As most of your readers, who are engaged in business, are now ascertaining the amount of their profits for the year 1898, will you allow us to remind them that, if such profits show a diminution, or are less than the amount upon which they have been assessed for Income-tax, they may be entitled to the repayment of a considerable portion of the Income-tax paid in respect of the same, and to point out the importance of making the claim forthwith. Many traders and others submit to over-charges because they feel that it is hopeless to appeal against their assessments, having failed on previous occasions to get the same reduced. In most cases that have come under our notice we have found that the reason why they have failed is that they have not furnished the commissioners with proper accounts, which are absolutely necessary to enable them to satisfy themselves that the assessment is excessive. Others, again, have neglected to keep any accounts of their business transactions. If proper accounts be kept, or even if a proper cash account be presented (which is very simple by using the *Taxpayers' Cash-Book*), there is but little difficulty in establishing a claim. The increase in the abatements now allowed in respect of incomes not exceeding £700 per annum renders it well worth while to take the little trouble necessary to keep a proper record of business transactions, as the relief granted to persons with small incomes is considerable. Thousands of people pay tax for which they are not liable, more particularly those whose incomes are derived from property and investments where tax is deducted before being paid to the recipients, or when dividends are paid "free of Income-tax." Claims can in many cases now be made for four years, and the sum repayable might in the case of private incomes alone exceed £42 up to the end of the current financial year, to say nothing of the tax allowed in respect of life insurance premiums, even when the income exceeds £700. We shall be glad to advise any of your readers, gratuitously, whether they can make a claim, if they send us full particulars of their incomes and a stamped addressed envelope. *The Income-tax Adjustment Agency*, 12 *and* 13, *Poultry, London, E C., December* 28, 1898.

NATURE'S COMPENSATIONS.—When it is suggested that in our more northerly latitudes we lose so much that is beautiful in the winter months, because nearly all our trees and so many of our shrubs are deciduous, those who so criticise seem to forget that we get variety in very diverse forms, and that in such variety alone do we find great compensations. But after all, is it to live in a paradise or an elysium to exist in a country where the foliage is ever green and leafage is perpetual? may there not be even under such conditions much that is monotonous and wearisome. It is true, that the home resident, passing from frost and snow into the huge temperate or tropical houses, at Kew, for instance, may like and appreciate the change, but living perennially in such surroundings may well make him sigh for those natural variations which European countries furnish. And after all, what in all Nature can be more beautiful than seeing vast masses of overhanging trees, the tiniest portion of spray, on which is glistening and sparkling in the wintry sunlight with hoar-frost? Nothing that the wildest imaginary fairyland can produce can equal such a spectacle in its wondrous beauty. But even when there is no frost, and every branch and shoot on tree is bare, is there not in the singularly effective tracery the varied forms of tree-branch presents against the sky, much that compensates for loss of leafage. Nay, where the trees ever in leaf we should neither see nor realise how great is the wealth of beauty thus furnished. And then see the varied forms which tree-branches present. The lofty Elm, the broad stately Oak, the giant and round-headed Horse-Chestnut, the grand Plane, or the tall Lime, the loftier Poplar, or not least the drooping and refined Birch and Beech, with their pleasing spray. How all these, in their exceeding diversities of form and beauty, stand out in marked contrast to the heavily-clothed and somewhat funereal aspect presented by the cone-shaped Firs, or more highly-cultivated Conifers. If the latter seem oppressive and mournful objects in the landscape, we have in the light varied branches of the deciduous trees a delightful foil, and an effective refresher of the soil. But apart from these compensations, there are the singularly beautiful foliage changes seen in the autumn, which, if evanescent, yet are, whilst they last, brilliantly lovely. Leafage dies, not of the lugubrious black, which humans favour as typical of decay. Rather does it, as if in joyous anticipation of change and recreation, or resurrection in other forms, clothe itself in rich and beautiful tints, making the landscape to revel in golds, pinks, browns, reds, yellows, and many other sunset hues. What tropical country, what latitude of perennial green, can furnish anything so delightful as is found in the annual decay of leaves? And then further, when, after a few months of defoliation, the warmer forces of spring commence to operate, what in all Nature then is more pleasing than that presented in the new leafage, expanding slowly, yet in so many diverse shades of the normal green? Here again is a fairy-like change—a literal transformation-scene. How with the clothing of the trees in living green comes with it the awakening of Nature in every direction. The grass puts on its hue of rich verdure, the Ferns once more send up their fronds, the Furze blossoms, the birds twitter and sing, the insects chirp and hum, and all the land is alive with beauty and harmony. Really our compensations excel greatly our losses. *A. D.*

THE SHREWSBURY GRAPE CLASSES.—I desire to support "Exhibitor's" wish to see a scale of relative value for judging. I find in the *Horticultural Handbook and Exhibitors' Guide* a system of judging exhibits by relative value, which meets the case of Grape-judging admirably. In the method there given, cultural value and relative merit are adjudged separately, and the result put in different columns. The maximum for cultural value is given at five points, and the maximum of relative merit at 1·. the difference between the kinds being computed in decimals, which is simple and appropriate, although generally not well understood. The maximum is accorded to varieties with Muscat flavour and good appearance, the scale descending as low as ·2, which represents the comparative value in competition of the variety White Nice. This subject of relative value is coming rapidly to the front; and if it has not been dealt with in the R. H. S. new rules, which I have not yet seen, I am afraid the amendments will soon require amending. Another point of the utmost necessity is to place cards on the exhibits giving the results in all important contests when pointing is recommended. Where this is done, the greatest interest is manifested, not only by exhibitors, but by the public generally. I admit that such a process exposes the judges to criticism in case they have slipped; but it also increases his watchfulness against mistakes. I am afraid there will always be "vagaries" of judges; but if a scheme of relative value were acted upon, one stumbling-block at any rate, would be removed. The cultural merit would still have to be dealt with, and a judge is not worth his salt who cannot determine how far short of perfection a bunch of Grapes is that has a slight defect in any respect. I hope to submit in a future issue a scale showing the relative value of Grapes, based on the system mentioned above. *Ayrshire Lad.*

OULTON HALL, LEEDS.—A change in the management of the gardens at the above-named place has recently occurred. Oulton belongs to the "Calverley" family, who have been connected with the West Riding of Yorkshire for a long period of time. The present owner is John Selwyn Calverley, Esq. Through the kindness of this gentleman, Mr. Richard Walker, who has been gardener at Oulton forty-three years, is retiring on a good allowance. During the time he has been there he has served three generations of the family. For some years before the finer varieties of Gloxinias were so generally cultivated as they now are, Mr. Walker had, by hybridising and selection, got together a fine strain—in fact, I believe he was one of the first gardeners who took the subject in hand. He has also possessed for a long time excellent strains of his own selection, both of Cyclamens and herbaceous Calceolarias. Mr. Walker was a close reader of the gardening press and of standard works on horticulture. While not, perhaps, so well known as some gardeners, he was all along considered, by those who knew him personally, an intelligent gardener. Moreover, he could give reasons for the horticultural faith he put into general practice. He will carry into his retirement the respect and good wishes of all who know him. His successor at Oulton is Mr. McFarlane, for some time past gardener at Stapleton Park, Pontefract. It is said the gardens generally in his new charge are to undergo a thorough renovation, hence the opportunity to put his well-known practical skill to good account. *H. J. C.*

TRAINING TOMATOS SPIRALLY.—Unless due to a printer's error, which converted "five" into "fine" [This was so. Ed.], Mr. Mackinlay does not tell us on p. 444 how many stakes he used to each Tomato-plant, but it is evident three or more must have been employed to form the needed columnar support. When at Wrest Park two or three years ago, I saw on the walls a remarkable crop of Tomatos. If the spirally-trained plants on stakes in the open ground gave better results last season, as compared with those grown on walls, then must the crop have been exceptionally good. The plan seems to be novel, and may, when clearly explained, be widely copied. That bending or depression of the stems conduces to fruitfulness, there can be no doubt. Very recently I saw at Clandon Park a large number of plants growing in a pit, the stems for some 2½ feet in height being bent into serpentine form, having previously borne fruit, so as to bring the upper portions of the plants more immediately under the lights, and each was carrying a heavy crop that should give plenty of ripe fruit up to the end of January. *A. D.*

MANURE AND PLANT ASH.—I read with interest the report of Mr. A. D. Hall's lecture upon Artificial Manures reported in the *Gardeners' Chronicle* of November 26. It would be more satisfactory before accepting his statement that "the composition of the ash of a plant bears no part or relation to the manure that it needs to be afforded by the soil," to learn from the results of what experiments he came to his conclusion. I should like, with your kind permission, to ask the following questions:—(1) Was the soil analysed previous to use? (2) Was a manure used which gave the same analysis as that of the plant-ash, taking into consideration those constituents in the soil which were found in the plant-ash? (3) Was the soil analysed after the plant finished growing? (4) Was the ash of the plant in question analysed? In the case of the Grape-vine, M. Ville, the eminent French chemist, proved that Grapes could not be grown without potash, and that without it the plant does not increase in dry weight. In the case of iron, also, though met with in very small quantities, it is absolutely necessary for the formation of chlorophyll, for the leaves of plants not supplied with it during their growth become "chlorotic" as soon as their own store is used up, and become green again only on the application of iron. From the statement quoted above, it would follow that plants would grow alike in all soils alike, yet how different is the case? The results of the experiments from which the statement is made would throw a great deal of light upon the subject. *Geo. W. Allen.*

THE LUCOMBE OAK.—The age of the Killerton specimen, referred to at pp. 416 and 461 of the last volume, is consistent with the account of the origin of this variety given by John Zephaniah Holwell in *Phil. Trans.*, Feb. 24, 1773. He says that the parent tree at Exeter was then seven years old, when it measured 21 feet in height and 20 inches in girth. A six-years'-old graft from the original was at that time 23 feet high. He adds: "Several gentlemen round this neighbourhood (Exeter), and in the adjoining counties of Cornwall and Somerset, have planted them, and they are found to flourish in all soils." Seeing, then, that William Lucombe raised it as a seedling in 1766, and had grafted some thousands of it in 1773, when Holwell saw them in the nursery at St. Thomas, Exeter, it is highly probable that the Killerton tree is 120 years old at the present time. *A. Hope.*

LAPAGERIAS IN THE OPEN AIR.—It may be interesting to your correspondents, "R. B. L." and "D. T. F." to know that a plant of Lapageria rosea, trained on a west wall in a private garden in West Argyllshire, Scotland, was in 1886 growing and flowering freely. The plant had been there for some years, and was unprotected during winter. As to the colour of flowers, my experience is that an excess of heat during the flowering season takes away the rich crimson colour, and makes the flowers light and transparent. *J. A.*

BEGONIA GLOIRE DE LORRAINE.—While perusing the pages of your issue of December 17 last, I was pleased to find an interesting little notice concerning this plant, writen by Mr. George Burrows of King's Norton; also a representation of the houseful of the plant to be seen in the gardens at Highbury, Birmingham. Having visited those gardens several times during the blooming period of the plants, which has already extended over three months, and bids fair to continue its progress well into next March, I should like to add a few words to what has already been said. The glasshouse, figured in the *Gardeners' Chronicle*, is 28 feet by 12 feet, span-roofed, and is one of an extensive range leading out of the creeper-covered corridor, which last, together with the interior of each house, represents a floral panorama of much beauty. The whole of the house is devoted to the Begonia, with the exception of a few exotic grasses, Adiantums, and Tradescantia zebrina multicolor. The plants, to the number of 150, are suspended from the roof, hanging in such a profusion of bloom as entirely to cover the pots, and completely hide the roof. Each plant has from 300 to 400 blooms upon the leading shoots. Disposed among the other plants were to be seen other fine specimens, whilst beneath the staging creeping-plants of various species were visible. Mr. Deacon, the gardener, says that his success with Begonia Lorraine is due to the regular temperature of the house, which from the commencement of the blooming period has been maintained at 60°, and the air uniformly moist. Mr. Burrows gave as the constituents of the soil used at Highbury, peat in a certain ratio, but Mr. Deacon informed me that the plants are grown in a compost which consists of yellow loam, silver-sand, and well-decayed leaf-mould; it is, nevertheless, satisfactory to know that Begonia Gloire de Lorraine is not fastidious as to soil. *Walter B. Child, Acocks Green.*

EUCALYPTUS GLOBULUS IN THE OPEN.—At Braymead, near Maidenhead, it may interest my fellow readers of the *Gardeners' Chronicle* to know that we have here the familiar Blue Gum-tree planted out in the pleasure-grounds, and standing 18 feet in height, from seeds sown at the beginning of the month of January, 1897, grown on in heat, and planted out the same season. They have been unprotected ever since the recent frost that registered here 13° on December 22, which took no effect on them whatever. I report this, as Eucalyptus Globulus is considered amongst so many not so hardy, as we find them here planted out in exposed positions. [If these Eucalypts are protected from the coldest winds they are really hardy in our warmer maritime counties. Ed.] *A. R. Pearce, Braymead Gardens.*

OUR CROWN WOODLANDS.—On p. 418 of the last volume of the *Gardeners' Chronicle*, Mr. H. C. Walker comments upon what he terms my "attack" on the management of the State forests, and objects to a particular passage therein. I think Mr. Walker will find this latter refers to the Crown woodlands generally, and not to the Forest of Dean alone; but if these woodlands are worked on a "definite plan of operations," it would be interesting to learn why the management of the New Forest differs so widely from that of the Forest of Dean, and why the "best financial results" should be the guiding policy in the case of the latter, and a useless and wasteful method of conservation in the case of the former. I found no fault with the "elaborate" working plan for the Forest of Dean (which Mr. Walker thinks beyond the comprehension of all but Indian and Continental foresters) as a mere tabulated statement of facts and suggestions; but I am surely justified in asking why the "few tourists" who frequent this forest should be denied the same consideration that the probably equally few tourists in the New Forest are granted, to the disadvantage of future generations. The improvement of Crown or other British woodlands will not be affected by the wholesale introduction of working plans more or less made in Germany, but will be brought about, if at all, by skilful and judicious treatment which is not bound down by any hard-and-fast line. Private estate owners will never adopt any working plan which does not provide for the preservation of picturesque, timber and game-preserving facilities in the vicinity of their mansion-houses; and as the majority of estate woodlands fall under this proviso, strictly economic management becomes a difficult matter, as practical men know too well. A working plan drawn up for most estates on similar lines to that formed for the Forest of Dean, would not be worth more than the paper it was written on, so far as results were concerned, unless the woods with which it dealt were maintained for growing timber alone, which is rarely the case in England. There is little doubt but that estate woods could be worked more economically than is the case at present, and their picturesque features preserved and improved at the same time, and the Crown woods might demonstrate this fact with advantage to British forestry generally, and with no appreciable loss of revenue to the State. *A. C. Forbes.*

HARICOT BEANS.—Your reference to a preparation of Haricot Beans on p. 463 of the last volume of the *Gardeners' Chronicle*, gives me an opportunity to say that I wonder these Beans are not made a much more general article of diet in English households than appears to be the case. Some time ago, Mr. N. Sherwood, of Messrs. Hurst & Sons, Houndsditch, sent me some small white Beans for cooking, which he designated the small white Haricot, and which I think may be identical with the French Bean or Haricot to which the late Mr. W. B. Booth refers in the *Treasury of Botany*. He appears to regard it as the original form of Phaseolus vulgaris, and he states that it is "of uncertain origin, probably Asiatic, the most generally cultivated in Europe and other temperate climes. Amidst a number of varieties or races, often described as species, it may always be known by its few-flowered peduncles, and by the ovate, striate bracts at the base of the calyx." The Bean Mr. Sherwood sent me is very small compared with those of most of the cultivated varieties, white, and egg-shaped, approaching the round rather than the flat form. Large seeded varieties are also grown for use in a ripe state, but in all probability the small is cultivated to a much larger extent than the former. Recently Mr. Sherwood has sent me for testing, three samples of apparently the same Bean, but grown in different parts of the world. The smallest sample is of Canadian growth; the next, a little larger in size, is Dutch; and the largest sample, which more nearly approaches the kidney shape, is Galician. These samples will be tested to discover if there is any difference in their quality; the difference in their size is probably owing to the climate in which they were grown. Haricot, as I take it, means a Bean in a dry state. [What about *Haricots* verts. Ed.] It is said this small white Bean is much esteemed in France for field-culture, especially in the western districts, where it is often distinguished by the name of Favette, or little Bean. The pods are long, cylindrical, and well-filled with seeds, and, when ripe, are, as grown in France, about three-eighths of an inch in diameter, and nearly round, and rather swollen than sunk in the eye; medium early, but not well adapted for using in a green state, by reason of the inner skin of the pods being more tough than in most of the others. The difference in the diameter of the samples sent, which Mr. Sherwood thinks represent the same variety, are no doubt owing to climatal conditions. Two methods have been tried in my household in the cooking of these Beans. One has been to soak them in water all night, and put them in boiling water to render them fit for table. The other is to put them into cold water in a saucepan, and allow the water to steadily rise to boiling point. The Beans require to be well boiled, and then they constitute a delicious table-vegetable, served without any accompaniment. Your recipe suggests one way of serving up Haricot Beans in a manner more attractive to the palate. I prefer these Beans to blue-boiling Peas, as I find them to be more tender, delicate, and palatable. *R. D.*

LARGER EXHIBITS REQUIRED AT OUR FLOWER SHOWS.—The time for compiling schedules will be on us immediately, therefore, before it is too late, I venture to offer a few suggestions which, if carried out, would, I venture to assert, be improvements in the matter of exhibiting. Where I should like to see improvement is in the fruit and vegetable classes, these not being represented in sufficient quantity in individual exhibits. Take, for example, a prize given for fifty pods of Peas or

Beans; this cannot be regarded as sufficient to represent the exhibitor's ability—it should be not less than 120 of each. Onions and Potatos are generally shown in dozens; now these could be increased to 1½ dozen, and so on with Tomatos, Turnips, Carrots. Celery, Cabbage, and Cauliflowers are generally shown in threes; no fewer than four or six heads should be shown. Bush-fruit of all kinds is often shown in very small quantities, and I would recommend that plates not less than 8 inches in diameter for holding these fruits, so as to secure larger exhibits. In the case of single dishes of Apples, Pears, Plums, &c., I consider that not fewer than nine or twelve fruits should be shown. Now, in order to compensate the exhibitor, or rather encourage exhibition, all prizes should be increased in proportion, to the evident improvement of the displays at our horticultural shows. *A. J. L., Wyfold Court.*

BEES.—In the issue of the *Gardeners' Chronicle* for Dec. 17, "Expert," the contributor of articles on the Apiary, seems to invite criticism, and if you can afford space I would like to say a few words upon the subject, the ventilation of bee-hives. In ventilating, he says, "some advocate front blocks of wedge shape, and others favour front and rear spaces," &c. All these methods are applicable only to hives furnished with loose bottoms, and a hive without that is of very little good—in fact, you will scarcely find them in the market. Plenty of bottom-ventilation, when the bees show signs of being crowded, is one of the principal methods used to prevent swarming. The hives may be wedged in front, or at the four corners, &c., but a better way which is beginning to come to the front, is to have a hole, about 6 inches or more, cut in the floor-board of the hive, and to tack a piece of perforated zinc on the upper side; underneath is a sliding board to regulate the ventilation as required. Regarding the question, why bees wipe their eyes with their fore legs. If we examine or watch our bees more closely, we can soon discover that it is their antennæ they wipe, not their eyes. I will try and explain it as plainly as possible. On the fore-legs of a bee, at the lower end of the tibia or shank is a spine, to which is attached a sail. In the upper end, and inner side of the palma or lower joint, is a deep incision, the edges of which are covered with hairs. Upon this the spine and sail of the bee can act at the will of the insect, and when the spine is brought down they form a circle. If the bee wishes to clean its antennæ, it lays it within this circle, the hairs removing any foreign substance. They very often give them a wipe before flying from the hive, the antennæ or feelers of the right side being cleaned by the device on the left leg. *J. Guthrie, Bee Expert, Doonfoot, Ayr.*

CURIOSITIES OF ORCHID BREEDING.

ORCHID hybrids have become very numerous, while new ones are constantly being brought to light. Up to the year 1860, we find but four flowered hybrids recorded, raised from distinct crosses; during the thirty years following the numbers gradually increased, until in 1890 there were about 200 enumerated. But it is in the present decade that the most rapid strides have been made, the numbers having increased by leaps and bounds, until at the present time there are on record no less than 800 Orchid hybrids, raised by hand from distinct crosses. These have all flowered in gardens, and have been duly described or recorded in various journals. And when we remember that many of these 800 crosses have been repeated in the same garden, and in other gardens, and that many individual plants may have been obtained from each capsule, we can form an idea of the large numbers of hybrid Orchids that have been raised by hand.

PRIMARY HYBRIDS.

Of the 800 hybrids from distinct crosses now on record, some 500 are primary, i.e., hybrids of the first generation between two different species. A careful examination of these primary hybrids shows that, as a rule, they are fairly intermediate between their parents, partaking of the characters of both, and at the same time perfectly distinct from either. The latter fact is most remarkable, and at once serves to distinguish primary hybrids clearly from all other hybrids. For example, Cypripedium × Leeanum is a typical primary hybrid, and has perhaps been raised more frequently and in larger numbers than any other Orchid hybrid. It was obtained originally by crossing C. insigne (Wallich), ♀, with C. Spicerianum (Rchb. f.), ♂, both well marked and distinct species. The hybrid is fairly intermediate both in its outward characters and in its inner structure (see Prof. Macfarlane on "Minute Structure of Plant Hybrids," *Trans. Roy. Soc. Edin.*, 1891, xxvii., p. 245), and although it has innumerable minor and individual varieties, yet it is always perfectly distinct from both of its parents.

Nor has any intrinsic difference been observed in the reciprocal cross, the same forms appearing equally in the obverse and reverse crosses. Often many varieties are obtained from the same capsule, differing slightly in colour, form and size, but all are specifically C. × Leeanum, and cannot be mistaken for anything else. As it is with C. × Leeanum, so it is with other primary Orchid hybrids, so far as experiments have been made. In short, we find that primary hybrids are, as a rule, so intermediate between their parent species, and so comparatively uniform in character, that they are specifically distinct from both parents.

GENERIC HYBRIDS.

Of the 500 primary hybrids on record, about 100 are generic hybrids, i.e., the parents belonging to different genera. In this respect alone these hybrids are interesting, though no doubt the systematic botanist views them with mixed feelings. It is not so long since generic hybrids were looked upon as anomalies, some of the older naturalists even regarding them as impossible, and forthwith proceeded to beg the whole question by classing those genera which were fertile with one another as species of one. Orchid-growers, at all events, have almost ceased to regard generic hybrids with curiosity, familiarity with them having bred a certain amount of indifference.

A list of the generic hybrids on record up to the end of 1897, together with a diagram showing how twenty-six different genera have been linked together by artificial hybridisation, has been prepared by the writer, and was published in the *Journal of the Royal Horticultural Society* (vol. xxi., April, 1898), and to which those interested in the details of generic Orchid hybrids may be referred.

Generally speaking, primary generic hybrids follow the rule of specific hybrids in bearing the intermediate characters of their parents, with a narrow range of variation.

But there are a few remarkable exceptions to this rule:—

1. Epiphronitis × Veitchi, a hybrid out of Sophronitis grandiflora (Lindl.) by Epidendrum radicans (Pav.).
2. Epi-Cattleya × matutina, a hybrid out of Cattleya Bowringiana (Veitch) by Epidendrum radicans (Pav.).
3. Epi-Lælia × radico-purpurata, a hybrid out of Lælia purpurata (Lindl.) by Epidendrum radicans (Pav.).
4. Epi-Lælia × Charlesworthi, a hybrid out of Lælia cinnabarina (Lindl.) by Epidendrum radicans (Pav.).

These four generic hybrids are very curious indeed, inasmuch as all agree in reproducing the generic characters only of the pollen parent, Epidendrum; without the slightest trace of the peculiar structure of the seed-parents, Sophronitis, Cattleya, and Lælia. Yet in minor characters, in colour, form, and size, the four hybrids distinctly differ from one another, and from their Epidendrum parent.

A close examination reveals the fact that these minor differences correspond with the peculiar differences in the parentage, thus showing that the crosses have really been effected; yet at the same time it must be candidly admitted that did we not know the parentage, we could never have determined it, so overwhelming is the influence of the predominant partner, Epidendrum radicans. It will, no doubt, be observed that E. radicans is the pollen parent in each of the above cases. Curiously enough, when this reed-like E. radicans is crossed with the pseudo-bulbous E. vitellinum (Lindl.), ♀, a similar result is obtained, the offspring E. × radico-vitellinum being scarcely distinguishable from the reed-like E. radicans. Again, when the reed-like E. × O'Brienianum—itself a hybrid out of E. evectum (Hook. f.) by E. radicans—is crossed with the pseudo-bulbous E. vitellinum, ♀, a similar result is obtained, the offspring being reed-like in habit as in the pollen parent. Yet when the reed-like E. radicans is crossed with other reed-like species of Epidendrum, and again when the pseudo-bulbous species of Epidendrum are crossed with species of Lælia, in every case normal hybrids are produced intermediate between their parents.

So far as experiments have been made, it seems quite clear that (1) the species of Cattleya, Lælia, Sophronitis, and the pseudo-bulbous species of Epidendrum, when intercrossed, produce normal hybrids intermediate in character.

(2) The same result is obtained when the reed-like species of Epidendrum are united with one another.

(3) But when the reed-like species of Epidendrum are united with the pseudo-bulbous species of Epidendrum, or with species of Cattleya, Lælia, and Sophronitis, abnormal hybrids are produced, having the essential characters of the reed-like Epidendra. From these facts it might easily be argued that a reed-like Epidendrum was the ancestor not only of the pseudo-bulbous Epidendra, but also of the more highly specialised genera Cattleya, Lælia, and Sophronitis. In that case the pseudo-bulbous Epidendra would form an interesting connecting-link between the lowly reed-like Epidendra and the gorgeous aristocratic Cattleya and Lælia. *C. C. Hurst, in "Nature."*

(To be continued.)

Obituary.

THE LATE MR. PAUL LUTZ.—This well-known Wolverhampton gentleman died at his residence, Newbridge Cottage, on the 30th of last month, after a brief illness, in his 69th year. Mr. Lutz, who was a German by birth, was a naturalised Englishman. He came to this country nearly fifty years ago, and entered the service of Messrs. John Moreton & Co., of Wolverhampton, rising by degrees in their esteem and confidence until he became trustee for the late Mr. Moreton, and confidential manager of the business carried on by the firm. Mr. Lutz was known far and wide as a devoted amateur florist, his special flowers being Pansies, Violas, and Roses. He was ever ready and generous with his support to horticultural societies. For a time he was chairman of the Floral Committee of the Wolverhampton Floral *Fête*, and during his term of office gave handsome prizes for Violas and Pansies. Mr. Lutz's floral friends were men like the late Mr. Wm. Dean, of Birmingham, and Mr. James Dobbie, of Rothesay. Mr. Lutz and his wife spent their holidays at Rothesay last summer, staying with Mr. Dobbie, where doubtless their battles were "fought o'er again" around the social board. Mr. Lutz, who had a keen artistic faculty, was the possessor of a fine collection of paintings, embracing examples by Geo. Moreland, Landseer, Lawrence, and others; and the Wolverhampton Art Gallery is enriched by a fine picture presented by him.

TRADE NOTICE.

MESSRS. T. METHVEN & SONS, nurserymen, 15, Princes Street and Leith Walk, Edinburgh, request us to announce the fact that, in order to meet the increasing demands on their nursery department, they have acquired the lease of the Baugholm Nurseries (so long in the occupation of the well-known firm of Peter Lawson & Son), and will be in a position to offer all kinds of nursery stock.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 31, is furnished from the Meteorological Office:—

"The *weather* during this period was extremely changeable. Much rain fell over the kingdom generally—especially in the west and north—but several fine bright intervals were experienced over Ireland and the greater part of England.

"The *temperature* continued above the mean, the excess varying from 2° in 'Scotland, N. and E.,' to 4° or 5° in most other districts. The highest of the maxima were recorded during the earlier days of the week, and ranged from 57° in 'Scotland, E.,' 'England, N.W.,' and 'Ireland, S.,' to 53° in 'Scotland, N.' The lowest of the minima which were registered on the 31st, ranged from 16° in 'Scotland, E.' (at Braemar), 22° in 'Scotland, N.' and 'England, N.E.,' and 23° in 'Scotland, W.' and the 'Midland Counties,' to 29° in 'Ireland, S.,' and to 36° in the 'Channel Islands.'

"The *rainfall* exceeded the mean in all districts, the excess being considerable generally, and especially so in the west.

"The *bright sunshine* was rather in excess of the mean in most districts, the percentage of the possible duration ranging from 27 in 'England, E.,' and 23 or 24 in Ireland and England, S.W., to 12 in 'England, N.W.,' and to 9 in 'Scotland, E.'"

WEATHER IN 1898.—A summary of temperature, rainfall, and duration of bright sunshine in the United Kingdom has been issued by the Meteorological Office, showing the accumulated results for the fifty-two weeks ending December 31. The temperature for the year was everywhere largely in excess of the average, the mean for the whole period being about 2° higher than usual. The excess of temperature was fairly similar over the whole country. The aggregate rainfall results differed materially in different districts. In the north of Scotland, where the total rainfall was 66·7 in., there was an excess of 16·2 in., and rain fell on 262 days, which is seventeen more than usual. There was a slight excess of rain over the whole of Ireland, the greatest excess being 0·5 in. in the south. There was a deficiency of rain over the whole of England, and in the east and west of Scotland. The greatest deficiency for the year was 7·6 inches in the south of England, where the total fall for the year was 21·9 in. In the Midland counties the excess was 6·7 in., in the east of England 6 in., and in the Channel Islands 5·8 in. There was an excess of sunshine in the north and west of our islands, but generally a slight deficiency in the south and east. At Greenwich the total rainfall for the year was 18·78 in., which is 5·78 in. less than the average for the previous fifty years. May, October, November, and December, were the only months with an excess of rain. The mean temperature for the year was 52°, which is 2° above the average. Every month was warm except March, May, and June. The temperature ranged from 92° in September to 26° in February.

MARKETS.

COVENT GARDEN, JANUARY 5.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

— — loose per doz., fine	2 0 —		
— foreign, per bundle	1 3 —		

REMARKS.—In last report Walnuts should have read cwt. (not half). On Saturday last all varieties of green vegetables were in demand, and good prices were realised. Mushrooms were easier in price. Leaves of Galax aphylla are being imported from America. The supplies of Yorkshire Rhubarb are increasing, but only the very best samples fetch 2s. per dozen.

SEEDS.

LONDON: *January* 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E. write that, notwithstanding the fact that to-day's seed market was poorly attended, with but little business passing thereon, an increased inquiry for Grass and Clover seeds is shortly anticipated. Meantime, stocks and prices are as previously noted, alike moderate. Rye continues scarce, and is wanted. Some new Kœnigsburg spring Tares have just arrived. The trade for bird seeds presents no fresh feature. As regards Peas, Haricots, and Lentils, the absence of severe weather naturally restricts the sale. Linseed favours sellers.

FRUIT AND VEGETABLES.

GLASGOW: *January* 4.—The following are the averages of the prices recorded since our last report:—Lemons, 1s. 6d. to 2s. per dozen; Chestnuts, 4d. per pound; Cob nuts, 4d. to 8d. do.; Prunes, 3d. to 8d. do.; Apples, per barrel, Canadian Spies, 18s. do.; Western States' Russets, 30s. do.; Oranges, Jaffa, 9s. 6d. to 11s. per case; Pears, 12s. to 18s. per cwt.; Tomatos, Guernsey, 4d. to 8d. per lb.; do., Scotch, 5d. do.; Grapes, home, 1s. to 4s. do.; do., foreign, 6d. do.; Cabbages, 9d. to 1s. 2d. per dozen; Cauliflowers, 1s. 6d. to 2s. 6d. do.; Parsnips, 3s. 6d. per cwt.; Herbs, 1d. to 2d. per bunch; Leeks, 1s. 6d. to 2s. 6d. per dozen bunches; Mint, green, 6d. to 9d. per bunch; Onions, 5s. 6d. per cwt.; ditto, 6s. to 7s. per case; Parsley, 1s. to 1s. 6d. per stone; Potatos, 5d. to 6d. do.; Carrots, 2s. to 3s. 6d. per cwt.; Artichokes, 1s. 6d. per stone; Cucumbers, 9d. to 1s. each; Lettuce, round, 1s. 3d. per dozen; Horseradish, 3s. per bundle; Mushrooms, 10d. to 1s. 3d. per lb.; Beetroots, 6d. to 7d. per dozen; Brussels Sprouts, 1s. to 1s. 6d. per stone; Turnips, 1s. to 1s. 2d. per bag; do., large white, 3s. per dozen; Savoys, 9d. to 1s. 6d. per dozen; late Cabbages, 9d. to 1s. per dozen.

LIVERPOOL: *January* 4.—*Wholesale Vegetable Market*:—Potatos, per cwt., Giants, 2s. to 2s. 4d.; Main Crop, 2s. 6d. to 3s.; Bruce, 2s. 2d. to 2s. 8d.; Turnips, 6d. to 10d. per dozen bunches; do. Swedes, 1s. 2d. to 1s. 4d. per cwt.; Carrots, 2s. 3d. to 3s. 3d. do.; Parsley, 6d. to 10d. per dozen bunches; Onions, English, 5s. to 6s. per cwt.; do., foreign, 4s. 3d. to 4s. 9d. do.; Cauliflowers, 1s. 3d. to 2s. 6d. per dozen; Cabbages, 8d. to 10d. do.; Celery, 8d. to 1s. 6d. do. *St. John's*:—Potatos, 10d. to 1s. per peck; Grapes, home, 2s. 6d. per lb.; do., foreign, 6d. to 8d. do.; Pines, English, 5s. to 6s. each; Cucumbers, 1s. 6d. each; Mushrooms, 1s. per lb., and basket. *Birkenhead*:—Potatos, 8d. to 10d. per peck; Filberts, 10d. per lb.; Grapes, home, 1s. 6d. to 3s. 6d. do.; do., foreign, 6d. to 10d. do.; Pines, English, 5s. to 10s. 6d. each; do., foreign, 3s. to 5s. do.; Mushrooms, 1s. to 1s. 6d. per lb.

CORN.

Average Prices of British Corn (per imperial qr.), for the week ending December 31, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.
	s. d.	s. d.	s. d.
Wheat	34 6	26 11	− 7 7
Barley	27 3	28 4	+ 1 7
Oats	17 1	17 0	− 0 1

GARDENING APPOINTMENTS.

Mr. J. Macfarlane, for the past six years Gardener at Stapleton Park, Pontefract, as Gardener to J. S. Calverley, Esq., Oulton Hall, Leeds.

Mr. Thos. Pilcher, until recently Head Gardener at Holborough Court, Snodland, Kent, as Head Gardener to F. D. Brockman, Esq., J.P., of Beachborough Park, Hythe, Kent.

Mr. G. Frost, as Gardener to the Earl of Zetland, Upleatham, Marske-by-the Sea, Yorkshire.

Mr. W. C. Lewis, Fruit Foreman, Mentmore, Leighton Buzzard, as Gardener to D. G. Landale, Esq., Limpsfield Grange, Limpsfield, Surrey.

Mr. James Masterson, late Gardener to James Smithwick, Esq., Kilcreen House, Kilkenny, as Gardener to James Cassidy, Esq., J.P., Togher House, Monasterevan.

Mr. Charles Masson, late Gardener and Steward to Colonel Cooper, D.L., Dunboden, Mullingar, as Head Gardener to E. J. Beaumont Nesbitt, Esq., D.L., Tubberdaly, Edenderry, King's co.

Mr. G. H. Clack, previously Head Gardener at Beechen Cliff House, Bath, as Head Gardener to B. Winthrope, Esq., Barton Court, Hungerford, Berks.

Mr. James Prentice, formerly Foreman at Gifford House, Roehampton, as Head Gardener to J. D. Charrington, Esq., at same place.

Mr. William Milne, from Drumlanrig Gardens, Thornhill, N.B., as Head Gardener to S. B. Almond, Esq., Standish Hall, Wigan, Lancashire.

Mr. T. Turton, for twenty years Head Gardener at Maiden Erlegh, Reading, as Head Gardener to J. K. D. Wingfield Digby, Esq., M.P., Sherborne Castle, Sherborne, Dorset.

Mr. E. Bryant, for the past six years Head Gardener at The Manor House, Tarrant Gunville, Blandford, as Head Gardener to Colonel Parry Otheden, Turnworth, Blandford.

Mr. Thomas Edington has been engaged by Lord Ducie as Head Gardener, in succession to Thomas Shingles, deceased.

CATALOGUES RECEIVED.

H. Kenkel, Darmstadt—Plants, including Orchids.

Fisher, Son, & Sibray, Ltd., Royal Nurseries, Handsworth, Sheffield—Seeds, &c.

David W. Thomson, 24, Frederick Street, Edinburgh—Seeds, &c.

Vilmorin-Andrieux & Co., 4, Quai de la Mégisserie, Paris—Wholesale List of Novelties in Flowering Plants, Vegetables, and Grains.

W. Bull, New and Rare Plant Establishment, King's Road, Chelsea—Seeds.

Robt. Veitch & Son, 54, High Street, Exeter—Seeds.

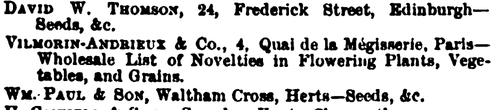
Kelway & Son, Langport, Somerset—Wholesale List of Seeds.

Wm. Clibran & Son, 10 and 12, Market Street, Manchester—Seeds.

E. P. Dixon & Son, Hull—Seeds, &c.

Armitage Bros., Ltd., High Street, Nottingham, Seeds, &c.

Fredk. Gee, Riverford House, Biggleswade, Bedfordshire—Seeds, &c.



Agricultural Rating Act: *Market Gardener* It can be obtained for a few pence of Messrs. Eyre & Spottiswoode, East Harding St., London, E.C.

Bedding Pelargoniums: *Novice.* Where many plants are required, boxes measuring 12 × 36 × 3 inches are used, instead of potting each plant separately, the plants being set in these boxes at 4 inches apart. Scarcely any more drainage is required than some rough fibry soil, half-decayed leaves, or the like, the bottom being made of thick laths or with augur holes half-an-inch in diameter. These boxes may be used for autumn and early spring-struck cuttings; late spring-struck cuttings are better for being potted in 60's. If the plants are to bloom early, one stopping in February or early in March will suffice. If you wish to increase your stock of plants, put the boxes, or some of them, in mild heat—58° to 60° by night—in late January, and take the tops 3 inches in length in about 20 days afterwards. If no increase is looked for, keep the boxes in the greenhouse till April and then place them in cold frames.

Begonia Gloire de Lorraine, &c.: *J. R.* There have been numerous notices of this plant in the *Gardeners' Chronicle*. The plant is very commonly grown now in gardens and nurseries. The parents of the variety are B. socotrana and B. Dregei. See "New Plants," in *Gard. Chron.*, January 21, 1893, p. 68. This was the first notice.

Books: *S. P.* Babington's *British Botany* is published by J. van Voorst, Paternoster Row. We believe a new edition is in preparation. Dr. Vines has lately issued an Elementary Text-book, which is published by Swan, Sonnenschein & Co.—"*Shrubs*: *A. D. Webster. Hardy Ornamental Flowering Trees and Shrubs*, published at 1, Clements' Inn, Strand, W.C.—*G. H. Observations on the Cultivation of Roses in Pots*, by W. Paul. Published by Simpkin, Marshall, Hamilton, Kent & Co., 23, Paternoster Row. —*The Rosarian's Year-Book for* 1898, published by Bemrose & Sons, Ltd., 23, Old Bailey, will afford the report of the National Rose Society's Conference, &c.

Chrysanthemums for Exhibition: *W. C.* Any such list must be more or less an arbitrary one. It is impossible to make up your mind in January what varieties you will exhibit in November, as certain sorts do not succeed in certain seasons, and the cultivator must necessarily possess himself of a greater number of varieties than he intends to exhibit. On p. 410 of our last volume, a list of the most popular varieties at the leading shows in November last was given by Mr. C. H. Payne. With such a collection as that, and by adding a few of the recent novelties, you will be as well prepared as possible. Of the new ones, General Paquie, Reginald Godfrey, H. J. Jones, Mrs. White Popham, R. Hooper Pearson, Chatsworth, Lord Ludlow, John Pockett, Mrs. Barkley, W. Carsham, Swanley Giant, Hanwell Glory, M. Fatzer, Madeline Davis, Mr. F. Carrington, Kathleen Rogers, and Miss Nellie Pockett, are all good ones.

"Creeper" with Scale.—The shrub is probably a Ceanothus. The X L was probably used too strong; it has killed the leaves, but not in every case destroyed the insect, which is not surprising, as it lives beneath a shield-like scale, which prevents the vapour from reaching the insect. Cut away all the lateral shoots, and burn them. Then dress the stem as you would do for a Vine, or if the scale is not very abundant, touch each one with a camel's-hair pencil dipped in methylated spirit.

Cyclamens: *Nemo.* The plants should be separated into their several colours, placing these in different houses. If crossing is practised it should be carefully done artificially with a camel-hair pencil, as a means of carrying the pollen from the anthers of the male flower to the intended seed-bearer. Not more than half-a-dozen seed-vessels should be allowed to remain on any one plant, and these should be allowed to droop and bury themselves naturally in the soil. The plants should not be unduly weakened by carrying a great number of blooms, but reduce the number. The setting of the flowers may begin when the days are a little longer—say, in February.

Fruit-trees Trained Against a Wooden Fence Painted Green: *C. N. M.* We have never heard of any ill-effects from doing this, and do not suppose that any would arise. If the ordinary green oil-paints are deemed injurious why not use Carson's anti-corrosion paint?

Grape-Vine Lifted Two Years Ago: *Novice.* The Vine probably suffered from the heavy crop that it carried the next year, and took its revenge by bearing scantily. Crop lightly this year, and its productiveness will be restored in a season or two. Do not be lavish with the use of solid manure on the Vine-border. It will do no good unless the fertilising properties in it are carried to the roots by means of heavy waterings whilst in active growth. If the loam is heavy do not employ a mulch of manure, but apply manure-water of good strength three times during the summer, first applying pure water. Dressings of lime, potash, and basic slag are useful to Vines at the rate of ¼ lb. per square yard. The retention of the straw round the stem did the Vine no harm.

Lily of the Valley: *Valley.* A bud having once flowered, does not do so again. It must be three years old to produce a flower, or, strictly speaking, its flowering year is the third of its existence. A clump of Lily of the Valley will contain buds one, two, and three years old. Trade growers separate these into three lots, the three-year-old, the plumpest and largest, being reserved for flowering indoors or out-of-doors, and the others for planting to grow on to the flowering age. In an undisturbed Lily-bed, buds of many different ages are found, none of them, however, producing flowers but those that are three years old. It is the unavoidable crowding of an old bed with much flowerless growth that leads to small flower-spikes and minute flowers.

Names of Fruit: *J. F. D.* Pear, Vicar of Winkfield.—*Dalyril.* Pale] Apple, Winter] Hawthornden; coloured, Beaspool.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.—P. E. H.* Habrothamnus elegans.—*T. T. C.* 1, Rhapis flabelliformis; 2, Cupressus Lawsoniana; 3, Retinospora pisifera, of gardens; 4, Adiantum decorum; 5, Adiantum formosum; 6, Pteris cretica variety; 7, Pteris cretica albo-lineata.—*A. T. C. J.* Probably a young frond of Adiantum pubescens.

Peristeria elata: *W. J. Kaye.* The withering and browning of the leaves is due to your having dried off the plant, which is an injurious procedure at the season of rest. The plant should be at such time afforded less water, but not be dried off, and less heat should be given.

Red-Spider on Carnations: *J. R.* This pest can be got rid of by using Richards' XL-All special preparation. Sponging the leaves with soapy water is of great use, and effects the same purpose.

Substitute for Glass: *Paper.* If "Duroline" be meant, this substance was being sold in 1894 by the New Wirewove Roofing Co., 75a, Queen Victoria Street, E.C. It is mentioned in the *Gardeners' Chronicle*, 1st vol. for 1894, p. 143.

Sulphuring Vines: *H. R. G.* Mention is made of the practice having been safely performed in the *Gardeners' Chronicle* for January 1 and 8 last year, pp. 13 and 28. We do not know of any correct formula, and would advise great caution in the use of burning sulphur, even before the buds of the Vine move in the least degree.

Two-flowered Cypripedium insigne: *E. W.* Unusual, but not unprecedented.

Vines: *Anxious One.* It will be quite safe to prune forthwith, cutting back the laterals to the best and plumpest bud on each, and keeping the vinery as cool as possible till the time for starting the Vines has arrived. What cleaning and dressing are needed should be carried out directly after the pruning is finished. Another year you should not cut back the laterals to four joints before the danger from any of the buds pushing is past, say the second week in October. The gain in strength is quite problematical, and in the case of black Grapes left hanging it results in loss of colour owing to the removal of the shade-giving leaves, although white ones may gain a higher tint.

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among Country Gentlemen, and all Classes of Gardeners and Garden-lovers *at home, that it has a specially large* Foreign and Colonial Circulation, *and that it is preserved for reference in all the principal Libraries.*

THE
Gardeners' Chronicle
SATURDAY, JANUARY 14, 1899.

DISEASES OF THE VINE.

THE Grape-Vine may be said to form the principal feature in hundreds of glasshouses in this country. A proprietor with only a small portion of land under glass likes to see a good part of it in the form of a vinery, and expects his gardener to take the best crop possible out of this department. The gardener knows, however, that it is this very crop which gives him a considerable amount of the worry attendant on his post. Nor is the Vine specialist, who gives almost all his time to Grape-growing, by any means free from cares due to the uncertain nature of the Vine itself. One hears our climate or the indoor mode of cultivation adopted in this country blamed, yet it is not so easy to explain away our troubles thus, for if we turn to France, with the greatest area of outdoor vineyards in the world, we find there, troubles quite as serious and not unlike our own; and that, too, in a land where Grape-growing has passed down from father to son for many generations. The reasons for failure are deeper then than ignorance of the gardener, or faults of our indoor cultivation; they belong to the Vine itself, and arise because we do not yet clearly understand the plant. Trouble has, however, brought study and investigation to bear on the Vine, and consideration of some of these may be profitable.

Diseases of the Vine may be conveniently classed into:—

(1) Those directly traceable to the action of parasitic fungi.

(2) Those directly traceable to the action of injurious insects.

(3) Those for which neither fungi nor insects offer a sufficient explanation.

The first and second class of diseases we propose on this occasion to pass over, because they and the remedies likely to check them may be found described in standard works on Vine-culture, and the more important have been dealt with in the back volumes of the *Gardeners' Chronicle*, either as replies to queries, or in special articles. Numerous papers of M. J. Berkeley, M. C. Cooke, Worthington G. Smith, and G. Massee, on the fungus diseases may be mentioned as examples.

The unexplained diseases of the Vine are important enough to merit special notice, as they have been the subject of many investigations. As a general conclusion of the perusal of some of the more important results obtained, we are led to regard most of the unexplained diseases as "physiological," that is, they are due to defects in cultivation, to adverse climatic or other conditions, and to the use of unsuitable varieties of the Vine. Fungi or insects may appear along with diseases of this kind, but they come later and only because the plants are already weakly. One might even go further, and say that most of the fungus-diseases of the Vine are really started by defects in cultivation; the Vines are weakened, the fungi come and complete the mischief. The Vine, as it has to be cultivated in this country, is open in many ways to defective cultivation. Its roots are generally in a border exposed to the changes of climate out-of-doors; its shoots are under glass; while the methods employed to produce a large supply of fruit of high quality may easily result in conditions favourable to the development of disease.

SHANKING.

"Shanking" is a trouble which accompanies Grape-growing all over the world. The Grapes as they approach maturity fall off the bunch, breaking away where the stalk joins the fruit; or they may simply shrivel up and remain attached. The Grapes to go first are those towards the lower end of a bunch, or those on the shoulders. The number may vary from one to many, and the trouble may be apparent all over the Vine or only on parts of it. The foliage is at the same time more or less affected; generally the leaves turn brown and curl in places, or all over. Insects or fungi have never been proved to be the real cause of the trouble, the chief reason is to be sought in the condition of the Vine itself. No doubt, the disease is not always due to the same cause. Over-cropping frequently leads to "shanking," so, also, does too early ripening of the wood. Both of these conditions result in a drain on the food-supplies which the plant has to provide, and will lead to starvation of maturing fruit. The atmosphere inside the house requires careful attention; excessive moisture and heat produce conditions favourable to "shanking" if they cause undue forcing of the Vines; on the other hand, any check due to sudden dryness or cooling, will be first seen in the fruit-bunches.

From what we can learn, the soil itself has no direct effect, but a weak root-system due to defects in the air, heat, texture, or moisture of the soil, will not be in a condition to supply the necessary water and food to a fruiting Vine. Excess of nitrogenous substances in the Vine due to over manuring or to over-cultivation of a rich outside border, easily aggravate "shanking." It is said by good authorities that "shanking" occurs when the Vine is deficient in potash, and they recommend this to be supplied in some form as a manure to the soil. Dropping of the Grapes is also a common result of any disease of the foliage, stems, or roots of the Vine.

A disease on out-door Vines, recently described by French investigators under the name "maladie pectique," seems to us very like a form of "shanking." The leaves in the lower parts of the Vines show discoloured patches, which become wine-red in dark-fruited varieties, or yellowish in white-fruited. This is followed by withering, curling, and drying-up of the leaves; as this goes on, the blade breaks away at the top of the leaf-stalk. Flowers and young fruit behave in the same way, shrivel, and drop from their stalk. The disease was never seen to cause total loss of a Vine, as it never seemed to spread beyond the lower branches. No parasites of any kind could be found. The conditions which lead to the disease are sudden changes of climate affecting the soil. The soils most liable to it are light, and of a pebbly or slatey nature. The vineyards, where it showed most, were subjected to severe drought in 1893, followed early in 1894 by continual rain and a marked fall in temperature of both air and soil. These facts support the view that "shanking" on our indoor Vines is not caused by either fungus or insect, but by conditions arising from soil or climate.

BLANCHING.

"Chlorose," or "blanching," is a disease which has caused much trouble in the south of France. The Vine-leaves lose their deep green shade, then become yellow or completely blanched. The loss of colour generally begins near the margin of the leaf, and spreads inwards between the veins; the affected parts may or may not become withered. Young green twigs sicken like the leaves, and may dry up. The woody branches are retarded in growth, and new leaves given off remain small and blanched. As the malady almost always develops before the flowering period, both flowers and young fruit are stunted and discoloured, and probably dry up or fall off. French experience shows that chlorose is worst on very limey calcareous soils. On such soils the Vines sicken in the first year, and gradually lose their vigour; death may ensue, but frequently the Vines recover gradually each year, and the chlorose may disappear. Where the soil is less calcareous, the disease is less intense. On clay or siliceous soils, chlorose only appears in some cold wet spring, when yellow patches may appear on the leaves, but growth is hardly interrupted, and, if the weather improves, all comes well again. The primary cause of chlorose is the presence of too much carbonate of lime (limestone or chalk) in the soil, and its action is assisted by any condition of the soil which increases the amount of soluble lime. This is further assisted by want of water, light, heat, or air, which defects tend to weaken the general health of the Vines. The disease is diminished by any mode of cultivation which promotes good drainage in the soil, or which strengthens the growth of the Vine. Above all, applications of sulphate of iron (green vitriol) to the soil round the roots of the Vine do most to cure chlorose; this is the case, even though the soil naturally contains iron. As many of the great Vine-growing districts of France have a calcareous soil, chlorose is a serious disease, and, during the Phylloxera epidemic, it assisted in almost exterminating the Vine, and in ruining many a grower. During recent years, however, great progress has been made in checking both Phylloxera and chlorose. This is done by selecting Vines produced by grafting the European Vine (Vitis vinifera) on stocks of American Vines. We cannot discuss the subject fully in this paper. Briefly, however, certain varieties of Vitis vinifera grow fairly well on calcareous soils (e.g., Folle-Blanche, Pinot, Colombeau, &c.); these are grafted on stocks of the American Vitis Berlandieri, which is found wild only on calcareous soils. The Vinifera-Berlandieri hybrids have been used to re-stock hundreds of acres in France, and the Grapes produced are not inferior in quality, while the Vines are much more resistent to disease. This is an important chapter in the history of Vine cultivation, and illustrates the great value of resistent varieties or hybrids as a means of combating diseases of plants. We have urged this before, and believe that more substantial progress will be made against diseases of plants by means of hardy varieties than by any methods of spraying or sulphuring sickly plants. *Wm. G. Smith, Leeds.*

(To be continued).

ORCHID NOTES AND GLEANINGS.

STAUROPSIS LISSOCHILOIDES VAR. MASSAIANA.

SOME time ago, H. J. Ross, Esq., of Poggio Gherardo, Florence, asked for information respecting a plant which, I believe, he purchased from Messrs. Linden as Vanda Massaiana. The communication was accompanied by an artistic accurate drawing made by Mrs. Janet Ross.

The flowers represented a brightly-coloured form of Stauropsis Lissochiloides (Vanda Batemani), and the reply given was that it could only be that species. Two facts, however, remained, viz., that this variety blooms freely on small plants, and the leaves are very different in shape, as in place of the hard, straight leaves tapering gradually to the point, as in the type, these are more strap-shaped, more equal in width, generally curved, and more acutely bilobed at the apex.

Recently I had an opportunity of examining a small importation of this variety made by Messrs. Jas. Veitch & Sons, of Chelsea, and the advantages it gave of securing a plant of moderate growth, and flowers in a small state, over the large, shy-flowering old type, was apparent.

The flower-buds are of a rich vinous-purple on the outside, the same hue remaining on the reverse of the flower when open. The face of the sepals and petals is bright chrome-yellow, with ruby-red spots, some of them being ocellate, a few crimson-purple marks being found around the column; and the lip is white and claret coloured.

ODONTOGLOSSUM CRISPUM, Rosslyn var.

This grand form of typical Odontoglossum crispum is comparable to the noble O. c. Prince of Wales, which received a First-class Certificate at the Royal Horticultural Society on June 14, 1898. In actual measurement this is slightly smaller than the variety named, but when it is considered that the certificated plant was a large one, and superbly grown, and this one is only a small imported plant, matters may be equalised.

O. crispum, Rosslyn variety, measures 4 inches across, and all the segments are so broad as to fill-in the greater part of the circumference of the flower. The sepals are white, delicately tinged with rose-colour, especially on the reverse side, each having one or two purplish-red blotches. The petals, which are slightly wavy at the margin, are pure white. The large and prettily crimped lip is white, with a clear yellow disc, and several large confluent dark chestnut-red blotches in the middle. The plant flowered with that enthusiastic lover of the genus Odontoglossum, H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood). *James O'Brien.*

THE RAINFALL OF 1898.

It is generally acknowledged that the rainfall for the year 1898 is below, and in some districts of the country very much below, the average. So great has been the deficiency of rain at Rothamsted, Hertfordshire, that in Sir John Lawes' experimental Wheat-field, which is pipe-drained, to enable the observer to determine the loss of nitrates in the drainage, no water passed from the early part of January until the beginning of December. This is the second time only of such an occurrence during a period of more than forty years.

The following table shows the rainfall for the past year at Rothamsted, Hertfordshire, according to the measurements taken from Sir John Lawes' gauge, which in size is 6 feet by 7 feet 3 inches, equal to one-thousandth of an acre in area. It stands 2 feet above the ground, and is 420 feet above the sea-level. The average rainfall from the same gauge is also given for forty years, with the difference of 1898 above or below the average.

Rainfall at Rothamsted for each Month of the Year 1898, and the Total Yearly Rainfall.

Month.	Rainfall, 1898.	Average Rainfall of Forty Years.	1898. Above or Below the Average.*
	Inches.	Inches.	Inches.
January	0·795	2·453	—1·658
February	1·098	1·743	—0·645
March	1·060	1·730	—0·670
April	1·443	1·972	—0·529
May	2·892	2·327	+0·565
June	1·607	2·414	—0·807
July	1·451	2·731	—1·280
August	1·207	2·599	—1·392
September	0·597	2·551	—1·954
October	2·889	3·193	—0·304
November	2·440	2·770	—0·330
December	3·013	2·170	+0·843
Yearly total ...	20·492	28·653	—8·161

* The sign (—) signifies below the average, and the sign (+) above the average.

The above data show that the yearly total of rain for 1898 was 20·492 inches, against an average for forty years of 28·653 inches, giving a deficiency in the twelve months of 8·161 inches. There were but two months in the year, namely, May and December, when the rainfall exceeded the average, there being ten months of deficiency. This is the smallest yearly rainfall measured at Rothamsted since 1864, when 18½ inches only fell; the next lowest was 1854, when 19·4 inches were recorded, and the year nearest to that of 1898 was 1858, when slightly over 20 inches fell.

In order to understand what this deficiency of rain means to vegetation, it may be stated that the 8·161 inches represents 824¼ tons of water on each acre of land, equal to 184,634 gallons, and as we began the year 1898 with a deficiency from 1897 of 1·579 inch, equal to 159½ tons, or 35,723 gallons of water, it means that at Rothamsted the land at the present time requires 220,357 gallons of water on each acre to bring the amount up to the normal average; consequently, our well-springs and other supplies of water may show a falling off which can easily be accounted for.

The amount of snow which fell at Rothamsted in 1898 was most exceptionally small: about 2 inches were recorded in February, 6 inches in March, and 8 inches in November, making a total depth of about 16 inehes for the year. *J. J. Willis, Harpenden.*

THE ROCK GARDEN.

GERANIUM SANGUINEUM ALBUM.

Within the last two or three years, there has been offered by a nurseryman a plant under the above name. It appears to correspond in every way with one received by the writer under a similar name from Mr. W. D. Robinson-Douglas, of Orchardton, Castle Douglas, N.B. Probably they are from the same stock. Mr. Robinson-Douglas found this Geranium on the coast of the Solway, near Auchencairn, in Kirkcudbrightshire. Although named as a variety of Geranium sanguineum, it appears to the writer that it is not that species, but a hybrid between G. sanguineum and another, which is, in all likelihood, G. pratense. The latter, like G. sanguineum, is plentiful on the sandy coasts of the Solway Firth. It is, it may be admitted, not improbable that the Bloody Crane's-bill may produce a white variety, but the plant under notice differs considerably from the type, and also from G. s. lancastriense, the Walney Island variety of the species. The habit of the plant is different, it being larger and less compact. The leaves are also more divided, and the flowers, besides being larger, are more cup-shaped. After growing the type and the Walney Island Crane's-bill under the same conditions as the so-called G. s. album, the writer submits, with considerable confidence, that the last-named is a hybrid between G. sanguineum and G. pratense.

As a garden plant, it is of much value. It grows very freely. It has, indeed, a tendency to grow a little too quickly. Its greater laxness of growth is, perhaps, a failing; but the way in which the flowers are poised above the leaves, like large white butterflies, renders a good clump very attractive. The flowers are a trifle flimsy in texture, but this adds to the lightness of their appearance. One prefers this Geranium on rockwork because of the opportunity afforded of checking gross growth, but it can be grown in the border as well.

FRITILLARIA MELEAGRIS, FLORE-PLENO.

Properly speaking, the Snake's Head Fritillary is a meadow-loving plant, but it grows well on rockwork not too dry, and its nodding flowers are seen to better advantage than when lower down. Although known to Parkinson, the double variety of Fritillaria Meleagris is not very generally known, and it is but rarely that we see it in gardens. It is grown at Kew, and one sees it occasionally offered at a fairly high price in catalogues. It is figured in Wooster's *Alpine Plants*, second series, plate xxx. The colouring is, however, too deep, and, singularly enough, the author makes no reference to its being the double form which he shows. The doubling, so far as the writer knows, is the only instance of the kind among the Fritillarias, although among the Liliaceæ, to which order the Fritillarias belong, several of the Lilies have flowers showing doubling. F. Meleagris, flore-pleno, is more curious than beautiful, but those who have a liking for out-of-the-way plants will appreciate its singularity.

POTENTILLA ALCHEMILLOIDES.

Few of our rock-garden flowers are such free-bloomers as this Cinquefoil. There are not many months in the year in which it does not give a few blooms. This winter a plant on a rather dry rockery in the writer's garden produced a few flowers from August until after New Year's Day. The flowers, as may be expected, have not looked happy, but the fact of their being in view may emphasise the remark as to the floriferousness of the Alchemilla-leaved Cinquefoil.

The hardiness of P. alchemilloides is unquestionable in the writer's garden. It is at its best in June here; then, after a month or so of rest, in July, it begins to flower again. The flowers are pure white, and the leaves in shape and in general appearance show how appropriately the plant has been called "Alchemilla-like," from their resemblance to those of the Alpine Lady's Mantle. It is easily propagated by division. It is a native of the Pyrenees, and a plant which can be confidently recommended to the grower of alpine flowers. *S. Arnott, Carsethorn, by Dumfries, N.B.*

ROME.

(Continued from p. 2.)

The Eucalyptus in Britain.—Before bringing this paper to a close, it seems to me pertinent to enquire—is there any future for Eucalypti in England at all, and will they do good there? I have known persons who would emulate the credulity of the monks in the virtues which they attribute to these strange Australian trees. A broken Eucalyptus-bough or a few leaves were in their opinion sure to be a defence against influenza and other things—but all this is for the most part beside the mark. In England, as elsewhere, they might be very serviceable for drainage purposes if only they would live, but that seems problematical in the highest degree, and for nothing else is it worth while to take much trouble about them. In your impression of December 3, I remember reading the following passage: "Eucalyptus Globulus.—I quite agree with 'J. H. D.' in his remarks as to the rarity or difficulty of growing this plant; here, we have plants 16 or 18 feet high that have withstood five winters without the slightest protection, &c. In my opinion the principal cause of failure to grow them is planting them too soon, &c." The writer, who is evidently alive to the difficulty that surrounds the whole matter, is full of hope that it may be somehow overcome. I am sure, I do not wish to daunt him in any degree. but with regard to E. Globulus I am persuaded that it has not a constitution which is sufficiently hardy for England. It is a great favourite wherever it gets on well because it makes a great show so quickly, and my friend the Trappist monk calls it A1, because it gives him no trouble at all; but that is a different thing from the way in which Cavaliere Palice speaks about the same matter. He does not say that Eucalyptus Globulus can be trusted in all places and positions, but he maintains exactly the reverse, and he puts E. resinifera at the head of the whole of them, because it is more reliable than the rest. And this, so far as E. Globulus is concerned, I have seen over and over again in the Isle of Wight. It goes on well, say, for seven or eight years or more, and then a more than usually hard frost comes, and every tree is destroyed.

I remember twenty or twenty-five years ago receiving a letter from a friend who had a fine place at Westridge, near Ryde, and his asking me to go to him at once. He certainly was not addicted to botany or to the cultivation of trees and plants at all, but, somehow, E. Globulus had found its way into his garden, and had attained to a great size; he was very proud of his tree, but he could not make out the buds, and one spring very unexpectedly, and very suddenly, so far as the owner was concerned, it broke out into blossom, and was a pretty sight to see. I really do not know what this gentleman imagined had taken place. The knob-like buds he had esteemed to be seed-vessels, so far as he had thought about them at all, and the difficulty in his mind was, what then had succeeded them? and he was very slow to believe that his Eucalyptus was blossoming. But that tree gave rise to many false hopes in the Isle of Wight. If E. Globulus could behave like this, and grow so tall, and blossom so luxuriantly, what more could be required? It would certainly take to the Isle of Wight, and the Isle of Wight might have a new possession of great value about which no doubt need be entertained. But what really took place? E. Globulus was planted in fairly large quantity in and about Ryde, and everything went on swimmingly for a series of years. Near Trinity Church in Ryde there were some very large specimens indeed, there were one or two in St. John's Park, the same (I think) in the grounds of Isle of Wight College, certainly one or two in my own garden, and nobody dreamt of any ill coming to them; all boded so well. But the frost of 1881 made short work of the whole lot, and for some time there was not a Eucalyptus in the place that was worth speaking of. Now they are coming up again in some plantations and gardens, and they look very promising, but the promise will only last till the mercury in the thermometer goes below a certain point, and the whole thing will be over. This sort of occurrence is by no means peculiar to the neighbourhood where I live. I asked a lady who is a visitor to Rome this winter, and who lives at Falmouth, how it fared with her about this matter, and her answer was, they get on well for five or six years, and then a hard frost comes and every Eucalyptus is killed. I have even heard of a fine tree at Bournemouth, which stood the climate there for seventeen years, and at last was cut off. They may do permanently in other places about which I know nothing at all, but the Scilly Isles give the only exception I can think of to a universal rule. [Fota, Mr. Smith-Barry's place, near Cork. Ed.]. I may, however, say that I know nothing about the west coast of Scotland, and how they fare there.

The question, therefore, about them is this. Is any one species so much more hardy and so much more slow-growing than the others as to afford solid ground for hope?

I remember myself hearing some time ago of two names of Eucalypti. I think they were E. Gunni, E. coccifera and another, and these were said to promise quite well for the future in point of hardiness, but I do not know how the promise was fulfilled—it can do no harm if a third one be added to the list—it may prove a failure, like so many others; but E. resinifera has a very good character here, which should not be overlooked

I would only just add, that I have brought a good supply of seed of E. resinifera from the Trappist Monastery, and I shall not myself want a tithe of it. I will readily send some of it to any one who applies for it to me on my return home to St. John's, Ryde, which will be, so far as I can tell at present, in the month of April next. *H. Ewbank* (*Rev.*), *Rome, Christmas Eve*, 1898. [E. resinifera was figured in our columns, with a descriptive article from the late Dr. George Bennett. See *Gardeners' Chronicle*, August 3, 1872, p. 104. E. coccifera, at Powderham Castle, Devon, has often been figured in our columns. See February 7, 1891. We should be pleased to hear the present height of that specimen. The tree at Kew which gets hurt by frost is E. Gunni. E. urnigera is the tree grown at Whittingham, East Lothian. See *Gardeners' Chronicle*, June 30, 1888. We may also refer to an article on February 7, 1891, as containing a summary of our knowledge of these plants, as grown in the open air in this country. Ed.].

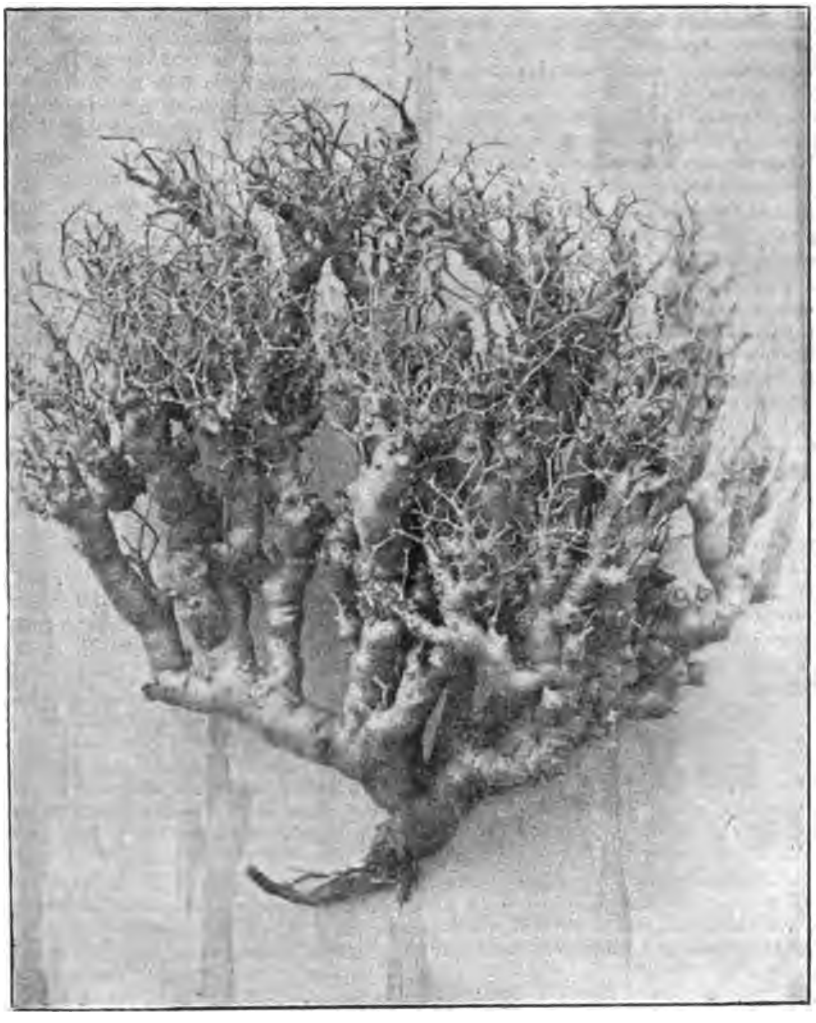

Fig. 5.—Pelargonium crithmifolium: flowers white, with a pink eye.

PELARGONIUM CRITHMIFOLIUM.

A large plant of this queer-looking Pelargonium (see fig. 5) has lately been added to the Kew collection by Professor Macowan, of Cape Town, who obtained it and numerous other rare and interesting succulents during a short stay in the Karoo district, north-west of Cape Town. Although leafless and well dried, the plant weighs 15 lb., and the thickest of its gouty-looking, succulent stems are nearly 2 inches in diameter. It is remarkable also in being enclosed, as it were, in a network of sharp spines, which are formed by the hardening of the persistent panicles, as in the case of Cotyledon reticulata, from the same region, of which a figure was published in the *Gardeners' Chronicle*, vol. xxi., p. 282. There is a figure of the Pelargonium in Sweet's *Geraniaceæ*, iv., 354, prepared in 1827 from a plant cultivated by Sir R. C. Hoare, Bart., at Stourhead, near Frome. It is there represented as having leaves and flowers like those of P. carnosum, an allied species, well known in botanical collections to-day. The leaves are irregularly bipinnate, and the flowers an inch across, white, with a pink eye.

Burchell mentions it in his *Travels*, vol. i., 225, under the name of P. munitum. He says: "We removed to the Yoke River . . . not a single drop of water could anywhere be found, even by digging. . . . In the interim I took a botanical ramble, and added forty-eight plants to my collection. Amongst them was a succulent species of Pelargonium, so defended by the old panicles, grown to hard woody thorns, that no animal could browse upon it. In this arid country, where every juicy vegetable would soon be eaten up by the wild animals, the Great Creating Power, with all provident wisdom; has given to such plants either an acrid or a poisonous juice, or sharp thorns to preserve the species from annihilation in those regions where for good and wise purposes they have been placed."

The photograph from which the illustration was made was taken by Mr. A. E. Griessen. *W. W.*

NOVELTIES OF 1898.

(*Continued from p. 2.*)

Messrs. Jas. Veitch & Sons, Chelsea, take the lead as producers of good Orchids. Not only has Mr. John Seden been able to raise and flower for them many fine novelties, especially in Cattleyas, Lælias, and Lælio-Cattleyas, but by reproducing known crosses, using the finest procurable varieties for crossing, placed several well-known things on quite a new footing. Instances of this kind may be noticed in Lælio-Cattleya × Wellsiana var. Langleyensis, L.-C. × Eudora splendens, L.-C. × Canhamiana superba, L.-C. × callistoglossa ignescens, L.-C. Dominiana var. Langleyensis, and Dendrobium × Aspasia Langleyensis, all of which, in the mere recent productions, have been so far superior to the originals as to secure for them awards at the hands of the Orchid Committee of the Royal Horticultural Society.

Other fine novelties certificated to Messrs. Veitch in 1898 are Lælio-Cattleya × Ingrami gigantea, a very remarkable flower, of great size, fine substance, and rich colour; L.-C. × Thorntoni (C. Gaskelliana × L. Digbyana), a fine companion for L.-C. Digbyano-Trianæi, and L.-C. × Digbyano-Mossiæ; L.-C. × Hippolyta aurantiaca, wholly of two shades of orange colour; Lælia × Digbyano-purpurata, a fine flower, though at present it has not developed the fringe, which is the great attraction of L. Digbyana crosses; L. × splendens, Cattleya × Miranda, C. × Adele, C. × Ella, C. × intertexta, and other Cattleyas, all good of their kind; Disa × Diores var. Clio, a fine form of a showy and variable batch; the singular Epi-Cattleya × radiata-Bowringiana, the curious illustration of colour-suppression Epidendrum × elegantulum var. leucochilum, the pretty Phalænopsis × Stuartiano-Manni, Masdevallia × Imogene, Cattleya Schroderæ amabilis, &c.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, have contributed well and continually to the Orchid displays shown throughout the year 1898, and many of their fine new plants have been Certificated. Among their finest productions were Cattleya Mendeli, Oakes Ames, and C. M. Mrs. E. V. Low, two superb forms; Cypripedium × I'Ansoni and C. × Mrs. Reginald Young, with which they performed the unusual feat for Cypripediums by taking two First-class Certificates on the same day. C. × F. S. Roberts, a pretty thing of the Tautzianum class; and C. × Olivia, a singular C. tonsum hybrid; Phalænopsis × Schroderæ, an improvement on P. × intermedia Portei; Odontoglossum nebulosum pardinum splendens, O. crispum Prince of Wales, one of the grandest of the typical forms; O. c. Memoria, W. E. Gladstone, and O. C. Dieudonné, both fine spotted forms; Lælio-Cattleya × Schilleriana, flowers with very richly-coloured lip; Dendrobium Dalhousieanum Salmoneum and Bulbophyllum Claptonense, the last-named a very handsomely coloured form of the B. Lobbi section.

Messrs. J. CHARLESWORTH & Co., at the last Temple Show made a fair display chiefly of novelties raised or acquired, and shown for the first time. Of the best were Cattleya × Fernand Denis (Acklandiæ × Warscewiczii); C. × Breanteana (Loddigesii × superba); Lælio-Cattleya × radiata (L. purpurata × C. dolosa); the singular Lælia × cinnabrosa (cinnabarina × tenebrosa); the pretty yellow L.-C. × intermedio-flava "Golden Queen"; Odontoglossum crispum Jeanette, O. nebulosum punctatissimum, O. Halli, Charlesworth's variety, &c. Messrs. Charlesworth also showed a fine batch of varieties of Phaius × Norman, three of the most distinct of which were awarded certificates; the singular Epi-Lælia × Charlesworthi, and the pretty Sophro-Cattleya × Cleopatra.

Messrs. F. SANDER & Co. have mainly devoted their energies to the re-introduction of desirable species, such as Dendrobium atro-violaceum, D. Johnsoniæ, &c.; and in that direction the introduction by them of the famous Dendrobium spectabile (figured as Latourei spectabile), is worthy of congratulation. Many hybrid Cypripediums also have been flowered by them, and, among other noteworthy subjects, the distinct Sobralia Sanderiana, Odontoglossum crispum Roi Leopold, a very remarkable spotted form; O. grande Sanderæ, a charming wholly yellow variety; Lycaste Skinneri Baroness Schroder, resembling the best form of L. S. alba, with a delicate blush on the sepals and lip; Lælio-Cattleya × Duke of York, a very handsome hybrid; and Cattleya Trianæi Sanderæ, a charming and novel flower. Of other novelties in Orchids of the year, mention should be made of the brightly-coloured Miltonia vexillaria Empress Victoria Augusta, shown by Messrs. BACKHOUSE; the fine Lælio-Cattleya × Henry Greenwood, shown by Messrs. B. S. Williams & Son.

Continental novelties have been more than ordinarily plentiful, though only a small proportion have been exhibited in Great Britain :—

M. LINDEN, l'Horticultural Internationale, Brussels, have been especially strong in fine forms of Odontoglossum crispum, which their remarkably good culture enables them to show at their very best. On several occasions they have staged groups of Odontoglossums showing the most bewildering variations, not the least beautiful being the many forms of their importation, which gave O. × Adrianæ, and which forms the type of a set which may be natural hybrids of O. Hunnewellianum. One of the handsomest is O. × A. venustum, for which they secured an Award at the last Temple Show, when the fine O. crispum zebrinum, O. c. decorum, O. Pescatorei bellatulum, and others, were similarly distinguished. Their varieties of Cattleya Mossiæ and C. Trianæi have also produced fine novelties, of which C. Mossiæ Marguerite is a good example; and the Moortebeeke forms of O. × Wilckeanum, beautiful though they are, are very puzzling to the one who wishes to thoroughly understand their derivation.

M. MADOUX, of Auderghem, showed at the Temple Show the pretty Odontoglossum × Adrianæ Charlesiana, and two or three other pretty varieties.

M. CHAS. VUYLSTEKE also showed at the Temple Show Odontoglossum × crispo-Harryanum, a home-raised hybrid of delicate markings, nearest in appearance to a pale O. Harryanum.

M. CHAS. MARON, of Brunoy, near Paris, the raiser of so many good hybrid Orchids, began the year with the handsome Lælio-Cattleya × Henry Greenwood, which took the Medal for the best hybrid Orchid at the Ghent Quinquennial Show; and later he showed the fine Cattleya × Maroni (velutina × Hardyana) at the Royal Horticultural Society, when it was pronounced one of the best new plants of the year.

Altogether, there is sufficient evidence of good progress in every branch of Orchid culture.

New or rare Orchids illustrated in the *Gardeners' Chronicle*, in 1898, include the following:—

Aceras Bolleana, June 11, p. 365.
Cattleya × Maroni, November 5, p. 332.
Cirrhopetalum appendiculatum, December 10, p. 415.
Dendrobium nobile Ashworthianum, April 2, p. 203.
Epi-Cattleya × radiato-Bowringiana, June 25, p. 391.
Eulophiella Peetersiana (flower-spike), Supplement, April 2.
Eulophiella Peetersiana (plant), April 2, p. 200.
Lælia anceps Amesiana, Crawshay's var., January 22, p. 59.
Lælia anceps Waddoniensis, February 26, p. 125.
Lælio-Cattleya × Henry Greenwood, November 26, p. 383.
Lælio-Cattleya × Digbyano-Trianæi, Jan. 1, p. 8.
Odontoglossum crispum Prince of Wales, June 25, p. 390.
Odontoglossum × Wilckeanum, Pitt's variety, May 7, p. 274.
Phalænopsis × John Seden, March 19, p. 171.
Phalænopsis × Ludde-violacea, July 16, p. 43.
Phalænopsis × Schroderæ, April 30, p. 259.
Renanthera Imschootiana, January 15, p. 41.
Spathoglottis × aureo-Veillardi, May 21, p. 309.
Stanhopea Madouxiana, August 20, p. 135.
Stanhopea Rodigasiana, July 9, p. 31.
Vanda × Miss Joaquim, Supplement, August 31.

(*To be continued.*)

FLORISTS' FLOWERS.

CARNATION PRINCESS MAY FOR WINTER FLOWERING.

THIS Malmaison breed of Carnation makes an admirable winter-blooming plant, as may be seen by any one calling at the nursery of Mr. C. Turner, Slough, where a large house is devoted chiefly to this variety. About 2000 plants are grown, the variety being in good demand; and at the time of my visit a few weeks since some hundreds of open and partially-expanded blossoms were in evidence, and flowers were being cut daily. The large, deep rose flowers are very useful at this season for button-hole and other cut-flower purposes. For winter flowering, cuttings should be inserted in early spring, and the plants grown on into 5 and 6-inch pots. *C. H.*

LATE-FLOWERING WHITE CHRYSANTHEMUMS.

We have now several late white flowering varieties, that are a distinct advance upon older kinds. For years I have interested myself in testing varieties for this purpose. Half-a-dozen sorts from those following would be difficult to beat, and the type they represent is really the best for various forms of decoration. Mrs. M. Simpson, raised in 1896, is an English seedling, and is naturally so late in flowering that it is extremely difficult to bloom the plants in November under the orthodox system of large bloom production. The full centred, solid blooms are of the purest white. From six to nine blooms on a spray are produced on stout stems, which is all in its favour when required for vase decoration.

Niveum is well known as a really good December-flowering Chrysanthemum. With age the blooms assume a slight creamy-white tinge of colour. For freedom in flowering none can surpass this American-raised variety, as many as a dozen blooms are borne on single sprays.

The Queen as a pure white Christmas flowering variety is excellent. The lance-shaped florets are rather short, but the bloom is a full and solid one.

Mrs. Weeks is well known as one of the best of incurved Japanese for November flowering to require much description here. When cultivated to produce late flowers, it is a most desirable variety. The florets in an exhibition flower are naturally of an incurving character, but under this treatment they reflex perfectly.

Simplicity produces pure white blooms, with long drooping florets, but the peduncles are weaker than desirable.

L. Canning is perhaps the best of all for January and February flowering. The florets are flat and of the purest white. To successfully grow late blooming plants, the cuttings should be struck early in January in the ordinary way. Top each plant when it is 6 inches high, to increase the number of shoots at the base. Repeat this operation when 6 inches more of growth has been made, and again early in July. After that allow the shoots to grow away uninterruptedly, each forming as many bloom-buds as they may. Grow the plants in frames as near to the glass as possible, to encourage a stocky habit. When all fear of frost has passed, put the plants out in the open ground, choosing an open situation, away from high walls or overhanging trees. The soil ought not to be too rich, or the growth will be too sappy to admit of the necessary maturity of wood. Fully a yard of space should be given each plant, so as to avoid overcrowding. Should the weather be hot and dry, copious root-waterings will be necessary.

Some support will be required to prevent the branches being broken by wind, or heavy rains. This is best done by placing a stout stake to each plant to which the shoots may be loosely tied. Cut around the roots of each plant with a spade at the end of September, to check growth, and thus enable the plants to better withstand the lifting a month later without check. Use a rather rich compost for potting-up the plants, and place them in a shady position for ten days, syringing them daily during dry weather to prevent the leaves flagging, and to encourage quick root-action. The plants should be allowed to stay in the open as long as frost is not anticipated. When, however, they have been placed into cool-houses, admit an abundance of air, and to stimulate growth give them frequent applications of liquid manure. Except large blooms are desired, no disbudding need be done, and the whole of the buds will then develop blooms as best they may. *E. Molyneux.*

CHRYSANTHEMUM CULTIVATION.

If cuttings were inserted early in December they should now be forming roots. The strongest growing varieties are generally the first to emit roots. A little air should then be admitted by tilting the lights slightly, increasing the degree until they may be removed entirely. But while some of the plants need air, the leaves of others that are less strong and have not rooted will flag. These should be removed to a frame by themselves, and kept closer than those which do not flag, but require more air. When the plants are well rooted, and will bear free exposure to the air without flagging, remove them from the hand-lights and place them upon a shelf close to the glass in the same house. If the house be not provided with shelves, temporary ones can easily be put up by suspending them from the rafters by means of strong wire and screws. The shelves may be about 9 inches wide, according to circumstances, and on each side there should be a groove, so that the water will run to one end, for which purpose a slight slope should be allowed when fixing the shelves.

The soil in which the plants are growing should never be permitted to become dry. Directly the pots are full of roots, the plants should be shifted on into larger pots. From the thumbs in which they were rooted, they should be put into 3½-inch pots. If a check to growth occurs at this stage, owing to the repotting being deferred, it will be a serious misfortune. For a compost, use two parts fibry-loam, one part leaf-soil, and one part decayed horse-droppings, with a free admixture of sharp silver-sand. For the greater convenience in potting, pass the compost through a coarse sieve, rubbing the fibrous pieces through also, and pot firmly; the pots must be quite clean, and well drained. If the soil be moist when used, as it should be, no water will be required for a day or two.

If by chance any plants receive too much water, and the leaves become pale in colour, allow the soil to become dry almost to flagging point for a couple of weeks, and new roots will form, and a return of colour to the leaves through the midrib will be noticed. In stubborn cases half-an-ounce of sulphate of iron dissolved in water will quickly restore the loss sustained. It is not wise to allow the plants to remain for long in this pale sickly condition. No position is better for the plants until they are again established than the shelf to which I have already alluded. When well-rooted again, put them close to the glass in a cold frame where frost will not penetrate. *E. M.*

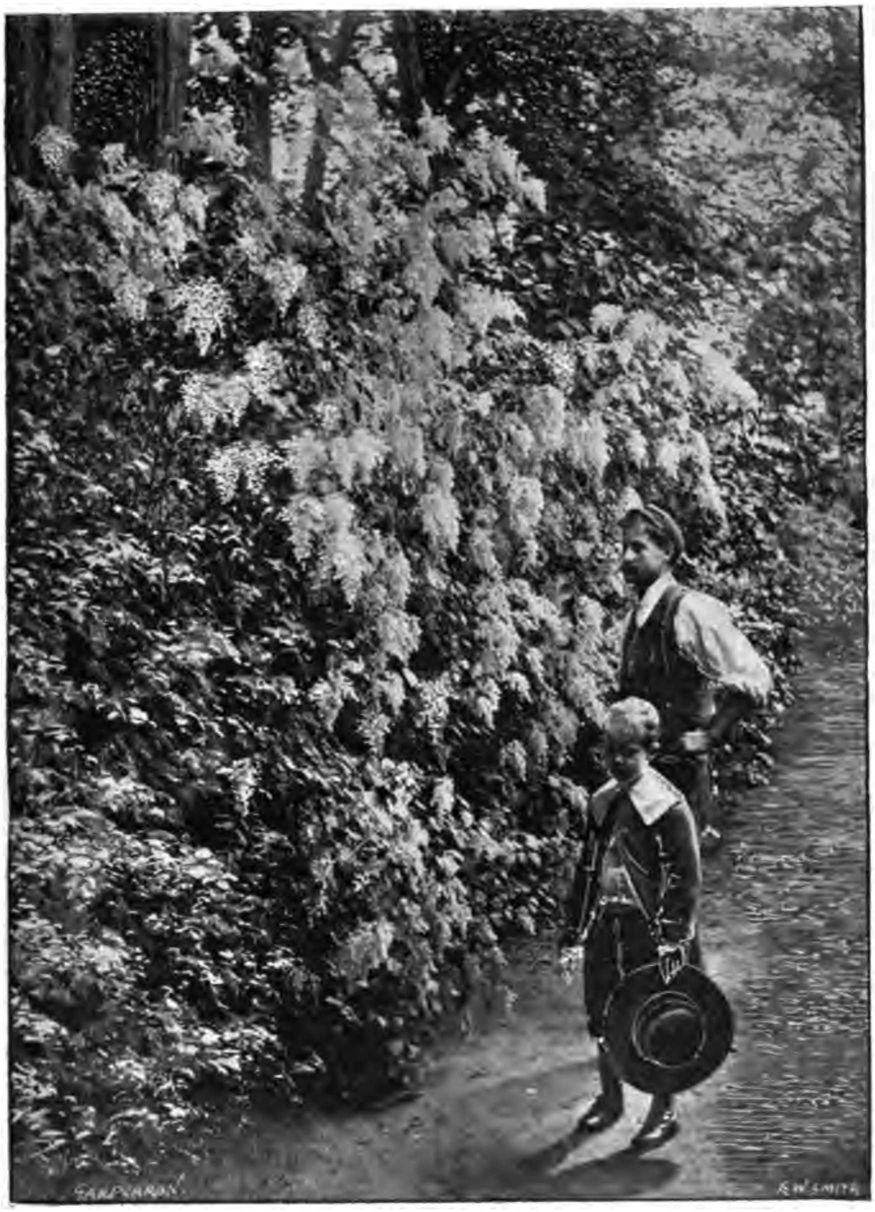

FIG. 6.—SPIRÆA DISCOLOR (*ARIÆFOLIA*) IN MR. E. R. BELLYSE'S GARDEN, OAKFIELD, NANTWICH. FLOWERS DIRTY WHITE.

SPIRÆA DISCOLOR
(*ARIÆFOLIA*).

AMONG the more robust-growing Spiræas this species would rank as one of the most striking, by reason of its long, pendulous, shaggy-looking inflorescence; and where the plant is afforded a good deep soil, and a sunny situation, with a plentiful supply of moisture at the root, Spiræa ariæfolia is no mean-looking decorative object. The rigid cuneate leaves are dark-green above, and silvery beneath. The plant is evidently at home in Mr. Bellyse's garden, Oakfield, Nantwich. The photograph from which the illustration (fig. 6) was prepared was taken on August 22, 1898.

TREES AND SHRUBS.

BERBERIS ANDREANA.

IN the current number of the *Revue Horticole* M. Naudin describes and figures a new species of Berberis, found in Uruguay by M. Ed. André, and introduced by him into cultivation in the Riviera. The leaves are tufted, coriaceous, persistent, ovate, lanceolate, entire. The yellow flowers are in long loose pendulous racemes, as in the Red Currant.

BETULA NIGRA (THE RED BIRCH).

Beautiful as are the Birches when in leaf, it is in winter that their individuality becomes most marked. The unusual colours of the bark, and the peculiar elegance of the trees' growth give them an unique place among deciduous vegetation. To none does this apply in greater degree than to our native White Birch, which is one of the most effective of trees in winter. Of several other species possessing the same character, the white Paper Birch (B. papyrifera) is the most noteworthy. Quite distinct from these silvery-barked species is the American Red Birch, one of the most characteristic and picturesque of all trees. In spite of its value and of the fact that it was introduced in the middle of the last century, this species has been very little planted in this country, and is still one of the rarest of American trees. Its chief peculiarity is in the dark-coloured bark, which peels away from the trunk and stands out in large flakes, giving a curiously rough, ragged aspect to the tree. It differs also from the other tree Birches, in that it branches both in Nature and under cultivation into three or four secondary trunks, when a few feet from the ground. Sometime ago a correspondent enquired in the *Gardeners' Chronicle* for trees other than Willows, Alders, and such like that would thrive in very moist positions. I think this Birch would be well worth trying on low lake-islands, by water-courses, &c., for it often grows wild in south-eastern districts of the United States under semi-aquatic conditions. At the same time it thrives in ordinary positions as well as other Birches.

THE YELLOW-BERRIED HOLLY.

Among evergreen trees and shrubs that have been introduced to this country, it is difficult to point to one which, in hardiness, beauty, and general usefulness combined, surpasses our own native Holly; one might almost add, "in variety," too, for it has sported into a wonderful number of forms, to which every year additions are made. Although not a new variety, the Yellow-berried Holly deserves special mention at this season. The year has in this district been a good one for the fruiting of the Holly, for the twigs of the common red-berried variety, as well as those of this yellow one, are thickly covered with berries. Unless the day happens to be bright, and the trees are lit up by direct sunlight, these yellow berries are, I think, even brighter and more effective than the red ones. However that may be, it certainly deserves to be grown for mid-winter effect, and it is just as hardy and vigorous as the common Holly.

Cotoneaster rotundifolia.

Several of the Cotoneasters are noteworthy for the beauty of their fruits, but this year by far the finest of them is C. rotundifolia. It is one of the most ornamental shrubs at new-year-time, its branches being very thickly laden with bright red berries. Like the majority of the Cotoneasters, it comes from the Himalayas. It is evergreen, the Box-like leaves being of a dark, lustrous green, almost round, and from a quarter to half-an-inch long. The berries are about the size and shape of the haws of the common Hawthorn, but are of bright scarlet-red. It has a spreading habit, and does not appear likely to grow more than 4 feet to 5 feet high. Its branches have much the same flat-growing character as those of C. horizontalis, although not so marked. C. horizontalis has smaller berries and is deciduous, although it is frequently described in catalogues as evergreen. *W. J. B., Kew.*

The Week's Work.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

The Houses.—An effort should be made to thoroughly clean the glass, woodwork, and stages of all plant-houses at least once a year; and whenever the weather is unfit for outdoor operations, a favourable opportunity is afforded for undertaking this important work.

Herbaceous Calceolarias.—To be thoroughly successful in the cultivation of this showy plant, it is essential that its requirements be promptly anticipated, and one of the most important of these is a cool, moist position, where a steady hardy growth may be maintained. Such a position is found in a pit or frame provided with a hot-water pipe, into which sufficient heat may be turned to exclude frost, and maintain a temperature of from 38° to 45° according to the outdoor temperature. Abundant ventilation is another important factor. A small amount of fresh air should be afforded when the temperature of the pit reaches 40°, increasing the amount as the temperature rises. A too close atmosphere induces a weak flabby growth, which will flag and droop over the pots upon the first sunny day, and it also favours the attacks of green-fly. Another point is to so order the re-potting that the plants are kept steadily progressing, neither performing those operations too soon, which would result in the plants being over-potted ultimately, nor delaying them too long, which would entail the loss of the bottom leaves, and cause the plants to throw up their flower-stems prematurely. A suitable compost for herbaceous Calceolarias may consist of three parts loam and one part leaf-soil, or rotten hot-bed or Mushroom-bed manure, together with sufficient sand to keep the soil sweet and open. If large plants are required, the first main flower-stem may be pinched out as soon as it appears, and the plants potted into pots a size larger; a larger number of flower-stems will then be produced, and the result will be a much finer head of bloom. If the plants have been strongly grown, a 7 or 8-inch pot will not be too large for the final shift, but good decorative plants may be grown in 6-inch pots. A sharp outlook should be kept for green-fly in its favourite hiding-place, the under-side of the bottom leaves. At this time of the year they are few in number, and may be dealt with by the finger and thumb; but if undetected, they remain until the warmer weather arrives, when they increase in number with marvellous rapidity, and it is then a difficult matter to thoroughly eradicate them on account of a way they have of taking up their quarters in the interior of the pouch-like flower.

Bulbs and Flowering Shrubs in Pots.—Introduce batches of these into heat as may be required. The forcing must be gradual to produce the best results, and all bulbs should be brought forward in an intermediate temperature before being introduced into the forcing-house. Rhododendrons, Ghent Azaleas, Lilac, Staphylea colchica, Spiræa arguta, Deutzia gracilis, Gueldres Rose, Hydrangea paniculata, Kalmias, &c., may be placed in a vinery or Peach-house which is being started, where the gradually-increasing temperature and moist atmosphere will meet their requirements perfectly.

Gesnera exoniensis.—Few winter-flowering plants are more easily grown or more effective than the above. The velvety foliage alone is beautiful, covered, as it is, with shining red hairs, and when to this is added the strong trusses of rich orange-red flowers, the whole effect is very striking, and this is particularly the case under artificial light. The flower-spike lengthens out and produces a succession of flowers over a considerable time. Plants that are now coming into flower may be assisted by occasional applications of weak liquid-manure, bearing in mind that an overdose would injure the fine hair-like roots.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Preparations for Forcing.—It will be necessary to hurry the completion of preparations for forcing early Carrot, Potatos, Seakale, &c. Get together sufficient leaves and manure, and turn them over twice or thrice, mixing them thoroughly together before making up the hot-beds. Have the brick-work of the pits well cleaned, and give it a good lime-washing. If the brickwork needs any pointing, this should be effected before the lime-washing is commenced. Clean the glass and the woodwork with a view to destroy any insects there harboured, and to facilitate the admittance of light to the young plants. In making hot-beds, aim to secure a mild lasting heat, and ram the materials very tightly together, especially in the corners and along the sides. Do not plant the tubers or sow the seed before you have ascertained the exact heat, which at the surface should not exceed 75°. The soil for most purposes should be light and moderately rich. It must not be thought that any old previously-used potting-soil is sufficiently good for early vegetables. A sweet fresh compost is the best, and this may be used again for another batch of plants following the early vegetables.

Asparagus.—Batches of roots should be lifted at certain intervals, and placed closely together over a gentle heat. Cover them with soil or leaf-mould to the depth of 3 inches. Give a gentle watering with tepid water through a rose-can, and keep the frame moderately close for a few days. Do not, however, force this vegetable severely. The grass should be ready for use in about twenty days. A temperature of 60° will be ample, as when the young heads are well above the soil the flavour will be greatly improved and the colour better if a little fresh air be admitted daily.

Seakale.—If pots have been over the Seakale crowns and covered to a reasonable depth with prepared fermenting material, it will be necessary to see that the heat does not become excessive, or the young stalks will be so spindly as to be of little use. All crowns it is intended to force in their permanent quarters should be cleaned at once and then covered with leaf-mould or ashes, the material first named is the better of the two. Seakale commences to grow naturally very early in the spring, and if the crowns be not kept dark from the very first they will fail to bleach. Those crowns that are to be lifted for forcing in tubs and pots, or under the lower stage in a Mushroom-house, may be removed at once and kept in the dark until such time as they are required. Retain the straight young roots (thongs), and tie them in bundles for making fresh plantations. Cut the upper end of each straight across, but the lower end in a slanting direction, that the planter may know how to set each piece at the time of planting. Young pieces, about 6 inches in length, with or without crowns, will be found suitable.

THE HARDY FRUIT GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

Pruning. — Where not already finished, the pruning of the Apple, Pear, Plum, Apricot, and Sweet Cherry trees should be finished without delay. This remark applies to wall-trees as well as to those standing in the open quarters and orchards. Where the usual summer-pruning was carried out, but little further will remain to be done. Bush or pyramidal Pears and Apples should have the leading shoots shortened more or less, according to their strength, weakly growths being cut back to one or two eyes, and strong ones left almost at their full length. If the leading branches are too numerous and crowded to allow of light reaching the inner portions of the crown, the worst placed of them should be sawn off close or within half an inch of the main stem of the tree, smoothing the cut surfaces afterwards with a knife, and painting with a mixture of Stockholm-tar and clay in about equal proportions.

Morello Cherries, and Peaches and Nectarines may be taken last in regard to pruning and nailing; and where labour is not stinted, the two last may be taken down from the walls and made secure to stakes placed about 1 foot distant therefrom, with a view to retarding the bloom. The trees may be left in this position until the buds are on the point of expanding.

Gooseberries and Currants should also be pruned forthwith, especially where birds do not devour the buds. With Gooseberries, little spurring back is really necessary to ensure heavy crops of fruit if the bushes are strong and healthy. My method of late years has been to thin out the main branches, cutting out annually the oldest and worst placed ones, and allowing sufficient space to pass the hand through the bushes in gathering the fruits. A few of the longest shoots are topped; in this manner the pruning takes less time, and very heavy crops are obtained. Much the same kind of practice may be followed with Red and Black Currants, although the former are cut in rather more severely than Gooseberries, the side-growths being spurred back to two or three eyes, and the leading ones shortened to about half their length. The larger branches are thinned out annually, and strong young ones afforded space. With Black Currants, thinning is all that is necessary, strong young growths from the base being encouraged. In gardens where bullfinches abound, it is a difficult matter to preserve the buds of the Gooseberry and Plum, and after trying the spraying of the bushes with lime, soot, and other mixtures, including paraffin and Quassia decoctions, I find there is nothing to equal the gun loaded with dust-shot and half a charge of powder. An old-fashioned plan sometimes practised for preserving Gooseberry-buds from birds is to tie the bushes into compact masses by passing string or a green band round each, and drawing the branches tightly together, and allow them to remain thus tied up till the buds are bursting. Cuttings of Gooseberries, Red and Black Currants, should be selected now, if it be desired to increase the stock of plants. Healthy shoots, about 15 inches in length, should be chosen, and for Gooseberries and Red Currants all the lower buds should be cut clean out, leaving only four or five at the top. No buds should be removed from Black Currant cuttings, a succession of growths from the base being desired. These cuttings may be laid in temporarily, or, if the land is ready, and the weather suitable, they may be planted forthwith in rows 12 inches apart, and 6 inches asunder from cutting to cutting.

Grafting.—Preparations may be made for this operation, at least in so far as relates to taking the shoots of varieties to be substituted for others less worthy, and heading-back such trees as are to be grafted. The heading-back may consist of leaving 6 to 12 inches beyond the point to which they will be cut when grafted. The shoots for forming grafts should be selected from quite healthy trees, and be tied together in small bundles, labelled, and the butt ends buried a few inches in the soil in a cool place.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

Early Strawberries.—Assuming that the earliest batch of plants were placed in a cool house in the beginning of last month, these will now be showing signs of activity, and requiring their removal to another structure in which slightly higher temperatures are maintained. They need all the light possible, and if stood on shelves, these are better lined with wood-moss or freshly-cut turves, the grassy side of which should be turned downwards. As the plants advance into bloom, let all expanded flowers be fertilised by hand, doing this every morning when the blossoms are quite dry, and the pollen easily detached with a camel's-hair pencil. Unless this operation be carefully and regularly attended to, perfect berries are unobtainable. Once the flowers are set, the plants may be pushed on briskly in a Melon or Cucumber-house or in the Pine-stove. A dressing of artificial manure applied once a week will stimulate growth in berry and leaf, similar results being obtained from alternate applications of diluted farm-yard manure.

Successional batches.—A larger batch of plants may now be brought indoors to succeed that already started. Before the plants are placed in warmth, the dead leaves and upper-crust of soil should be removed, the latter being replaced with loam, leaf-mould, a pinch of potash, and a table-spoonful of bone-meal per plant. After a time the weekly surface sprinkling of artificial manure may be repeated as for the earlier batch. Royal Sovereign is one of the best early varieties for present forcing, and any newly-started vinery and Peach-house will furnish just the right kind of conditions for successions until the shelves become shaded with the foliage of the Vines, &c. A constant danger with Strawberry plants in vineries and peacheries, is the spreading of red-spider from the former to the Vines and Peach-trees. Before Strawberry plants are placed in such structures, the under-sides of the leaves should be coated with flowers-of-sulphur, and the plants kept no longer in them than is necessary.

Melons.—A large sowing in variety may now be made in small pots filled with a sufficiently moist loamy soil to support the seed through the germinating period without the need of affording water. One good seed should be placed in the centre of each pot, or two if there is doubt about their germinating power, the weaker plant being drawn out. A brisk heat obtained either from a bed of tree-leaves and stable-manure, or from hot-water pipes, is necessary to ensure a satisfactory start.

Cucumbers.—What has been advanced with respect to Melons, applies also to the Cucumber, excepting that the compost used in filling up the seed-pots should contain a good proportion of leaf-mould, cocoa-nut fibre refuse, and sharp sand. Earlier-raised plants may be re-potted and returned to the same frame or house in which they were raised. In re-potting, the roots should be most carefully handled, and the soil and the pots should be made as warm as the bed out of which the plants have come, any check arising from neglect of this precaution being very slowly recovered from at this season. Soils, decayed manure, and leaf-mould for future potting or making of beds ought, if not already done, to be brought under cover.

The Second Early Vinery.—If red-spider, mealy-bug, or mildew caused trouble last year, the Vines should be dressed with tar and clay, the best known remedy to use against mealy-bug. This dressing should be brought to the consistency of thin paint, and be applied with a half-worn-out paint-brush to every part excepting the buds. Sulphide of potassium or sulphate of iron are antidotes for mildew and red-spider if used at a strength of half-an-ounce to 1 gallon of warm water. This should be brushed into every crevice after the house has been thoroughly scrubbed down, the walls lime-washed, and the upper-crust of the inner borders cleared off.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Treatment of the Houses during Fog.—The characteristics of fog vary according to the districts in which it occurs, those in the country far removed from the Metropolis and large manufacturing towns being more beneficial to certain classes of Orchids than hurtful, and therefore fog of this kind need not concern us; but the one, more particularly known as the "London" fog, a compound of ordinary mist or vapour in which the injurious gases evolved from coal-smoke are mixed, is that which has so many terrors for the cultivator of Orchids. Its action is baneful in two directions, first, it banishes daylight at a season usually when sunlight is of short duration; and secondly, the sulphurous acid present in it spoil the plants, and ruins the expanded and opening flowers, and sometimes the prospects of the future. To mitigate the evils of a smoke-laden fog, there are a few simple precautions which, if taken in time, allow of Orchids coming through the foggy season without much loss of flowers and buds, or other injury to the plants. The plants should be kept at such times more dry than wet, the atmosphere also should be fairly dry, and to this end damping operations should be practiced as little as may be desirable, so long as the plants do not suffer in health. The temperatures of the various houses should be kept just above the minimum during the daytime, and if anything a trifle below it at night. Of course, the grower cannot always know when fog is coming on, and he cannot, therefore, be quite prepared for it. As instance, it may follow a sunny day, which may have been taken advantage of to afford water to the plants, and damp down a little more than usual. In such a case a higher temperature is necessary in order to get rid of the moisture present in the air of the houses. It need hardly be said that no air should be admitted by the ventilators whilst a thick fog covers the district.

The Cattleya-fly and its Grub.—One often hears accounts from orchidists of the ravages wrought by this exotic insect, Isosoma orchidearum (fig. 7), and those who have not yet made its acquaintance, are always interested to learn what it is like, and what it does, and how its presence is made known. So far as my observations go, the fly is a pale yellow-coloured insect, with transparent wings, almost an eight of an inch long. In the fly state it does no actual harm, excepting that it deposits its eggs on the growing mucilaginous tip of the root, which in time become embedded in it, and as the grub develops, a globular swelling is produced. To all appearances these swellings do not arrest the growth of the roots, for in many instances I have picked five grubs from one protuberance, and the growing part of the root has remained healthy. At first I used to remove the roots on which eggs were laid, doing thereby probably more harm than the grub; but now I let them alone until the growing-point has got a few inches beyond the affected part, and then carefully pick out the grubs with a knife-point, and thus, in most cases, save the roots from destruction. The most harm is done when the eggs are laid in the bud, which would, in the ordinary manner, develop into a rhizome and pseudo-bulb. Its presence here is detected by an abnormally strong break, the bud becoming two or three times the size of that it should have, and if allowed to remain, it would seldom extend beyond the bract stage, the leafy portions becoming quite crippled. The remedy for this is to carefully remove the affected growth, so that the plant may exert its energies in building up the secondary bud which may exist upon it. Although I have had, I might say, hundreds of roots attacked during the past season, there has only been one growth affected as described above. Now that there is no pressure of work, the occupants of the Cattleya-house should be examined with a view to exterminate the grubs. Frequent light fumigations all through the year, with XL-All is a good means of keeping it under by destroying the fly.

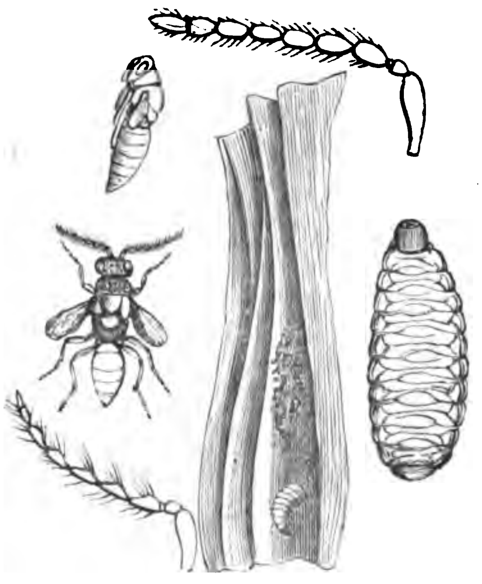

FIG. 7.—ISOSOMA ORCHIDEARUM, OR CATTLEYA-FLY.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

The Home Nursery.—All who have much planting to do know full well the advantage of having trees and shrubs growing on the estate, either to plant new shrubberies, &c., or to take the place of those that may have become sickly or have died. Those who contemplate making this useful accessory to a gentleman's place, should select a piece of ground of good quality, fully exposed to the sun, protected from the cold north and easterly winds, and securely fenced against hares and rabbits. The land should be well drained—artificially if not naturally, and be trenched throughout, adding accordingly to the richness of the soil, burnt ashes, leaf-mould, and manure. A good stock of Hollies, Berberis, Aucubas, Laurels, Phillyreas, Yews, Cotoneasters, Privets, Lilacs, Laburnums, Cratægus, Viburnums, Spiræas, Weigelas, and Box in varieties should be secured in young examples, these forming the groundwork of most sorts of ornamental planting. Plants ranging from 1 to 2 feet are the best size to plant in a nursery, and these should be planted in rows sufficient distant apart to allow men to pass between them in cleaning the ground, &c. Let the best part of the ground be selected for planting the choicer Conifers, viz., those with glaucous, yellow and white variegation, and those of handsome aspect. In planting afford sufficient space from plant to plant to allow light to reach them on all sides and give uniform growth, and allow of sufficient soil coming away with the roots when lifted.

The Reserve Garden.—At this season let a piece of open ground be prepared for parting and planting such plants as will be needed for furnishing cut-blooms, and thus save the specimens growing in ornamental grounds and beds from disfigurement. Such plants as perennial Asters, Iris, Pæonies, Oriental Poppies, also annual species of Phloxes, Sweet Peas, Delphiniums, Eryngiums, Cimicifuga, Bocconia cordata, Gypsophila, Statice latifolia, Gaillardias, Campanulas, Solomon's Seal, Helianthus and Erigeron, these are easily grown, and effective when cut and put up with their own foliage.

Trees with Coloured Bark.—Nothing brightens up the landscape so much in the winter as the beautiful bark of trees and shrubs, and though there are many, such as the Japanese Wineberry, several of the Spiræas, Roses, and Limes, none can equal in brilliancy the bark of the Cardinal and Yellow Willows, and the varieties of Dogwood—Cornus sibirica and C. stolonifera, syn. alba. The Willows are known under the names of Salix cardinalis and S. rubra, red-twigged; and S. vitellina of a yellow hue. These can be grown into large trees, and are most effective when planted amongst the Conifers as pollard trees by the side of streams and ponds, and as bushes in the pleasure-ground. They prefer a deep, not too rich, soil, and one that is thoroughly drained. The pollarded trees should be cut back every five, and the bushes every third year; propagate these by dibbing in stout pieces about 18 inches long, dibbed in nursery. Well watered in spring, they soon take root, and grow into bushes and trees. The Birches should not be forgotten, nor Acer pennsylvanicum (striatum), the Canada Poplar, the Tulip-tree, Gymnocladus canadensis, and Bignonias (Catalpas). Of Dogwood, the two varieties Cornus sibirica and C. stolonifera are best planted in clumps and masses. They require to be pruned back once in three years. It is the young wood that produces the fine-coloured bark; C. sibirica has bark the colour of red sealing-wax; select a position in planting facing west, as it is apt to have the young shoots damaged by spring frosts. Propagation of this can only be by layering, and the best month for this is September. C. stolonifera (syn. alba) is much hardier, can be grown either on outside of copse or woodland. The bark of this resembles the colour of Henri Jacoby Pelargonium; in planting, select positions where the sun can shine upon them. This variety can be propagated as easily as Privit: cut up in pieces 1 foot long, plant in rows; they will be fit to transplant in the second year. They do not like a too retentive soil, neither will they stand drought. The wood of this makes pot-baskets, and can be used as withies for tying bundles.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER.**

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Jan. 14	Royal Botanic Society Meet.
MONDAY,	Jan. 16	National Chrysanthemum Society Executive Committee Meet. Shirley Gardeners' Improvement Society Meet.
TUESDAY,	Jan. 17	Loughborough Gardeners' Improvement Society Meet.
WEDNESDAY,	Jan. 18	Renfrewshire Gardeners Meet.
THURSDAY,	Jan. 19	Linnean Society Meet. Gardeners' Royal Benevolent Institution: Annual Meeting, and Election of Pensioners, at "Simpson's," Strand, London.

SALES.

MONDAY,	Jan. 16	Roses, Lilies, Hardy Perennials, &c., at Protheroe & Morris, Rooms.
TUESDAY,	Jan. 17	Hardy Border Plants and Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	Jan. 18	Japanese Lilies, Palm Seeds, Continental Plants, Greenhouse Plants, Roses, Shrubs, &c., at Protheroe & Morris' Rooms.
THURSDAY,	Jan. 19	Carnations, Spiræas, Iris, Roses, &c., at Protheroe & Morris' Rooms.
FRIDAY,	Jan. 20	Hardy Climbers, Hardy Border Plants, and Bulbs, at Protheroe & Morris' Rooms. Imported and Established Orchids' at Protheroe & Morris' Rooms.

Average Temperature for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—36·9°.

Actual Temperatures:—

London.—*January* 11 (6 p.m.): Max., 44°; Min., 36°.

Provinces.—*January* 11 (6 p.m.): Max., 44°, Cromer; Min., 38°, York.

The Physic Garden at Chelsea.

Frequent mention has of late been made in the daily papers of the Physic Garden of the Society of Apothecaries, at Chelsea, long under the curatorship of the late Mr. Thomas Moore. The history of this interesting relic has been given repeatedly in our columns, with illustrations of its principal features. Of late years it has fallen into decadence, and the Society of Apothecaries became desirous of being relieved of what had become a burden to it, the more so as in virtue of comparatively recent legislation, botany no longer forms part of the curriculum and study demanded of medical students.

The Charity Commissioners, to whom the Society applied, have framed a scheme for the administration of the garden, which consists of 3½ acres, established by Sir Hans Sloane by an indenture dated February 28, 1721-22, with the curator's residence and other buildings, a yearly sum not exceeding eight hundred pounds for maintenance payable out of the income of the City Parochial Foundation (as set up by the Acts of 1883 and 1897), a yearly sum of not less than one hundred and fifty pounds out of moneys voted by Parliament, and the subsidiary gifts of John Meeres (1726) and Mrs. Ann Rand (1757).

The garden is to be maintained for promoting the study of botany, with special regard to the requirements of (*a*) general education; (*b*) scientific instruction and research in systematical botany and vegetable physiology; and (*c*) instruction in technical pharmacology, as it concerns the culture of medicinal plants. The scheme provides for the erection of new offices, lecture rooms, and a physiological laboratory, the appointments of a curator and a head gardener, the establishment of lectures upon botany, and the maintenance of collections of living plants for teaching purposes. The students and professorial staff of the Royal College of Science are to be accorded free admission into the garden, with use of the collections, lecture-rooms, and appliances, so long as the sum of £150, or more, shall be paid in that behalf to the Trustees of London Parochial Charities, as trustees of the re-modelled charity. The committee of management is to consist of fifteen persons, nominated by the London Parochial Charities' Trustees (eight), the Treasury, Royal Society, Society of Apothecaries, Pharmaceutical Society of Great Britain, and other public bodies (one apiece). The trustees are empowered to contribute a sum, as yet undetermined, for the equipment of the garden and for new buildings.

We are specially pleased to see that scientific instruction and research in systematic botany and vegetable physiology are to be provided. Thirty or forty years ago vegetable physiology was at a very low ebb indeed in this country. Histology, or the investigation of the minute anatomy of plants by means of the microscope, was in arrears in comparison with its condition in other countries; and the natural history of the so-called flowerless plants was scarcely studied here at all. We are not going to contrast the present state of things with the past further than to say, that the pendulum has swung to the full in the opposite direction, and that systematic botany is now-a-days, in spite of its great importance, scarcely studied at all. Without in the slightest degree derogating from the other departments of the science in which such great progress has been made, we may lament the little attention now paid to the knowledge of plants in general, and of their affinities and uses. Now-a-days the student gets to know about parenchyma and sclerenchyma, centrosomes and mitoses, when he is unable it may be to recognise the botanical differences between the flower of a Cabbage and that of a Cucumber.

The medical profession till lately furnished the great majority of our botanists. They took service in India and the Colonies, took part in exploring expeditions, and they contributed enormously to our knowledge of the botany of the globe. It is to be feared that the medical men of the future will not be so well equipped for this purpose as their predecessors were, and that systematic and economic botany will suffer proportionately. The matter is also of much consequence to horticulturists, who are expected to be familiar to some extent with the leading Natural Orders of plants, their relationships, points of difference, and economic uses. It is to be hoped, then, that the old Chelsea garden will not be given up wholly to microtomes and staining agents, but that the old traditions will be kept up in the shape of practical instruction in systematic botany.

There are still some among us who recall with pleasure and gratitude the lectures given in the garden by the late Dr. Lindley. Attendance on those lectures involved a long walk from the centre of London in the early morning before steamboats or omnibuses were running. On arrival at Chelsea about half-past 8, the students found the Professor prepared to give a lecture analogous to the "clinical" lectures the pupils were accustomed to in the hospitals. Just as the physician took for the subject of his comments and explanations any cases that might be under observation in the wards at that time, so Dr. Lindley availed himself of any plant of interest that might be in bloom in the garden. With the aid of the blackboard, he explained its structure, showed wherein it differed from its neighbours, pointed out its relationships, near or remote, and indicated its use for medical or other practical purposes. It may be imagined how fresh and interesting these lectures were in contrast to the stereotyped courses given in the college lecture-rooms, which were, for the most part, a mere hash-up of the information given in the text-books. Of late years Mr. J. G. Baker delivered set courses of lectures in the same garden, which were much appreciated. We earnestly hope that in the rejuvenated Physic-garden means will be taken to provide adequate instruction in systematic and morphological botany, in their relation to economic uses.

Arundinaria Falconeri *syn.* **Thamnocalamus Falconeri.**—We afford our readers an illustration (fig. 8) of a clump of Arundinaria Falconeri, about 20 feet high, growing in the gardens of J. J. Rashleigh, Esq., Menabilly, Cornwall. This species of Bamboo is tall and very beautiful, and in favoured spots in these islands it grows to a good height, but dwindles to 8 feet and less where frost cuts it down to the roots, and finally disappears. This appears to be Mr. Freeman-Mitford's experience in the Midlands. The culms are slender in proportion to their height, and both stems and foliage are of a brilliant green, and the internodes are covered with a white waxy bloom. The leaves are about 4 inches long, narrow, pointed with striæ on the upper surface, and inconspicuous transverse veins on the lower surface. The edges of the leaves are slightly serrated.

Linnean Society.—An evening meeting will be held on Thursday, January 19, 1899, at 8 p.m., when the following papers will be read:—I. "New Peridiniaceæ from the Atlantic," by Mr. G. R. Murray, F.R.S., F.L.S., and Miss F. G. Whitting. II. "On the Structure of Lepidostrobus," by Mr. Arthur J. Maslen. III. "Some Observations on the Caudal Diplospondyly of Sharks," by Dr. W. G. Ridewood, F.L.S.

Gardeners' Royal Benevolent Institution.—We remind our readers that the sixtieth Annual General Meeting and Election of Pensioners of this Institution will take place at "Simpson's," 101, Strand, London, on Thursday, January 19, at 3 p.m.; and that the usual annual friendly supper of members and friends will be held at the same place and on the same date at 6 p.m., when Mr. George Monro, of Covent Garden, member of the Committee of Management, will preside. Any friends who desire to be present, and have not intimated their desire to the Secretary, should do so on or before Monday, January 16, at the offices, 175, Victoria Street, London, S.W.

"The Rosarians' Year-Book."—One of the pleasantest annuals that "awakens, blossoms, ripens, and sleeps," till the time comes round for its successor to appear, is the *Rosarians' Year-Book*

(Bemrose & Sons, 23, Old Bailey). Twenty years have elapsed since first the little book appeared, so that the series constitutes a valuable historical document. The present issue opens with a good portrait and a biographical sketch of Mr. R. Harkness. The prowess of the Messrs. Harkness, father and sons, has been not a little remarkable, as evidenced by the record of Challenge Trophies, and other prizes secured by them since 1887. Whether at Bedale in Yorkshire, or in the Home Counties at Hitchin, success waits upon them; and it is clear this success is mainly due to the personal element. A cheery article is that of the Rev. A. Foster-Melliar, detailing his experiences as an exhibitor:—"I think," says Mr. Foster-Melliar, "I think when anyone has a really extra-fine and perfect bloom, something quite out of the common, that he really ought to have it photographed." We share that opinion; and we go further and say, that the possessor ought really to send a copy to the gardening journals, that the representation of a "standard or model flower may be set before the lieges." Is it heretical to suggest further, that some "shocking examples" should also be photographed, not for the encouragement of others, but to contribute to the history of the Rose? What opportunities for advancing knowledge are wantonly thrown away, as if the acquirement and diffusion of knowledge were not a much finer thing than the winning of a prize! No exhibitor will admit this, we are sure. Dr. Shackleton gives a list of Roses which he has found to succeed in the outer suburbs of London. Mr. Mawley, as usual, contributes a valuable paper on the relation of the climate of the Rose-year to the growth and quality of the Roses.

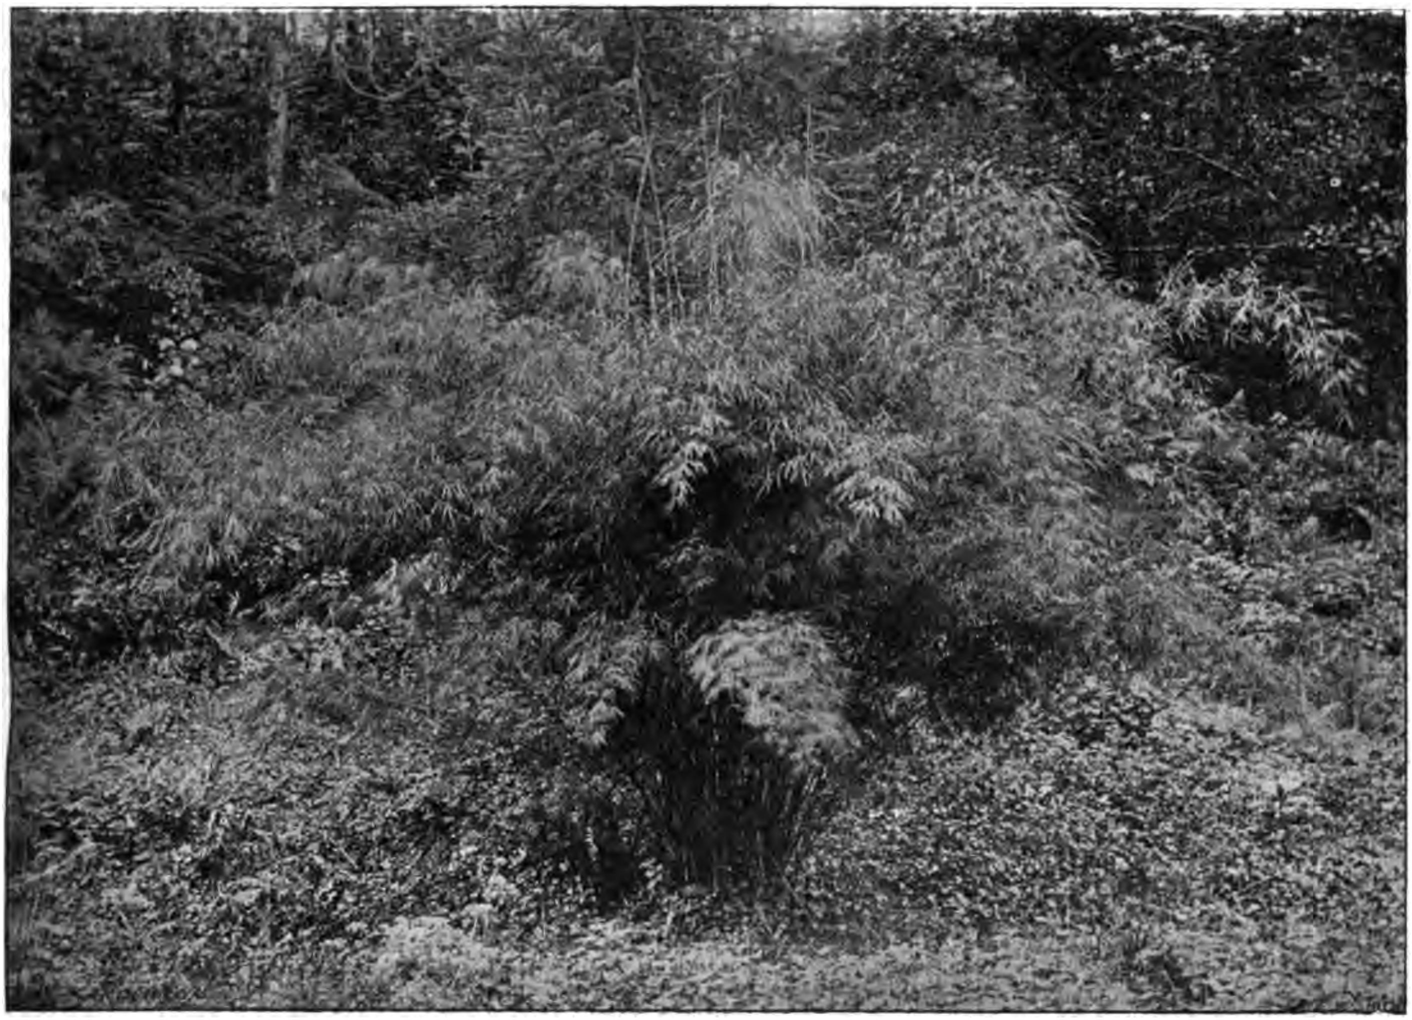

Fig. 8.—Arundinaria falconeri (height 15 feet), from the garden of J. J. Rashleigh, Esq., Menabilly. (See p. 24.)

The Rev. C. Wolley Dod.—The last volume of the *Garden* is dedicated to this gentleman, of whom an excellent portrait is given.

"Florilegium Haarlemense."—The last number of this publication, devoted to the illustration of the best and most widely-known bulbous plants, contains coloured figures of the following:—Hyacinth Mont Blanc, single white, whose history is not known. Tulips: 1, Joost van der Vondel, crimson; 2, Joost van der Vondel, white; of these single early Tulips the history is not recorded. Iris hispanica: 1, Blanche superbe, best white; 2, Chrysolora, light yellow; 3, Sappho, purplish, with yellow falls; 4, Coquette des blanches, soft lilac. The typical blue species grows wild in Spain; the yellow variety in Portugal.

Decease of H.H. the Maharaja of Darbhanga.—One of our Indian correspondents writes us as follows: "Doubtless many readers of the *Gardeners' Chronicle*, and especially those who have been in any way connected with India, will regret to hear of the death, which occurred on the 17th ult., of His Highness the Maharaja of Darbhanga. Maharaja Sir Lachmeswar Singh, Bahadur, was well known throughout the Indian Empire for his knowledge and benevolence. During the recent famine he did much to alleviate the suffering of the distressed, by providing relief works for the unemployed, and by giving additional pay to his numerous *employés* all through the famine period. He took a great interest in agriculture and horticulture. His famous garden at Durbungah contains a choice collection of plants, and an unrivalled collection of Mangoes and other fruit-trees."

The Botanical Magazine.—The plates issued for the present month include representations of the following plants:—

Acalypha hispida, Burmann, t. 7632.—This is the very remarkable and ornamental plant described in our columns in 1896 as A. Sanderi, which name we expect it will still bear in gardens. It appears that A. hispida has not until now been met with in a wild state, the plant figured and described in old books relating to Malayan botany being cultivated only. Messrs. Sander & Co. received their plants from the islands of the Bismarck Archipelago, where it was found by Micholitz. At present only the female plant is in cultivation, and its long, pendulous, crimson spikes are produced throughout the entire year. It is probable that when the male plant is introduced and pollination is effected, that the duration of the brilliant colour will be limited by the production of fruit and seed.

Lewisia Tweedyi, B. Robinson, t. 7633.—A remarkable Portulaccad from the mountains of Washington State, where it grows at an elevation of 6,000 to 7,000 feet. The plant is of tufted habit, with numerous stalked, ovate, oblong, somewhat fleshy, glabrous leaves, from the axils of which proceed flower-stalks exceeding the leaves in length, and each bearing one or two 8-petalled flowers, each about 3 inches in diameter, with the bell-shaped or spreading corolla of a pale yellow colour, passing into bright pink at the tips and margins. It flowered in the Alpine-house at the Royal Gardens.

Lilium rubellum, Baker, t. 7634.—This is the beautiful Lily introduced into commerce by Messrs. Wallace, of Colchester, and described by Mr. Baker in our columns—1898, p. 321, fig. 128.

Gaultheria trichophylla, Royle, t. 7635.—A pretty little rock-plant, native of W. China, and of the Himalayas. It is a low-growing evergreen shrub, with small ovate bristle-margined leaves, and small pink bell-shaped flowers. Introduced to Kew by the Hon. Charles Ellis, of Frensham Hall, Haslemere.

Meconopsis heterophylla, Bentham, t. 7636.—An ally of the Cambrian Poppy, Meconopsis cambrica, the sole European species, as the present plant is the sole American representative of a genus which has many species in the Himalaya mountains, and in Western China. M. heterophylla was originally discovered by Douglas in California. The leaves are deeply cut, and the flowers of an orange-red colour, with a purplish zone in the centre.

The San José Scale.—At the last meeting of the Berlin Horticultural Society, Professor Frank read a paper of great interest on the "San José Scale and its allies." Professor Frank said that zoologists have an idea that the Aspidiotus conchæformis, which is widely dispersed in Europe, is but a geographic form of the American Aspidiotus perniciosus. To decide this question, Professor Frank made a special journey last summer to those countries which have a similar climate to that of those American regions where the San José scale makes the greatest devastation, viz., to Tirol, especially to the valley of the river Etsch and Eisark, and also to South Baden. The result of these investigations was to establish the fact that there is not the slightest difference between the Aspidiotus conchæformis of Meran, Botzen, &c., and that of Eastern Prussia. So this is a true species, and different from the American one. Besides this, Professor Frank gave particulars respecting the reproduction of the scale-insect. He found that Aspidiotus conchæformis and ostreæformis have but one generation yearly, and that one female has a progeny of thirty-five to fifty descendants. American writers say that the San José scale has three generations yearly, and that each female breeds about 600 young scales. To examine into this remarkable difference, Professor Frank received at three different times, in the spring, at the end of June, and in the autumn, twigs of Peach directly from America, densely beset with the true San José scale. Investigation showed that on the twigs sent in spring there were numerous females and males, as also young chrysalids in different states of development. On the twigs in June the adult males were absolutely lacking, also the adult females, only young scales in great quantity were present. On the twigs in autumn there were again females and males, and young chrysalids. From this Professor Frank concludes that the San José scale has also but one generation yearly. Besides this, he investigated the females, and found, not 600, but about thirty ovules and young in them, a number which is in accordance with that found in the European scales. His decision, therefore, is that the American theory is an erroneous one. It is questionable whether the San José scale can live in Europe at all. *Dr. Udo Dammer, Grosse Lichterfelde.*

Roman Hyacinth.—Mr. G. H. Griffin, of the Seymour Nurseries, Anerley, kindly sends us a bulb of Roman Hyacinth with no fewer than eight spikes of bloom. The plant has been greatly admired, but we are not sure that this proliferous tendency is to be encouraged, inasmuch as the additional number of spikes is due to premature or precocious development of flower-stems, which should not have been produced till another year.

Stock-taking: December.—Month by month we have given the Board of Trade statistics concerning foreign and colonial trade, so far as it has been in the least connected with horticulture. To-day we have to record the fact that the imports for the month of December exceed those for the same period in the preceding year by £3,998,072—that is to say, whilst the total value of imports for the last month in 1897 was £41,334,536, those for the twelfth month of 1898 footed up £45,332,608—a most satisfactory increment resulting. The only articles noted in the decrease column are in animals, living, for food, = £54,940; dutiable articles of food and drink, = £256,483; chemicals, &c., = £22,456; miscellaneous articles, = £17,789. Against a decrease in Wheat and flour there is an increase in Barley of £341,589; Indian Corn went up by £339,027; fresh beef added to its value by £135,361; hams, £43,942; butter went up £60,863; Hops increased by £196,519; the value of sugar imported went up by £222,397; Cocoa increased £26,316; Tea gave way by £63,728; and Coffee, £104,099; the article of tobacco shows a gain of £54,499. The following figures are culled from the summary table:—

Imports.	1897.	1898.	Difference.
	£	£	£
Total value ...	41,334,536	45,332,608	+3,998,072
(A.) Articles of food and drink—duty free	14,337,976	15,981,811	+1,643,835
(B.) Articles of food & drink—dutiable	2,621,073	2,364,590	−256,483
Raw materials for textile manufactures	8,257,787	9,593,105	+1,335,318
Raw materials for sundry industries and manufactures	3,797,752	4,090,759	+293,007
(A.) Miscellaneous articles	1,593,153	1,575,364	−17,789
(B.) Parcel Post ...	59,257	77,885	+18,628

The figures respecting fruits, roots, and vegetables show the following very interesting results:—

Imports.	1897.	1898.	Difference.
Fruits, raw:—			
Apples ... ... bush.	410,954	642,278	+231,324
Grapes ... ... "	1,634	13,805	+11,671
Lemons ... ... "	139,129	223,484	+84,355
Oranges ... ... "	1,816,013	2,231,712	+415,699
Pears ... ... "	11,892	18,951	+7,059
Plums ... ... "	604	338	−266
Unenumerated... "	78,827	80,520	+1,693
Onions ... ... "	435,079	494,379	+59,300
Potatos ... ... cwt.	472,867	75,354	−397,513
Vegetables, raw, unenumerated .. ... value.	£73,021	£124,601	+£51,580

The reader will be glad to know that the imports for the year show a value of £470,604,198 against £451,028,960 for 1897; an increase amounting to £19,575,238.

The Exports

for the last month foot up at £20,978,408, against £19,320,156 for the corresponding period in 1897—an increase of £1,658,252. The items of decrease are of £31,810 in articles of food and drink; metals and articles manufactured therefrom except machinery, £199,941; and in chemicals, &c., £20,560. The largest increase is one of £610,814 in yarns and textile fabrics; machinery and mill-work went up by £601,253; raw materials figured for £381,386. Orders can now be sent speedily from Khartoum to Manchester and Birmingham—goods from these centres, we are informed, are beginning to ornament the inhabitants of what was a desert but a few months since. Influential journals in St. Petersburg and Moscow are busily lamenting now that caravans with British and British-Indian goods are driving all the Russian wares from the markets of Central Asia; and doubtless Indian and English products will soon show up in the Philippines. The figures for 1898 prove that we exported therein to the value of £233,390,792—against £234,219,708 in 1897; a falling off to the tune of £828,916. We did hope, and expressed the hope once or twice, that the close of the year would show an equalisation of values, but this has not been the case.

Winter Aconites.—Some surprise has been expressed at the non-appearance of this welcome little winter flower this year. Will some reader who takes note of the date of flowering of this species kindly tell us on what day they first noticed its appearance.

Lady Louisa Fortescue.—The death of this lady at an advanced age took place at Torquay on the 9th inst. Her estate at Dropmore, near Maidenhead is well known for its fine collection of Conifers. The estate, we believe, passes to the only surviving son.

A Strike of Nursery Employés.—On Monday morning the *employés* of Messrs. Palmer & Co., Ltd., nurserymen, Annan, came out on strike for an advance of wages. The men were being paid 15s. per week, working ten hours per day in the summer, and eight in the winter, and they requested to be paid in future at the rate of 4*d*. per hour. At an interview with the employers on Monday morning an offer of 1*s*. per week rise was made; but this was refused, and the men remained idle all day. At night another interview took place, when an offer of 2*s*. rise was made provisionally, pending a meeting of the directors to be held this week. The men accepted the offer and resumed work next morning.

Interesting to Amateur Gardeners.—A unique law case was contested last month in South Australia. The plaintiff is an amateur gardener residing in Adelaide, and had planted a row of Pepper-trees (Schinus Molle) about 18 inches from the fence. As the trees grew, the owner trimmed the branches on one side, while his neighbour, the defendant, attended to the other. The roots of the Pepper-trees advanced as far as 60 feet into the defendant's nursery garden, and naturally proved troublesome by taking away plant-food from his trees and shrubs. A trench was dug along the fence, a quantity of coarse salt emptied in and filled up again, with the result that a number of the trees were killed. The owner sued for damage to his trees, and the defendant put in a counter-claim for damage of shrubs in his garden and nursery. The Chief Justice, before whom the case was tried, visited the spot and made careful examinations in the presence of lawyers and experts. and after expressing surprise that no case of the kind had ever arisen before in England or Australia, advised the parties to come together, his opinion being to the effect that—1. A man has a perfect right to plant trees close to his boundary, but if the limbs overhang the neighbour's property, the neighbour can cut off the overhanging part, or give the owner notice to do so. If he cuts off the branches, he must, if required, throw them into the owner's property. He has no right to them. 2. The same rule applies to the roots. The neighbour may dig a trench and cut the roots on his boundary, or he may call on the owner to prevent them from trespassing into his property; and if the roots are allowed to trespass, he can claim damages if any is done. But he must not apply any foreign substance to the soil, even in his own property, which will spread into the owner's land, or will be carried by the sap into the trees and so damage or kill them. The case thus resolved itself into this: The plaintiff was entitled to damages for the destruction of his trees. The defendant was entitled to damages to the amount of the loss he had sustained from trespass of the roots of the plaintiff's trees, and should the latter continue to allow the roots of his trees to trespass, the defendant could recover further damages. The parties conferred, and decided to stop proceedings, bear their own losses, and pay their own costs, and the plaintiff promised to remove the Pepper-trees.

IMPORTATION OF PLANTS INTO BULGARIA.—The importation of living plants, with the exception of Vines, is allowed from all districts and countries not infested with Phylloxera; still, the sanction of the Bulgarian Minister of Trade and Agriculture must first be obtained. The imports may enter only at the customs towns and ports of Tsaribrod, Sofia, Harmanly, Varna, Burgas and Rustchuk, and they must be accompanied in all cases with a statement from the country of origin that Phylloxera is not present. Such statement is also required with imported fruits and vegetables. The importation of Potatos and Onions, as well as all parts of Vines, is forbidden, whilst the through transit of these goods, if the permission of the Minister be obtained in advance, is allowed. All plants, with the exception of those in flower-pots, must be freed from the soil, and be bound in linen and packed in chests or baskets.

COLONIAL PUBLICATIONS.—We have received the following publications:—*Agricultural Gazette of New South Wales*, October, 1898, with articles on Indigenous Vegetable Drugs, J. H. Maiden; Chat about Wattles, J. H. Maiden; Insect and Fungus Diseases of Fruit-trees, and their Treatment, Messrs. Allen, Blunno, Froggatt & Guthrie; Orchard Notes, &c. — *Queensland Agricultural Journal*, November, 1898, with papers on Disease in Pine-apple Plants, G. F. Gerler; Contributions to the Flora of Queensland, and Plants reputed poisonous to Stock, by F. M. Bailey.—*Nova Scotia Provincial Government Crop Report*, November, 1898. The crops were favourable as regards hay and Wheat, in spite of heavy summer rains. The Potato harvest was poor, but the prices obtained were poor.—*Agricultural Resources of Nova Scotia*. B. W. Chipman. A valuable pamphlet, speaking briefly of the geographical conditions and climate of the colony, and of the value of its various districts for Wheat, hay, and fruit-culture. The necessary hint is conveyed that Nova Scotia is no ground for the pioneer, but is in a highly advanced state as regards civilisation, education, and customs generally.

PUBLICATIONS RECEIVED.—*Journal of the Board of Agriculture*, December, 1898. Contains papers relating to Grain harvest of 1898; Thinning of woods, J. Nisbet; English orchards; Consumption of Potatos in the United Kingdom, and allied subjects.—*Fruit Preservation* (Technical Education Committee, Kent County Council). An important "interim report," by Mr. W. P. Wright, upon experiments on the cold storage of fruit, conducted at the works of Messrs. J. & E. Hall, Dartford. — *Sonderabdruck aus Zeitschrift für Pflanzenkrankheiten*, Prof. Dr. Paul Sorauer.—*Botanisches Centralblatt*, No. 52, and the Index.—*Annales Agronomiques*, December 25, 1898.—*Revue de l'Horticulture Belge*, Jan. 1, 1899.

PLANT PORTRAITS.

BEAUMONTIA PURPUREA, Lindley, *Revue de l'Horticulture Belge*, January.

BESSERA ELEGANS, *Revue de l'Horticulture Belge*, January 1.

CATTLEYA LABIATA, new form, *Wiener Illustrierte Garten Zeitung*, t. 4, a form in which the segments are marked with white spots.

FUCHSIA, MONARCH, *Garden*, December 31.

INCARVILLEA GRANDIFLORA, *Revue Horticole*, January 1.

MILLA BIFLORA, *Revue de l'Horticulture Belge*, January 1.

NERINE UNDULATA, *Revue de l'Horticulture Belge*, January 1.

PÆONIES: MARGARET ATTWOOD, white; THE MIKADO, crimson. *Garden*, January 7.

HOME CORRESPONDENCE.

A WORD ABOUT MUSHROOMS.—Parts of our park have been down more than a hundred years, and not a Mushroom was to be found on it last autumn; another part was laid down about forty years ago, this portion produced a few, but other portions that were laid down ten years since, were white with them. The whole of the park is cut for hay and then fed by cows. One would have thought the older parts would produce most Mushrooms, but such does not appear to be the case. About two years ago I procured some spawn from a good firm of seedsmen, and put it over a little meadow in lumps, about a yard apart. I raised the turf about 2 inches deep to insert the spawn, and afterwards made it firm by treading. Not a Mushroom has appeared since. Can our Mushroom-experts explain these matters? *N. Kneller, Malshanger.*

OUT-OF-DOORS MUSHROOMS.—It may interest your readers to know that I have picked two good dishes of Mushrooms in the park at Newnham House this month, viz., on Thursday, the 5th inst., and to-day, the 9th, and have every prospect of another good dish in a few days, if the mild weather continues. I also picked several during December. *M. F., Newnham House, Wallingford.*

DECORATING FRUIT AND POINT-JUDGING.—I have been watching with interest the expressions of opinion on point-judging at the great Grape prize at Shrewsbury, &c., which have appeared in the *Gardeners' Chronicle*. Everyone who knows the energetic committee of that show may rest assured that they will appoint such men as judges who are capable of apportioning the points in the case of every bunch of Grapes adjudged; and I fear that the finest and best collection of Grapes will only be awarded a 2nd or 3rd place. I am not in favour of decorating a collection of Grapes or any other fruit, and the points allowed in the schedule for such decorations are not considered to be just by gardeners, and I fear that it will come to be a disputed and a vexed question, as these decorative articles may not be the property of, or may not have been grown by the exhibitor. What a disappointment it will be to a hard-working gardener who, after giving unremitting attention to his Vines for a period of twelve months, to find that his collection has lost the coveted grand prize by a few points in the matter of decoration. There is nothing to hinder an exhibitor, if he so chooses, employing a trained florist, male or female, in the decoration of his Grapes; how unfair, however, to the "practical," who despises such meretricious aids! This fashion of decorating a dessert-table may be new to the public, but I hope it will soon die a natural death. If decoration is to be continued, let it be done by the Society; or let a prize for decoration be given independently of that given to the fruit, or if done by the exhibitor let all plants, flowers, &c., be grown by him, the same as his fruit. *A. Kirk, Norwood Gardens, Alloa, N.B.*

LARGER EXHIBITS REQUIRED AT OUR FLOWER-SHOWS.—As an exhibitor of several years experience, I cannot agree with the suggestions of your correspondent "A. J. L., Wyfold Court," in the largely increased numbers constituting a dish of fruits or vegetables. Fifty pods of Beans or Peas would represent as much ability in their production as would twice the number, and the danger of such an extension furnishes ground for a decrease rather than an increase, either of quality or effective arrangement. Instead of advocating 1½ dozen, where dozens are now common, I would rather reduce the number to six, a provision that would not only ensure a greater, because more uniform effect, but an increased number of exhibitors. Three Cauliflowers, Celery, or Cabbages, make a neater exhibit than four or six, and are much more easily arranged. In the case of cooking Apples, I consider five fruits ample for a dish, nine or twelve are both awkward to arrange, and seldom look neat after they are staged. Six fruits each of Peaches, Apricots, Nectarines, Pears, and dessert Apples are quite enough, and a dozen Figs or Plums are ample. The compensation to the exhibitor in a proportioned increase of prize value is not likely to be taken serious account of by societies, the tendency more often being in the opposite direction. *W. S.*

CHRYSANTHEMUMS AS BUSH PLANTS.—Trade catalogues contain lists of decorative varieties of Chrysanthemums, but these only go to prove the little interest taken by the trade in catering for the wants of those who cultivate Chrysanthemums exclusively for home decoration. We are not satisfied to grow varieties whose only merit is that they produce a quantity of small flowers. The flowers will of necessity be less in size than show blooms, but we have no doubt as to where they appear to best advantage, e.g., on our bush plants. It is a matter of surprise that no large trade grower looks after the hundreds of fine varieties which, after a brief existence, are discarded, because they have failed under the "big-bloom" system to produce flowers according to the mop-head standard. Many such discarded sorts had they been allowed to grow more naturally would have produced six or eight fine flowers per plant, without "coarseness." Under the rational system we should hear less than we do about "coarse" blooms. With the object of assisting others who may be placed similarly to myself, I give a list of varieties which have been fully tested, and found to answer well under the bush-system of culture. It will be noted that a few well-known sorts are left out, such as Edith Tabor, the Viviand Morel family, Pallanza, Australian Gold, Colonel Smith, Pride of Madford, Madame Ad. Chatin, &c. These have not, for various reasons, been found to answer when grown as bush plants.

The new variety, R. Hooper Pearson, will, I believe, prove to be a most useful one for bush-culture. *A. Edwards.*

GRAPE JUDGING. — If your correspondent "Ayrshire Lad" will apply to the Royal Horticultural Society, 117, Victoria Street, Westminster, for a copy of the new code of judging rules—I think the price is small—he will find in it that Grapes in relation to their respective varietal exhibition values are dealt with. But the method adopted is simpler than is the more elaborate arrangement proposed by Mr. Ward recently. The Royal Horticultural Society's code simply places Muscat of Alexandria as the very best flavoured of all exhibition Grapes, one point maximum above all the rest, these being equal. Of course, in judging, the judges can, even with fixed maximums, vary the points both according to appearance and known quality, so that no matter what maximums may be, they really indicate relative merit of variety when first-rate, and they also indicate points beyond which, in making awards, the judges cannot go. What "Ayrshire Lad" asks for in the way of exposing publicly the judges' points in each case, is done at Shrewsbury fully, and it is there found to have great educational value. It has been too long subject for complaint that at shows, the grounds on which in important classes Awards are based, have not been published, and therefore have left both the competitors and public sometimes bewildered. It would involve no more trouble in pointing an important class for the judges to enter their point Awards on a card than in their note-books. Of course, all these great competitions so much depend on the capacity of the men engaged in making the Awards. Still further, it has often occurred to me that at great shows, to secure something like consistent judging, the judges should be invited to confer with each other beforehand, and settle satisfactorily their respective bases of judging similar exhibits. *A. D.*

ACALYPHA HISPIDA (SANDERIANA).—The persistency with which Acalypha hispida produces its long, cord-like inflorescences is one of the prime features of this extraordinary plant. I have just seen the group of plants Mr. J. Hudson exhibited at a meeting of the Royal Horticultural Society some weeks ago; a number of plants, and, excepting that some of the handsome drooping spikes are losing their freshness, none has been removed, and as the plants grow taller they produce fresh flower-spikes from every leaf-axil. It would thus appear that so long as the plant is kept in a growing state so long will the inflorescences be produced. Mr. Hudson speaks very highly of it as a house-plant;

he says that some of his plants were kept for nine days in the town house of Mr. Leopold de Rothschild in Hamilton Place, and when returned to him they did not appear to have suffered in any appreciable degree. Mr. Hudson's intention is to convert some of his strongest plants into standards. With this object in view, he will shortly behead some of them, give them a brief rest, and then start them into growth, so as to form branching heads. The capacities of the plant to stand this has, of course, to be proved, but it would appear there is ground to hope it will be abundantly realised. Mr. Hudson states, in reference to its cultivation, that it requires the warmth of a stove, seeing that it comes from the coast of New Guinea. He finds that a minimum night temperature of from 50° to 60°, and a day temperature of from 65° to 70° in winter, with a summer temperature of from 10° to 15° higher, suits it well. The plant requires plenty of light to develop its colour, with a light shading in summer. The plants at Gunnersbury House are in a low span-roofed house, and they are near the glass, where they obtain an abundance of sunshine, which appears to be necessary to its well-being. The plants should not be syringed overhead, otherwise the inflorescences become both disfigured and damaged. It is good practice to sponge the leaves occasionally to remove dust and insects, the under being sponged as well as the upper side. A suitable compost is one made up chiefly of turfy loam, with leaf-soil and sand, adding some peat if the loam is very heavy. The plant should not be over-potted, and when established it should be afforded plenty of water. As it appears to be a plant that roots freely, a stimulus in the form of a fertiliser is found of advantage, and Clay's Manure is in use at Gunnersbury House. Propagation is by means of cuttings and of "eyes." So far it does not appear to have produced seeds in this country, nor have its capabilities to form seeds been determined. [The male plant has not yet been introduced]. Mr. Hudson recommends the plant as a suitable one for filling vases in the decoration of rooms, and then only such plants as are well established. When used in rooms it should be placed so that light papers may form a background, and then by reason of its colour it shows up to advantage. *R. D.*

CLEANING TOMATO - SEED.—The method of cleaning Tomato-seed practised by "E. J." (see last volume of *Gardeners' Chronicle*, p. 444) seems rather a tedious process. A much quicker way, and one that I have practised for a number of years, and find to answer well, is to cut the fruit in half horizontally, squeeze out the seed with as little pulp as possible, or with some varieties pick it out with a knife-point or a pointed stick. The whole should then be put in a muslin bag, and the latter twisted up so as to get the contents into as small a space as possible. It must now be well rubbed between the fingers and thumb under water until the seed is well separated from the surrounding pulp. Much of the latter will be squeezed through the muslin during this process, and what remains may be easily removed by washing in water. The seed will then be quite clean. If "E. J." will give this method a trial, I think he will find it a quicker as well as a cleaner way than the one he follows. I described this method of cleaning Tomato-seed in the *Gardeners' Chronicle* of Oct. 17, 1887. This was my first venture of writing to this paper. Two correspondents criticised my article. "A. D." said it would, in the case of a quantity of fruits, prove rather tedious and worrying. No doubt "A. D." was quite right. I was writing only for those who, like myself, might wish to save a little seed for their own use. At the time I had a great desire to know who this writer was. This desire was gratified three or four years ago at the Shrewsbury show, where I was staying at the same hotel as this well-known writer, and was pleased to find that he remembered replying to my note. The other correspondent was Mr. S. Castle, then of West Lynn, who disapproved of washing Tomato-seed in water, and said: "I venture to say my Tomato-seed, some of which is several years old, has more germinating power than this season's washed seed." This sentence is followed by a note of interrogation. Further on he writes: "I should be sorry to clean any Tomato-seed by the water plan; in fact, I can see no need of it, the seed saved by me being white or light brown, and good." In reply, I asked Mr. Castle if he would kindly say what injurious effect the water had upon the seed, and if the same rule held good with the washing of Melon and Cucumber-seed? As far as I remember, he did not reply. I do not think washing has any injurious effect upon seed. If any reader of the *Gardeners' Chronicle* thinks or knows differently, perhaps he will kindly record his experience. *J. S. Upex, Wigganthorpe Garden, York.*

SULPHURING OF VINES.—The following is the method that I have seen used by others, and have used in our vineries without injury being done to the Vines. By its use red-spider and mildew are checked. Having a small glass lamp, nearly fill it with methylated spirit; put a stand over the lamp, and get a tin (a small cake-tin would do), taking care that it should be large enough, so that the sulphur does not boil over, and put a 60-potful of sulphur into it, being careful not to spill any, and feeding it twice with a tablespoonful of sulphur at an interval of twenty minutes. Put one lamp and tin to every 8 feet run of glass. Have a wet sack ready in case of accident, so as to throw over the sulphur should it boil over or catch in any way. The best time to do the sulphuring is late in the evening if the sun is powerful, and air should be put on early in the morning before the sun has any power. *B. E.*

MANURE AND PLANT ASH.—Your correspondent, "Mr. G. W. Allen," in your issue of the 7th inst., rather misapprehends the bearing of my lecture at the Royal Horticultural Society. Briefly, the argument was, that we know we must manure with nitrogen, phosphoric acid, and potash, but that the composition of the ash of the plant gives us no guide as to the proportions to be employed. For agricultural crops this fact has been established by the experiments at Rothamsted and other stations; and Mr. Allen will find a few experiments illustrating the point in a note of mine that appeared in the *Gardeners' Chronicle* of May 28, 1898. *A. D. Hall, South Eastern Agricultural College, Wye.*

EUCALYPTUS GLOBULUS IN THE OPEN AIR.—It may interest your correspondent, A. R. Pearse, to learn that a plant of Eucalyptus globulus, planted in a garden in the south-west part of the county of Cork, out of a small pot in 1880, was at the end of 1893 killed to the ground by 18° of frost. When killed it was 61 feet high. This frost was the hardest registered during the thirteen years the tree had been planted. It was in the summer of 1893 a very fine sight, covered as it was with beautiful yellow flowers. Does "A. R. P." know if it commonly flowers in this country? *J. A., Panshanger.*

NOTES FOR NOVICES.—I.

LET not the student-gardener for whom this note is to be written imagine that we are going to teach him practical gardening. That can only be learnt by experience. Experience is valuable to one man because he knows how to appreciate it, and to turn it to account; it is unprofitable to another, because he works with his hands only, and cannot or does not let his hands be controlled by his brains.

On turning to p. 7 of our last issue, some directions for digging may be read from the pen of a practical gardener of long experience. Messrs. Cannell's catalogue, now before us, also points out that there is digging and digging, and shows by means of a woodcut which is the right, which the wrong, way of carrying out this most important operation. One half-hour spent in watching the practice of an expert spadesman will, however, teach more than all the columns of a gardening paper. Besides, there is stiff land and light land, dry land and that which is water-logged, peat-land and that which contains more pebbles than soil. Again, digging as a preparation for planting fruit-trees, or for the benefit of kitchen-garden crops, is one thing; digging in a shrubbery or in the herbaceous border is quite another matter. It may almost be said that the more you do in the one case the better, the less you do in the other the less likely you are to incur the wrath of the proprietor. No book and no garden calendar can tell you exactly what you ought to do under the special circumstances in which you happen to be placed. Such publications can only deal with generalities, and you must use your brains so as to be able to adapt the general directions to your special case.

Whilst there is all this diversity in practical matters, according to varying conditions of the soil and subsoil, and in reference to the object in view, the underlying principles are the same in all cases. To get at and to understand these principles, ask yourself why you are intending to undergo this muscular exercise? It is, no doubt, a splendid thing for a young man, but he might, perhaps, prefer football or cricket. These might be equally advantageous to him as a man. But in these forms of athleticism, the gratification is mainly selfish. When a man digs he is, or should be, animated by the fact that he is doing good to others as well as to himself. First and foremost he is doing good to the plants he is about to grow—that is the primary reason why he doffs his coat, thrusts in his spade, and neatly turns the sod. By helping the plant he realises his ulterior aim of benefiting his fellow man.

We dig, then, in order to promote the welfare of the plant, and more particularly of its roots. Those roots, generally speaking, have relatively thick bodies and branches, and a crowd of fine thread-like branchlets. Neither the body of the root, nor its branches, nor even its fine threads, have any *direct* influence on the feeding of the plant. The feeding surface is confined to the vicinity of the extreme tips of the finest threads, and to the very minute root-hairs which clothe some roots under propitious circumstances. One fibril or one root-tip does very little towards supplying the wants of the plant, but the work of the whole suffices with other agencies to send up the water to the highest leaves. Botanists teach us, moreover, that this minute root-tip is one of the most wonderful things in Nature. It not only absorbs water and air, but it is sensitive to touch, has some of the properties of a nerve, and during growth is endowed with a faculty of twisting round and round, screwing itself into favourable positions, of avoiding those that are not so, and of circumventing obstacles. Truly, we ought to feel respect for the root-tips; but how many give them a thought when digging? If the soil is not broken up, how can these tiny threads penetrate among and between the particles of the soil? The root-thread, then, thus requires unrestricted room to move in and to spread itself where food may be found, and digging affords this space.

Again, free access of water is essential; that cannot be ensured unless the soil is broken up. Another essential is air; the roots, like other parts of the plant, breathe. The process is, in essence, the same as in human beings, and in all living creatures. If you prevent the access of air (oxygen) to the root, or if you do not provide, as you do by digging, for the free entry of air, you suffocate the root, and the plant dies. Stagnant water in the soil causes ill-health or death, simply because it does not allow of the free access of air to the root. The water by itself is not injurious if it be kept in motion, the air moves with it, and the soil is kept fresh and sweet. In seasons such as we have had lately, the plants on well-tilled land suffered much less from the drought than those on hard-baked consolidated soil. The water from the subsoil was enabled to rise in the minute interstices of the friable soil, and contribute to the wants of the plant, its motions were checked and impeded in the impervious soil.

Digging secures a warmer temperature in the soil; that is proved by experience. Then the action of those extremely minute plant-cells called microbes, or bacteria, in the soil, must not be forgotten. The ordinary gardener has little or no chance of actually seeing them; he must rely on his text-books for the requisite information. Some are harmless, others harmful, and some of advantage by converting the inert and otherwise useless portions of the soil into soluble food in a state in which it can be utilised or digested by the plant. To understand these matters thoroughly, one must be a physiologist and a chemist. Being only practical gardeners, we must content ourselves for the present with knowing that not the least important reason for digging is to secure and promote the beneficent action of exiguous bacteria! More, and much more, might be said here, but is it not written in the text-books? Suffice it for us now to set up a finger-post. *S. Retsam.*

EMIGRATION.

The information contained in the latest circular issued from the Emigrants' Information Office, 31, Broadway, Westminster, S.W., indicates briefly those colonies or districts in which there are openings for emigrants. For example, it is stated that it is too early in the year to emigrate to Canada. In New South Wales, matters relating to trade, labour, and industry are improving, and land settlement is increasing. The dairy industry is largely on the increase, and many new factories are being erected. The number of unemployed throughout the colony has become much less; scrub-cutting at the West Bogan is almost the only Government work now being carried on for the benefit of those out of employment, the average wages there being 5*s.* 6*d.* a day. But the effect of the long drought, and of serious disputes between capital and labour, have made employment in many cases precarious. The building trade remains depressed, and there is a large number of empty houses in Sydney and the suburbs. At the large Broken Hill silver mines there are sufficient miners, and mechanics can always be obtained from Adelaide when required. At the Cobar copper mines there has been plenty of work for miners. In many parts the saw-mills have been very busy. In the metal trades at Sydney, there is no demand for any kind of mechanic; in the furniture, clothing, boot-making, printing, and other trades, and in the woollen-mills, there is no demand. The large coal industry at Newcastle has been busy, and miners have been working full time; but as the weighing question is still undecided, the industry is in a very unsettled condition. In Victoria, farmers would do well; and a skilled mechanic, who lands with sufficient money to provide for himself and family during the first few weeks, would have a reasonable prospect of finding remunerative employment, especially in country districts. A few more plumbers and glaziers—if duly qualified—would find employment on the drainage works which are now being carried out at Melbourne. There is an opening for a few experienced miners at Carisbrook and Bendigo; but for ordinary labourers employment continues to be scarce.

In South Australia a Government labour Bureau has just been established for the purpose of facilitating the obtaining of employment. The Bureau is situated in Victoria Square, Adelaide, and branches may be established elsewhere; a register is to be kept of all persons applying for employment, but no one can be registered unless he has resided for one year in the colony; a register of employers applying for labour is also to be kept. No labour is to be employed in the public service except through the Bureau.

In Queensland, notwithstanding the late severe drought, which caused great losses in the western and central districts, settlement on grazing-farms by practical men is steadily progressing, especially in the west and north-west. There is a general demand throughout the colony for ploughmen and other farm-labourers, and for female domestic servants, but not for mechanics, except for a few tailors at Brisbane. A sum of £22,500 is proposed to be spent during the financial year in promoting immigration; of this amount, £15,000 will be used for reducing the cost of immigrants' passages. The Report of the Queensland Government Labour Bureau for 1897, which has just been issued, does not point to any very satisfactory results; but, on the whole, the tendency of the labour-market was towards improvement. There was more demand at Ipswich, Mackay, Rockhampton, and Toowoomba, than at Brisbane, Bundaberg, or Townsville. Increased settlement and the improved position of settlers have had this year a stimulating effect upon the manufacturing industries of the colony, and the outlook is good. Gold-miners are doing well, and considerable attention is again being directed to the long-neglected copper-mining industry.

In Western Australia there is a good demand for farm-labourers in many parts of the south-west, and for miners on some of the gold-fields, but not at Coolgardie. A considerable number of public works are being carried out in all parts of the colony, but as many of these are nearly completed, the Government will during the next few months gradually discharge some 200 of the *employés* in the Public Works Department. The free-passages hitherto given to female domestic servants going to Western Australia are suspended for the present. In Tasmania, the demand for most kinds of ordinary labour (except compositors) is increasing there as the mines develop, and men able to take up and work a few acres of land will get a good price for vegetables. In other parts of the colony there is no general demand for more mechanics or farm-labourers. In New Zealand, in the district of Auckland, the building and saw-mill trades have been very busy. In other parts of the colony also, except at Wellington, men in the building trades have been fully employed; engineering trades have also been busy, except at Auckland and Oamaru. Ordinary labourers find plenty of work in country districts at this season of the year; but they must avoid large towns like Auckland, Wellington, Christchurch, Timaru, and Dunedin, where many hands have been unable to find employment. There is an excellent demand for female servants.

In Cape Colony and Natal there is very little demand for mechanics or labourers at the present time; and emigrants are warned to avoid Beira in Portuguese East Africa.

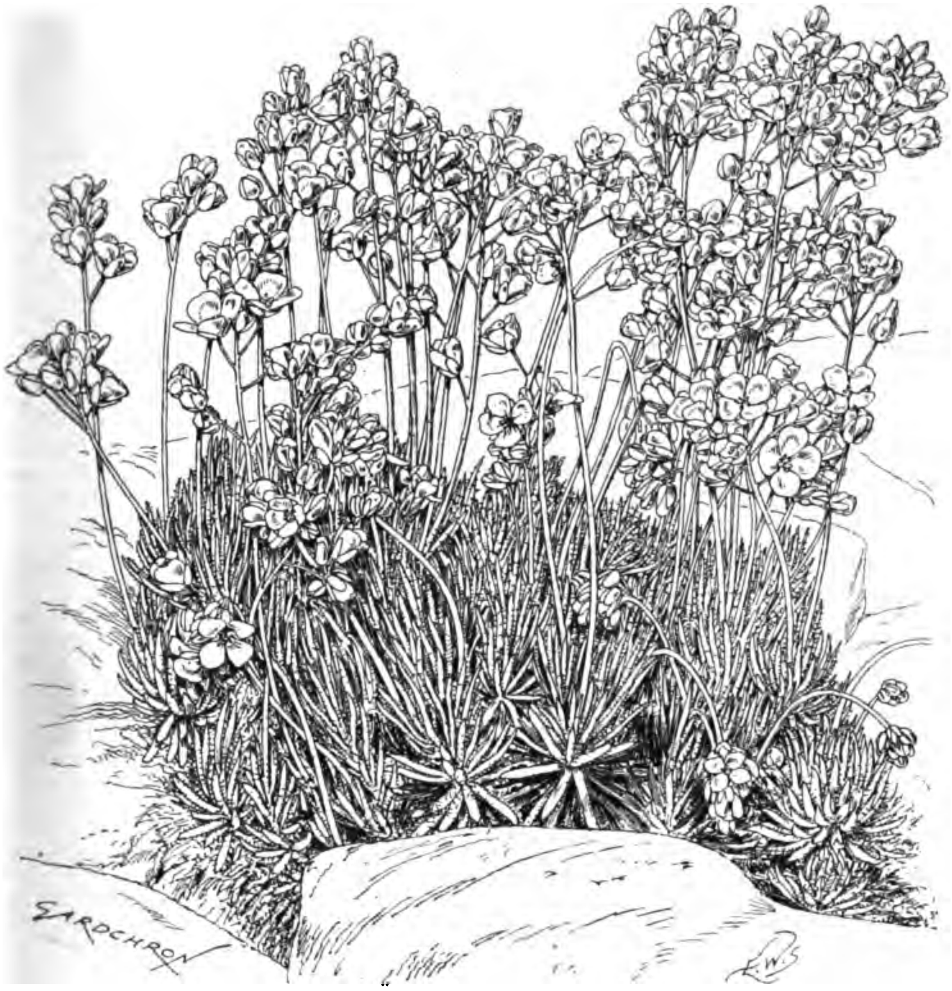

Fig. 9.—Draba olympica heterocoma (natural size).

DRABA OLYMPICA VAR. HETEROCOMA.

This is a pretty little Draba of tufted habit, with linear, erect, glabrous leaves, and spikes of golden-yellow flowers. It is a native of Anatolia, and other parts of the Levant. Our illustration (fig. 9), for which we are indebted to Mr. Siehe, of Mersina, shows a plant as growing under natural conditions. The plant is fully described in Boissier's *Flora Orientalis*, vol. i. (1867), p. 295.

MARKET GARDENING IN THE CHANNEL ISLES.

(Continued from vol. xxiv., p. 454.)

The Nurseries of Mr. A. J. Guilbert, at Rohais Road, Guernsey, are of a much more varied character than the market establishments already mentioned, for not only are Tomatos and Grapes grown for sale at home and for export, but there is a general collection of plants indoors and outside, beside an immense stock of early spring-flowering bulbs, such as Iris, Freesias, and Narcissus. Acre after acre is planted with these bulbs, and houses and pits are filled with boxes in which the Freesias are planted. And by no means is this a solitary instance, for bulb-culture, if not taking the place of some of the staple goods, is nevertheless becoming a large adjunct to the regular work at most of the nurseries. At Rohais, almost the first plant to arrest attention is a splendid specimen of Arundinaria gracilis, 12 feet in height and 15 feet through. Hedychium Gardnerianum is in robust health; to see this treated as a hardy plant was a novel experience. Close by are the yellow Marguerites in regular bushes, 8 feet high, and as much through. These remain out all the year, and are constantly in flower. Chamærops excelsa and C. Fortunei are represented by plants 8 and 10 feet in height.

Continuing our walk through the grounds, we notice a broad finely-kept walk through the nursery. On one side of this are herbaceous plants, backed with choice shrubs, and on the other Begonias, Carnations, and bedding plants. Among other trees outside were large Camellias, 30 feet through, and almost as much in height. The old Double White and Marchioness of Exeter are represented by such specimens. Close by is a tree of Magnolia Fraseri, 30 feet high, and bushy withal. The Cork-tree is represented by large specimens, whilst Bamboos, Dracænas, and Phormium seem to vie with one another to cover the space allotted them in the shortest space of time. We notice Benthamia fragifera in the best of conditions, choice greenhouse and Himalayan Rhododendrons, and so on until we approach a dell at the lower part of the grounds, through which a stream of water is constantly running. We have had the pleasure of inspecting some large winter gardens, but this nook, so natural and free, without any protection whatever, charmed us immediately. Along the stream were masses of Gunnera scabra, with leaves 4 feet across, bearing large cone-like clusters of flowers; Phormium tenax and P. t. variegata; Bamboos in some twenty species and varieties; Palms, Camellias, Dracæna indivisa; Acanthus mollis, with Osmunda regalis, Woodwardia radicans, Cyrtomium falcatum, and Cyperus alternifolius. Pittosporum Ralphi, Datura sanguinea and D. aurea, now full of flowers. Bouvardia odoratissima, some of which are 8 and 10 feet high. Aralia Sieboldi, Ligustrum chinense, with beds of various sorts of Montbretias, full of flowers. Passing by a Camellia-hedge we come to a large field, where all the best Chrysanthemums are grown by thousands.

Of Anemone fulgens, we noticed large beds just beginning to appear above the ground; the St. Brigid and other forms are also largely grown. English, Spanish, and choice German Iris, in large quantities; of the two former types, the number of bulbs run into six figures in a season. The white Agapanthus is also here in large masses. Roses and Carnations are represented by quantities of the best sorts.

Indoor Plants, &c.

The houses are numerous, and the inmates included double-flowered Begonias, large and bright; Asparagus decumbens, grown in quantity; Cannas of unusual size and brightness. The choice varieties of Canna grow on these islands to a great size; the flowers, which are freely produced, are very large, and of intense and vivid colours. Here also are Ferns of sorts, and Palms for decoration; while overhead is a wonderful plant of Stephanotis floribunda, clean and vigorous, from which no fewer than 6000 trusses of bloom had been cut this year. A vinery close by, 70 feet by 36 feet, contained a fine crop of Black Alicante Grapes, and along the centre path a good portion of space was devoted to planted-out Freesias; the pure white F. refracta alba only is grown, and the stock is always kept pure. In another house, Cypripedium insigne is represented by a large number of plants; these are potted in loam, leaf-soil, and sand—in fact, in soil just suited to a Fuchsia. Asparagus plumosus and A. p. nanus are grown in large quantity, mostly in 8-inch pots—splendid plants they are. These are raised from seed, and quickly pricked out and grown on. Large specimens are kept, which flower and seed freely, so there is no fear of the stock diminishing; a houseful of pot-Vines, chiefly Muscats, were ready for removal outside. A house of Melons, 40 feet long and 8 feet wide, with a narrow border each side, had 200 splendid fruits of the old Guernsey A 1—a form Mr. Guilbert finds most useful and profitable. A Tomato-house, 200 feet by 30, span-roof, with twelve plants in rows from path to wall. and spaces 3 feet wide, was filled with a grand lot of plants and fruit, the variety being The Cropper. It is a splendid cropper, and has large, round, regular fruit, produced in good clusters. Heaps of Daffodils were piled up on the borders inside, to be sorted and then planted. There is a vinery 100 ft. long, in which the Vines were planted six years ago, and have been grown on the extension system. A long rod has been carried along the front wall, and from this numerous canes have been carried up to the top. Peaches are grown in a span-roof house, and the trees are clean, stout, and vigorous.

My attention was first drawn to 15, Pollett Street, the shop in the town where Mr. Guilbert disposes of so much of his goods, by seeing in the window a dish of Lady Palmerston Peaches, several of which were weighed in my presence, and reached 16 oz. Some fruits of this variety had been exhibited, weighed no less than 21 oz. Passing through the nursery I could not help remarking on the number of squares of glass covered with Tomato seed. On enquiry I was informed that, if a given quantity was saved in good condition, a promise had been made that the men should have another day's outing.

(To be continued.)

CLOVER AND GRASS SEEDS.

We learn from Messrs. Hurst & Son's recently-issued circular that of English Red Clover and Cow-grass a very large acreage was left for seed in almost all the producing counties, but the exceedingly warm and bright weather of the late summer shrivelled a considerable proportion of the stems on the light and warm lands, preventing the development of the seed-heads, and therefore those crops saved early in September will, we think, prove light in yield. The seed that was saved later on the colder and heavier lands will show the best quality and largest yields. Taking the crop as a whole, we should say it will be barely up to an average one. Samples will vary very much, the great bulk of the seed will be small, bright-coloured, and weedy. Fine large-grained purple seed with the true English character will be scarce. There is still a large quantity of yearling seed held over, which will have to come on to the markets. We may add that up to the present date fewer parcels of new seed have been brought to market than we ever remember. Single cut Cow-grass is in very short supply; as this is always saved early, our remarks above apply in full force here.

Foreign Red Clover: America, the country we always look to for the largest output of seed, has considerably below an average, but the enormous quantity of 1897 crop still held over more than counterbalances any deficiency. France has some fine seed, but as her crop is not up to an average, she will not be able to send us the large quantities she did last year. From some parts of Germany we have rather free offerings of large-grained, fine-coloured and clean seeds, but prices asked at present are rather high. The Russian crop is reported small, and it is thought she will have to import.

White Clover: A large English crop, but of bad colour, and unusually weedy. America has a large crop of even-looking seed, but it does not find favour in this country, the plant is so small and weak that we doubt whether it is an economical article, even if the seed should be at a low price. German offers are pretty free, of medium and low qualities; fine clean handsome seed seems scarce.

Alsike: Is in fair supply. Germany has apparently a larger crop than for several years, but the samples we have seen lack the cleanliness of the Canadian and American samples.

Trefoil: Had it not been for the great quantity of yearling and 2-yr.-old seed on the market, this article would have advanced to a high figure, the crops of new, both in this country and on the continent, are much below an average, and quality not good.

Lucerne: French crop reported large, but their home demand is so extensive that prices have already advanced. American supplies are good, with prices a trifle higher than last year. This article has risen rapidly in favour in England during the last few years, and is certainly a valuable crop.

Sainfoin (Giant and common): Perhaps the largest crops on record, both in England and France, of excellent quality.

Italian Rye-grass: The French crop is not large, but owing to the large Irish one, prices are still kept down. English crop below an average.

Perennial Rye-grasses: Again very large crops, with almost record minimum prices. The quality of the samples should be a matter of the greatest importance—more land is fouled by impure Perennial-grasses than by any other means we know of.

Natural grasses: Cocksfoot is in large supply from New Zealand. America has sent the cleanest samples, lacking in brightness, but of the highest germination. Timothy in full supply, and low in price. Crested Dogstail much cheaper than for some years. Meadow Fescue a small crop, but last year's was so large that much of it is still held over, and growths of this are very poor. Meadow Foxtail plentiful. The Poas are scarce, but Sheep's and Hard Fescue in good supply.

White Mustard: English crop large, of almost invariably fine quality; medium and low samples are scarce. Rape: A very small crop in England. Foreign supplies seem good.

Spring Tares: The samples we have seen show excellent quality; the extent of the crop we are not yet able to determine, but we expect it is large. Winter Tares: Still in large supply, both new and yearlings, at almost lowest recorded prices.

COLONIAL NOTES.

THE WEST INDIES.

Dr. Morris, who acted for several years as Assistant-Director at Kew, during which period he rendered valuable services to the Royal Horticultural Society, and made many friends among horticulturists, has taken up his work as Imperial Commissioner of Agriculture for the West Indies. An address which he delivered before the Agricultural Society at Trinidad defines the scope of his future work as comprising the furtherance of every possible agency to benefit the general welfare of the people. The Sugar-cane in its various aspects will receive much attention, and amongst other things attempts will be made to obtain a variety with a higher percentage of sugar, and drawings are to be made of all the varieties cultivated in various parts of the world, so that uniformity and fixity of nomenclature may be secured. Trinidad has a very efficient botanical department, and an energetic and experienced superintendent in the person of our valued correspondent, Mr. Hart. A similar establishment exists in Jamaica under the superintendence of Mr. W. Fawcett, so that these two islands do not stand in need of official assistance in the degree that the less prosperous islands do. Agricultural and industrial schools are to be established, horticultural exhibitions started, agricultural instructors appointed, and experiments carried out. Mr. Hart strongly recommends the growth in Trinidad of Castilloa elastica, a rubber-yielding tree which promises well in a commercial sense, both in British Honduras and in Trinidad.

VEGETABLES.

CARTER'S FORCING PEA.

Those who are on the look-out for a good early Pea for growing in frames or pots, will find no better than Carter's Forcing. It is a variety with a good dwarf habit, rarely, if ever, exceeding a foot in height; the haulm strong, and the plant a great cropper for its height. The pods contain on an average six peas, the flavour of which, when cooked, is that of a first-rate Marrowfat. *H. W.*

Beetroot.

It was stated by "D." in the *Gardeners' Chronicle* for October 15 that finer roots would be obtained if the seed of spindle-shaped Beet was sown at the end of the month of May, instead of earlier in that month. That may be so in some soils, and if the season is favourable for germination and growth; but I have more than once had failures from sowing late, and I now sow seeds for the main crop of Beetroots in the beginning of May. The roots from late sowings, should the summer weather prove very dry, rarely come of a serviceable size on light or dry soils. On chalky soil last season I sowed three varieties, namely, Cheltenham Green-top, Dell's Crimson, and Veitch's Improved Black. Sparrows were troublesome during the hot weather, devouring the young Beet-plants, with the exception of the Green-top variety, growing alongside the dark-leaved varieties, compelling me to use Pea-guards as a protection against them. *H. Markham, Wrotham Park Gardens.*

SOCIETIES.

ROYAL HORTICULTURAL.

January 10.—A meeting of the committees of this Society was held on Tuesday last in the Drill Hall, James Street, Westminster. There are to be two meetings held during the present month, which is an innovation in respect to January that is possibly capable of satisfactory explanation. But to say the least of Tuesday's meeting, it certainly afforded no evidence that a greater number of opportunities is needed during the winter months for the presentation of novelties for Certificates in plants or fruits.

No award save of Medals was made by either the Floral or Fruit and Vegetable Committees. The Orchid Committee granted distinctions to a very few novelties. Nor was the general display of exhibits extensive. But at 3 o'clock in the afternoon took place the most encouraging event of the day. A meeting was held for the election of new Fellows, and the list submitted was so large as to prove that the vigorous growth the Society has continued to make in point of numerical strength is unabated.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. John Fraser, Owen Thomas, Chas. T. Druery, A. B. May, R. Dean, Wm. Howe, Jas. Hudson, J. F. McLeod, C. J. Salter, J. Fraser, Chas. Jeffries, Ed. Mawley, George Gordon, Chas. E. Shea, Herbert J. Cutbush, Edwin Beckett, H. J. Jones, E. T. Cook, J. W. Barr, Harry Turner, and Chas. Blick.

Some very handsome sprays of Asparagus deflexus, 5 to 6 ft. long, were shown by R. B. Leech, Esq., The Cottage, Wood Hall. The sprays were studded with the very bright scarlet-coloured berries, and were much admired.

Mr. F. Miller, Fulham Road, South Kensington, S.W., exhibited some early spring flowers, including Narcissus, Lily of the Valley, Tulips, Roman Hyacinths, Arum Lilies, &c. These were very tastefully set up in various devices, and relieved with Myrsiphyllum asparagoides and other greenery; also dried Grasses, being several species of Cape Restiaceæ (Silver Banksian Medal).

Messrs. James Veitch & Sons, Royal Exotic Nursery, Chelsea, showed a strong-growing Davallia, named D. intermedia, and supposed to be a hybrid between D. Mooreana and D. decora. The hybrid has larger and broader pinnæ than either D. intermedia or D. decora, and produces large spreading fronds. Messrs. Veitch & Sons had also several varieties of flowering and berried shrubs, including Skimmia japonica, S. Fortunei in berry; Skimmia fragrans rosea in bud; and Skimmia japonica oblata, in bud and in berry. This last one has larger leaves and berries than the other species. The firm showed a number of trusses of warm-house Rhododendrons. A few specimens in flower of Hamamelis arborea (Witch-hazel) were also shown. Taxus baccata erecta semper aurea, sufficiently describes a plant of an ornamental Yew, also from Messrs. Veitch.

A variety of Saintpaulia ionantha with white or flesh-coloured flowers was shown by Mr. P. Blair, gr. to the Duke of Sutherland, Trentham Hall, Staffordshire; the flowers had just a suspicion of purple in them, but are very distinct from the type, and will probably meet with appreciation.

Messrs. F. Sander & Co., St. Albans, Herts, again displayed their valuable new plants of last season, such as Acalypha hispida (Sanderiana), A. Godseffiana, Kentia Sanderiana, Dracæna Sanderiana, and Licuala Jeanenceyi. The very showy A. hispida has been exhibited throughout the year in perfect flower. It is evidently a plant that may be obtained in bloom at any season.

Messrs. Barr & Sons, 12 and 13, King Street, Covent Garden, London, exhibited a batch of plants of varieties of Primula sinensis. The plants were well grown, and exhibited several distinct colours, the "blue" one being especially worthy of remark.

A white decorative Chrysanthemum named Elaine Squelch was shown by E. Speyer, Esq., Boxhurst, Dorking (gr., Mr. H. Squelch).

The orange-coloured Gerbera Jamesoni was shown by Messrs. H. Low & Co., Bush Hill Park, Enfield. The plant had one flower, and was in a pot. This very pretty Composite was figured in the *Gardeners' Chronicle*, June 22, 1889, p. 773.

Mr. R. B. Leech, gr., Woodhall, Dulwich, showed a vase filled with well berried sprays of Asparagus deflexus.

Sprays of flowers of Cyrtanthus intermedius were shown by Mr. F. W. Moore, from the Royal Botanic Gardens, Glasnevin. The flowers of long and very slender tubes of rose-colour, the interior of the corolla being much paler. The orange-coloured calices present a pretty contrast.

Orchid Committee.

Present: Harry Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), S. Courtauld, T. W. Bond, R. Brooman-White, H. Little, F. Sander, J. Gabriel, H. Ballantine, H. M. Pollett, H. T. Pitt, W. Cobb, E. Hill, F. J. Thorne, W. H. Young, H. J. Chapman, and J. Douglas.

The first meeting of the year brought forth an interesting display, though the exhibits were not numerous.

Messrs. J. Veitch & Sons, Limited, staged a group containing many rare hybrids. Of the plants making their appearance for the first time, very remarkable were Angræcum × Veitchi (sesquipedale ♀, eburneum (superbum) ♂), a noble hybrid, in habit intermediate between the parents, i.e., having the leaves more fleshy and more ascending than in A. sesquipedale, and with a decided tendency to produce an elongated scape. The plant bore three fine flowers and one bud, the flowers equal in size to those of A. sesquipedale, but with shorter spur. The sepals and spur were greenish-white, the broad petals and lip clear ivory-white. A First-class Certificate was awarded for the plant, and a Silver Flora Medal to Mr. J. Seden, the chief of Messrs. Veitch's hybrid Orchid department. Another singular and pretty hybrid of more modest pretensions was Epi-Cattleya × Mrs. James O'Brien (E. O'Brienianum ♂, C. Bowringiana ♀). The plant had stout stems, clad with alternate fleshy green leaves, the apex bearing the scape 9 inches in height, and clad with leafy, sheathing bracts at the lower half. The flowers, which were about 2 inches across, had ovate sepals and petals, and singular three-lobed lip, adnate to the column for the greater part of the length; of a bright rose-purple colour, of that crystalline appearance seen in Barkeria Lindleyana (Award of Merit).

Other pretty hybrids were Cattleya × Breauteana var. Hebe (Loddigesii ♀, superba ♂), a pretty flower, somewhat resembling a large Lælia Perrini; Lælio-Cattleya × Dominiana var. Langleyensis, a noble and finely-coloured flower; varieties of L.-C. × Pallas, Cattleya × leucoglossa (Fausta × Loddigesii), Epidendrum × Wallisii-ciliare, Epiphronitis × Veitchi, Cypripedium × Euryades, both spotted and purple-tinted varieties, C. × Niobe, C. × Arthurianum pulchellum, C. × Zeno, C. × Leeanum superbum and giganteum, Dendrobium atroviolaceum, three fine plants of Cymbidium Tracyanum, and other species. A Silver Flora Medal was awarded for the group.

Sir Trevor Lawrence, Bart., Burford, Dorking (gr., Mr. W. H. White), showed Sophronitis Rossiteriana, a remarkable variety of the same form as the ordinary S. grandiflora, but with a clear yellow flower (Award of Merit).

Norman C. Cookson, Esq., Oakwood, Wylam, Northumberland (gr., Mr. Wm. Murray), showed a fine hybrid Cypripedium, raised out of C. bellatulum, and which the committee decided should be named C. × Schofieldianum superbum, it being near to C. × Schofieldium, recorded as C. bellatulum × C. hirsutissimum, but which record the committee doubted. The present flower was large in size, of a clear cream-white ground, evenly spotted with dark purple (Award of Merit). Mr. Cookson also showed his Calanthe × Sybil, a fine pure white hybrid, with the less white C. × Cooksoni for comparison; and the carmine-tinted C. × Phœbe.

Sir Frederick Wigan, Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed a plant of Phalænopsis grandiflora (amabilis) which had been in the Clare Lawn collection since 1884; and flowers of Phalænopsis Aphrodite, Schilleriana, casta, Stuartiana, grandiflora aurea, and leucorrhoda, each of which had been at Clare Lawn for a number of years, the last-named having been purchased from the Downside collection.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Lælia anceps Rosefieldiensis, a very dark and brightly-coloured variety, with richly-coloured lip, characterised by the clear white of the tube, bearing broad dark purple lines, and by the broad purplish-crimson border to the side-lobes (Award of Merit). Mr. Crawshay also showed L. anceps Titania, a large flower with light rose-pink sepals and petals.

Walter Cobb, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes, showed Cypripedium bellatulum Dulcote var., with yellowish-white ground colour, the spotting being more distinct, and more widely separated than in other forms, showing more of the ground colour (Award of Merit); the fine C. × J. Howes (villosum aureum × Sallieri Hyeanum), which had previously received an Award of Merit; and the distinct C. insigne, Dulcote variety.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. H. J. Chapman), showed Cypripedium × Buchanianum magnificum (Spicerianum × Druryi), a handsome flower, and decided improvement on the original. The flower had the, main features of C. Spicerianum magnificum, but the substance was firmer, the surface more glossy and yellower, telling plainly of C. Druryi; also C. insigne Arthurianum, a large lightly-spotted form.

Henry Tate, Esq., Allerton Beeches, Liverpool, showed three very dissimilar Cypripediums, all supposed to be between C. Boxalli atratum and C. nitens superbum, and named (1) Parksianum, Tates var., the upper sepal flaked with purple; (2) Sirdar, with white upper sepal spotted with purple; (3) Cromer, with pale green upper sepal, with white margin and purple spots.

Messrs. B. S. Williams & Son, Upper Holloway, were rewarded a Silver Banksian Medal for a good group of Cypripediums, &c., and comprising C. Spicerianum, C. × Sallieri, C. × S. aureum, C. × Williamsii, C. × Barteli, C. × Harrisianum superbum, C. × Measuresianum, C. × Leeanum superbum, C. J. Fitchianum, C. × discolor, C. × nitens, C. × Pitcherianum, Williams' var., C. insigne Wallacei, Maulei, punctatum violaceum, albo-marginatum, and grandiflorum; and good examples of Lælio-Cattleya × Sallieri, Oncidium tigrinum, Lycaste fulvescens, &c.

Messrs. F. Sander & Co., St. Albans, had arranged with their remarkable Acalypha hispida, some well-flowered specimens of Phalænopsis Stuartiana, the clear white Miltonia vexillaria virginalis, a very handsome form of Cattleya Trianæi, C. Percivaliana, Oncidium varicosum Rogersii, &c. Mr. Thos. Rochford, Turnford Hall Nurseries, Broxbourne, showed Odontoglossum × Ruckerianum, Rochford's variety, a very handsome form, with well-made flowers of a cream-white, densely spotted with reddish-brown in the way of O. R. egregium (Award of Merit). F. M. Burton, Esq., Highfield, Gainsborough, showed a spike of the original Lælia anceps Amesiana, or a re-introduction of it.

Sir Wm. Marriott, Down House, Blandford (gr., Mr. T. Denny), showed Lælia × Latonia splendens. W. P. Burkenshaw, Esq., The West Hill, Hessle, Hull, sent Cymbidium Tracyanum splendens, with large flowers and dark purplish-brown markings.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, showed as Phaius Tautziana a plant which seemed to be Phaio-Calanthe × Sedeni rosea, with cream-white flowers marked with dark rose colour.

Fruit Committee.

Present: Philip Crowley, Esq., chairman, and Messrs. Geo. Bunyard, Jos. Cheal, Jas. H. Veitch, W. Poupart, M. Gleeson, A. H. Pearson, Alex. Dean, A. F. Barron, J. W. Bates, W. Farr, W. J. Empson, Geo. Wythes, H. Balderson, F. Q. Lane, Geo. Reynolds, Geo. Norman, and J. Willard.

A nice collection of Apples was staged by Mr. W. J. Empson, gr. to Mrs. Wingfield, Ampthill House, Ampthill. It consisted of about forty dishes or varieties, and some of the best were Gascoigne's Scarlet, Worcester Pearmain, American Mother, King of the Pippins, Ribston Pippin, Mère de Ménage, Baumann's Red Reinette, Prince Bismarck, and Lord Derby (Silver Knightian Medal).

Mr. Hislop, gr., Bletchley Park, Bletchley, showed a dish of the Russet Apple Scotsman.

A basketful of very nice fresh-looking Mushrooms was shown by Mr. J. W. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, Surrey (Vote of Thanks).

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

January 4.—A fortnightly meeting was held on the above date, Mr. W. Pope presiding.

Mr. J. W. Groves, F.L.S., F.R.M.S., gave the third of the series of his botanical lectures, the subject being, "Roots, Leaf-stalks, and Leaves." The development of the root from the seed was first described, and special attention was called to the root-cap, its structure, and uses. A section of a young root was next described, and the manner in which the structures in the stem become continuous with the structures of the root was clearly explained. The various forms of roots, and their uses, were briefly described, the acid exudation from the root-hairs, and its uses, being minutely explained. A typical leaf was taken, and its blade, leaf-stalk, and stipules pointed out. An imaginary microscopic examination of its structure was made, sketches drawn on the blackboard, and the epidermal-cells, stomata, and guard-cells, chlorophyll, and air-spaces all minutely described. The formation of the hard glossy surface on such leaves as the Holly and Laurel, and on straw, Bamboos, &c., and its uses, were explained, as were also the water-pores in such plants as the Fuchsia, Nasturtium, and the Nectaries; crystals and hairs in some other plants. The various forms of leaves were passed over, but the four principal uses dwelt upon, viz., absorption, assimilation, respiration, and transpiration. The modification of leaves into prickles, thorns, and tendrils, was also pointed out. The lecturer said he could not conclude without referring briefly to an exceptional class of plants, of which the Sundew and Pitcher-plants were well-known examples. A series of lantern-slides were then exhibited, by way of recapitulating what had been explained.

A hearty vote of thanks was passed to Mr. Groves for his useful and instructive lecture, which he duly acknowledged. A number of microscopic slides of hairs, sections of roots, leaves, &c., were also on view. Mr. W. Pope staged a large group of Euphorbia jacquiniæflora. *H. Colby, Hon. Sec.*

ISLE OF WIGHT.

The annual meeting of the Isle of Wight Chrysanthemum Society was held at Newport on Saturday last. Dr. J. Groves, B.A., J.P., presided over a small attendance. On the proposition of the chairman, the report and balance-sheet were adopted.

Owing to the inclemency of the weather at last year's show, there is a loss of £17 on the year's workings, which leaves a balance in hand of about £4. On the election of officers and committee, Sir Chas. Seeley, Bart., J.P., was unanimously re-elected President; Dr. J. Groves, B.A., J.P., chairman of the committee; and Mr. C. H. Cove, Hon. Sec.

Several important alterations were made in next year's schedule, which it is hoped will be to the benefit of the Society financially, and of greater interest to the lovers of the popular autumn flower.

RESUSCITATING A FLOWER SHOW.

JANUARY 7.—A general meeting of the horticulturists of the district and others interested in the proposal to resuscitate the Society, and hold an annual flower-show in Dumfries, was held on the above date, Councillor NEWBIGGING presiding.

It was agreed to re-form the Society, and revert to the old name, "The Dumfriesshire and Galloway Horticultural Society," this having been actually the oldest Society that had held a public flower-show in Great Britain. The Society was instituted in 1812, and the first show was held in that year. Office-bearers were elected as follows:—Hon. President, his Grace the Duke of Buccleuch; President, Mr. Maxwell, of Munches; Vice-Presidents, Provost Glover, Dumfries; Sir Robert Jardine, Bart., of Castlemilk; Mr. W. H. Scott, of Nunfield; Mr. Galbraith, Terregles; Mr. W. J. Maxwell, of Terraughtie; Mr. Dubs, Cargen; Sir Herbert Maxwell, M.P., of Monreith; and Sir Mark J. McTaggart Stewart, M.P., of Southwick. Mr. Mann (late Secretary of the Newton-Stewart Society), was elected Hon. Treasurer; and Mr. G. Kerr, Dumfries, the Secretary; and a representative committee was also formed. It was agreed to hold an indoor show on Wednesday, September 6.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

JANUARY 10.—The annual general meeting of this popular society was held on the above date, at 5, St. Andrew Square; Mr. M. TODD, the President, in the chair.

There was a very large attendance of members, who took a lively interest in the proceedings. Mr. R. Laird, the secretary, read the report, and the society proceeded to elect their office-bearers and transact other business. The numbers still continued to increase, four life members and 183 ordinary members being added to the roll during the year. The report also referred to the striking success of the Chrysanthemum show; and the council of the association took the opportunity of thanking the Lord Provost, Magistrates, and Town Council for their support. The funds on December 31, 1897, were £679, and the revenue for the year, including the balance from the year from the Chrysanthemum show of £102, was £200, so that the total charge was £879. The funds on December 31, 1898, were £798. Both reports were adopted. An interesting presentation was made to Mr. and Mrs. Mackenzie during the evening of a gold watch and a gold bracelet, in appreciation of Mr. Mackenzie's services as treasurer for fifteen years. The following office-bearers were then elected, and the usual votes of thanks concluded the proceedings:—President, Mr. C. W. Corvam, Valleyfield, Penicuik; Vice-President, Mr. M. Todd, who has served the Society so well as Vice-President for the last two years; and Alexander Mackenzie, the late Treasurer; Mr. Robert Laird, Secretary; and Mr. Wm. McKinnon, Treasure *D. T. F.*

SEEDLING CARNATIONS.

DURING October and November of last year I have had 600 or 700 Pinks from seed, blooming. A few of Messrs. Ladhams', 200 or 300 ordinary mixed Dianthus plumarius, 300 or 400 of Alegatière's strain, 70 or 80 "Nelly," about 100 Mrs. Sinkins, and 28 Her Majesty. I lined 200 or 300 yards of my borders with these, and for weeks before the Carnations, excluding Margarets, were in bloom; these made a lovely show. I had no idea that the old Clove Pink could be so beautiful; they have been undeservedly neglected out here, and considering their many good qualities, this is to be wondered at. They practically extend the Carnation season by several weeks; the stems are not angled like those of so many Carnations, and few or no buds are destroyed in cutting, and yet straight clean stems, 12 inches long, can be had in most of them. Of course, they lack the colours of the Carnation, and the scent is not so pronounced; still, they have a special season to fill, and their exceedingly prolific flowering make them of immense value where great quantities of flowers are wanted. In addition, for the edges of borders they are specially suited, the glaucous-coloured foliage giving a distinct effect, and setting off the brighter hues of the various shrubs and perennials. Of the ordinary D. plumarius I did not get two per cent. double, a few nice half-doubles, and a very fair lot of singles. In M. Alegatière's strain, I had 10 per cent. choice doubles, about same half-doubles, and some fine singles. In Mrs. Sinkins all were double, and all split badly. This variety does not come pure in colour, for all seemed to have a yellowish-green tint in the centre of the flowers. Of the twenty-eight Her Majesty seedlings, only one proved to be true to description, being an immense flower, of purest white, fine broadly-toothed petals, but like Mrs. Sinkins it splits—not very badly though. Three blooms standing in a tall vase in the house, covered a space almost as large as one hand outstretched. One other plant of this variety was true to colour and shape, but much smaller. "Nelly," a rose-coloured Pink, produced quite twenty sorts. Among seventy or eighty plants, only five or six doubles were true to description; it is very finely toothed. *Fred. C. Smith, Angaston, South Australia.*

CATALOGUES RECEIVED.

HARRISON & SONS, 33, Market Place, Leicester—1, Wholesale list of Seeds; Retail Seed List.

Answers to Correspondents

BLENHEIM ORANGE: *W. N. G.* First discovered at Woodstock, and received its name from "Blenheim." It is also called Kempster's Pippin. See Hogg's *Fruit Manual*, p. 25, where you will find the history as given in these pages.

BOOKS: *D. H. S.* *My Gardener*, by H. W. Ward, published by Eyre & Spottiswoode, East Harding Street, E.C.; we do not know the price. *The Garden Calender*, by T. W. Sanders, published by Hamilton, Adams & Co., Paternoster Row, E.C., price 2s. 6*d.*—*C. B. G.* Yes, the book is very suitable. A few shillings. Bell & Sons.—*P. J. W.* *Observations on the Cultivation of Roses in Pots*, by W. Paul, seventh edition. Published by Simpkin, Marshall, Hamilton, Kent & Co., 23, Paternoster Row.—*G. A. R.* You do not tell us what description of botany you desire to take up. If you will do this, we will indicate suitable books.

BULBOPHYLLUM DEAREI, &c.: *Beppo.* The plants should be grown in Orchid-baskets or pans, and they should succeed well suspended, as you say yours are, in a stove-house. They should be freely watered with rain-water at all seasons, as it does not require drying-off. Utricularia montana should be planted in Orchid-baskets, and suspended in a warm-house. It requires to be liberally watered, as it is a semi-aquatic plant.

COUCH-GRASS AND DANDELION ROOTS: *F. B.* You would be wise to char the roots, or mix them with a large quantity of fresh stable-dung, and throw into a heap to ferment, turning it once or twice whilst the heat is great.

"CRAG": *F. Myers.* It would doubtless be useful if burned or charred so as to render it of the nature of quicklime. In the state as sent, it is poor stuff in which to grow any kind of garden-plant.

CYPRIPEDIUM LEAVES: *H. H., Peebles.* The leaves sent seem to indicate that the plant has been grown in a too warm or badly-regulated temperature. Being kept in a position where they are in direct contact with the heat coming from the hot-water pipes will often cause a similar appearance.

DENDROBIUM SPECTABILE: *W. P. W.* It may flower from the old pseudo-bulbs. If from the new ones, it will be after they are made up.

DOUBLE-SPATHED RICHARDIA: *J. Young.* This is not at all an uncommon incident amongst the Richardias. It is usually due to high cultivation, with rich manures or compost.

DURATION OF GERMINATIVE POWER IN SEEDS: *A. W.* The well-ripened seeds of Godetia, Calystegia hederacea (pubescens), Lupin, Convallaria, Erythronium, Aquilegia, Thalictrum, Myosotis, and Anemone, would germinate to a large per cent. the second year if sown out of doors in May, or on a mild bottom-heat earlier in the year. The third year few of them would grow at all.

DUROLINE: *C. S.* Useful for sheds and such like purposes.

"KILLMRIGHT" AND LOSS OF PEACH-LEAVES: *T. T.* It may be, as stated by the makers, non-poisonous when taken internally, but unless the instructions sent with it are followed, injury to plants in leaf would be likely to occur. You should state your case to the firm who supplied you with the stuff.

MANURE FOR ZONAL PELARGONIUMS: *Zonal.* Standen's, or Clay's, or Peruvian Guano, are as good as any.

MANURE FOR AN ORCHARD OF PLUMS AND APPLES: *Zonal.* An orchard may be kept in good heart with ordinary farmyard-manure, both liquid and solid; but after the trees come into bearing, the land should receive a biennial dressing of potash and nitrate of soda, superphosphate of lime, as well as a surface-dressing of manure.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.—Plympton.* The flower sent seems to be an imperfect one of Lælis rubescens (peduncularis).—*E. K.* Travellers' Ivy, Clematis Vitalba.—*H. H., Peebles.* The leaves of Codiæum, or Croton, as they are more often called in gardens, vary much, but yours appear to be—1, Evansianum; 2, a form of C. trilobatum; 3, C. majesticum; 4, C. elegans; 5, C. Johannis; 6, C. angustifolium.—*T. H., Cheshunt.* The specimen is Dendrobium formosum. It could not come from Mexico as an indigenous plant.—*W. P. W.* The two varieties of Lælia anceps are very fine in colour, but the segments are narrow. The others are Cypripedium × cardinale and Oncidium prætextum.—*J. J. W.* Basella tuberosa.—*F. W.* Cattleya labiata: a poor form.

PELARGONIUM: *Baffled.* The plants have been potted too deeply, and the stem has suffered therefrom. The part beyond the affected point will die, but the other part may live and throw out shoots in course of time.

PRIMULA OBCONICA: *X.* There is no fungus or other disease upon your plant. The leaves have been injured by some detail in the cultural conditions. Have your hot-water pipes been made too hot, or have you treated the plants to excessive fumigation?

SOLANUM CAPSICASTRUM: *Nemo.* You will find an article on the subject in our last issue.

SOUTH AFRICAN BULBS: *G. A. H.* Pot all the bulbs; the small ones several together in a pot, and keep all of them tolerably dry until they start into growth, after which afford water moderately at first and afterwards freely. Most of them require to be thoroughly dried off again after the growth is made, and the leaves begin to wither. In summer they may be kept in the open garden.

STREPTOCARPUS WITH VARIEGATED FOLIAGE: *P. W.* We know of none.

VIOLETS: *A. B.* The blooms of Marie Louise sent were very fine ones.

WIRE-WORK FOR DINNER-TABLE DECORATION: *A. W.* Obtainable from the Horticultural Sundriesmen, probably.

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS *at home, that it has a specially large* FOREIGN AND COLONIAL CIRCULATION, *and that it is preserved for reference in all the principal Libraries.*

(For Markets and Weather, see p. x.)

THE
Gardeners' Chronicle
SATURDAY, JANUARY 21, 1899.

THE FLORA OF CHINA.

IT is, perhaps, not saying too much to allege that the Chinese and Japanese element in our gardens and in our greenhouses is the most attractive of all exotic representatives. Taking those far Eastern plants that will flourish in the open air in our western and southern counties, and with very slight shelter in the less favoured parts of the islands, it would be difficult to find a parallel. North America, and the extreme parts of South America, and New Zealand, are largely represented in our gardens, but China and Japan give to a great extent our winter variation in flowers. Take, as examples, the very diverse Chrysanthemum and the Camellia. Moreover, it is especially in England that the introduction and cultivation of these far Eastern plants commenced and flourished. Other countries were before us in the earliest European investigation of the marvellous flora of Cathay, but thanks to the natural inclination of our race for gardening and for cultivating plants for their beauty, and, of course, to the facilities our naval and mercantile marine gave us, we outdistanced most other, if not all other, nations in the introduction and cultivation of exotic plants.

We do not forget the splendid collections cultivated in the Imperial gardens of Austria, illustrated and described by the Jacquins, nor the Paris and Berlin gardens of the end of the last and the beginning of the present century. Nor do we forget that the Dutch were before us in Japan; and that the famous work of Siebold and Zuccarini made us familiar with many of the peculiar plants of the far East before they were known and cultivated in the West. But a most remarkable work that has just been published * shows with great fidelity that our naval and mercantile marine, apart from special collectors, made extraordinary efforts to bring home seeds and plants of such things as struck them as being very different from what they had been accustomed to see. One of our greatest writers has said that the floras of the British Islands and Japan were more alike than the floras of Madagascar and Africa; but most gardeners would be able to refute this extraordinary statement. Many of our wild flowers are very beautiful, and our Oaks, Beeches, and Elms are grand amongst trees; yet they exhibit comparatively little variety. Against our one or two species of these genera, China and Japan possess a wealth that is positively bewildering. For instance, at least a score of species of Oak inhabit Japan, and in China no fewer than forty species are at home. Since the commencement of the publication of Forbes and Hemsley's *Enumeration of Chinese Plants*, upwards of fifteen hundred new species of flowering plants have been described in various publications, besides those described in the work in question; and there are probably in the herbaria of Kew and Paris another five hundred species still undescribed. Indeed, the flora of Western China, especially in the mountainous region of the provinces of Yunnan and Szechuen, seems to be inexhaustible; and so many of the shrubs and herbaceous plants are highly ornamental. There is probably no other place in the world that would yield so many hardy and half-hardy plants worth cultivating. Hitherto, seeds of only a comparatively small number have reached Europe. Therefore a good harvest awaits a keen collector. Of course, we already cultivate a large number of different plants from the Far East, and if they were eliminated from our gardens, there would be some big gaps.

A glance through Dr. Bretschneider's book of some one thousand one hundred and fifty pages, enables us to realise how much China and Japan have contributed to our gardens, and how much more they have yet to offer. The talented author has devoted years of research to his task, which he has accomplished in a manner that probably no other person could have equalled. And what is a great boon to the large English-speaking community of the world, it is written in our mother tongue; the style and idioms of which have been practically mastered by the writer. The book covers a much wider area than the title indicates, including indeed besides China, the surrounding countries, Japan, Amur, Mandshuria, Mongholia, and Tibet to its western extremity. It is a comprehensive history of the botanical exploration of this wide area, and to a great extent, of the persons engaged thereon, chronologically arranged under the various nationalities. He begins with Marco Polo, the Venetian, who lived many years in China during the latter part of the thirteenth century, and to whom we are indebted for our earliest knowledge of that vast empire and its vegetable productions. But it was not until the arrival of the Portuguese in China in 1516 that intercourse and trading with the Chinese began. According to Bretschneider, the Portuguese claim to have introduced the sweet Orange from China into Europe before the middle of the sixteenth century; and they also imported various Chinese drugs and other vegetable productions. Very much of our earlier knowledge of the country and its people and products we owe, however, to the Jesuit missionaries, who were exceedingly active during the latter part of the sixteenth century and the beginning of the seventeenth As early as 1610 they had built ninety churches in the eastern provinces, besides many in the interior. Michael Boym, of this order, published the first *Flora Sinensis* in 1656. It contains engravings of twenty-one plants, mostly cultivated for their fruit, and among them is one of those curious, Figs which bear their fruit in huge clusters, springing from the base of the trunk. The Dutch followed the Portuguese in the far East, and long had a monopoly of the trade with Japan.

In 1637 an English fleet appeared in Chinese waters, near Canton, and there is evidence in Ray and Petiver's writings that dried plants were received in this country from China previous to 1688; but James Cunningham (Cunninghamia sinensis) is the first collector of whom we have any definite record. He formed a rich herbarium of Chinese plants (1698–1709), which is now in the British Museum. A century later, in Aiton's *Hortus Kewensis*, we find about eighty Chinese plants recorded as being in cultivation at Kew. The next notable collection of dried plants that came to this country was made by Sir George Staunton and other members of Lord Macartney's Embassy in 1793. They also introduced a number of living plants. In 1803, William Kerr was appointed botanical collector in China for Kew, whither he sent numerous living plants, including the familiar Kerria japonica. The second edition of Aiton's *Hortus Kewensis* (1786-1813) contains nearly a hundred additional Chinese plants. Lord Amherst's Embassy to the Chinese Court (1816 - 1817) was the means of introducing many more plants; and Dr. Clarke Abel's narrative contains an account of those observed and collected, including Lindley's genus Abelia. A few years before this (1810) the Horticultural Society of London was founded. Previous to this—long previous in some cases—many of the classical Chinese plants, such as the Aster, Chrysanthemum, Camellia, Aucuba, Azalea, Tree Pæony, and the Maidenhair Tree had been introduced into British gardens; but soon a greater impetus was given to the introduction of plants by the action of the Society—firstly, by means of correspondents connected with commerce, and afterwards by collectors sent out at the expense of the Society. John Reeves (Reevesia thyrsoidea), who was in China from 1812 to 1831, sent home many ornamental plants, including the charming Wistaria, in 1816; and his son, J. R. Reeves, who spent thirty years in Canton, was also active in the same cause. The original plant of Wistaria is still growing at Chiswick. Dendrobium nobile is another of their valuable introductions; it first flowered in Loddiges' nursery in 1837. John Potts (1821-22), was the first collector who was sent to China by the Society. He made a collection of forty varieties of Chrysanthemums, but through an accident to the ship they were all lost; but he was more successful with other plants. Hoya Pottsii was raised from a single leaf brought home by him in 1822. John D. Parks succeeded Potts in 1823, and he introduced a number of new varieties of Chrysanthemums, described by Joseph Sabine in the *Transactions* of the Society; a number of Camellias, and various other plants.

Passing over numerous contributors to our knowledge of Chinese plants in a living state, we come to Robert Fortune, whose travels and explorations, beginning in 1843, and ending in 1856, inaugurate, as Dr. Bretschneider justly observes, a new era in the history of botanical discoveries in China; and he devotes more than a hundred pages to a summary of Fortune's collections and writings. These, and the labours of subsequent travellers and botanists, are better known to the present generation. But everyone interested in the history of gardening and botany should see Dr. Bretschneider's book, which is a mine of wealth, and a monument of industry and careful research. *W. B. H.*

NOVELTIES OF 1898.

(Continued from p. 20.)

Stove and Greenhouse Plants.—In these the class called decorative still holds sway. New introductions are hailed with enthusiasm if they belong to this class and are easily propagated; otherwise, they are handed over to the specialist or botanist.

Messrs. Jas. Veitch & Sons continue their efforts to improve those showy things of which they make a specialty. Hence, among the large number of new Amaryllis which they have flowered during 1898 some have received certificates, and of these A. Clonia, white, veined scarlet; Tacola, a large vermilion flower; Daones, brilliant scarlet;

---

* *History of European Botanical Discoveries in China*, by . Bretschneider, M.D.

and Ideala, white and scarlet, are the best; as of their new Cliveias, C. Optima and C. Favourite are the most distinct.

At the great Temple Show one of the most admired groups was composed of their hybrid strain of Phyllocactus, P. Agatha and P. Epirus being among the most beautiful. Their new forms of greenhouse Rhododendrons, and their improved, large-flowered strain of Streptocarpus also give novel features, and among other useful new introductions of Messrs. Jas. Veitch & Sons may be noted Dracæna Exquisite, very graceful; D. Eckhautiana, a very handsome plant; D. Duchess of York, a fine decorative variety; and Alocasia spectabilis, with silvery leaves 18 inches in length.

Messrs. F. Sander & Co., of St. Albans and Bruges, at the great Ghent Show, and more recently in England, made a most remarkable display of new plants. The one which attracted the most attention, and which will doubtless always be a standard plant in gardens, was Acalypha hispida (= Sanderi, *hort.*). It is a most distinct plant, producing its long, drooping, tail-like crimson inflorescences in great profusion apparently in either stove or greenhouse. As a sub-tropical plant also, it should give a new feature. Other fine new plants of the year by Messrs. Sander, are Acalypha Godseffiana, a compact and pretty decorative kind; Leea sambucina Roehrsiana, a very richly-tinted plant; Dracæna Broomfieldi, green with silver margin; Pandanus Sanderi, with gold-striped foliage; Furcræa Watsoni, and with cream-white variegation; Dracæna aureo-striata and Aralia Balfouriana, both distinct novelties; Panax Mastersianus, an elegant and curious species; Begonia Rex Mrs. F. Sander, with vinous-crimson-tinted leaves; Alocasia Wavriniana, with bronzy, jagged foliage; and Ptychosperma Sanderi, P. Warleti, Ceratolobus Micholitzianus, Kentia Kerstenіana, Licuala Jeanenceyi, and Linospadix Petrickiana, all handsome Palms quite new to gardens.

In tuberous Begonias, Caladiums, and Gloxinias, specialties of Messrs. John Laing & Son, Cannell & Son, and others, the work of improvement has been successfully carried out, and among the many fine things shown, some have been deemed worthy of Certificates.

Among the new introductions of Mr. Wm. Bull, of Chelsea, two are specially noteworthy, viz., Dracæna Victoria, a very handsome type with bright green leaves finely banded with yellow; and Cactus epiphyllum truncatum Princess, a charming white or blush-white variety, and quite a new departure in the species.

Ferns.

Notwithstanding the many new species which have been described by Mr. Jenman in the columns of the *Gardeners' Chronicle*, though exhibited seem to have been mainly recruited by the efforts of the market grower.

Mr. H. B. May, Upper Edmonton, leads with by far the greater proportion of novelties which are not only new and distinct but desirable market and garden plants. In his fine group at the last Temple Show were included his best efforts in new Ferns, and of special note were his Phlebodium glaucum Mayi, a charming Palm-like variation; Adiantum Hemsleyanum, an elegant and light form, named in honour of the clever manager of the firm; Pteris cretica Summersii and P. serrulata gracilis multiceps two elegant new representatives of species supplying the largest proportion of all the market Ferns grown; Davallia fijiensis effusa, a stout grower, with elegantly divided fronds; Gymnogramma chrysophylla grandiceps superba, which carries the cresting to the extreme possible; and other good things.

Florists' Flowers.

This popular section has in every class been advanced by new introductions, the most noteworthy of which have been illustrated in the *Gardeners' Chronicle*, and will be found enumerated in the following list.

Altogether, there is evidence that the work of the past year compares favourably with that of any period in the recent history of gardening, and that the art in all its branches is more generally taken up than ever it has been before, some of the things which had been slighted having again showed signs of renewed vitality, as, for example, the new Camellias shown by Mr. Wm. Paul; the hardy ornamental shrubs shown by Messrs. Jas. Veitch & Sons; Messrs. Geo. Paul & Son, whose Acer Negundo elegans, Ligustrum Walkeri, and Acer Jühlkei variegata are useful acquisitions: the Auriculas of Mr. Douglas and others; the Tree Pæonies which Mr. Kelway, of Langport, seems to have taken up with the same energy as he exercises in all the great cultures which he undertakes; and various other subjects which, although not wholly neglected in gardens, had not been so actively worked of late, but which during the past year seem to show a return to their former favour.

(*To be continued.*)

WATER.

Water is an essential factor in the life of a plant; if moisture is wanting, or if the roots do not transmit to the leaves water in quantities sufficient to provide for losses due to transpiration, the plant is endangered, and ceases to grow. If the scarcity of water continues, the crops dry up rapidly, and yield but a poor return. These crops are only abundant in proportion as the moisture furnished by the soil enables the plants to endure long periods of drought without suffering.

To ensure this provision, the grower, from autumn onwards, ploughs or digs up the land hardened by the desiccation caused by the plants themselves, and by the heats of summer. By breaking the superficial crust the water is not allowed to lie on the surface, but, on the contrary, penetrates beneath it. The first work is, therefore, undertaken with the special object of establishing a reserve supply of water in the ground, and, consequently, rendering it soft and pliable, so that further workings become possible.

These operations provide a tilth that, by progress in the construction of machinery, can be rendered deeper and deeper each year. It is turned over, the soil is broken to a depth of from 12 to 14 inches; nevertheless, the plough often forms hard compact clods, retaining water imperfectly; and the ground, after working, is not completely prepared. It is needful to break these clods by harrows, scarifiers, Norwegian harrows, or Crosskill's rollers, the object being to make the soil mellow and porous, so that on the one hand it may be charged with moisture, and on the other that it may allow all the water which it does not retain to filter through to the subsoil, thus ensuring it from loss by evaporation.

According as this pulverisation is thoroughly done, or imperfectly executed, the reserve of water will be copious or scanty, and the yield good or bad.

A good cultivator knows his land well: he knows in what condition it should be to be profitably worked, he knows the exact time to make the necessary preparation. If he acts carelessly, the soil is compacted into clods, it is badly tilled, and the crops dry up as soon as there is any lack of rain.

Winter is the season when this provision for water should be made, and consequently the earth should be worked then. When the seed-time comes, if an opportune rain does not fall to soften the seed and ensure germination, fresh stirrings and diggings are necessary.

When after the spring sowing the ground is hard, an endeavour must be made to supply the water lacking. The reserve supplies in the deep soil can alone be resorted to; to raise these to the higher levels, the land is rolled, and thus the continuity between the layer of worked soil and the sub-soil, which the working itself checked, is re-established. Instead of improving the soil, the object is to call into action capillarity, by means of which the water from the deep soil is raised to the superficial layers where the seeds have been placed. We have seen, in fact (in the *Annales Agronomiques*, t. xxii, p. 459), that worked land containing in 100 volumes from 38·3 to 40 volumes of air, holds only from 33·3 to 31·6 after rolling; the particles of earth being then brought together, and the rise of water facilitated.

All the successive operations during the year, therefore, aim especially at accumulating in the soil a supply of water sufficient, on the one hand, to allow it to pass deep down so as to serve as provision for the long roots; and, on the other, to cause it to rise into the upper soil to favour the germination of the seed. If it be remembered that the useful ferments contained in the soil, those which secure atmospheric nitrogen, as well as those which form the nitrates, are only effectual under conditions of moisture, if, further, it be remembered that in worked land carefully pulverised the quantity of nitrates formed is very great, it is plain that the cultivator should always consider the working of the land as the true source of abundant harvests, and remember that everywhere the emblem of agriculture is an implement used from all antiquity to dress the earth—the plough [whilst for garden use the spade is even more effectual. Ed.]. *M. Dehérain in "Annales Agronomiques,"* t. xxiii, p. 490.

SEEDING OF THE GREAT BAMBOO
(BAMBUSA ARUNDINACEA).

Some account of the seeding of this plant in its native country may not be out of place at the present time, when the cultivation of the hardier kinds of Bamboo in Great Britain is receiving such general attention, creating, as it were, another link of sympathy between the nations of the East and West, bringing to the minds of former travellers familiar and graceful objects in the landscapes of foreign climes, and to the untravelled some idea of the graceful beauty of one of the most interesting and wonderful genera of plants. It would almost appear that there is nothing in this life unaccompanied with some disappointing drawback, and the more exquisite "a thing of beauty" it first appears, the more crushing the subsequent disappointment.

In the case of the genus under notice, the drawback undoubtedly is the death of the plant after producing seed, this effort of reproduction being, I believe, in most if not all the species, fatal to the existence of the parent plant.

The seeding and subsequent death of at least some of the hardier kinds of Bamboo in Britain may, perhaps, be familiar enough to some people, but it may be doubted if it has fallen to the lot of many Englishmen to have witnessed the phenomena on a large scale in the native country of the Bamboo. It was my lot early in life to see this mysterious act of Nature in relation to the huge forests of Bambusa arundinacea covering hundreds of square miles of country in Malabar and Coorg, in Southern India, and reaching far into the adjoining province of Mysore. It was at the close of the year 1862 that I took up my residence in an upland district of Malabar, where the slopes of the Western Ghauts were clothed with gigantic evergreen forests, and from their base stretching for several miles into the Mysore territory, grew a veritable forest of Bamboo, intermixed with Teak and other deciduous and hard-wooded trees, the Bamboo predominating.

My primary object is to give some account of the seeding of the Bamboo, I yet cannot help writing a few words on the beauty and grandeur of this forest as I first beheld it, and before "decay's defacing fingers" had wrought desolation. Viewed as a whole from an eminence, nothing could well surpass the splendour of this vast area of waving plumes rising to a height of 60 to 70 feet; and individually the clumps as seen more or less isolated on the grassy laterite knolls, were of surpassing beauty. From March until nearly Christmas, the Bamboo is clothed with leaves of a pale delicate green, after which they begin to fall, and the jungle for a month or two is shorn to a great extent of its attractiveness. But there is extra beauty in the young leaves as they begin to appear in response to the first showers of spring. I shall never forget a ride I took on my first arrival in the country along a road leading from Malabar into Mysore, and cut right through the heart of the Bamboo-jungle, and when the trees had on their best attire. The huge clumps stood almost at regular intervals close by the road on either side, the culms bending over and forming a complete archway of greenery for miles. This was the grandest triumphal archway I ever beheld, and when the subsequent seeding and destruction came, one could hardly help lamenting the inexorable laws of Nature.

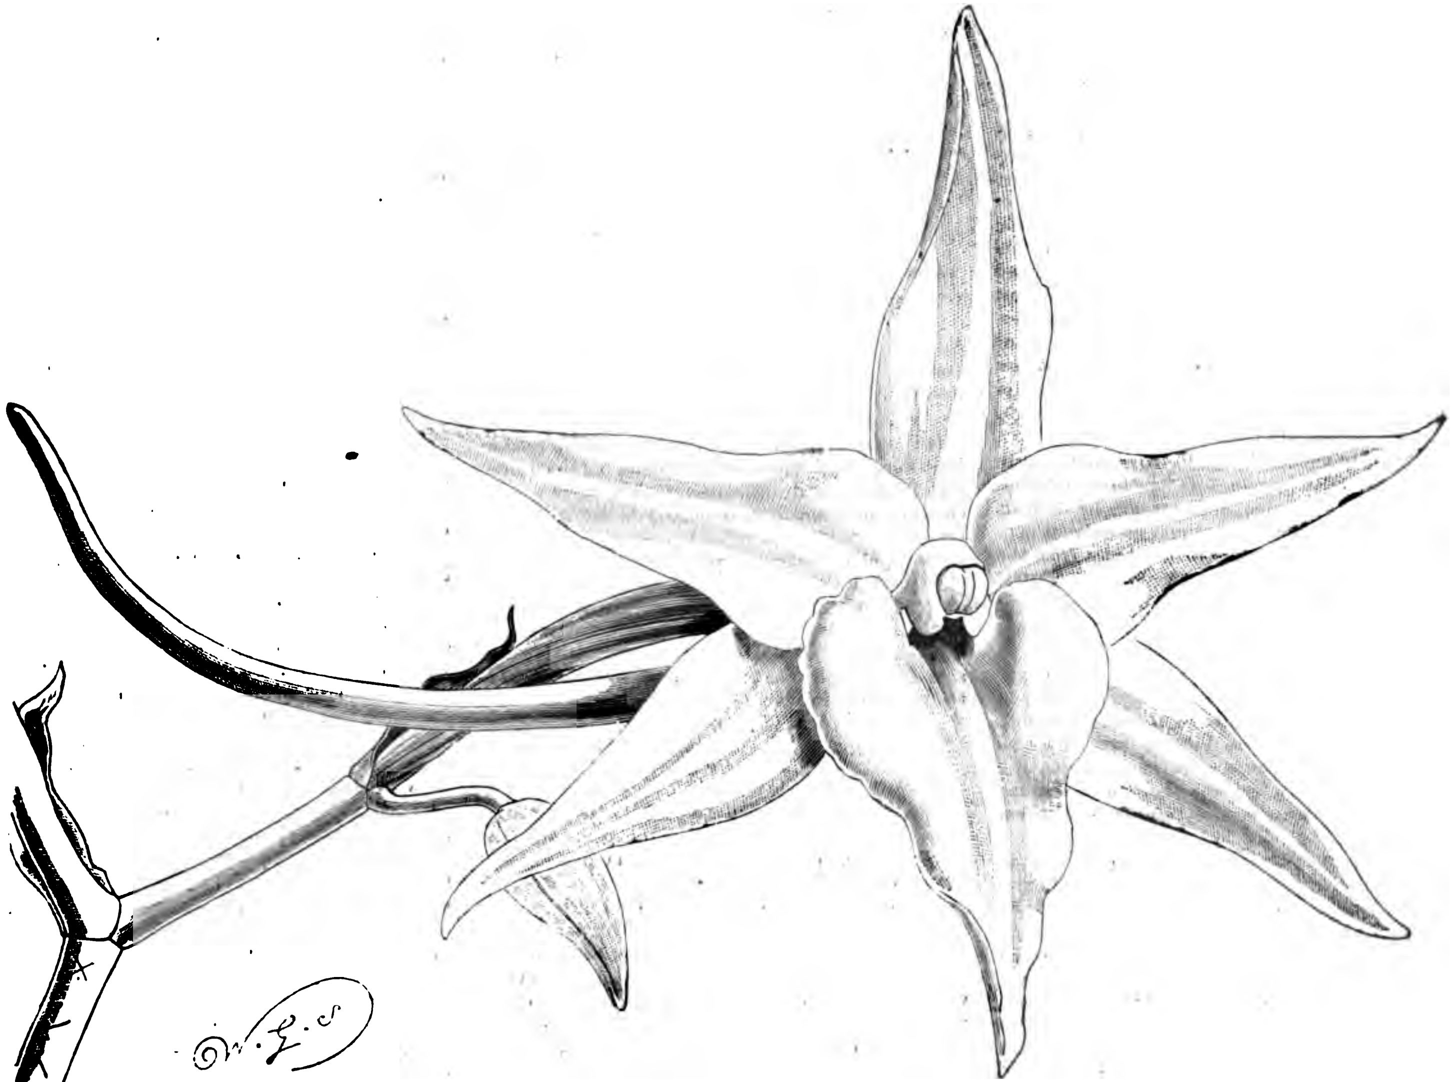

Fig. 10.—Angræcum Veitchi ×: a hybrid from A. sesquipedale by A. eburneum.

(See "Orchid Committee," in p. 31 of our last issue.)

Very soon after my arrival in Malabar, I heard rumours that the Bamboo forests of Travancore to the south were in seed, and in the following season our turn came, and then that of Coorg to the north. So that this strange frutescence would appear to have taken place in sections, beginning at the most southern point of India, and travelling northwards year by year.

When the seed became fully ripe, the culms were quite divested of leaves, and bent down with the heavy load of oat-like seeds—a magnificent harvest, it is true, but one which only occurs twice in a century, and which is then accompanied with the annihilation of the parent plants.

When the seed became quite ripe, it fell to the ground, which was quickly covered with what had a wonderfully close resemblance to Oats. This fall was the signal to the jungle tribes to lay up a store of the grain to serve them during the ensuing monsoon, and groups of men and women were to be seen all over the forests gathering and deftly winnowing the seeds, whilst pea-fowl, jungle-fowl, partridge, and others of the feathered tribe, were not slow in taking advantage of the bountiful supply of food, and waxed fat and lazy, and so became an easy prey to the fowler's gun. Long, however, before a tithe of the rich store could be consumed the season of jungle-fires began, and added by the thick coating of leaves on the ground, completely licked the Bamboo forests from end to end, to all appearance converting into charcoal every seed that had dropped from the trees, extinguishing every hope that the land would ever again resume its former appearance. Nature, however, had her own secret way of preservation, and as time went on, tiny little Bamboo seedlings began to appear, which year by year increased in strength till, in 1877, or fifteen years from the time of seeding of the forests, the country had all but resumed its former grandeur.

No description of mine could possibly convey an adequate idea of the scene of desolation the country presented after the death of the Bamboos over the whole extent of this magnificent forest, which was transferred suddenly from a scene of surpassing splendour into one of dust and ashes. The monsoon, which had brought revivifying power to the leafless Bamboos for the byegone fifty years, and bid them again and again burst into leaf and beauty, at last failed in its appeal to the "dull cold ear of death."

The succeeding hot season began its drying process on the dead culms, preparing them for the fires which were destined eventually to clear the country of every vestige of the old forest. It was several years, however, before this process was completed, and here again rested a marvel, viz., how the young seedlings escaped with life and increased in stature through the years of heat and smoke.

For several seasons in succession the country was filled with smoke from the combustion of the dead and dry culms from about January to April, which made it very unpleasant to the lives of the Coffee-planters and others. There was kept up night and day also a succession of loud reports from the ignition of the pent-up gases between the joints of the huge culms.

I do not know, but I sometimes doubt if there is any example in the vegetable kingdom which can boast of a more rapid growth in a given space of time than the culms of a fully-developed plant of Bambusa arundinacea in its native clime. The clumps send up a yearly supply of culms, which begin to appear in February, and by the end of July they have reached a height of from 60 to 70 feet, and are well furnished with lateral branches from top to bottom, with a diameter, close to the ground, of some 8 or 9 inches. The culms, as they issue from the ground, are furnished with a curious protecting capping of brown-coloured sheaths, which they retain till they reach a considerable height, and the points are out of danger—an admirable protective process of Nature.

With reference to the longevity of the Bamboo, I took considerable pains to arrive at the approximate truth. I questioned and cross-questioned on many occasions the jungle tribes, who had their homes in the seclusion of these Bamboo wilds, and who, previous to the advent of the Coffee-planting industry, hardly ever left, but lived on the produce from their small clearings, edible roots dug with pointed stakes from the woods, honey, and the fruits of the chase. One tribe was called Jain Coorumbers, or, in plain English, honey men, or honey collectors. They are a lively race of people, with a wonderful amount of intelligence, and withal a rare appreciation, among natives, of fun and humour. I singled out several of the elder and most intelligent of this interesting tribe for my inquiries, and arrived at the conclusion that fifty years, or thereabouts, was the limit to the life of Bambusa arundinacea. There were several other species of Bamboo in the district, which, curiously enough, seeded simultaneously with B. arundinacea.

The uses to which the larger Bamboo is put in Malabar and other provinces of Southern India are too numerous to mention, and it would be difficult to imagine what the natives would do without it.

The Bamboo in Malabar is found almost from the sea level up to an elevation of something over 3000 feet, so that its range is considerable, and although it is generally described as a stove-plant in England, it might, I think, flourish in a house with less heat than that usually assigned to a stove, and might possibly, without hurt form an interesting object in the sub-tropical garden during a warm summer. To make the canes more lasting, and, in some measure prevent the ravages of the white ant, the natives of Malabar adopt the practice of soaking them in water for some months before putting them to use.

The belief, or rather superstition, obtaining in some parts of England with regard to the influence of the moon on vegetation is also found amongst the natives of Malabar, and no native will cut a tree or a Bamboo for his own use during the wane of the moon.

For some reason unexplained these Bamboo forests of Malabar are very unhealthy, alike to European and native. Ague and fever prevail, more especially during the showery weather of spring, and immediately after the end of the south-west monsoon, when the ground begins to dry, or, as the natives put it, "during the making of mud and the making of dust." The natives sometimes attribute the prevalence of malarial fever in these jungles to the quality of the water, and I have frequently known a gang of coolies fresh from the Mysore stop at a Coffee plantation and taste the water, and then pass on to the next plantation.

If I am correct in thinking that the life of Bambusa arundinacea is limited to fifty years, those forests in Malabar which I saw in seed and then perish, will again come to maturity about the year 1913, when will be witnessed a very curious phenomenon in the vegetable kingdom. *J. Lowrie.*

MANURIAL REQUIREMENTS OF ORCHARDS AND FRUIT TREES.

IT does not seem to be sufficiently understood that fruit trees use up plant-foods in the same way that other crops do. The common neglect of orchards seems to show that many fruit-growers think otherwise, or else do not think about the matter at all.

We are told by Mr. L. H. Bailey (*Principles of Fruit Growing* *) that the depletion of land by fruit trees is very serious, from the fact that plant-foods are locked up for many years in the trunks and branches of the trees. On the other hand, it may be mentioned that the roots of trees have a larger foraging area than the roots of smaller-growing and annual crops. Thus, we find the roots of trees extending widely in search of food, while the roots of an annual crop have a comparatively limited range.

Fruit removes from the soil certain proportions of potash, phosphoric acid, and nitrogen, and these elements must be replaced if fruit-growing is to be a success. Potash is the predominating constituent in Apples, Cherries, Damsons, Peaches, Grapes, and most stone-fruits, while nitrogen takes the lead in Pears. A sufficiency of lime is also very essential in the growth of Pears.

The following table gives the relative amounts of the essential ingredients in Apples, Pears, and Peaches per 100 bushels of fruit :—

Selected Constituents in 100 Bushels of Three Descriptions of Fruit.

In 100 Bushels of—	Phosphoric Acid.	Potash.	Nitrogen.
	lb.	lb.	lb.
Apples	1	10	7
Pears	1½	4	7
Peaches	2½	13	6

It is more economical to grow large marketable fruit than small unsaleable samples, as the latter take from the soil, bushel for bushel, more of the elements of plant-food than the better grades of fruit do.

Professor Roberts has estimated the amount of plant-food which may be expected to be carried away in the fruit of the Apple, and blown away in the leaves of the tree (not computing the amount stored up in the wood), for the period between the ages of thirteen and thirty-three years of Apple-trees, to be as follows :—

	Apple-fruit.	Apple-tree Leaves.
Nitrogen	499 lb.	... 457 lb.
Potash	729 ,,	... 442 ,,
Phosphoric acid ...	38 ,,	... 126 ,,

Thus, it is seen that, during the twenty years of fruiting-growth, there will be required in fruit and leaves 956 lb. of nitrogen, 1171 lb. of potash, and 164 lb. of phosphoric acid.

While the above results are obtained by assuming a given amount of Apple-fruit and leaves per year in a fruitful orchard, and while the facts in any given case, at any given time, may vary widely, yet it is believed that these figures are valuable, because they furnish a means of measuring in any given case with a great degree of accuracy the amount of soil exhaustion.

With regard to the question of manure, whatever is used as an orchard fertiliser should be readily available, so that the trees can be benefited from the period the manure is worked into the soil.

Professor Voorhees writes : "It is argued by many, and sometimes by those who should know better, that fruit-growing is quite similar to growing timber-trees ; that the question of soil-exhaustion is not a matter of very great importance, provided the soil is well cultivated, and that all soils contain sufficient quantities of the food elements to ensure the relatively small available supply required from year to year."

It is admitted that on soils of good mechanical condition, well drained and cultivated, which are naturally adapted by their fertility for fruit-growing, because well supplied with the essential constituents, namely, nitrogen, phosphoric acid, potash, and lime, the exhaustion arising from the continuous removal of fruit crops will not become apparent for a long time ; but it should be emphasised that it is only upon soils which possess these characteristics that the growth of fruit, even poor fruit, can be obtained for any considerable period without the application of manure.

It is evident that the manurial requirements of culinary vegetables and similar crops must be different from those necessary to the growth of fruit. In the first place, as a rule, vegetable crops require but one year for the entire processes of growth and maturation. For fruit-crops, on the other hand, with but few exceptions, the purely vegetative processes continue for at least three years, and with many kinds much longer. After the fruit-bearing period begins the vegetative processes do not cease, but are coincident with the growth and ripening of the final product, the fruit.

In the second place, the yield of fruit-trees differs very materially in its character from that of ordinary garden crops, which develop and mature their products in one season ; while the larger fruits, such as Apples, Pears, Quinces, &c., require a whole season for their growth and maturation. Accordingly, it is necessary that there should be a constant transfer of the nutritive juices from the tree to the fruit throughout the entire growing season, while the growth for each succeeding year of both trees and fruit is dependent upon the nutrition acquired and stored up in the buds and branches, as well as upon that which may be derived directly from the soil.

In the third place, the relation of fruit-growing to soil exhaustion is very different from that in kitchen-garden crops, because in orchards there is an annual demand for specific kinds and proportions of soil constituents ; it is really a continuous cropping of the same kind ; there is no opportunity, as in the case of ordinary garden crops, to correct the tendency to exhaustion by a frequent change of crops, or the frequent growth of those which require different kinds and amounts of plant-food constituents.

In studying methods of manuring orchards, however, it must be admitted that the general principles of manuring which apply to fruits, apply quite as well to kitchen vegetables ; that is, the essential constituents of manures must be the same. A fruit-tree will not make normal growth in a soil destitute of nitrogen. That nitrogen encourages leaf-growth is a recognised fact, and since trees grow by means of both leaf and root, its presence is required in the soil in order to promote the growth and extend the life of the tree.

It is evident, too, that potash is an essential constituent in the growth of fruits, not only because it constitutes a large proportion of the ash of the wood of the Apple, Pear, Cherry, and Plum, and sometimes more than fifty per cent. of the ash of fruit, but because it forms the base of the well known fruit acids ; and in order to nourish a tree properly, as well as to insure proper ripening, phosphoric acid is also very essential, especially for stone-fruits.

It is also a matter of common observation that, in the production of stone-fruits particularly, lime is an important constituent. Its function seems to be to strengthen the stems and woody portions of the tree, to shorten the period of growth, and to hasten the time of ripening. Fruit-trees growing on soils rich in lime show a stocky, steady, vigorous growth, and the fruit ripens well, while those on soils which contain but little lime, particularly the clays, appear to have an extended period of growth, the result of which is, that the wood does not mature, and the fruit does not ripen properly. *J. J. Willis, Harpenden.*

CURIOSITIES OF ORCHID BREEDING.

(*Continued from p.* 14.)

PREPOTENT GENERIC CROSSES.—Perhaps the strangest curiosity in the history of Orchid hybridisation is the remarkable prepotency of the genus Zygopetalum over the three genera Odontoglossum, Oncidium, and Lycaste, so far as experiments have been made. Zygopetalum Mackayi (Hooker) has been crossed with four distinct species of Odontoglossum, viz., O. Pescatorei (Linden), O. crispum (Lindl.), O. grande (Lindl.), and O. bictonense (Lindl.), also with one species of Oncidium, O. unguiculatum, and one species of Lycaste, L. Skinneri (Lindl.), by more than one hybridist, and the result has always been the same, namely, Zygopetalum Mackayi pure and simple, without a trace of the peculiar structure of the pollen-parent in any case. The result is very perplexing, and exceedingly difficult to account for. Parthenogenesis, too, is evidently a broken reed to lean upon, for the seedlings from the same seed-pod differed among themselves in colour and other minor characters, which would hardly have been the case had they arisen from parthenogenetic seed-buds. Neither is Z. Mackayi naturally prepotent over other species when crossed, there being at least three cases to the contrary. Nor is the genus Zygopetalum naturally prepotent over other genera, as two distinct and intermediate hybrids between Zygopetalum and Colax testify. As in the case of the Epidendrum crosses, mentioned above, it may be suggested that Zygopetalum is the ancestral genus of Odontoglossum, Oncidium, and Lycaste, and that the characters of the ancestral genus remain latent in the more recent genera, with the result that when the latter are crossed with the former, the mixing of the germ-plasms causes these original characters to dominate, the outcome being a reversion to the ancestral genus Zygopetalum.

---

* *The Principles of Fruit Growing*, by L. H. Bailey (Publishers, Macmillan & Co., London).

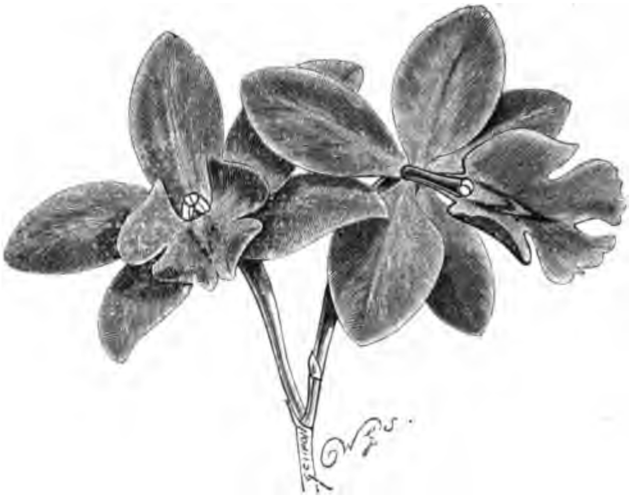

Fig. 11.—Epi-Cattleya Mrs. James O'Brien × ; flowers rosy-purple.

A rather interesting fact has come to light which certainly lends colour to the above speculation:—The seedling Odontoglossums, raised in the gardens of Baron Rothschild, of Paris, during the first eighteen months of their growth, are said to have resembled Zygopetalum more than they did Odontoglossum. This coincides with the established fact that living beings tend to resemble their ancestors in the early stages of their development.

Another curious fact in connection with generic crosses may perhaps be of interest, and that is the remarkable crosses between the East Indian species of Cypripedium and the South American species; these two sections of the old genus Cypripedium have recently been raised to generic rank, under the names of Paphiopedium and Phragmipedium respectively, by Mr. R. A. Rolfe, of Kew, and seem to form two distinct and natural groups. Hybrids between these two new genera are peculiarly interesting, inasmuch as the former has a one-celled ovary, while the latter has a three-celled one, showing that this condition is no barrier to fertilisation. More than twelve distinct crosses between different species of these two genera are on record, and many plants have been raised, but so far all resolutely refuse to flower, notwithstanding the many inducements that have been put in their way, and many of them are now large vigorous plants, long past the usual flowering age. One plant of these crosses is recorded to have flowered in the United States, but as it flowered exactly the same as the mother-plant in genus, species, and variety, one cannot be quite sure that the cross was really effected.

Many of the remaining plants (the writer has several in his collection) are distinctly intermediate in their foliage and habit of growth, and clearly bear the stamp of their recorded origin.

Secondary and Tertiary Hybrids.

Of the 800 distinct crosses mentioned in the foregoing, some 270 are secondary hybrids, i.e., hybrids of the second generation, one or both parents being a primary hybrid; while thirty are tertiary hybrids, i.e., hybrids of the third generation, one of the parents, at least, being a secondary hybrid. So far no hybrid Orchids are recorded to have flowered beyond the third generation, but perhaps it may not be premature to mention that unflowered hybrids of the fourth generation are known to be in existence. The writer has in his collection six hybrids of the fourth generation, five years old, all raised from the same capsule, and which contain in their pedigree five distinct species, and three distinct hybrids; so that in the near future there will be ample material in this direction at the disposal of the student of heredity; with this distinct advantage, that Orchids being individually valuable, their pedigree is carefully and systematically recorded, which unfortunately is more than one can say of the great majority of garden hybrids.

A careful examination of secondary hybrids shows them to be very different from primary hybrids in their range of variation. As we have already seen, primary hybrids are comparatively uniform in their characters; so much so, that, as a rule, they are quite distinct from their parents. On the other hand, secondary hybrids have a much wider range of variation, often approaching either parent, and sometimes even reverting wholly to one or the other. For instance, to take the simplest form of a secondary hybrid, i.e., a hybrid crossed with one of its parent species. We find that the offspring, as a rule, are very variable, a few reverting to the parent species, and a few to the parent hybrid; but the great majority are intermediate forms approaching either parent, the whole forming a series of links between one parent and the other. In short, we find that secondary hybrids have a far wider range of variation than have primary hybrids.

Natural Hybrids.

The existence of natural hybrids was formerly thought by some naturalists to be highly improbable, if not actually impossible. But now, when absolute facsimiles of supposed natural hybrids have been raised by hand in gardens, from the same two species among which they naturally grow, they can no longer be regarded as pious speculations, but are indeed accomplished facts. The number of proved natural hybrids in Orchids alone is now very considerable, with the result that many intermediate and doubtful forms, hitherto classed as distinct species, are now placed in their proper position as natural hybrids. Mr. R. A. Rolfe, of Kew, has done yeoman service in reducing the chaos of natural hybrid Orchids to something like order. And so it has come to pass that artificial hybridisation, which it was supposed would lead systematic botany into the direst confusion, by the irony of fate, seems destined to be the only trustworthy means of saving systematic botany from its own confusion; and the systematist, however orthodox he may be, can no longer afford to ignore artificial hybrids. *C. C. Hurst, in "Nature."*

(To be continued).

ORCHID NOTES AND GLEANINGS.

EPI-CATTLEYA MRS. J. O'BRIEN.

This is a cross between an Epidendrum, itself of hybrid origin, and Cattleya Bowringiana. The plant was raised by Mr. Seden, and shown at the Royal Horticultural Society on the 10th inst. by Messrs. Veitch, when it received an Award. The habit is that of Epidendrum, and the general appearance of the flower (fig. 11) is also like that of an Epidendrum, but the lip, although connate with the column, as in Epidendrum, has its scoop-like lateral lobes partially encircling the column, thus showing traces of its Cattleya parentage, and the rich deep rosy-lilac colour of the flower recalls that of Cattleya Bowringiana. The upper end of the column is petaloid, as in Cattleya; so that, while on the whole, the appearance is that of Epidendrum, closer scrutiny reveals the existence of peculiarities belonging to Cattleya.

The flower is about 4 to 5 cent. in its longest diameter, and rather less transversely. The sepals are ovate-lanceolate, broad at the base, about 1 cent. broad in the centre. The petals are about 15 mill. across, the broadest portion being between the base and the middle. They are ovate-oblong, narrowed at the base, so as to be almost stalked. In colour, both the sepals and the petals are bright rosy-lilac. The lip is even deeper in colour, between 2 and 3 cent. in longest diameter, 2 cent. in greatest breadth. The stalk of the lip is connate with the column; the disc is oblong, with two lateral, oblong, rounded, erect lobes, and one anterior, flat, spreading lobe, the latter being divided into two rounded, slightly-toothed lobules, separated by an excised sinus. The column is about 1 cent. long, deflexed into a horizontal position, dilated above into two petaloid lobes, one on each side of the concave stigma. The two halves of the anther are widely separate; each of the four subdivisions contains a linear, imperfectly-developed granular pollen-mass. The slender, elongate ovary is marked by six prominent rounded ribs, separated by as many furrows. It contains a single cavity, with no trace of ovules.

Dictionnaire Iconographique des Orchidées.—The last numbers, dated August and September, 1898, but which have only lately reached us, contain figures of Angræcum eburneum, Bory; Cattleya granulosa var. Schofieldiana; Cypripedium Lachesis, Reg. Young; C. nitens superbum; Dendrobium Calceolaria, Carey; D. densiflorum, Wallich; Odontoglossum crispum var. Wrigleyanum;

O. citrosmum, Lindley; Oncidium micropogon, Rchb. f.; Phaius, Norman, var. roseus; Sobralia xantholeuca, hort.; Vanda Kimballiana, Rchb. f.; Vanda Denisoniana, Benson and Rchb. f. In the September number are Angræcum modestum, Hook. f.; Cattleya labiata var. Petersii marmorata; C. Prewetti, hort.; Cyrtopodium punctatum, Lindley; Dendrobium superbiens, Rchb. f.; Lælio Cattleya, Kranzlini var. Clementinæ; Miltonia candida var. purpureo-violacea, Cogniaux; Odontoglossum Hunnewellianum, Rolfe; O. Andersonianum, Rchb. f.; Oncidium chrysomorphum, Lindley; O. caloglossum, Rchb. f.; Phalænopsis amabilis, Blume; Vanda lamellata, Boxalli, Rchb. f.

This useful little publication, which has the immense advantage of scientific accuracy, has now completed its second year of publication, and a list of all the plates hitherto published is given, arranged in the order in which they may be placed in the little portfolios issued with the plates. At present a considerable number of the genera are without any "farde special," but we trust, as the series progresses this defect may be remedied, so that each genus may have its own portfolio. We are glad to find that M. Cogniaux does not break up the old genus Cypripedium, but adopts the newly-proposed names as sectional.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.

Bedding-plants.—All stock plants should be kept well up to the light to keep the growth sturdy and the foliage strong; give sufficient water to keep them from flagging, so that in a few weeks' time, when the daylight lengthens, and with the application of more heat, they will throw good cuttings. Pelargoniums should have plenty of air and light, to prevent damping-off. Keep all flower-buds picked off, as this weakens the growth.

Pæonies.—Plants of P. officinalis, which, having grown into large clumps, are showing signs of weak growth in the centres through the soil having become exhausted, should be lifted and divided into pieces by means of a sharp spade, leaving on each division from four to eight crowns. All roots much damaged in the operations should be removed with a knife, and the wounds dressed with powdered charcoal. The divisions, when early planted, take readily to the new soil, and bloom freely the second year. If planted in shady positions, the blooms last in perfection a long time. The stations for the new plants should be heavily manured and deeply trenched, new loam and crushed bones being added to the staple.

Tree Pæonies (P. Moutan).—These, unfortunately, push their young growths so early in the spring that the flower-buds are apt to get killed by frost. In planting choose a position facing west, or where the cold cutting wind from the east does not reach them, but as fully exposed to the light as possible, consistently with the necessary shelter, so as to encourage stocky growth; isolated places on lawns, or in nooks backed up by shrubs, suit these varieties admirably. In planting Moutan Pæonies, being usually grafted on stocks of the common Moutan and P. albiflora, should be planted sufficiently deep to cover the point of union. A nice selection of the best double varieties, and those which can be purchased in good-sized plants, may consist of Reine Elizabeth, Gloria Belgarum, Jeanne d'Arc, Louise Mouchelet, Madame de Vatry, Madame Laffay, Madame Stuart Low (very fine), Princess Louise, Gloire de Versailles, Marchioness of Granby (semi-double), and Rubida.

Herbaceous Pæonies.—These plants being perfectly hardy, require but little attention when planted properly; and the flowers are excellent for cutting, being delicately scented, and very showy. Here we have them planted on the edge of shrubberies, or in kidney-shaped beds, alternate with the yellow-flowered crown Imperial, Fritillaria imperialis maxima lutea, for the sake of the pleasing contrast of the yellow flowers of the former, against the young red-shoots of the Pæonies. In planting these varieties, the same kind of compost may be used as I have recommended for the tree section. In selecting places for them in the shrubberies, see that the shrub near is not one whose roots will rapidly encroach and deprive the plant of its nutriment. There are so many good varieties that I will only name a few of the best, that is, those which have good substance, fine colours and good form, viz., Duke of Clarence, Glory of Somerset, Mountebank, Princess Beatrice, Princess May, Queen Victoria, Lady Alexandra Macduff, Gwendolin Cecil, Lord Rosebery, Connie Culot, General Millekin, Lottie Collins, Festiva, Phormis extra fine, and Persimmon. These should have prominent places afforded them, and older varieties removed, parted, and planted in the reserve garden.

THE ORCHID HOUSES.

By W. H. Young, Orchid Grower to Sir Frederick Wigan, Bart., Clare Lawn, East Sheen.

Phalænopsis.—Various members of this interesting genus will, when grown with success, be on the point of displaying their blossoms, and the species about to do so are P. amabilis, grandiflora and its variety aurea, Schilleriana, Stuartiana, Sanderiana, and the natural hybrids casta, Cynthia, leucorrhoda, and intermedia. The plants, if suspended now, will have to be lowered as the spikes lengthen, in order to prevent contact with the roof. The plants will need a fair amount of moisture at the root and humidity in the air, more indeed than otherwise would be the case if it were not necessary to use fire-heat largely to maintain the required temperature. My method of affording water to Phalænopsis is to immerse the baskets containing them in a pail of water to about two-thirds of their depth, leaving capillary attraction to moisten the remaining portion of the materials. In doing this, frequent applications are necessary, and the sphagnum-moss never gets into a saturated state. Failure in the cultivation of these lovely plants is often due to attempts made to keep the sphagnum-moss living and green by frequent and copious applications of water during the winter months. Phalænopsis Luddemanniana, P. violacea, P. speciosa, P. Mariæ, P. Boxalli, P. tetraspis, and others of that section, should occupy the moistest and shadiest part in the East Indian-house, and should be afforded water in the same manner as the other species. P. Esmeralda, and its varieties antennifera and Brysoniana, with P. Lowii, will need water only occasionally, to prevent the young leaves shrivelling. I believe they are deciduous in a state of nature, and the last-named is often so under cultivation, without being apparently injured thereby. Drip from the sash-bars always causes injury when it falls into the centre of a plant, and to lessen the chances of injury from this cause the plants should occupy positions midway between the bars. It is well to carry a soft-haired brush when watering, so that should any water fall into a plant it can be removed. The sash-bars should be wiped with a sponge fastened to the end of a stick when there is a large accumulation of moisture on them.

Destroying Slugs and Snails.—The mild open weather suits most of the inmates of the cool-houses, and the small amount of fire-heat used or necessary is especially beneficial to Odontoglossum crispum and allied species. Many of the plants in these houses are throwing up their flower-spikes, needing careful protection from slugs and snails. To capture these creatures, saucers containing bran, Cabbage and Lettuce-leaves, and other tempting baits should be placed amongst the plants, and examined nightly. The practice of standing the plants on an inverted pot, placed in a saucer of water, is not to be commended, as the potting materials remain wet for too long a period of time to be good for the plants. Wadding also placed round the flower-spike is of little avail, for it soon gets moist, and then it forms no longer a barrier to the slugs. A plan worthy of a trial is to insert a disc of perforated zinc between the plant-receptacle and the one it stands on, its edges extending about an inch from either.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

Early Figs in Pots afford the earliest crops of fruit, and where no house can be set apart expressly for their cultivation, the early vinery or Peach-house will be found convenient places during the early stages. Those trees that were brought in some time since will have burst into leaf, and it will be safe to adopt a higher temperature. The materials for affording bottom-heat will probably stand in need of replenishing, so that no serious fluctuation of warmth to check root-action ensues. If the plunging-thermometer indicates a temperature above 80°, raise the pots slightly from their position, so that some of the heat may escape, and when a cooling of the bed takes place, the pots may be re-plunged. When five or six leaves have been formed pinch out the growing point of the stronger shoots; weaker ones may be stopped before they reach this length. This regulation of the growth will assist the fruit, as well as prepare for a successional crop in the current season's shoots. A temperature of 70° from fire-heat will be ample for the earliest trees, with 10° higher during sunshine. At this point ventilation may be afforded, in accordance with external conditions. Syringing will be necessary daily when there is sun, and the floors must be kept moist by repeated damping down with a rose watering-pot or a syringe.

Successional Trees.—These usually occupy a portion of a house in which Peaches or Vines are grown, the back wall frequently being allotted them. Here their general treatment is identical with that given the other inmates. If the Fig crop is an important one, they will have priority of attention. The same routine in cleaning of the roof and walls, dressing the trees with an insecticide when scale or mealy-bug have been troublesome, should be given as with earlier-started trees. Where there is a tendency to excess of vigour, there is yet time to correct it by shortening the chief roots, whether the plants are growing in a border, or in small brick-work divisions. In the latter they invariably stray beyond the walls, and when this happens, it is easy to shorten them back to the walls with a spade and knife. Lime plays an important part in the successful culture of Figs, and it should be freely afforded on the surface, preferably that gathered from old and demolished buildings, or old ceiling and other plaster. When this cannot be obtained, slaked lime in smaller quantities may be put on frequently, and washed in with clear tepid water. Together with the lime, new turfy loam may be added as a top-dressing, first removing some of the old surface-soil. In pruning, allow sufficient space for full leaf-development, and cutting away as much of the old and bare wood as possible, and providing for an evenly furnished tree from the ground-level upwards. Trees about to be started should be afforded a moderate application of tepid water if the soil be dry. Those that are in active growth must have careful attention in this matter, or the swelling fruits will assume a yellow tinge, and eventually fall off.

THE HARDY FRUIT GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

Feeding Land under Fruit Trees in Winter.—Trees of Apples and Pears, or, in fact, any kind of fruit-tree of which the growth, from poorness of the soil or from heavy cropping, is not satisfactory may be assisted by manure at this season. In many instances, sewage-tanks, catch-pits, and other receptacles adjoining dung-yards, stables, &c., in which the drainage from cow-sheds and stables is collected, often become full, and overflow at this season; where such is the case, fruit-trees in the state described may usually be found to which manure-water can be afforded advantageously. Care should be taken that the liquid is diluted rather than strong when using it on the land, although the latter will absorb moderately strong manure-water without injuring the trees. Pear-trees, from the nature of their foliage, have a tendency to shoot off the rain beyond the reach of many of the roots, and, no doubt, some trees are yet in a dry state that received no water in the summer; for although many wet days have occurred, the rainfall to the end of December was very slight, and about 6 inches below the average in our southern counties. This state of the soil was very recently noted when moving a few pyramidal Pear trees, where the ground was firmly trodden down, for lower than 12 inches from the surface the soil was quite dry; and the soil under a standard Apple tree blown down in the recent gale (12th inst.), was in a similar condition. I can therefore recommend applications of water even at the present time, and manure-water may also be advantageously applied, especially where the soil is naturally light. Old fruit-trees usually need most assistance in the way of manuring. Where the soil is known to be in an exhausted condition, the present is a suitable time for renewing or top-dressing the same with new soil and rich manure. In doing this, first remove the surface-soil for a few inches in depth, not injuring or destroying any roots. Bone-meal and wood-ashes, mixed together in equal quantities, are found beneficial, and they should be applied in sufficient quantity to just cover the surface, and afterwards be lightly pointed in. If new loam be available, it may be added in quantity to the staple, and be covered with a mulch of half-rotten manure.

Pruning and Manuring Raspberry-canes.—Where the young canes were not thinned to the required number in the autumn, the thinning should be carried out forthwith, and the old fruiting-canes of last season cleared away and burned. If the canes are trained to wires stretched horizontally, the space apart at which they are planted must regulate the number of canes reserved for this season's fruiting; in any case, a too close training should be avoided, and ample space afforded for summer-fruiting growths. Four or five canes will in most instances be quite enough, and this number should suffice where a single stake is given each stool. In either case, the young canes should be topped at a height of from 4 to 5 feet, and be secured with tarred string or withes to the wires or stakes. Raspberries grown for autumn fruiting should be cut down nearly to the ground. As Raspberries produce numbers of fibrous roots near the surface, digging of the land should not be practised; but after clearing away weeds and rubbish, the ground should be slightly stirred with a fork, and a top-dressing of short-manure afforded, from 12 to 18 inches on either side of the rows. Wood-ashes may also be strewn on the land before laying on the manure. When the rows are from 4 feet to 5 feet apart, the central space, for the width of 2 or 3 feet, may be forked over deep enough to cover in weeds or rubbish, and a dressing of manure, especially if a row or two of some vegetable, as early Savoy Cabbages or Lettuces, be grown between, which may be done when planted at this width without any injury to the canes.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Cauliflowers.—I prefer the old method of raising the earliest crop of this vegetable from a sowing made in the open air in the month of September, transplanting the seedlings under handlights or in cold frames, and for this sowing I have found no better variety than the Walcheren. Afford the plants in handlights and frames all the air possible by the removal of the tops and lights, and only cover them when frost is likely to occur. Keep the surface fresh by stirring the soil, and endeavour to get sturdy growth in the plants. If this old-fashioned practice has made way for winter sowing, a pinch of seed of the Early Erfurt type, and two other trusty varieties to form a succession, should now be sown, sowing in pans or well-drained shallow wooden boxes filled with sandy loam and leaf-mould. Sow the seed thinly, and place in a temperature of 55°, and when the young plants appear, stand the seed-pans in a rather dry atmosphere in preference to a humid one, much humidity causing the plants to damp off; and keep the soil rather on the dry side. When the seedlings have got two leaves each, prick them off 2 inches apart, either in small pots or shallow boxes, and grow them on as sturdily as possible, the aim with spring-sown plants being to keep them from getting checked, as if once this happens, they fail to produce fine heads. The ground on which to grow these Cauliflowers should be thoroughly prepared by digging it two spits deep, and using plenty of rich manure.

Seeds.—Let the remains of last year's seeds be tested for their germinating qualities previously to ordering the present season's seeds. To test any of them let a certain number of each variety be placed in small pots and stand these in moderate heat, and those which take a long period to germinate, or which come up irregularly, should be put aside, as they cannot be depended upon for sowing outside. Every gardener should try a few novelties each year in small quantities, and such as are found to be superior to old varieties should be grown in quantity the next year.

Watercress.—Wherever there is a stream of clear water Watercress may be grown, there being a general demand for this plant as a salad. It can be grown on the north side of a wall, or in a special damp part of the kitchen-garden, and even in pots stood in pans, which are stood in shallow saucers of water. Permanent beds should be now cleared of weeds and rubbish, being planted anew every second year, which job may be done at almost any time after this date. Take up the quantity required to be replanted, then clear out all the rest, weeds and rubbish, out, and replant, laying pieces of stone on the plants to keep them where required.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Winter-flowering Begonias.—The earlier-flowering section of Begonias, which includes Gloire de Lorraine, John Heal, &c., are now out of flower, and the plants should be cut back to within a few inches of the soil, if that has not already been done, at the same time reducing the supply of water until signs of fresh growth are apparent. When they have made sufficient growth, the cuttings should be taken, inserted in sandy soil, and placed in the propagating-frame, or under a bell-glass in the stove.

Begonia socotrana is now at its best. This beautiful species is one of the parents of most, if not of all, the hybrid winter-flowering Begonias. It is not easy to induce it to flower before Christmas, but from the new year onwards it is a most valuable plant, and reigns supreme among Begonias for late-winter-flowering purposes, producing strong trusses of bright pink flowers, which remain a long time in perfection. It is a native of Socotra, as its name implies, and therefore enjoys plenty of heat and moisture; and while growing should be given a light position in the stove, or other house, where the night temperature ranges from 60° to 65°. When in bloom, the plants may be placed in an intermediate temperature if required.

Begonia corallina is of but little use when grown as a pot-plant, but planted out in a warm-house, and trained to a pillar, or, preferably, to a trellis on the roof, it becomes a most striking object. It flowers the whole year through when well grown; but when it is required to be at its best during the winter mouths, it is a good plan to cut off all its flower-trusses early in June, shortening the growths somewhat at the same time, and affording more air and less water. Thus treated, the plants take a short rest, and then break into fresh growth, and commence to flower at the end of October, the huge trusses of bright coral-red flowers hanging from the trellis in the greatest profusion. When planted out in this way, it should be afforded plenty of root room, and good drainage; and when the roots have taken possession of the soil, the plants should be given manure-water at frequent intervals, to compensate for the loss entailed by the production of such great quantities of bloom. The cut blooms are very useful for dinner-table designs upon the cloth, but the trusses are too large and loose for ordinary decorative purposes, its chief use being for the furnishing of pillars and roof-trellis, as described above.

Dipladenia boliviensis.—This white Dipladenia flowers very freely in 5-inch pots, when propagated annually by means of cuttings. The best results are obtained when the cuttings are inserted in the autumn, but cuttings taken at the present time, and placed in thumb-pots filled with peat, loam, and plenty of sand, and plunged in the propagating-pit, will soon strike, and if when they are sufficiently rooted, they are potted into 4½-inch or 5-inch pots, and grown on in the stove, they will flower at the end of the summer or early in the autumn.

Allamanda nobilis and A. Williamsii.—Plants of the former which have been rested and cut back to within 12 or 15 inches of the old wood, may now be introduced into heat if they are required for early flowering, and if they can be afforded bottom-heat by being plunged in a hot-bed in the Melon-house or pot-vinery, the breaking will be greatly facilitated. When the plants have made a few inches of new growth they may be repotted, reducing the ball and returning them to the same sized pots in the case of large plants. The smaller-flowered Allamanda Williamsii flowers freely in small pots, and a plant or two of that variety may be cut back and introduced into heat to provide cuttings, and if these are taken off with a heel when 3 or 4 inches long and inserted in thumb-pots filled with sandy soil, and plunged in a hot-bed, or propagating-frame, they will take root freely. They should be stopped once or twice, in order to produce bushy plants, and be afforded several repottings, the final shift being into a 5-inch or 6-inch pot, in which they will flower freely at the end of the summer. An open porous compost should be used, such as three-parts good loam, one part leaf-soil not too rotten, and half a part each of silver-sand and crushed charcoal, to which may be added a sprinkle of bone-meal.

THE APIARY.

By Expert.

The Apiary in the Winter.—I believe the question of shelter in outdoor wintering is of more importance than is generally believed. Though it is true that in some instances colonies have been known to winter safely when exposed to the fierceness of the winds, these exceptions instead of weakening the rule, can only strengthen it, for it will always be found that the circumstances otherwise were most favourable where the results were so unexpectedly good. In a natural state, the bees which resort to hollow trees can hardly be used as a safe criterion, for we have no means of knowing how many or how few such colonies winter safely in this climate; but even if it could be proven that they generally succeed, the fact that their abode is usually at only a short distance from the ground, and in thick timber, where the force of the wind is lightly felt, and the additional fact that the body of the trunk which they inhabit is very thick—much thicker than our improved hives—would still indicate that some shelter is advisable. The straw-hives formerly used by the old apiarists of Europe were certainly very good abodes as far as winter protection was considered, for they were very thick, and the material used is one of the best non-conductors of heat or cold. But it is out of the question to make such hives to-day, or at least to put them in use in a practical way, so we must see what we can do with the ordinary movable frame-hives. Double-wall hives are very good for winter, especially where they have a dead-air space between the two walls. They are exposed to two weighty objections. The first is, that in the warm days, or in early spring, they are not readily and quickly warmed by the first rays of sunshine, and the bees in them will be less readily induced to take a flight. The other defect is, as to their cost. Few bee-keepers will adopt them because of the expense involved in the purchase of such hives. This objection should have no weight with a practical man, who will readily figure that the first cost of a hive is a trifle when he considers the time of its usefulness, which may be reckoned, if the hive is well made and well painted, not less than thirty years. But, since most of our apiarists have only single-walled hives, it is useless to spend much time in the consideration of anything else. A bee-house, if properly made, built as a shed, with a roof, and three sides closed for winter, would be an ideal wintering place, especially if the front could also be closed during stormy days, and the hives more or less packed in straw, leaves, &c. But a bee-house for a large apiary is almost out of the question, and it is only in small apiaries, or in cities, that they are used. A tight board-fence is a good shelter, as far as it goes, especially if on the north side of the apiary. A movable outer covering, made so as to fit over the hive, and arranged so that it may be taken to pieces and piled away for summer, is very good. It may be made of rough boards, or of thin lumber, to be more easily handled when removed. But it must be so arranged as to permit of the bees' flight during warm days, as said before. It would be a big error to place the bees in any repository, or to cover them with any shelter which prevents their flight, unless the temperature of such repository were kept evenly at the point which would enable them to remain inactive with the smallest possible consumption of stores. That is why the placing of bees in garrets, or enclosed sheds, where they are certainly warmer than out-of-doors, but where the temperature nevertheless falls much below the freezing point, or rises, in warm days, so as to make them restless, has always been an entire failure.

(To be continued.)

Chrysanthemums.—M. Couillard estimates the number of known varieties of Chrysanthemum at more than 8800.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	JAN. 24	Roy. Scot. Arboricultural Society's Annual Meeting.
WEDNESDAY,	JAN. 25	Renfrewshire Gard. Imp. Soc. meet.
THURSDAY,	JAN. 26	—Manchester Hort. Imp. Soc. meet.

SALES.

MONDAY,	JAN. 23	Roses, Hardy Border Plants, Carnations, &c., at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 24	Pæonies, Spiræas, Hardy Perennials, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 25	Great Sale of Japanese Lilies, and Palm Seeds, Roses, Continental Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 27	Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—38·3°.

ACTUAL TEMPERATURES:—

LONDON.—*January* 18 (6 P.M.): Max., 53°; Min., 38°.

PROVINCES.—*January* 18 (6 P.M.): Max., 53°, Southern Counties; Min., 35°, Sumburgh Head.

Mild, stormy, wet.

The Gardeners' Royal Benevolent Institution.

WE do not think we can more appropriately prelude a note on the "Gardeners' Benevolent," the annual meeting of which Society is being held as these pages are passing through the press, than by presenting our readers with a portrait of the Hon. Treasurer. Mr. HARRY VEITCH is well known throughout the horticultural world, and we may venture to say that no one is more popular among the fraternity than he; and more, that no one can show more substantial reasons for his popularity. A keen man of business, he is also ever eager in the promotion of the higher aims of horticulture. As a philanthropist, he is always to be counted on when help is needed. May it be very long ere we have to write his biography! Enough now if we allude to his connection with that admirable Institution, to which he has been so munificent a supporter, and to which he has devoted so much of his energy and time.

The following figures bear witness to his zeal in promoting its welfare, to say nothing of the institution of the Victorian Era Fund which largely does away with the objections that have been raised as to the occasional want of success of candidates, whose friends are less numerous or influential than those who exercise their privilege in favour of the more fortunate claimants. Every approved candidate is now sure of his election sooner or later, and the Victorian Fund provides those who have subscribed to the society, when they were able to do so, with some amount of relief until such time as they can be elected to the full advantages of the Institution. Here are the figures to which we allude, to them we need only add the record that Mr. VEITCH became Treasurer in 1886.

Description.	1885.	1895.	1898.
	£	£	£
Annual subscriptions ...	1,200	1,340	1,496
Investments..	21,100	26,205	27,008
Pensions	1,655	2,668	2,892

At the beginning of last year, 1898, there were no fewer than one hundred and sixty-eight pensioners on the list, ninety-three of whom were men, seventy-five widows. This involves an annual liability of three thousand and sixty pounds.

Sixteen pensioners, we are informed, died during the year, five of the widows being, in consequence, placed on the pension-list for life.

Good service has been done during the year by those who were instrumental in organising flower-shows and other means for promoting the interests of the Society, and specially by the branches or auxiliary societies. The Society must needs have its offices in London, but in all large provincial centres or horticultural districts there should be branches to secure a wider knowledge of, and a more general support for the Society than the metropolitan district alone could furnish. This is important to dispel the objection sometimes raised that the metropolitan members have greater privileges than others. A glance at the list of pensioners and their place of residence is sufficient to show how utterly unfounded this is, but a still better means of destroying this mischievous impression is afforded by the establishment of auxiliary branches like those at Worcester or Exeter.

We believe that an additional seventeen pensioners will be elected on the present occasion, five by virtue of their previous subscription, twelve by the votes of the members. The total number of pensioners will thus be raised to one hundred and seventy-four.

The Victorian Era Fund, to which we have already called attention, came into operation for the first time in 1898, when one hundred and six pounds ten shillings were distributed exclusively among those candidates who were formerly subscribers to the Institution, and who are now awaiting election. The capital of this fund is now over four thousand pounds, so that a sum of nine hundred and twenty-five pounds is required to bring it up to five thousand pounds. A considerable portion of this amount has already been furnished, and the following gentlemen have each promised an additional fifty pounds, conditionally on the entire amount needed being obtained, viz., Messrs. N. SHERWOOD, ARTHUR W. SUTTON, LEONARD SUTTON, and HARRY J. VEITCH.

There can be little doubt that the full sum required, five thousand pounds, will be shortly obtained.

HARRY J. VEITCH, ESQ.

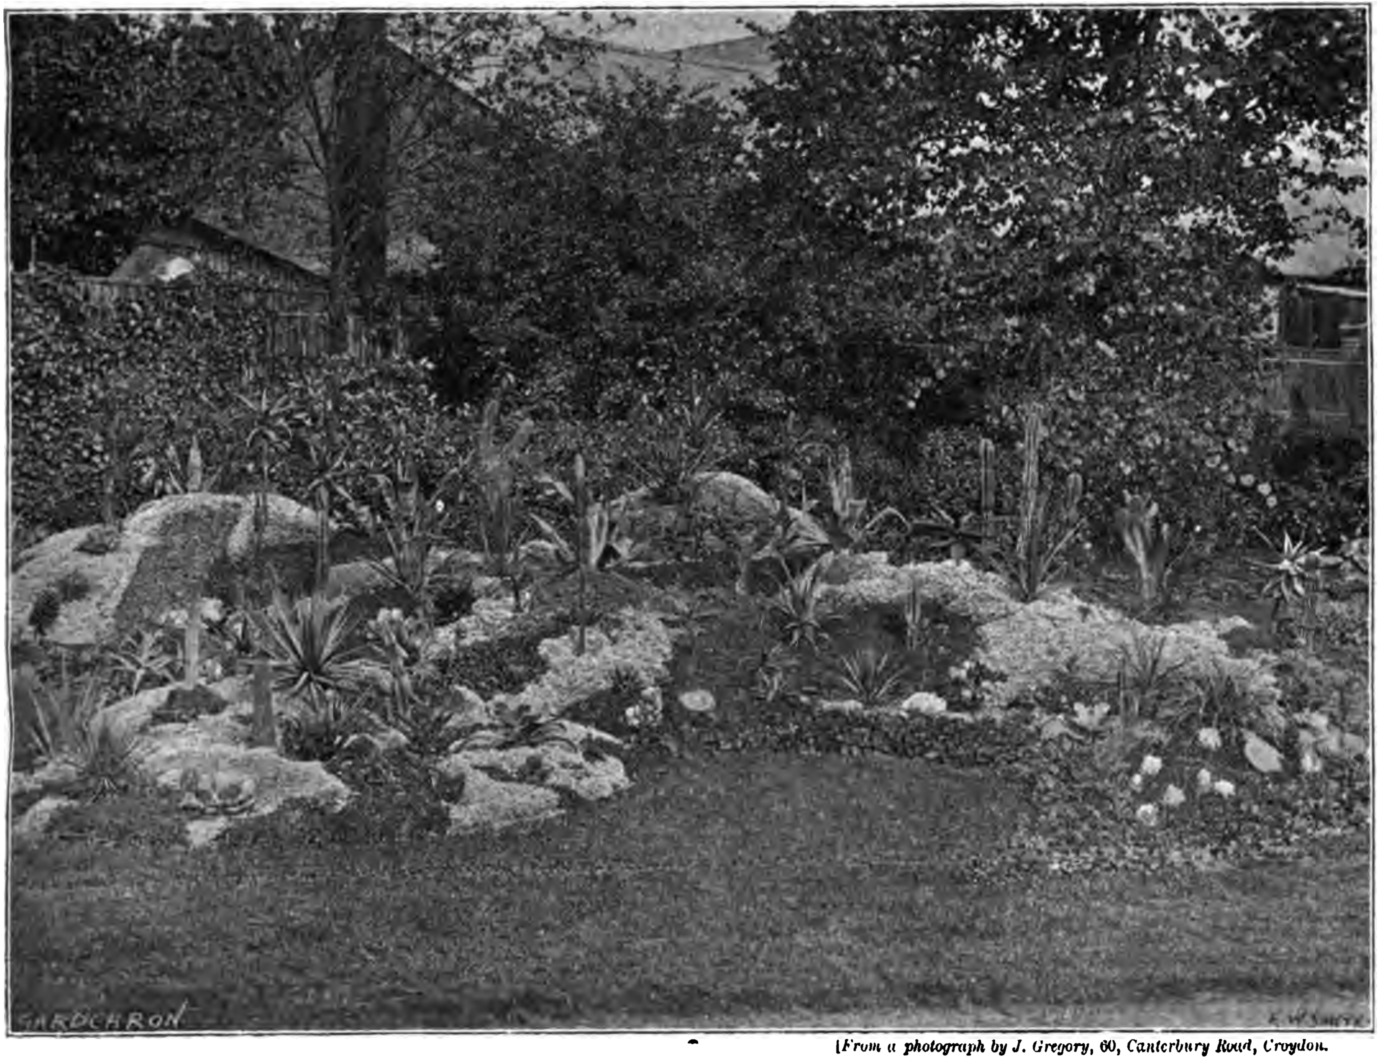
(Treasurer of the Gardeners' Royal Benevolent Institution.)

Such in general terms is a record of the year's working, and we think it will be satisfactory to the subscribers, as showing that the Committee and officers do their utmost to promote the objects for which the Society was instituted, and effect their object at a minimum cost.

While there remains each year a residuum of unsuccessful candidates, we cannot say that we are all of us doing our duty to the full, we therefore earnestly press upon gardeners the necessity of affording a greater measure of support to the Society. The number of subscribing gardeners is still disproportionately small, the new subscribers hardly do more than replace those who have died within the year. We cannot, and do not, believe, but that there are very many whose means would allow them to subscribe for the benefit of their fellows, and for heir own possible advantage. Looked at from his latter point of view, we do not believe a etter investment could be found; considered rom the former point of view, there is no more mperative duty than that of affording help to those who need it.

PENGE RECREATION-GROUND. — One of the prettiest groups of succulent plants that we have seen during the last season, was that of which Mr. GREGORY, of Croydon, has furnished us with an illustration (fig. 13). The plants are placed on irregular raised mounds, and are not only highly decorative but very instructive as conveying an idea of succulent vegetation, and of the character they impart to the scenery. Mr. DRAY, who had charge of these grounds, deserves much credit for his originality. The plants employed comprise the following:—

- Agave Victoria Regina, and other kinds
- Cereus fastuosus
- ,, peruvianus
- ,, ,, giganteus
- ,, unica
- ,, variabilis
- Opuntia missouriensis
- ,, Filipendula
- ,, mamillata
- ,, tomentosa
- ,, leucotricha
- ,, grandis
- ,, polyacantha
- ,, decumuna
- Opuntia albicans, and others
- Euphorbia cereiformis
- ,, pentagona
- Aloe picta
- ,, distans
- ,, ferox
- ,, prolifera
- ,, barbadensis
- ,, pentagona, and others
- Dasylirion Wheeleri
- Bonapartea juncea
- Mamillarias, a few
- Echinocereus, a few



[From a photograph by J. Gregory, 60, Canterbury Road, Croydon.

FIG. 13.—A BED OF SUCCULENTS IN THE RECREATION-GROUND, PENGE, LONDON, S.E.

A large number of Echeverias, Gasterias, Haworthias, Semvervivums, Yuccas of sorts, and other succulent plants is also used; and for ground-work, Saxifragas of sorts, Sedums, Herniaria glabra, Spergula pilifera aurea, Antennaria tomentosa, Ajuga reptans purpurea. Carpet-bedding is always well done, and the beds of Fuchsia, Abutilons, and other plants were all equally good, so that the condition of the grounds reflect great credit on the skill of Mr. DRAY. Mr. DRAY has lately been promoted to the charge of the recreation-grounds at Sydenham.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY. —The forty-sixth annual general meeting of the Royal Scottish Arboricultural Society will be held in the Hall of the Young Men's Christian Association, 14, St. Andrew Street, Edinburgh, on Tuesday, January 24, 1899, at 2 P.M., Colonel BAILEY, President, in the chair. The financial statement shows a balance in favour of the Society of £124 6s. 9d. At the close of the business, Colonel BAILEY will give a short account of his recent visit to Canada, illustrated by lime-light views. Mr. ROBERT GALLOWAY, 5, St. Andrew Square, is the Secretary.

THE ANNUAL DINNER.—The annual dinner of the Society will be held in the Royal British Hotel, 22, Princes Street, Edinburgh, on Tuesday evening, January 24, at 6 o'clock, the Right Hon. the Earl of MANSFIELD in the chair.

HYBRIDISATION CONFERENCE. — The Royal Horticultural Society has issued a provisional programme of an International Conference, to be held on Tuesday, July 11, at Chiswick, and Wednesday, July 12, at the office of the Society, 117, Victoria Street, on "Hybridisation (the cross-breeding of species), and on the Cross-breeding of varieties."

The Committee of Arrangement comprises the following gentlemen: F. W. Burbidge, M.A., V.M.H., Sir W. T. Thiselton-Dyer, K.C.M.G., F.R.S., James Douglas, F.R.H.S., G. H. Engleheart, M.A., G. Henslow, M.A., V.M.H., Maxwell T. Masters, M.D., F.R.S., T. J. Bennett-Poë, F.R.H.S., Charles E. Shea, F.R.H.S., Harry J. Veitch, F.L.S., William Wilks, M.A., Sec. R.H.S.

Plant-growers, whether amateurs or nurserymen, are particularly requested to exhibit hybrid or cross-bred plants (whether in bloom or not), with the species from which they were raised, at the meeting of the Conference at Chiswick, on Tuesday, July 11. All plants should arrive at the Society's Gardens at Chiswick at or before 11.30 A.M., and may be removed at 5 P.M.

The ordinary Committees of the Society will meet at Chiswick on Tuesday, July 11, at 12 punctually, and plants, &c., for Certificate, will be placed before them as at the usual meetings in the Drill Hall, but with the exception of Plants, &c., for Certificate and hybrids and their parents no other plants, &c., may be exhibited on this day.

MEETINGS.

(*Tuesday, July* 11, *at Chiswick.*)

12 noon.	Fruit, Floral, and Orchid Committees meet.
12.45.	The President of the Society, Sir Trevor Lawrence, Bart., will receive the Invited Members of the Conference.
1 P.M.	Luncheon.
2.15 P.M.	Conference on Hybridisation and Cross-breeding.
5 P.M.	Conference will adjourn.
6.0 for 6.30 P.M.	The foreign members of the Conference will be entertained at dinner on the kind invitation of the Horticultural Club, under the presidency of Sir John T. D. Llewelyn, Bart., M.P., at the Hotel Windsor, Victoria Street. Morning dress.

Wednesday, July 12, *in the Lindley Library* (117, *Victoria Street, S.W.*).

2.15 P.M.	Conference continued.
5.0 P.M.	Conference concludes.
6.30 for 7 P.M.	Banquet of the Society at the Whitehall Rooms, Hôtel Métropole. Evening Dress. All Fellows can, as far as space will permit, obtain tickets (price 21*s.* each), for ladies or gentlemen, by applying (with Cheque or Postal Order) to the Secretary, 117, Victoria Street, before July 1.

THE CONFERENCE.

The following arrangements are provisional, and subject to alteration :—

Tuesday, July 11, *at Chiswick, at* 2.15 P.M.

1, Introductory observations (Dr. Maxwell Masters, F.R.S., London, Chairman) ; 2, Hybridisation and cross-breeding as a method of scientific investigation (W. Bateson, Esq., M.A., F.R.S., Cambridge) ; 3, Hybridisation—its successes, its failures* (The Rev. Professor Geo. Henslow, M.A., V.M.H., London) ; 4, The stability of hybrids (Professor Hugo de Vries, Amsterdam) ; 5, Progress of hybridisation in the United States of America (Professor L. H. Bailey, Cornell University, Ithaca, U.S.A.).

Wednesday, July 12, *at* 117, *Victoria Street, Westminster, at* 2.15 P.M.

1, Introductory observations (Dr. W. O. Focke, Bremen, Chairman) ; 2, The structure of certain new hybrids (Passiflora, Albuca, Ribes, Begonia, &c.) ; with lantern demonstration (Professor J. H. Wilson, M.D., F.R.S.E., St. Andrew's, N.B.) ; 3, Hybrid and cross-bred Orchids (Norman Cookson, Esq., F.R.H.S., Wylam-on-Tyne) ; 4, Hybrid and cross-bred garden plants (M. Lemoine, F.R.H.S., Nancy) ; 5, Cross-bred bulbous plants (Heer S. A. De Graaff, F.R.H.S., Leyden) ; 6, Cross-bred Caladiums (M. Bleu, F.R.H.S., Paris) ; 7, Hybrid and cross-bred fruits (Luther Burbank, San Rosa, California, U.S.A. ; T. Francis Rivers, Esq., V.M.H., Sawbridgeworth) ; 8, Cross-bred vegetables (M. Henry L. de Vilmorin, F.R.H.S., Verrières) ; 9, Hybrid or cross-bred Irises, Begonias, Chrysanthemums, Cinerarias, Rhododendrons, Clematis, Fuchsias, Violas, Gladiolus, &c. (Dr. Michael Foster, Sec. R.S. ; M. Crozy, Messrs. J. Laing, V.M.H. ; Chas. E. Shea, W. J. James, F. G. Waterer, Harry J. Veitch, A. G. Jackman, R. Lye, G. Yeld, J. Heal, V.M.H. ; V. Lemoine, and Dr. Stuart have been invited to supply short papers on these subjects.

The selection of the Papers to be read at the Meetings and their order must be determined at the time, and will be left to the discretion of the Chairman and Committee ; but all the Papers will be printed in full in the Society's official report of the Conference.

Those gentlemen who are unable to attend the Conference in person are requested to furnish brief abstracts of their communications, to be read at one or other of the Meetings.

All MSS. in a foreign language should be sent to the Secretary (with a short abstract) at least ten days before the Conference, that they may be translated in readiness.

In order that accurate results may be arrived at, and to facilitate comparisons and deductions, a card will be supplied to all exhibitors on application, which it is requested may be carefully filled up with all the necessary details. When either the seed or pollen parents, or both, are themselves cross-bred, it is particularly requested that the pedigree may be given through as many generations of ancestors as possible. Exhibitors are most earnestly requested to apply for their cards beforehand, and to fill them up accurately and legibly, as the utility of the Conference will greatly depend on their so doing. Each separate plant should be entered on a separate card, so as to avoid confusion —only one plant on one card.

Raisers who will be kind enough to send plants or cuttings of hybrids to be grown at Chiswick in readiness for the Conference, will receive the best thanks of the Council, and of all interested in the matter.

The Surveyors' Institution.—The next Ordinary General Meeting will be held on Monday, January 23, 1899, when a Paper will be read by Mr. Edward Boyle, Q.C., on the "Rating of Collieries." The Chair will be taken at 8 o'Clock. The attention of the members is specially called to the fact that the rooms of the Institution are open daily, and are available for reference to the library, for arbitrations, writing, appointments, or other business purposes. Members who are graduates of any of the recognised universities of the United Kingdom are requested to intimate the fact to the Secretary of the Institution, in order that the same may be indicated in the next issue of the list of members. It is particularly requested that the members who have not already signed the register will take the opportunity of doing so when they happen to be at the Institution or in its neighbourhood. New members are required by the Bye-Laws to sign the register at the first Ordinary General Meeting at which they are present after their election.

M. Van Tieghem has been elected President of the Académie des Sciences for the present year.

Jadoo Fibre.—Colonel Halford Thompson, chairman of "Jadoo, Limited," has received from M. R. de Merona, Château de Begorée, Margaux, France, a letter, from which the following is an extract :—"I have to-day examined, at Begorée, old Vines, some completely, others partially, grown with Jadoo. The Jadoo is full of new rootlets, leaving no doubt but that the manuring has been highly successful. In those plants partially treated with it the result is obvious ; on the one side of the Vine Jadoo was placed, on the other none was used. The soil on the Jadoo side is full of rootlets, and there are not any on the other. I have removed, and enclose you two or three pieces of the fibre enclosing rootlets.

Société Française des Chrysanthémistes.—The Congress of the French Chrysanthemum Society will be held in November next at Lyons.

"**Rhodora**" is the title of a new journal published at Boston, Mass. (740, Exchange Buildings). It is to be devoted almost exclusively to the publication and information of various kinds relating to the plants of the New England States, more especially to their topographical distribution. Being intended mainly for local use, we suppose we must not protest against such names as Rattle-snake Plantain, which is altogether misleading, and surely not easier to write than Goodyera tesselata. Two plates accompany this number, the one giving illustrations of three species of Goodyera, the other of an equal number of species of Lactuca.

Fruit Notes: Cape Fruit Supplies.—Our interested readers will remember that the first consignment of Cape fruit for the season last year arrived here on Feb. 7 ; we learn, on application to the import manager of the Union Royal Mail Steamship Company, that the first consignment for the current season may be expected on or about the same date. We sincerely trust that proper care may be taken over the cutting or picking, and packing of the fruit intended for the English market ; in previous seasons there was much reason for regretting the lack of proper precautions.

Winter Aconite and Other Flowers.—In response to Mr. Mawley's enquiry as to the date of flowering of this species, we have received the following particulars :—Rev. Canon Ellacombe, Bitton, writes, under date January 14, that he noticed the first flowers expanding on that day. Erica herbacea, Cyclamen Coum, Chimonanthus fragrans, Crocus Imperati were in bloom, and Azara microphylla will shortly be in flower. Mr. R. Lindsay, Murrayfield, Midlothian, gives January 9 as the date when the Winter Aconite was in full bloom. The Dowager Viscountess Hood, Barton, Seagrave, Kettering, states that she first observed flowers of the Winter Aconite on January 10. Several other communications on this subject will be found on p. 43.

Transplanting a Cedar.—The *Daily Graphic* of the 17th inst. has an illustration showing the removal of a Cedar at Southsea. The tree is estimated to be 100 years old. It is 30 feet in height, and 36 feet in the spread of its branches. A hole, 18 feet square, and 7 feet deep, was dug round the trunk, the actual size of which, with the roots and a good thickness of mould, was 10 feet 6 inches by 9 feet 6 inches, and 3 feet 6 inches deep. After the hole was dug, planking secured by iron-belting was built round, and a timber cradle gradually placed underneath. The whole was then lifted in position for the trolly by five screw and two hydraulic-jacks. The total weight was about 22½ tons, and it took a traction-engine to draw the trolly along. The cost of removing will probably amount to about £100.

Vienna.—Dr. Wettstein, formerly of Prague, has been appointed Professor of Botany and Director of the Botanic Gardens in the University of Vienna.

Leaf-action in Terrestrial Orchids.—The *Comptes Rendus* for December 5, 1898, contains a note by M. Ed. Griffon on experiments made at the Laboratory of Vegetable Biology at Fontainebleau, under the superintendence of M. Gaston Bonnier. The experiments in question bore reference to the work done in the chlorophyll in terrestrial Orchids, and especially in Limodorum abortivum :—"It is known that a certain number of terrestrial Orchids have short, swollen, coral-like roots, in each of the cortical cells of which is enclosed a small cushion-like mass of fungous spawn-threads. M. Frank has given to these peculiar roots, which are found with the same characteristics in Ericaceæ, and with different characteristics in Conifers and Cupuliferæ, the name of 'mycorhizas.' This authority considers this association of a root and a fungous spawn or mycelium as an illustration of co-operation or 'symbiosis,' and not of parasitism. According to him, the fungus receives from its host substances which it is unable to elaborate, such as hydrocarbons, sugars, starch, &c. ; and, on the other hand, it furnishes it with water and nitrogenous matter, which it derives from the humus. Orchids with green foliage, and unprovided with 'mycorhiza,' probably derive all their carbon from the air. These plants are entirely self-sufficient, and have no need of humus ; Epipactis latifolia, often found in sandy mud at the sides of roads, comes under this category. Other Orchids with green foliage, but provided with 'mycorhizas,' such as the different species of the genus Orchis, are, if M. Frank's theory is correct, partly saprophytes—that is to say, that they live to a certain extent at the expense of the humus; but their green portions, while giving off a considerable quantity of oxygen when exposed to light, do not provide the plant with all the carbon necessary to it. But no experiment has as yet proved this. M. Griffon wished to see decisively if some of the plants of this class in which the saprophytism appears to be doubtful, would not exhibit gaseous changes in the light of such a nature as to disclose the part played by the mycorhizas in the assimilation of carbon. The very curious results obtained by M. Bonnier in the Rhinanthaceæ induced M. Griffon to experiment in this direction. It is, indeed, now known that some green plants, such as Euphrasia or Pedicularis, do not emit oxygen when exposed to light, and are therefore, perforce, parasites." The author draws the following conclusions:—"1. As regards the assimilation of carbon, terrestrial Orchids show all intermediate conditions, from green species, lacking in mycorhiza, such as Epipactis, which draw all their carbon from the air, and colourless species, such as Neottia, Corallorhiza, which are wholly saprophytes, and the roots of which, existing in symbiosis with fungous mycelia, are capable of drawing from humus the matters necessary for nutrition. 2. Limodorum, in spite of its richness in chlorophyll, must be reckoned as a saprophyte, because of the imperfect diffusion of the chloroleucites, and perhaps, also, the special nature of the green pigment; this plant decomposes but little carbonic acid, and its respiration is always noticeably superior to its assimilation."

---

* Professor Henslow will be most grateful to anyone who will send him full detailed particulars of attempted hybridisations *which have failed.*—Address, the Rev. Professor Geo. Henslow, 80, Holland Park, W.

CHAMBRE SYNDICALE OF GHENT.—At the last meeting on the 8th inst., a Certificate of Merit for Epidendrum Endresio-Wallisii was awarded to M. L. De Smet Duvivier, and a Cultural Certificate for Caraguata cardinalis to M. A. Van Hecke.

"**FREAKS.**"—A short time since we were told by the daily papers that the "freaks" now exhibiting at Barnum's show held at least two meetings to protest against the application to them what they consider an objectionable term. The proceedings of those meetings would require the pen of a Dickens to narrate. Enough for us, if we be allowed to express our entire sympathy with these teratological illustrations—we hardly know what English word to employ which shall convey our meaning without also being liable to an interpretation that we should be unwilling to endorse. The fact is, that the application of such words as freaks, prodigies, sports, caprices, monsters, and the like is altogether inappropriate. There is nothing freakish or capricious in Nature. All is orderly, methodic, adaptive, responsive to cause, purposeful. It is our imperfect perception alone which makes us see breaches of law when there are none. We are reminded of these matters by the kindness of the authorities of the Royal Gardens, Kew, who have obliged us by forwarding some interesting flowers of Cyclamen. The leading feature of these flowers is the development of the sepals into full-sized leaves, forming a ring of leaves around the corolla, such as is often met with in the Chinese Primrose. It is obvious, from these specimens, that the ordinary sepals of the Cyclamen represent the petiolar part of the leaf only, the blade or laminar portion not being developed. We can easily imagine that the presence of food-making leaves in the immediate vicinity of the ripening ovules, which make such heavy requisitions on the food supply, might be advantageous. If so, the tendency to leafy development seen in these Cyclamens would be perpetuated, and in time a new "race" will be developed. A section of the scape showed not a central ring of vascular tissue, but a pentagonal stele.

HORTICULTURAL CLUB.—The usual monthly dinner and conversazione took place on Tuesday last, 17th inst.; the chair was occupied by Mr. Harry J. Veitch, and there were present besides, the Rev. W. Wilks, the Rev. J. H. Pemberton, Messrs Charles E. Shea, George Monro, James H. Veitch, George Bunyard, C. T. Druery, and others. The discussion was opened by Mr. Charles E. Shea with an interesting paper entitled "A chat about Chrysanthemums;" many points of much value were brought forward, and there seemed to be an unanimous revolt against the race for size which now marks the Chrysanthemum. Most of the members took part in the discussion which followed over the paper, and many interesting statements were made. A hearty vote of thanks was accorded to Mr. Shea. It was announced by the Secretary that the annual meeting would be held on February 14, when the chair will be taken by Sir John Llewelyn, Bt., M.P. (chairman of the Club), and ladies would be specially invited to attend.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The sixtieth annual general meeting of the subscribers to this Institution was held on Thursday last at "Simpson's," Strand, London, H. J. Veitch, Esq., in the Chair. The report of the Committee, and the accounts for the year were adopted with unanimity and satisfaction. This was followed by the election of officers for 1899, and the election by ballot of candidates to become pensioners on the Fund. There were seventeen candidates elected, as against nineteen last year. Upon the recommendation of the Committee, five of these were unanimously placed upon the Pension list under Rule III., s. 5, without the trouble or expense of an election. Their names were as follows:—

JOHN COLLINS, Bockhampton, Dorchester, aged 80, annual subscriber of £1 1s. for 41 years.

CHARLES GOODALL, Cheetham Hill Road, Staleybridge, aged 64, annual subscriber of £1 1s. for 20 years, also a life-member.

WILLIAM KIDD, New Street, St. Neots, aged 81, annual subscriber of £1 1s. for 17 years.

JONATHAN SQUIBBS, New Oxted, Surrey, aged 67, annual subscriber of £1 1s. for 17 years, also a life-member.

GEORGE YEARNSLEY, Silver Hill, St. Leonard's-on-Sea, aged 68, life-member for 35 years.

A ballot took place for the remaining twelve, and below are the names of the successful candidates. The eight first mentioned have been subscribers to the Institution, and the remaining four were non-subscribers.

ALFRED BARNFIELD.
ANNIE HATCH.
ALEXANDER LEE.
JAMES PLEVY.
JOSEPH SHEARN.
GEO. STAPLES.
EMMA WOODWARD.
CAROLINE WOOD.
JOHN AKEHURST.
THOS. CAWLEY.
GEO. CRAGG.
SARAH ANN SIMS.

The annual friendly supper is being held under the Chairmanship of G. Monro, Esq., as these pages are in the press.

HOME CORRESPONDENCE.

EUCALYPTUS GLOBULUS IN THE OPEN.—The readers of the *Gardeners' Chronicle* should be glad of the information respecting this tree afforded by "J. A." on p. 28. If a tree be killed to the ground by 18° of frost after being planted thirteen years, each must decide for himself whether it is a tree worth planting. Certainly it grows very freely and makes a fine tree in a few seasons, and then comes a hard frost and it is killed to the ground. I have only known E. globulus to flower in the open air in our maritime counties. *A. R. Pearce.*

—— On p. 19 of a recent issue, you ask for the present height of the Eucalyptus coccifera at Powderham Castle, several times figured in the *Gardeners' Chronicle*. In my notes on Powderham, published on October 22, 1898, p. 299, full reference will be found to this grand specimen [70 feet in height], also to the peculiar manner in which it sheds its bark. Several specimens are also to be met with at Abbotsbury, Dorsetshire, but these are far less in size than the Powderham specimen. *W. Swan.*

SPIRÆA DISCOLOR (ARIÆFOLIA).—The beauty of this plant when in flower is well shown in the illustration, p. 21, and a sunny situation is recommended in the accompanying letterpress. I would advise intending planters to place it in an airy position, and where it gets shade from the sun. There are many specimens at Belvoir in various positions, and all lose the whiteness of their flowers in two or three days after they expand, except one plant, which grows where the sunshine does not reach it, which keeps in good condition three times as long as the others that grow in the sunshine. It is a perfectly hardy plant, and evidently likes moisture, doing well in our cold clay soil. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

INCREASE OF SHOW EXHIBITS.—Your correspondent "A. J. L." seems to have a somewhat extraordinary preference for bulk. Generally there has been too much room for complaint, that exhibits, especially in vegetables, were too large in use, and now he wants yet more. He has little mercy for the exhibitor. Take Onions, bulbs of which now range from 2½ to 3 lb. each in weight, a dozen of these now average over 30 lb. "A. J. L." would like to make the weight about 50 lb. Potatos, Carrots, Beetroots, and Cauliflowers, are heavy, and yet he is for increasing the weight for transit to and from shows, 50 per cent. And after all, beyond presenting exhibits in the plan of greengrocers shops, what would be gained? Of course, exhibitions should be made attractive, but mere quantity does little in that direction. Far more attractive is quality, and just as six of any one thing selected from eighteen, gives the highwater-mark of excellence; twelve of the same comes a few points lower in average excellence, and the entire eighteen shows a still greater reduction. Generally, all descriptions of fruits and vegetables are well represented in the ordinary dishes or quantities presented. Fifty pods of Peas, or a dozen Tomatos, gives just as good a representation in either case as would quantities doubled. A collection of a dozen kinds of vegetables as now ordinarily presented, inclusive of basket and packing material, presents a formidable weight, and would, if doubled in bulk, be only compensated for by double prices. But the public in seeing greater bulk would gain nothing. If such a proposition were enforced, it would do much to kill competitions, which is already to the ordinary exhibitor sufficiently exacting or burdensome. *A. D.*

WINTER ACONITES AND OTHER FLOWERS.—Observing on p. 26 of last week's issue a question concerning the flowering of Winter Aconites, I write to say that generally after a wet and warm autumn, such as the last, late winter bulbs in Edge gardens are very precocious being often forwarder than they are in the south of England in January, though by March they are overtaken by the warmer counties. I make casual but not regular notes on the weather and first appearance of flowers. The average time at which Winter Aconites break the surface is New Year's day, and if there is no hard frost, many are in flower in a week or ten days. In 1896, Jan. 13, I find an entry, "Crocus Imperati generally out; also many Anemone blanda, and some Aconites and Snowdrops. Thrushes singing and wood-pigeons cooing." In 1897, Jan. 23—"Aconites out before the New Year, and Snowdrops showing white; Narcissus minimus out middle of February" (about its usual date). 1897, Dec. 17—"a warm sunny day, nearly 100 flowers of Crocus Imperati fully open; also many Anemone blanda, also Cyclamen Coum. 1898: January 5.—Aconite abundantly out; also, Anemone blanda, and Crocus Imperati, at best. January 21.—Scarlet Anemone (hortensis) plentiful, Crocus Imperati nearly over, Galanthus Imperati fully out; Narcissus minimus in flower. 1899.—The same flowers are nearly a fortnight later than last year. Aconite broke the ground before New Year's Day, and are now, on January 16, plentifully out; also, Anemone blanda, is very forward, and in full flower; Crocus Imperati, many in flower. No Scarlet Anemones yet. Oriental Hellebores very forward. Some plants in sheltered spots are in full flower. Crocus Sieberi out. Thrushes have been as noisy for ten days as in April. *C. Wolley Dod, Edge Hall, Malpas.*

—— There are large quantities of this plant at Belvoir in various places, and no flowers have as yet appeared on them—only one tiny speck of yellow was visible yesterday (January 13). On looking through my old note-books, I note that January 15, 1896, and January 9, 1898, are the dates when the first flowers appeared in those years;

but it will be quite as late as the 20th this year before I shall be enabled to report the opening of the flowers. I notice several other early flowers this season are later than usual here, and this lateness is not due to cold, as up to the present date the season has been exceptionally mild; but it may be attributed to the very dry time we had in September and October. *W. H. Divers.*

—— I have seen Winter Aconites in bloom, not expanded, in a spot shaded from south to west, in a warm enclosed garden they are only showing; last year, one was gathered on January 7. *Thos. Taylor, Beech Holme, Bocking, Braintree, Jan.* 15, 1899.

—— My neighbour tells me he had the Aconite blooming in his garden on the 5th inst. *F. T. Tayler, Little Baddow Rectory, Chelmsford, January* 17, 1899.

—— Referring to the paragraph in yours of the 14th inst., the first yellow bud of Winter Aconite was seen yesterday in my small garden; it is on a drier slope than the part they usually appear first. I have a few Snowdrops in garden, plenty of fine ones in window-boxes that have been out a fortnight, some going off. A few Polyanthus in garden, and red buds of Pyrus japonica showing. *Tilson Lee.*

—— I had been looking for this little flower to make its appearance in various parts of the grounds here. I have, to-day, January 18, made a rather minute survey in the various places which in some seasons by this time have been sheets of yellow; and I have also found some old lists of flowers, which, in a former employer's day, we used to send up to London weekly. I find, January 19, 1887, Aconites, five large bunches; January 13, 1890, two large bunches; but to-day I cannot discover flower or foliage. Has the dry autumn something to do with it? *J. Batters, Gillingham, Norfolk.*

—— Although not yet open to-day, January 16, the Winter Aconite is not later than usual here. The first flowers began to show above the ground about New Year's Day. It usually blooms with me from the last week in January to the second week of February should the weather prove open. *S. Arnott, Carsethorne, by Dumfries, N.B.*

MUSHROOMS IN PASTURES.—In answer to Mr. Kneller's communication on this subject, I may be allowed to state that having had sixteen years and more experience in Mushroom growing, I think I can give him some explanation of the circumstance. Firstly, if his pasture has had Mushrooms growing on it for 100 years, the spawn will have become exhausted, and he would do well if he sprinkled some sharp road-sand over the land. Secondly, I think that he is mistaken about the older portion of the park giving the most Mushrooms. He will find the piece which has been laid down ten years will afford magnificent crops for many years to come, especially if cows are pastured on it, as of course he will know that artificially-made spawn consists of cow-dung and sand—or it should be. As regards the meadow which he has spawned, it is not likely ever to do any good, my experience teaching me that artificial spawn should have a little warmth when started, otherwise its germinating power gets killed. I always break the cake when spawning a bed. I would persuade him the next time he lays spawn in the land, to carry out the operation in the hottest part of the summer, and keep the land well moistened, Mushrooms doing best in mild, moist weather, such as we are having this winter I grow Mushrooms indoors and on beds outside, and have no failures. *A. S. Knight.*

GRAPE JUDGING.—It will be a source of satisfaction to those who take an interest in exhibiting and judging, to see that the relative value of exhibits is receiving a degree of attention, which may ultimately lead to a proper settlement of the question. I notice in your last issue (p. 27) a few remarks from "A. D.," one of which, to me, is not very clear. "A. D." says, "The judges can, even with fixed maximums, vary the points, both according to appearance and known quality." If the various maximums be fixed with scope sufficient to meet all claims, there would be no need to change or vary them, a conclusion which "A. D." seems to support in the last words of the sentence; thus: "they (the maximums) also indicate points beyond which, in making awards, the judges cannot go." I concur with this statement, but consider that a wider range of opinion is necessary in adjusting these maximum standards than that of two or three judges before they begin operations. Any endeavour to fix standards or formulate a system of judging would be wasted labour, if they could be varied according to the taste of the individual. "A. D." also says, "Maximums indicate relative merit of variety, if first-rate." There seems to be a slight mixture of ideas here; relative merit is generally understood to mean the qualities of an article naturally inherent, which should not change; while cultural merit signifies the properties imparted by art, which varies with the skill of the cultivator. The two elements being distinct, should be kept separate, and a maximum properly adjusted for both, with sufficient gradation by which all differences could be recorded. Mr. Kirk on the same page raised another matter in connection with judging, and depreciates the necessity for decorating Grapes, while he ventures to prophecy that bad things will happen in consequence. I assume there will be no decorations insisted upon in connection with the forthcoming Grape competition; but I expect that the Grapes will be adjudged entirely on their own merits. If decoration were to be a strong element in the competitions, I would simply put my best Grapes into classes where merit would not be divided, and my next best I would risk being overweighted by decorations. After expressing various doubts and difficulties, which probably mean but little, Mr. Kirk animadverts on dessert table-decoration with an air of disgust. In my opinion, there is nothing more pretty or attractive—leaving aside utility—than an artistically and tastefully-displayed dessert-table. Let such, then, be encouraged at shows, but as before said, great care should be taken in fixing the maximums for culture, quality, and taste in the matter of arrangement. If high-class fruit be the primary object, let the maximum be high; if flowers and arrangement are the principal features desired, then the fruit will occupy a subordinate place. If I entered a competition, with the issues plainly stated, and only came out second best, although I looked upon fruit myself as of major importance, I would simply "grin and bear;" or offer a mild protest to the proper authorities, which would probably not be entertained. When conditions of adjudication are laid before the judges, it would be a dereliction of duty not to adhere to them. *Ayrshire Lad.*

RELATIVE VALUE OF GRAPES IN COMPETITION.—As mentioned in my last letter, I now submit for the consideration of interested readers a scale of relative value for most of the varieties of Grapes worth growing at the present time. This value is calculated and shown by the decimal system as being the one best adapted for recording the most minute shades of difference between the sorts. The cultural value again is reckoned by units (but not shown), five being the maximum for a perfect bunch. This is a fair proportion to strike between the two elements, and corresponds to the balance given by the authority quoted in my last letter:—

TWENTY-FOUR VARIETIES OF GRAPES, TWELVE BLACK AND TWELVE WHITE.

White.	Relative value.	*Black.*	Relative value.
Muscat of Alexandria ...	1·2	Muscat Hamburgh ...	1·0
Canon Hall Muscat ...	1·01	Mrs. Pince	1·0
Bowood Muscat ...	1·0	Madresfield Court ...	1·0
Mrs. Pearson	1·0	Appley Towers... ...	0·9
Duke of Buccleuch ...	0·9	Black Hamburgh ...	0·9
Lady Hutt	0·9	Lady Downes'	0·8
Buckland Sweetwater .	0·8	Gros Colman	0·8
Foster's Seedling ...	0·8	Gros Guillaume ..	0·8
Golden Queen	0·7	Alicante...	0·7
Tokay	0·7	Gros Maroc	0·7
Trebbiano	0·5	Alnwick Seedling ...	0·6
Raisin de Calabre ..	0·5	West St. Peters ...	0·6

It will be observed the above estimate is not based on the property of flavour alone, although that element predominates, but on all the qualities which characterise good useful Grapes, and contained in the words quality and appearance. Since despatching my last, I observe a letter from "H. W. Ward" (p. 474), in which the relative value of certain varieties is fairly stated, but which in practice would not work very satisfactorily, unless the value of the two properties were placed in separate columns. Otherwise, the judges would get confused among vulgar fractions when competition is close, and where the smallest difference has to be recorded. The relative value of 1½ points in 6 between Gros Colman and Muscat Hamburgh may also appear to some excessive. [Canon Hall Muscat, being a variety of Muscat of Alexandria, should not be included in a collection of varieties.] In framing a graduated scale of value, the most important factor, namely, the skill of the horticulturist, should be carefully guarded, and as there are slight shades of difference in quality among the varieties, provision should be made for registering the smallest degree. Everyone will agree with your correspondent's remarks regarding the preference shown to large against smaller bunches, other points being equal; but shape should not weigh in importance, but due regard should be paid to the natural form of the variety. *Ayrshire Lad.*

CHRYSANTHEMUMS.—In Mr. Edwards' list of Chrysanthemums at p. 27, of the last issue of the *Gardeners' Chronicle*, he recommends some to be grown as bushes. Now, I have grown most varieties as they have been sent out for more than a dozen years past for the purpose of getting big blooms, and passing on all that I thought suitable to be tried as bushes. Of these we usually grow from eighty to one hundred plants for cutting from, and sometimes we pinch them and get nice medium-sized blooms, and at other times I have allowed them to grow on to the terminal bud for a mass of bloom. My favourites now are:—

WHITES.	YELLOWS.
Avalanche	Phœbus (old)
Souvenir de P. Ami	,, (new)
Niveum	Edwin Beckett
Madame Lacroix	W. H. Lincoln
Mrs. J. J. Lewis	Pride of Ryecroft
Lady Canning	Charles Curtis
PINKS.	DARKS.
Margot	John Shrimpton
Lady Randolph	E. Molyneux
Eda Prass	Wm. Holmes
James Bidencope	Mathew Hodgson
Pride of Madford	Milano
William Tricker	Val d'Andorre

I can recommend the above list to all beginners, as they are free growers and sure constant bloomers. *A. Haggart.*

BEGONIA GLOIRE DE LORRAINE.—This plant is, I understand, so far asexual, that it produces only male or barren flowers, hence it can be propagated only by division or cuttings. But there seem to be exceptions to every rule, as I recently saw on a small plant at Chiswick a seed-pod of the ordinary angular form, the product of a female flower, which had been fertilised with pollen from the flower of a small white winter-blooming kind. It will be interesting to learn in time what is the product. Gloire de Lorraine has such excellent habit, and is so wonderfully floriferous as a winter pot-plant, that it is difficult to avoid wishing for its duplicate as a summer-bedding plant. Certainly for such purpose stouter and stiffer stems would be useful, but if the flowers are relative to those of the tuberous kinds, small, they are borne in such great profusion that most beautiful floral objects are furnished. To obtain such a summer variety should be the object of raisers. *A. D.*

CLEANING TOMATO SEED.—I have watched with interest the different articles appearing in your columns on the best means of getting through this tedious task, and have long been under the impression that there must be some more practical method than those employed by your correspondents and myself. I had exceptional results from a new variety of outdoor Tomato the last summer, and I was naturally anxious to save my own seed. I had but a small idea of the methods adopted in practice, so I decided to try two different plans. One lot I put through a process almost identical with that advised by Mr. J. S. Upex, in an article on p. 28 of your last week's issue, namely, washing and squeezing through muslin. As another test I squeezed the pulp on to sheets of clean glass, and pasted it over very thinly, so that the seeds barely touched each other. After they had been near the roof in a dry house for some days they were separated with a pocket-knife; they were not clean, though, and I found this plan considerably more difficult, and more likely to injure the seeds, than the "washing system." I had some doubts as to whether the latter plan would be detrimental to the quality of the seeds, so decided to test them. I put equal quantities of each in separate pots, and grew for twenty-eight days. The result was very satisfactory; for the one was identical with the other. It must not be lost sight of, however, that my test was made only a few months after the drying of the seed. Whether that which has undergone the "washing process" would be reduced in quality if kept for several seasons I cannot say; but knowing Mr. S. Castle (referred to last week) to be an excellent cultivator, I am convinced that he would not condemn "washed seed" without having reasons for doing so. Probably Mr. Castle will see this and other articles, and kindly enlighten us. *A. F. Acton, "Mon Repos," Dover, Kent.*

LAPAGERIA.

The illustration (fig. 14) of a fine spray of this most useful climbing plant was obligingly furnished to us by C. T. Lawrence, Esq. It shows well the free-flowering character of the plant, and when grown at Burford Lodge, we may be sure that the plant is placed under the most favourable circumstances.

MARKET GARDENING IN THE CHANNEL ISLES.

(Continued from p. 30.)

The Caledonian Nursery, Guernsey.—At this establishment there is a notable departure from the class of goods usually met with at so many of the other nurseries on this island. The growers for market devote roomy houses chiefly to the production of some three or four articles, viz., Grapes, Tomatos, Beans, and early Potatos, so that but little in the way of decorative plants ever comes in their way, and, indeed, there is no need! There is a vast difference in growing simply these things for certain disposal, and the cultivation of choice plants and shrubs that are much longer in coming to a saleable size, and whose disposal is not so rapidly consummated. The Caledonian Nursery is a compendium of all that is choice and rare in the way of out-door shrubs and trees, and the lover of novelties may come and be interested in seeing fine specimens such as cannot be found in the open on any part of the mainland except in a few highly favoured spots in Dorsetshire, Devonshire, and Cornwall. Almost as soon as the grounds are entered we are face to face with a grand specimen of Erythrina Crus-galli, with branches 8 feet in length, and stem as thick as one's arm. The singular-looking coral-coloured pea flowers were numerous, and would be in good condition for a long period of time. How different to see this plant in this guise to seeing it treated as an intermediate-house plant for six months of the year; here, it is simply let alone, or just pruned hard in. Close by was a number of Crinum Powelli alba, raised from seed and planted in beds. They had made good growth, and many were in flower.

Entering some of the glass-houses we noticed a capital lot of middling-sized Palms grown for house decoration, and associated with them a quantity of Ferns for similar purposes. Houses, too, of single and double flowered Begonias, of Cannas flowering with remarkable freedom—these both indoors and out-of-doors; zonals also in good varieties, and nicely grown.

Guernsey Lilies.—Among plants grown under glass, Messrs. Smith are famous for their Nerines—Guernsey Lilies. My visit was made too early for me to see them in flower, the majority being still dormant. Doubtless the display made by these bulbs will be of marvellous beauty. A thousand pots of Nerines! it seems incredible; yet there they are, and additions are constantly being made to the stock of them. Great care is exercised in regard to the shifting or potting of these plants; this operation is performed as seldom as possible. Pots of, say, 5, 6, or 8 inches are used for the bulbs, according to the mass to be potted, and when the pots are filled with roots, and the bulbs crowded well upon the top, during the flowering and growing time, then the application of some kind of manure answers admirably; while during the long resting period no such assistance is required. Such species and varieties as N. Fothergilli major, Manselli, angustifolia, Planti, &c., are under cultivation; and besides these there are hosts of seedlings, many of which have already flowered, and proved to be beautiful, and worthy of further cultivation. The stock of these, however, is yet too limited to allow any of them to be disposed of at present. Among other Nerines, coruscans major has been crossed with N. flexuosa, and N. filifolia with N. coruscans major; in fact, so numerous are the varieties represented, that they need to be studied in a very full and careful manner. Passing outside, we came to grand masses of Bignonia radicans, then densely covered with its tubular orange-scarlet flowers, whose outer calyx has the look and texture of leather. A plant of Mandevilla suaveolens covers a large area of wall, and it is perfectly hardy. Plants of Clianthus magnificus are also very strong; the flower is somewhat lighter in colour than the old C. puniceus.

Dracænas.—Then some Dracænas, which must at one time have been trees, so large were the boles, 4 to 5 feet in girth at 1 foot up from the ground. These boles had been cut down during the severe winter three years ago, and clusters of young shoots 10 feet high have sprung up from them, so that clumps of eight to a dozen stems now take the place of a single stem. But what models these side-shoots were! stout, with broad leaves, the colour of which was a deep purplish-green. How grand these would look in pots! and a hundred of them exhibited at the Temple, either in groups or single specimens. A display might be made by such means at many an exhibition that would, I am sure, be highly appreciated, and add much to the scenic effect. Edwardsia microphylla is represented by a large plant fastened to a wall; this particular specimen seldom flowers, although not far away another one does so regularly.

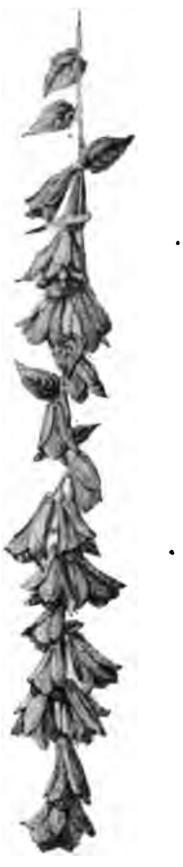


Fig. 14.—Lapageria rosea, in the garden of Sir Trevor Lawrence.

(From a photograph by C. T. Lawrence, Esq.)

Belladonna Lilies.—And then we came to these; and what a display they made! one can scarcely imagine what such beds of these bulbs would look like—but here they were, and the sight was a glorious one. A most beautiful variety, Amaryllis Belladonna purpurascens maximus, as its name implies, has large flowers of an intensely dark colour.

The Bamboos.—I would say of these that the species are so numerous, the health so perfect, the dimensions of many as regards height and size so great, that one need have a measuring-rod always in hand, and spend an entire day among them. Arundinaria nobilis is worthy of special mention, as well as Bambusa palmata; Arundinaria Falconeri, A. erecta Hindsii, Phyllostachys castillionis, and Bambusa flexuosa, a close grower, of which a plant was noted 6 feet in height. Associated with these were some twenty species and varieties, and the stock of them is being very assiduously increased; in fact, these Bamboos are treated similarly to Conifers in other nurseries, and beds and whole quarters are devoted to their cultivation, constant propagation, replanting, &c., and then wide dispersion all over the country. And then, when planted and established, how different is the effect, and how beautiful! Bamboos are now in the front rank as decorative plants, and where they will stand the winter they will be planted more commonly. A large Macartney Rose was covered with its single white flowers, looking interesting among so many novelties. Overhead the new Vitis Coignetiæ had run up to a great height among some trees, its leaves were still quite green.

Shrubs and Trees.—To visit the different parts of the nursery, and note the host of choice plants and shrubs, was no mean task; and it must suffice if I touch upon a few only—Acacia asparagoides, a very fine specimen, was full of flower-buds that will open in the spring; Lomatia pinnatifida is a beautiful shrub, whose Davallia-like leaves impart to it a singular beauty; Dimorphanthus manchuricus and Weigela hortensis nivea come next into view, and then fine specimens of Magnolia stellata, whose flowers in early spring are so much admired; Magnolia Lenne, a very large tree, one of the deciduous forms, whose Tulip-like flowers are of a bright purple colour outside; M. Halliana, M. grandiflora, &c. Danea racemosa, the Alexandrine Laurel that has stood out for many years; Poinciana Gilliesii in capital form, and of much vigour. The Olearias, nitida, dentata, and macrodonta, are grown close together for the sake of comparison, and O. argyrophylla is also near by, its beautiful leaves silvery beneath, mark this as a very distinct-looking species. Plants of Embothrium coccineum were constantly passed, being trees, some of them 18 to 20 feet high. Pyrus Malus floribunda Scheideckeri was interesting, and the same may be said of Gymnocladus canadensis. Hedges and beds of Azalia indica alba, here called A. Ledifolia, divide many of the quarters in this portion, and in their season are a mass of flower. Of the greenhouse hybrid and Himalayan Rhododendrons, a large collection was remarked, and every species and variety was found in healthy examples, and Countess of Haddington, campylocarpum, barbatum, Falconeri, Lady A. Fitzwilliam, Mrs. Butler, fulgens, and Aucklandi, are but a few names of the many that were doing well.

A plant of Diospyros kaki, the celestial fruit of China, was remarked in fruit. Another singular plant observed was Panax ferox, whose spike-like leaves have a touch-me-not forbidding aspect. Fine bushy plants of the Camellia were noticed planted in beds; a pretty plant near them was Hypericum densiflorum covered with its small yellow flowers; and a plant of Cotoneaster horizontalis was covered with berries of a bright colour.

The Apples and Pears, pyramids and cordons, were in capital condition—and among Apples, American Wealthy holds a prominent place; and beside these, which occupy so much space, some 5000 Richardias are grown, and large numbers are being constantly disposed of. The Chrysanthemums were likewise a fine lot of plants, forming row after row of clean, healthy plants, some 8000 in all, plunged in beds to about half the depth of the pots. These were just 4 feet high, and were being grown for furnishing flowers for cutting. Beside these, which would be taken indoors, there were large breadths of planted-out Chrysanthemums, also for cutting. I have left but little space to say anything concerning the Daffodils, an important branch of trade, but one about which no more than an allusion can be made.

I noticed as I passed along that a part of a large field was being ploughed. Green manuring is practiced here which helps materially to enrich the soil, and prevent it becoming bulb-sick. It consists in sowing the land when the bulbs are lifted in the months of May or June fairly thickly with Buckwheat, which grows quickly. In September, when the plants are about 2 feet in height, and in flower, it is mown. The plough is then taken into the field, and a furrow made on one side, right through the piece; the bottom spit is thrown out with the spade, and a dressing of the green Buckwheat forked in all along the trench. The plough again comes along, and turns over the top on to the green dressing, and again the spades follow, turning up the bottom spit, and by this proceeding the roots, green crop and all, are buried well below the surface, and fresh soil is brought to the top. The ground is then carefully prepared, and the Daffodils are planted. The method answers admirably. Rye-grass has also been sown, and a good breadth was covered with a dense turf; and this piece of land will be treated in a similar manner. Mr. Smith expressed a wish that even a greater portion had been covered with Rye. To observe the tens of thousands of bulbs of choice varieties planted in breadth after breadth, to notice the heaps of bulbs in the sheds still waiting for grading and planting; and to watch the number of men and women engaged in this particular branch, afforded one a capital idea of the importance of the Daffodil industry. Naturally, one asks, What becomes of all the immense number of bulbs and of flowers? Well, the Channel steamers carry most of the flowers away, and a good number of the bulbs in the season. To watch the packing part of this business enterprise is interesting and suggestive. Of Freesias, the heaps of refracta alba and the size of the bulbs are both remarkable. This variety of Freesia alone is grown, and great pains are taken to keep the stock true from intermixture with the yellow form. In the other glass-houses I visited I will only say, that all of them were filled with various crops in a clean and vigorous state. The bulb and packing-sheds are scenes of bustling activity.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JANUARY 10.—*Present:* Dr. M. T. Masters, in the chair and Mr. Veitch, Mr. Bennett-Poë, Dr. Müller, Dr. Russell, Rev. W. Wilks, Prof. Church, Mr. Michael, and Rev. G. Henslow, Hon. Sec.

Bigeneric Orchid.—Mr. Veitch exhibited a flowering plant of an Epi-Cattleya, Mrs. Jas. O'Brien; its male parent was Cattleya Bowringianum, and its female parent Epidendrum × O'Brienianum, the latter being from E. evectum × E. radicans. It has been stated that in these bigeners the result generally resembled the female parent almost entirely, but in this case there was a decided inclination towards Cattleya in the form of the lip and foliage.

Mildness of the Season.—Mr. Wilks brought a spray of Oak-leaves, still partially green, and mentioned that Blackberries had been lately gathered ripe—an unusual occurrence in early January.

Thuia gigantea (plicata) Barked.—Dr. Masters showed a stem which had been nearly stripped of its bark, exposing the central axis as an almost cylindrical rod. The young wood had made renewed efforts to surround the latter, which appeared to be dead. It was received from Mr. Croucher, of Auchstertyre, near Crieff.

GRAND YORKSHIRE GALA.

JANUARY 7.—The annual meeting of the life-members and guarantors of the Grand Yorkshire Gala was held on the above date at Harker's Hotel, Sir CHRISTOPHER MILWARD, Chairman of the Council, presiding.

In the course of his introductory address, the Chairman said that exactly twelve months had elapsed since their last annual meeting, and during the interval they had had to deplore the loss of their late chairman, Sir Joseph Terry. When that sad event took place, they did him the honour of electing him as Sir Joseph's successor. As chairman, he had to congratulate them on one of the most successful years experienced in the history of the Grand Yorkshire Gala. Proceeding, Sir Christopher proposed the election of the Lord Mayor as president for the ensuing year. Since the establishment of the Gala they had had the honour of the co-operation both of the Lord Mayor and Sheriffs; but it was seldom that they were able to elect to the presidency one so closely associated with the management of the Gala as the present Lord Mayor, who had served them well and faithfully as vice-chairman.

Mr. Ald. Foster, in seconding, remarked that one of the most pleasing features of the Gala was the fact that their principal citizens, the Lord Mayors, had always been associated with the undertaking in the capacity of president.

The motion was carried by acclamation.

The Lord Mayor, in reply, thanked the mover and seconder for their kind references to himself, and said he took an especial pride in the success of the Grand Yorkshire Gala.

The re-election of Sir Christopher Milward as chairman of the Council was moved by the Lord Mayor, and the Sheriff of York seconded the nomination. The resolution was adopted unanimously. The Chairman appropriately acknowledged his re-election.

On the proposition of Mr. G. Balmford, seconded by Mr. J. W. Craven, the Lord Mayor was re-elected vice-chairman.

Mr. Joseph Wilkinson was unanimously re-elected treasurer, Mr. C. W. Simmons secretary, and Messrs. Pearson and Taylor auditors.

Mr. T. G. Hodgson proposed that the sum of £650 be granted to the Floral Committee. The amount was the same as that granted last year, but he understood that the committee contemplated a revision of the schedule, which was not up-to-date.

The sum of £230 was granted for the musical arrangements. £120 for the firework displays, £60 for balloon ascents, and £175 for the entertainments. A special grant of £100 was made to the entertainment committee for the improvement ot the stage, and the provision of a proper proscenium.

Mr. Hugh Low, of the firm of Messrs. Hugh Low & Co., London, was elected a life-member. The Chairman, in submitting the proposition, commented on the fine exhibition of Orchids contributed by Messrs. Low to the Gala of last year. The firm had also sent a donation of £5.

A vote of thanks to Sir Christopher Milward for presiding concluded the proceedings.

ULSTER HORTICULTURAL.

JANUARY 12.—The annual meeting of the above was held on this date in the Imperial and Windsor Hotel, Belfast, Sir JAMES HASLETT in the chair.

The financial statement showed the Society to be on a firm basis, thanks to the genuine interest taken by the city merchants on the Committee. The total income taken for the last show amounted to £662 12*s.* 8*d.*, and the expenditure £588 17*s.* 7*d.* The Committee also voted 200 shillings to the Lord Mayor's Queen's-statue Fund, which leaves, with balance brought forward, £105 16*s.* 6*d.*

Votes of Thanks were passed to Messrs. Paul and Allen, the Hon. Secretary and Treasurer; and November 13 and 14 fixed for next Show.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JANUARY 12.—The last meeting took place at the Coal Exchange, Manchester, on the above date, and there were present Shorland Ball, Esq., in the chair, and Messrs. Law-Schofield, Warburton, Greenwood, Weathers, Holmes, Robson, Johnson, J. Leemann, and Mills (Hon. Sec.).

THOMAS STATTER, Esq., Whitefield, showed Cypripedium insigne Sanderianum, receiving a First-class Certificate; Cyp. Luciani superbum and Cyp. vexillarium superbum (Award of Merit). G. SHORLAND BALL, Esq., Wilmslow, showed Lycaste Ballæ (Skinneri × Measuresiana), Cyp. nitens magnificum (F.C.C.); Cyp. Dauthieri albino (Award of Merit); Cyp. Germinyanum (Award of Merit); and Oncidium cheirophorum (Cultural Certificate). SAMUEL GRATRIX, Esq., Whalley Range, showed Cattleya Trianæi "Mrs. S. Gratrix" (Award of Merit); Cyp. nitens superbum (Award of Merit); Cyp. Chapmani, (Award of Merit); Cyp. Ceres, Cyp. Mrs. Margaret Hye (Award of Merit); Cyp. Seedling (Leeanum superbum × Boxalli atratum), Cyp. Calypso, Cyp. Seedling (œnanthum superbum × Harrisianum), Cyp. Seedling (insigne × unknown), Cyp. Seedling (œnanthum superbum × Sallieri), Cyp. Bellona superba, and Cyp. Alcides.

G. W. LAW-SCHOFIELD, Rawtenstall, showed Cyp. Measuresiæ (F.C.C.). JOHN LEEMAN, Esq., Heaton Mersey, showed Cattleya Trianæi, Lælia Gouldiana, F.C.C.; Cyp. Seedling, Cyp. Sallieri Hyeanum, Cyp. Smithi, Cyp. insigne, West Bank House var.; Cyp. Lathamianum giganteum, Cyp. J. B. Haywood (Award of Merit), Odontoglossum crispum, and miscellaneous group of Orchids (Silver Medal). HENRY GREENWOOD, Esq., Haslingden, showed Cyp. Gillianum (Award of Merit), and Cyp. Mons. de Curte (Award of Merit), and Vote of Thanks for Group. O. O. WRIGLEY, Esq., Bury, showed Cyp. insigne, Uplands var.; C. i. subfuscum, C. i. Dormanianum (Award of Merit); C. i. Luciani (Award of Merit); C. callosu magnificum (F.C.C.), Cyp. M. de Curte (Award of Merit), Cyp. Mrs. Maynard, Cyp. nitens magnificum (F.C.C.), Cyp. Jupiter (Award of Merit), Cyp. Leeanum aureum (Award of Merit); also, Silver Medal for collection of Cypripediums. D. B. RAPPART, Esq., of Liscard, showed Cyp. Harrisianum albens (Award of Merit).

H. H. BOLTON, Esq., of Newchurch, showed Dendrobium Andromeda (Award of Merit). F. SANDER & Co., St. Albans, showed Cyp. Euryale magnificum, Cyp. Chamberlainianum × Cyp. Leeanum giganteum (Award of Merit); and Cyp. Lathamianum inversum. HEATH & SON, Cheltenham, showed Cyp. Elliottianum (Award of Merit) and Cultural Certificate.

BRISTOL AND DISTRICT MUTUAL IMPROVEMENT.

JANUARY 13.—The present session of the society was opened on the above date with a very successful meeting, to hear a lecture by Mr. F. W. E. SHRIVELL, F.L.S., of Tonbridge, Kent, on "Chemical Manures."

The lecturer, who was cordially received, said, that as a nation we were far ahead of any other in the use of chemical manure, and stated that at the farm at Tonbridge experiments were being conducted with a view to ascertaining the results of growing crops with chemical manures alone, and in conjunction with stable manure. By means of a black-board and a lucid manner of dealing with the subject, he showed his audience the constituents of stable manure, and how they could be applied in chemical form. He also detailed the experiments that had been made under different conditions at Tonbridge, and gave results, which showed, that in some cases crops could be more successfully grown with chemical than with other manure; and always proving that chemicals could be profitably and successfully added to other manures. Asparagus, Onions, Strawberries, Broccoli, and Cabbage were all mentioned as having been grown under the varying conditions and always to greater advantage with the aid of chemicals.

Concluding his lecture, Mr. Shrivell said that the proper method of gardening was to throw aside all old-fashioned prejudices, and as science was the handmaid of practice, there was no reason why, as time went on, they should not grow as good crops and at a cheaper cost by the use of chemical manures.

A hearty vote of thanks was accorded the lecturer on the motion of the Chairman, Mr. W. A. Garaway.

A prize of 10*s.*, offered by Mr. White, for two Nepenthes, was secured by Mr. W. H. BANNISTER.

EDINBURGH BOTANICAL.

JANUARY 12.—The monthly meeting of this society was held at 5, St. Andrew Square, Edinburgh, at 8 o'clock, P.M., on the above date. The President, Dr. W. WATSON, occupying the chair. Two new candidates were elected—A. W. Borthwick, B.Sc., and Alexander Morton, B.Sc.

The exhibitions included a specimen of Tremellodon gelatinosum, the "Dumfriesshire fungus." This is a gelatinous-looking fungus, the specimen exhibited being about one inch across, and was found by the president at the foot of trees in a wood at Moffat. Though frequent on the continent, in Britain this fungus is said never to have been discovered out of Dumfriesshire. When fresh it is covered with glaucous spines, and possesses a bluish tint. Dr. Cooke states this is an edible fungus. A fine specimen of Goes tigrina, a longicorn beetle, was brought before the notice of the society by Dr. R. Stewart MacDougal, M.A., who had secured the specimen from a section of wood perforated by this insect. Some of these were stated to make tunnels large enough to lay the fingers in, and the specimen of wood shown illustrated well the great damage capable of being done by this North-American species.

Of the communications and papers, the first was given by Symington Grieve, Esq., being "Some Notes on Andromeda polifolia, Linn.," with special reference to a new station found by the reader in Liddesdale, at an elevation of 1000 feet.

A. W. Borthwick, Esq., B.Sc., gave two papers, one on "Quadrifoliar Spurs in Pinus Laricio var. virgata," and also "Notes on the Interfoliar Buds of Pinus Laricio, Poir." The reader illustrated his papers by branches and buds. "Some Micro-methods," by Alex. Lundie, Esq., were communicated by R. A. Robertson, Esq., M.A., B.Sc., who also read some notes on experiments on "Contact Negatives for the Comparative Study of Woods;" slides and photographs of these were laid before the society. The claim was stated by the reader to be principally for their adaptability in class work. *R. L. H.*

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

JANUARY 14.—The members and friends of the above Society assembled in strong force on the above date, for the purpose of celebrating the Tenth annual dinner.

Among the visitors were Messrs. Hiehle, Tivey, Arnold Moss, Thos. Bevan, Harman Payne, Tucker, Gaskill, &c. The chair was taken by Mr. Drost, of the Kew Nurseries, to whom the Society was indebted for the loan of a nice collection of Palms, foliage plants, &c., to decorate the room with.

Mr. George Schneider, in a few well-chosen words, briefly traced the progress of the Society since its formation, and in introducing the chairman, mentioned that he was an employer of many of the young members of the Society who came to this country to learn the language and complete their horticultural education.

Mr. Drost replied. He thought they could look back with great satisfaction in the past, for the Society, having began in a humble way, was now one of great importance and usefulness. The membership was now about 500. The library had largely increased, many of the books having been bound uring the past year; and the balance in the bank showed a substantial increase, all of which were matters for congratulation, and largely due to devoted and active efforts of their friend, Mr. Schneider. He hoped the Society would continue to flourish, and would ask them to drink to their President's health, which was responded to with the utmost cordiality.

Mr. Schneider returned thanks. He referred to the good understanding between English and Continental gardeners, and to the help the Society received from honorary members, who made room in their nurseries for those of the young men who came to this country. More than eighty new members joined this year, and the Society had now the advantage of a nice place for meetings. Other improvements had been made, and expenses incurred, but still they could boast of a larger balance in hand than ever. He was pleased also to see so many English visitors present, and called upon the company to drink to their health. At this juncture, M. Gouillond, in the name of the *membres titulaires*, made a presentation of a *cafétiere* to Mr. Schneider as a mark of their esteem and appreciation. After Mr. Schneider's reply, Mr. Arnold Moss responded for the visitors. Mr. Gachelin proposed the English horticultural Press, to which Mr. Harman Payne responded.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT.

January 14.—The annual meeting of the Isle of Wight Horticultural Improvement Association was held on Saturday last at the Newport Guildhall. Dr. J. Groves, B.A., J.P., presided over a large attendance of members from all parts of the Island.

After the confirmation of the minutes of the last annual meeting, the report for 1898 was adopted, on the proposition of the Chairman, seconded by Mr. R. F. Eldridge, J.P., C.A., Vice-Chairman of the County Council, and Chairman of the Technical Education Committee. Then followed the election of officers for the ensuing year, after which a social entertainment took place at Warburton's Hotel, where songs, recitations, duets, &c., were given by the members. Mr. A. Guy staged a collection of Cyclamen, for which he received a unanimous vote of thanks.

SHIRLEY & DISTRICTS GARDENERS' MUTUAL IMPROVEMENT.

January 16.—The monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on the above date, when the President, W. F. G. Spranger, Esq., presided, there being an average attendance of the members. The lecture, "The Effects of Electricity on Plants," was given by R. W. Stewart, Esq., D.Sc., London, principal of the Hartley College, Southampton, and was under the auspices of the Southampton County Council Technical Education Committee. The lecture was very efficiently illustrated by a number of diagrams, lantern slides, and electric experiments.

The lecturer first gave a brief description of electric science, explaining with actual experiments the meaning of high and low pressure, positive and negative electricity, and many other terms in constant use. He also showed how a current may be made to pass through ordinary soils, and showed that a box of seeds which had been subjected to a current for two hours daily, showed a higher and better percentage of germination than boxes of similar seeds not so treated. Reference was also made to experiments carried out in France and Russia, and also in this country at Clifton, where, on experimental plots of land, high poles carrying conductors had been erected, and connected underground with wires in all directions. Comparison of the crops grown on these experimental plots, with similar crops grown on adjacent plots, not electrically treated, showed an increase of from forty to sixty per cent. in favour of the former.

The lecturer concluded by hoping some of his audience would try some of the experiments he had shown them, and communicate the results to him later on. A hearty vote of thanks was accorded to the lecturer at the close of the lecture.

Obituary.

Mr. A. C. Wheeler.—We regret to announce the death of Mr. A. C. Wheeler, J.P., of Gloucester, which occurred after a long illness on Friday the 13th inst. The deceased was the sole proprietor of the old-established nursery and seed business carried on under the style of Messrs. J. C. Wheeler & Son, Gloucester. The firm has been in existence upwards of a century, Mr. Wheeler being the third head the business has known in this long period. He had long enjoyed in the West of England a wide reputation in horticultural science, and throughout his career he was intimately connected with agricultural interests of the county and district, and actively promoted every movement for their advancement. As far back as 1862 he was presented with a valuable clock, salver, and claret-jug, in recognition of his services as local secretary to the Gloucester meeting of the Gloucestershire Agricultural Society, the President of the Association, Mr. E. Holland, M.P., supplementing this with a gold snuff-box; and four years later he was presented with a handsome piece of plate, in the form of a silver epergne, by the Agricultural and Horticultural Society, in recognition of his exertions during the prevalence of the cattle-plague of that time. Mr. Wheeler was for a long period hon. secretary of the Gloucester Chamber of Agriculture, and retained the appointment up to the time of his death. He was formerly for some years hon. secretary of the Gloucestershire Root, Fruit, and Grain Society. The deceased gentleman, who was seventy-three years of age, was an Alderman of the City Council, and had held the distinguished offices of High Sheriff and Mayor of Gloucester.

The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending January 14, is furnished from the Meteorological Office:—

"The *weather* during this period was very changeable, and rainy over the whole kingdom, but several fine bright intervals were experienced over the southern and eastern parts of England, as well as over Ireland.

"The *temperature* was again above the mean, the excess ranging from 2° in 'Scotland, N. and E.,' and over 'Ireland,' to as much as 6° in 'England, E.,' the 'Midland Counties,' 'England, S.W.,' and the 'Channel Islands,' and 8° in 'England, S.' The highest of the maxima were registered either on the 8th or 12th, and ranged from 57° in the 'Channel Islands,' and 56° in 'England, S. and S.W.,' and 'Ireland, S.,' to 50° in 'England, N.E.' The lowest of the minima which were recorded on the 8th in Scotland, and during the middle of the week elsewhere, varied from 25° in 'Scotland, E.' and 'Ireland, N.' to 33° in 'England, N.W.,' and to 41° in the 'Channel Islands.'

"The *rainfall* was more than the mean very generally, but only just equal to it in 'Scotland, N.,' and slightly less in 'Ireland, N.' Over the southern half of the kingdom the fall was about twice as much as the normal.

"The *bright sunshine* exceeded the mean over Ireland, in 'England, S. and E.,' and the 'Midland Counties,' and just equalled it in 'Scotland, N. and E.' In all other districts however, there was a deficiency. The percentage of the possible duration ranged from 35 in 'England, E.' and 31 in 'England, S.' to between 28 and 25 in Ireland, and to 9 in 'England, S.W.'

MARKETS.

COVENT GARDEN, JANUARY 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Amongst fruits, the prices are much the same as in last report. French Spinach advanced in price. Home supply practically *nil*. Note Cape Plums as above. Further arrivals of Cape fruits are expected next week, when Peaches, &c., may be expected to show. Home-grown Tomatos are now finished. Canaries come in good condition and quality.

SEEDS.

LONDON: *January* 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's seed market as thinly attended, with but few transactions passing. For grass and Clover seeds the sale is, as yet, confined to narrow lines, whilst as regards values, no important alteration can be noted. There is still a great scarcity of Rye. Tares show no change. The demand for Haricot Beans, Blue Peas, and Spanish Lentils is, in consequence of the mild weather, meagre. Bird seeds likewise attract, for the moment, but little attention. For Linseed the trade is quiet. Mustard and Rape seed keep steady. The Board of Trade returns give the imports of Clover and grass seeds into the United Kingdom for the month of December, 1898, as 42,872 cwt., value £82,352, as against 43,084 cwt., value £79,497 for the corresponding period of 1897.

FRUIT AND VEGETABLES.

GLASGOW: *January* 18.—The following are the averages of the prices recorded since our last report:—Apples, per barrel, Canadian Baldwins, 25*s*. to 27*s*.; Phœnix, 24*s*. to 26*s*.; Mignons, 22*s*. to 24*s*.; American — Californian Newtown Pippins, 7*s*. 6*d*. to 9*s*. 6*d*. per case; Lemons, Messina, 7*s*. to 10*s*. do.; Palermo, 8*s*. to 10*s*. do.; Grapes, home, 1*s*. 3*d*. to 1*s*. 9*d*. per lb.; bitter Oranges, Blond Bitters, 7*s*. per case; Oranges, Jaffa, 7*s*., 7*s*. 6*d*., to 8*s*. 6*d*. do.; do., Valencia, ordinary, 420's, 5*s*. 9*d*. to 7*s*. do.; do., large, 9*s*. to 10*s*. do.; do., extra large, 11*s*. to 13*s*. do.; do. 714's, 6*s*. 6*d*. to 8*s*. do.; Mandarins Oranges, 6*d*. to 9*d*. per box; Marcias, 5*s*. to 7*s*. per case; Pears, Californian Winter Nelis, 9*s*. to 13*s*. do.; Pears, do., Easter Beurré, 12*s*. to 15*s*. do.; do., Glou Morceau, 12*s*. to 15*s*. do.; Onions; Valencias, 4's, 7*s*. 6*d*. and 8*s*. per case; do., 5's, 9*s*. 6*d*. do.; Cabbage, late Savoys, 9*d*. to 1*s*. 6*d*. per dozen; Parsnips, 3*s*. to 4*s*. per cwt.; Herbs, 1*d*. to 2*d*. per bunch; Parsley, 1*s*. to 1*s*. 6*d*. per stone; Potatos, 5*d*. to 6*d*. do.; Carrots, 2*s*. 6*d*. to 4*s*. per cwt.; Cucumbers, 9*d*. to 1*s*. each; Lettuce, 6*d*. to 9*d*. per dozen; Radishes, 1*s*. 6*d*. per dozen bunches; Horseradish, 2*s*. per bundle; Mushrooms, 9*d*. to 1*s*. 3*d*. per lb.; Beetroots, 6*d*. to 9*d*. per dozen; Brussels Sprouts, 1*s*. 3*d*. to 1*s*. 6*d*. per stone; Turnips, Swedes, 1*s*. to 1*s*. 2*d*. per bag; do. white, 2*s*. per dozen large bunches; Sea Kale, 1*s*. 9*d*. to 2*s*. per bunch.

LIVERPOOL: *January* 18. — *Wholesale Vegetable Market*:—Potatos, per cwt., Giants, 2*s*. to 2*s*. 2*d*.; Main Crop, 2*s*. 8*d*. to 3*s*. 2*d*.; Bruce, 2*s*. 4*d*. to 2*s*. 8*d*.; Turnips, 8*d*. to 1*s*. per dozen bunches; Swedes, 1*s*. 4*d*. to 1*s*. 6*d*. per cwt.; Carrots, 2*s*. 9*d*. to 3*s*. 6*d*. do.; Parsley, 6*d*. to 8*d*. per dozen bunches; Onions, English, 5*s*. to 6*s*. per cwt.; do., foreign, 4*s*. to 4*s*. 9*d*. do.; Cauliflowers, 1*s*. 9*d*. to 3*s*. per dozen; Cabbages, 8*d*. to 1*s*. do.; Celery, 8*d*. to 1*s*. 6*d*. do. *St. John's*:—Potatos, 10*d*. to 1*s*. per peck; Grapes, English, 2*s*. to 3*s*. per lb.; do., foreign, 6*d*. to 1*s*. do.; Pines, English, 4*s*. to 7*s*. each; Cobnuts, 8*d*. per pound; Asparagus, 1*s*. per bundle; Cucumbers, 1*s*. 3*d*. each; Mushrooms, 1*s*. 4*d*. per lb., and basket. *Birkenhead*:—Potatos, 8*d*. to 10*d*. per peck; Grapes, English, 1*s*. 6*d*. to 3*s*. 6*d*. per pound; do., foreign, 6*d*. to 10*d*. do.; Pines, English, 6*s*. to 10*s*. each; do., foreign, 4*s*. to 6*s*. do.; Mushrooms, 1*s*. to 1*s*. 6*d*. per lb.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending January 14, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	35 0	27 2	– 7 10
Barley	27 8	28 2	+ 0 6
Oats	17 4	17 1	– 0 3

GARDENING APPOINTMENTS.

MR. WILLIAM OWEN, principal Foreman at Madresfield Court Gardens for the past three years, as Head Gardener to the Hon. G. H. ALLSOPP, M.P., Foston Hall, Derby, in succession to Mr. G. LEWIS, who retires from gardening to take up farming in March next.

Mr. J. W. BUCKINGHAM, for the past two years Foreman at Taplow Court Gardens, Maidenhead, has been appointed by the Trustees of the late Sir ROBERT MEADS to take charge of the Englemere Estate, Ascot, Berks.

Mr. GEO. MURRAY, for the last twelve months Gardener to P. R. WAUD, Esq., 14, Spring Bank, Manningham, Bradford, as Gardener and Bailiff to Mrs. BARLOW, Shimdda-Hir, Llandudno, North Wales.

CATALOGUES RECEIVED.

WM. SAMSON & Co., 8 and 10, Portland Street, Kilmarnock—Seeds, &c.

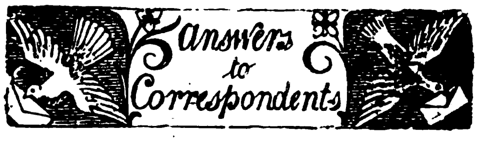
FRED. SMITH & Co., Church Street, Woodbridge—Seeds.

THOS. DAVIES & Co., Wavertree, Liverpool—Seeds, &c.

ARTHUR ROBINSON, 1A, Bishopsgate Street Without, London, E.C.—Seeds, &c.



Answers to Correspondents

ASPARAGUS PLUMOSUS: *James*. This plant and others similar grow well in the intermediate house, *i.e.* at a temperature of 50° to 65°, but the sprays are then too compact, and growth generally is very close, and more graceful growths are obtained by cultivation in a temperature of 60° by night, to 75° or 80° by day. In the dull season a medium should be struck between the temperatures of the stove and that of the intermediate house.

BOOKS: *B. G. Stanley*. *Journal of the Board of Agriculture*. This publication is printed and published by Laughton & Co., 1, Essex Street, Strand, W.C.

CYMBIDIUMS: *Veritas*. The Cymbidiums you mention are regarded as winter flowerers, though they often flower at other seasons.

CYPRIPEDIUM: *J. D., Burton-on-Trent*. We do not know a Cypripedium by the name you gave.

DENDROBIUM FLOWERS: *M. N.* A very good form of D. nobile.

FORCING FREESIAS AND NARCISSUS PAPER-WHITE TWO YEARS RUNNING: *Reader*. No good results would follow the practice.

GARDENERS' WAGES: *R. T.* We think that generally the highest wage is paid in the manufacturing districts of mid and northern England. With reference to the number of hours worked, the rule of 6 A.M. to 6 P.M. in the summer half-year, and 7 A.M. to 5 P.M. in the winter half, hold good in most places over the entire country. In some districts Saturday is a "short" day.

MARRAM GRASS: *W. F. M.* See the *Gardeners' Chronicle*, December 16, 1898, p. 750.

NAMES OF FRUIT: *H. T. C.* 10 and 11, resembles Gravenstein; 12, French Crab.—*J. B.* Not known.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*A. F.* 1, a form of Cypripedium × nitens, with more than the usual evidence of C. villosum in it. 2, Oncidium sphacelatum; 3, Vanda Amesiana; 4, Calanthe × Bella, with sepals not quite so white as the original.—*P. H.* Cattleya Trianæi var. delicata.—*T. T.* Cœlogyne Rossiana.—*J. B. R.* Plympton. The flower of Lælia peduncularis sent previously, like these now sent, was imperfect on account of all the parts being pressed together, and the pollinia lost. We did not find a flower of Cypripedium. Flowers should be sent in strong boxes, so as to preserve their form, and particulars, or a rough sketch of growth materially assists identification.—*Scotch*. Dolichos Lablab, of Linnæus, native of India, and frequently cultivated in warm countries. The pods in a green state are used as pickles, and in Egypt the pods are cooked as Kidney beans. It is figured at t. 896 of the *Botanical Magazine*.

POTASH—QUANTITY TO EMPLOY AS A DRESSING: *Reader*. The quantity of this salt (carbonate of potash) to be used on land under fruit trees, if applied in the form of wood-ashes, is 40 bushels to the acre. If the mineral salt is used 2½ cwt. per acre is a sufficient dressing applied in the autumn or spring. If manure from the farmyard or stables be used, and there is a good proportion of straw therein, much potash is supplied to the land by that means.

"RIVIERA FLORA": *Enquirer*. Moggridge's *Flora of Mentone*, and Bicknell's *Flowering Plants of the Riviera* are both most useful, containing numerous coloured plates. *Ardoino Flore des Alpes Maritimes* is even more complete, but is not illustrated. Probably there are local Floras to be had at less cost, for which enquiry should be made of the leading booksellers in the large towns. The general Floras of France and Italy, naturally include the plants of the Riviera.

SERVANTS LICENCES: *Shaw*. A licence has to be taken out yearly for each gardener and under-gardener, but not for garden labourers.

"TWIN" FRUITED APPLE: *J. L., I. W.* Your specimen is by no means an uncommon one. Apples, Tomatos, and other fruits frequently furnish instances of two fruits having become perfectly united together. It is hardly correct to describe such cases as "freaks" of Nature, as the circumstance is due to the fact that at a very early stage of their growth two buds became fused together by the close pressure exerted. Occasionally one growing point becomes divided, and produces a similar condition. We are pleased to know that for a period of upwards of forty years the *Gardeners' Chronicle* has been a source of interest to you. May it long continue to be so.

WATERPROOF PAPER: *W. W.* We must decline to recommend dealers, and you should either scan our advertisement columns, or advertise your needs.

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS *at home, that it has a specially large* FOREIGN AND COLONIAL CIRCULATION, *and that it is preserved for reference in all the principal Libraries.*

THE
Gardeners' Chronicle
SATURDAY, JANUARY 28, 1899.

DUNS CASTLE.

At the gardens at Duns Castle, in Berwickshire, is to be seen a fine old tree of the common Myrtle, which, on account of its great age, and the story in connection with it, may fairly claim to be the most remarkable Myrtle in the country. The tree is planted in the middle of the conservatory, the top of which it long since reached, and although now 120 years of age, its vigour is that of a youngster.

The following history of the tree is related on a tablet:—"This Myrtle was a sprig in the bouquet of the beautiful Miss Lucy Johnstone, of Hutton Hall, worn at a ball given in her honour about the year 1777-78. Mr. Lumsdaine, of Blanerne, presented the plant to Mrs. Hay, but there being no greenhouse here at the time, it was reared at Kimmerghame till the year 1803, when it was transplanted here."

Conflicting opinions anent the authenticity of this version of the plant's genesis are, however, held by some students of the legendary lore of Berwickshire, it being affirmed that in place of the ball being given in honour of Miss Lucy Johnstone, who was one of the beauties of her time, the fair maid was not even honoured with an invitation (she presumably not having at the time "come out"), but that with the aid and connivance of her old nurse she managed to evade the maternal vigilance, and descended to the ballroom, clad in simple white, with a sprig of Myrtle in her bosom as her only adornment. In any case the story is a pretty one, and adds greatly to the interest of the tree. History does not relate how the plant came into the possession of Mr. Lumsdaine.

Kimmerghame House is but a short distance from Blanerne and Duns Castle, and the plant is thus connected with four of the principal seats in Berwickshire; and there are few dwellers in the county who have not heard of the Duns Castle Myrtle, and there are many who, from sprigs of the tree, have reared plants of their own, of whose origin they speak with pride.

After being removed to the newly-built greenhouse or conservatory at Duns Castle, the plant seems to have thriven splendidly, and soon taxed the resources of its somewhat limited quarters, so that the branches had to be twisted and coiled, the then lord of the manor having a strong objection to the plant being cut; and not the least interesting circumstance connected with the plant, from the visitor's point of view, was the curious twisting and turning of the thick limbs, which still continued to flourish.

To enable the tree to expand further, the house was eventually raised, and is now, in the centre, some 30 feet in height. The limits of space were soon again filled, and clipping had to be resorted to, although this was not carried out further than was actually necessary until some two years ago, when it was decided to severely prune the tree, which had now become very unshapely. It was, therefore, cut hard back, nearly to the trunk, many branches and limbs of considerable thickness being removed. After the operation, it was regularly syringed with tepid water to encourage it to break; and it responded in a most satisfactory manner, new growth springing out from every part, until now it is a pyramid of beautiful green, and will for years continue an object of interest.

On the lawn in front of the conservatory in which the plant is situated are three fine trees of Araucaria imbricata, one of which—a female tree—is a noble specimen in every way. It is about 45 ft. in height, and is very symmetrical, its lower branches sweeping the ground around, and covering a circumference of 105 feet. It has for the past few years fruited regularly, and last autumn was carrying between twenty and thirty cones. A fine batch of seedling plants has been raised from seeds collected in previous years. A photograph of the tree was exhibited at the Conifer Conference of the Royal Horticultural Society at Chiswick.

Besides the conservatory, there is at Duns Castle a further range of glass, 300 feet long, which is in capital repair, and which is given up principally to the cultivation of fruit—Peaches, Grapes, Tomatos, Melons, &c., being exceedingly well grown. Of plants under glass, great attention is given to the cultivation of the Begonia, and the entire side of one house is occupied by these beautiful plants.

Outside, the principal feature of the gardens is the hardy fruit, and there was in the autumn a very fine crop of Apples, although Pears were somewhat light, while Plums were not above average.

The Apples are principally pyramids on the Paradise stock, in which Mr. Aikman, the chief of the gardens, has great faith, and the health and vigour of the trees, combined with the fine crops they are carrying, are proof of the soundness of his methods and the wisdom of his theories. Many old orchard trees are also to be seen, but these are being gradually removed and replaced by younger trees of the most approved varieties. Small fruits were last year an enormous crop, Gooseberries especially being here seen in quantity and quality such as is seldom met with.

So far north there is, of course, always the devastation of spring frosts to be dreaded whilst the trees are in bloom, but this evil is mitigated by the adoption of a glass coping which projects some 2 feet along the top of the wall. Attached to the front of this coping is an iron rod, and when the trees are about to burst into bloom, a similar rod is erected about 9 feet from the ground, and on these are stretched on rings curtains of frigi-domo, which are drawn regularly every night, and the trees are thus shut off from all possible harm. The curtains are again drawn back on the following morning, and secured to upright posts, which are erected at intervals for the purpose.

Vegetables of all sorts last season yielded good crops, although the drought had to be contended against, the gardens resting on a gravelly subsoil.

There is no flower-garden proper at Duns Castle—and, indeed, on an estate of so much wild and natural beauty it would be almost an impertinence to introduce it—but here and there throughout the gardens are beds and borders of all sorts of old-fashioned flowers, one border in particular, over 100 yards long, and filled with herbaceous plants, Roses, &c., making a delightful feature.

Leaving the gardens for the Castle, the path lies through the ancient park, in which are many noble trees. It was to this "Duns Park" that Robert the Bruce, in the year 1318, commanded the Earl of Douglas and Dunbar to repair and join Randolph, prior to an assault on Berwick, and it was this same Thomas Randolph, Earl of Moray, who took so prominent a part under Bruce in the War of Independence, and who built the Castle in the year 1320, King Robert having bestowed on him the lands and town of Duns as a reward for his services. The walls of this ancient structure are of enormous thickness, and the place must have been one of considerable strength in those days. Duns Castle was the headquarters of General Leslie when the Covenanters lay encamped at Duns Law in the year 1639, and the bedroom which he occupied is shown to this day.

Alterations and additions have from time to time been made on the building, the latest of which were effected by the late Colonel Hay, who built at the angles of the old structure the tall battlemented turrets which now form such characteristic features of the edifice, added a main doorway on the south side in a style to correspond with the turrets, and converted the original square windows into large lights of late Gothic form.

The Castle contains many portraits and pictures of great historic interest, as well as most valuable relics connected with the Royal House of Stuart. Chief among these latter are a lock of Prince Charles Edward's hair, and a draught-board once the property of the ill-starred Mary Queen of Scots. The squares of this board are of silver and gold alternately. But of greater interest than either of these, perhaps, is a document embodying the agreement known as the Solemn League and Covenant, dear to the heart of every patriotic Scotsman. It was on the neighbouring hill—Duns Law—at the foot of which the Castle stands, that the document was signed, and it is said to be the original one, though there is a doubt about it. "The Covenanter's Stone" still marks the spot where the bargain was sealed, and is a source of unfailing interest, with its recollections of General Leslie and the Covenanting Army of 24,000 men who here lay encamped in 1613, ready to do battle "For Christ's Crown and Covenant."

At the foot of Duns Law, and immediately behind the castle, stretches the lake, locally known as the "Hen Poo," a glimpse of the extreme end of which is obtained in fig. 19. This is a magnificent sheet of natural water, stretching for three-quarters of a mile, and containing an area of about fifty acres. It is of very pleasing and irregular outline, and contains two islands, on one of which are trees of a considerable size. In a natural expanse of water of this description, no attempt is made to artificially beautify, but Nature has been wonderfully lavish, and round its sides are abundance of Bullrushes, Spiræas, Sedges, and a host of other water-loving plants; while in one spot is a magnificent breadth of the white Water-Lily (Nymphæa alba), which, when in bloom, presents a most charming spectacle. With the exception of the side of Duns Law, on which sleek and thriving herds of cattle may be seen grazing, the lake is wooded to the water's edge; and on the opposite side from the Law rises abruptly from out the water a correspondingly high hill known as the Witch's Knowe, where, in days gone by, persons suspected of witchcraft were wont to expiate their supposed crimes by burning. *A. A.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM × HAYNALDO-BELLATULUM (HAYNALDIANUM ♀, BELLATULUM).

A VERY singular, new, and pretty hybrid, possessing the desirable feature of being distinct from any other. The scape bears but one flower, though it is almost certain to bear more when thoroughly matured and strong. The flower-stem is covered with soft purple hairs; the bract, which is two-thirds of the length of the ovary, is green, spotted with purple; the ovary greenish, white with purplish down on the prominent ridges. The upper sepal, which is 2½ inches long, and 2 inches broad, is yellowish-green over the basal two-thirds of its area, the upper and marginal third being pure white; the whole surface, with the exception of a narrow white margin, bearing irregularly dotted purple lines. The petals, which have a peculiar wave or twist in them, suggestive of the influence of C. Haynaldianum, are 1 inch broad and 3 inches long, distinctly decurved, creamy-white, with a striking purple reticulation in spots and lines over their whole surface. The lower sepal is half the size of the upper one, greenish-white, with purple-dotted lines. The lip, which has a peculiar lateral compression, has the side-lobes folded one over the other, both being closely shielded by the large staminode, which is yellow, with a few purplish lines towards the base. The colour of the lip is very pale yellow, the face being delicately tinged and dotted with rose. The leaf resembles that of C. Haynaldianum, but bears an obscure dark green reticulation. It flowered for the first time with Walter C. Clark, Esq., Orleans House, Sefton Park, Liverpool, who kindly furnished the material to enable the writer to describe it. *James O'Brien.*

MADRESFIELD COURT GARDENS.

IT is interesting to find that, under the control of the present Earl Beauchamp and his gardener, Mr. Crump (whose portrait is given herewith), this fine old place, near Great Malvern, has not only continued to worthily occupy its old position amongst British gardens, but it has greatly advanced. Lord Beauchamp is a great lover of flowers, and for that reason has had large masses of many descriptions of hardy things planted in all sorts of places, hence in all directions there crop up big climbing, bulbous, and ordinary perennials, beneath trees, amidst long grass, in semi-woodlands—indeed, wherever it is possible to find space, with some show of adaptability or fitness. There are, too, the usual mixed hardy borders, also gardens solely of Roses and of annuals, beautiful flowering or foliage shrubs and trees in all directions, a considerable range of rockwork, not the least prominent feature on which is constituted by Cyclamens in their season; whilst on grass there is a broad serpentine rivulet of Colchicums in variety, the large C. maximum being very prominent. In all directions hardy bulbs have been planted, and the grounds in the spring may be said to be full of Daffodils of all descriptions, Squills, and other bulbs. A very quaint feature of the large flower-gardens fronting the mansion is its coloration, which consists exclusively of orange, yellow, and lemon shades. These allied hues are furnished by all descriptions of plants that have adaptability for the purpose. Such a flower garden is so widely dissimilar to what is commonly seen in similar positions, that it is difficult to criticise it, yet there is, in spite of the oddity, a softness, and harmony in the whole that renders it far from unpleasing. Of course, it would entail immense labour were it resolved to vary the colours to buff, brown, blue, red, white, &c., from year to year. There seems, however, to be no such intention, and Mr. Crump is still on the look-out for yellow-flowered plants that will suit Earl Beauchamp's tastes, although as it is, he seems to have almost everything yellow, or of allied shades. In a new garden where mixed colours rule, there was a small mass of the most perfect single-flowered bedding Begonia I have ever seen. It is there known as the French Worthiana, and though of the same height, it is much stiffer or erect in habit than is the common Worthiana, and the flowers are of double the size, of a rich orange-scarlet, and borne boldly in great profusion. Every one who uses Begonias for bedding should have this beautiful one. They would not then plant the ungainly, large-flowered ones again.

Conifers are very abundant here, especially in the neighbourhood of the fine rockery, which is one of Pulham's best productions. This is well furnished, and the garishness so characteristic of new rockwork has entirely disappeared. The entire construction now looks quite natural. There are intersecting the grounds two very fine avenues of Conifers, each some quarter of a mile in length. The trees composing these are now in the very prime of life. One is of Abies nobilis glauca, the trees averaging 50 feet in height, and perfectly furnished throughout; the habit is somewhat stiff but the colour of the foliage, here almost blue, gives to the trees a very marked aspect. Each tree has lately received a top-dressing in the shape of a couple of cartloads of marl, which they seem to like greatly, previous dressings having done great good. At one end of this avenue there runs at right angles another of a more elegant Conifer, Cedrus atlantica glauca. Some of these trees have the true blue or glaucous tint of the variety richly displayed, others less so, but the avenue is one of great beauty, and commands warm admiration. At its extremity, towards the kitchen gardens is a yet rather new semi-rock garden, which is fast becoming furnished, and will soon become of exceeding interest. Here plants are fully exposed to sunlight, and many thrive that would hardly do so in the comparative shade of the rockery previously mentioned.

MR. W. CRUMP
(The Gardener at Madresfield Court)
See p. 51.)

Hardy Fruit is at Madresfield a very prominent feature. It is evident that the reputation the gardens enjoyed in the days of Mr. Cox has not suffered in any way in the hands of his successor. Fruit-trees are not only found in remarkable abundance, but are wonderfully well done, and generally carried capital crops. The walls within and without the gardens are well clothed, and all ordinary trees are in perfect condition. Pears are specially good, and such varieties as Pitmaston Duchess, Doyenné du Comice (see fig. 16, p. 51), Beurré Boussoch, Beurré Clairgeau, Beurré Superfin, Beurré Diel, Williams' Bon Chrétien, Josephine de Malines, here regarded as the best late Pear, and keeping well till February, were, with many others, finely cropped, having noble fruits. A long series of cordon Pears, planted on either side of the central garden-walk, have had three shoots or branches run off laterally on either side, and these are trained along wires strained tightly overhead, so that the path becomes literally a Pear-bower some 400 feet long. Between each of these side cordons there is a large pyramid or bush-tree. From this walk very fine crops are obtained. Some old espalier Apple-trees merit notice, notably several Ribston Pippins. These are about 4½ feet in height, are in superb health, and were carrying wonderfully fine fruits. There is an espalier of Lord Derby, 4½ feet high, with four horizontal branches on either side, and the entire tree is 42 feet long (see fig. 18, p. 53). This was carrying a grand crop of superb fruits, and indicates in a marked way the value of espalier training in Apple culture. These are, however, only the few out of many. Cox's Orange Pippin was giving a splendid crop on double oblique cordons. These have been six years planted, each stem is about 9 feet long. There are some 30 feet run of these cordons, planted 2½ feet apart. The fruits were remarkably fine, quite perfect samples. These trees were originally budded on to seedling stocks obtained from pips of the cider fruits. Also similarly worked and fruiting well were Claygate Pearmain, Sturmer Pippin, Tyler's Kernel, and others. Apples, Pears, and Plums, are in great plenty in outer gardens and orchards, and there is in one place a large trial orchard, the trees being all of bush form, and planted rather close. Here varieties are tested for fitness for general estate as well as for home culture.

THE ESTATE NURSERY.

A remarkable feature is the fruit nursery. Lord Beauchamp, with thoughtfulness and regard for his tenants' interests, has had raised under the gardener's care yearly about 2000 trees; that is, at least, the number annually worked, chiefly by budding. The nursery, which is changed from one area to another every two or three years, vegetables alternating, has at the present moment several thousands of trees in it, all first-class stuff. The maiden growths on Apples, Pears, Plums, and Cherries would do credit to any nursery in the kingdom, as would also the appearance of the entire stock. Good trees are sent out to tenants yearly, on application, and under such conditions no farm or garden need be otherwise than well stocked. All the best varieties found suitable for the locality are grown. Mr. Crump raises his own stocks; and all seedlings when lifted after the first year for planting up in lines for budding later, have the long tap-root carefully preserved, not cut off or shortened, but bent horizontally, and in the process of planting always towards the front. The result is, he states, that this tap throws out numerous fibres, and these during the season form such mats of roots, that the trees when lifted from behind literally stand alone. That is very much more than can be said of fruit-trees generally when young.

Cordon Currants and Gooseberries are a very interesting feature in the kitchen-gardens; Gooseberries are trained as treble cordons on a single wire trellis, and as quadruple cordons on a double wire trellis. This latter is of the greater interest, as being the more novel. The bushes are planted 18 inches apart in one row; each bush has four stems. These are trained up in pairs on either side, so that, reaching a height of about 6 feet, they are at the top 20 inches apart, each side slanting outwards. Originally each stem was tied up to sticks. There are but three wires on either side, and the top ones are nearly 7 feet high, to carry the nets which

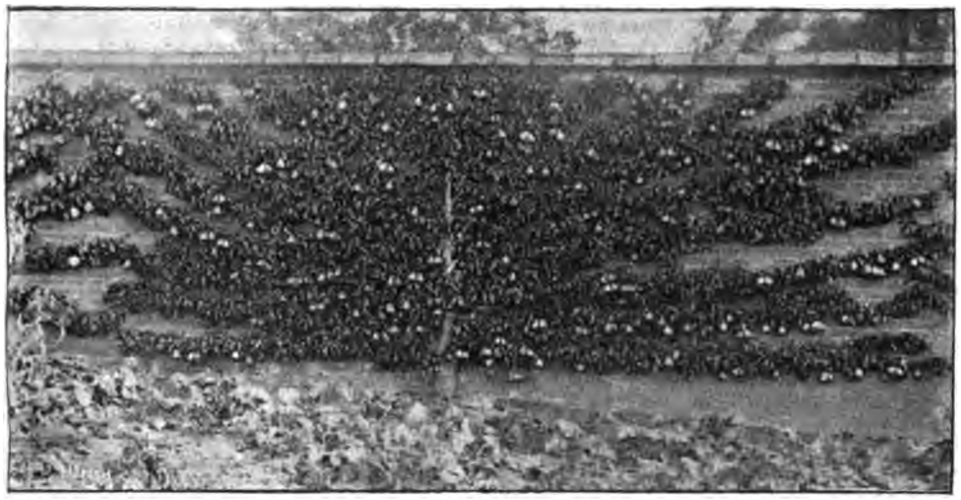

Fig. 16.—A fan-trained tree of Doyenné du Comice Pear, Madresfield Court.

(See p. 50.)

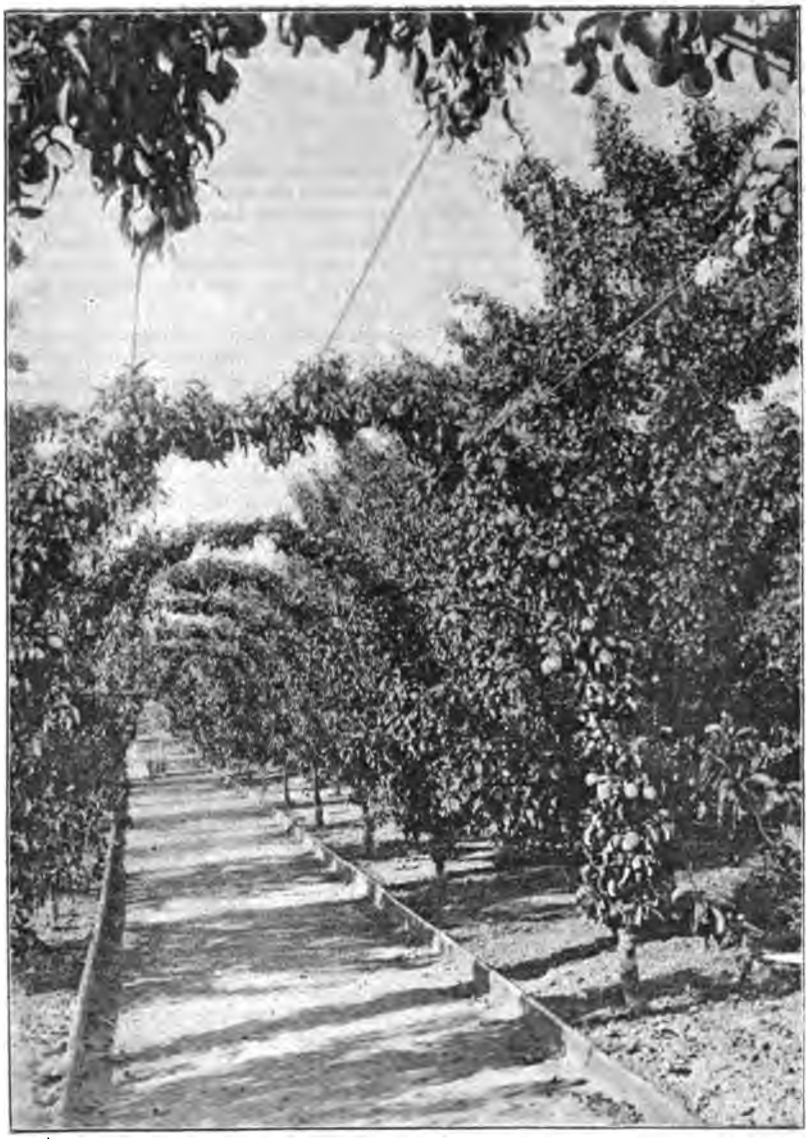

Fig. 17.—An arcade of Pears Madresfield Court

(See p. 50.)

enclose all the quarter. This double cordon of Gooseberries includes dessert varieties only. The adjoining one that is single, is composed of the Lancashire show varieties. Next come wire trellis-trained Raspberries, one row being double-wired as for the Gooseberries. This latter row gives far more fruit from the same space than is given by single-wired trellises. Red and White Currants are trained as cordons by wire also. The former, planted 2½ feet apart, each have three stems, completely furnished with spurs, to the full height of 6 feet. The stems slant somewhat obliquely. The produce in fruit is enormous, and it is wonderfully fine and clean. Birds do not seem to trouble either whites or reds so grown.

There are, of course, large numbers of houses devoted to plant and fruit-culture, but these have for me little of interest compared with what is found outside in hardy fruit-culture at Madresfield Court. *September*, 1898.

William Crump,

the highly esteemed gardener at Madresfield Court, was born at Pontesbury, Salop, in the year 1843. He must have been born a gardener (not bred), for not one of his friends or relations were ever engaged in matters horticultural. From earliest childhood he spent nearly all his time in his parents' small garden amongst the flowers, planting one day, and taking up the next "to see if they grew." One of his earliest experiences was the raising of a healthy sapling Oak from an Acorn, but owing to being planted too near an important window, it proved his first disappointment. After overcoming the objections of his friends, young Crump was duly apprenticed, and went through all the necessary probationship, until the year 1865, when he took charge of the glass department at Powis Castle, Welshpool, under the late Mr. G. Brown, a good all-round Scotch gardener of the old school. Carpet-bedding then became fashionable, and in his thirst for practical knowledge Crump took an unusual step, viz., an Irishman's rise, involving a reduction of wages, but which proved a very wise step. He took the general foreman's place, under the late Mr. Wildsmith, at Heckfield Place, Hants—a place from which have proceeded so many gardeners now holding leading positions. After staying there three years, he became head gardener to F. Harris, Esq., The Grange, Lamberhurst, Kent, a new place, which did not reach the anticipations formed of it. After four years' service there, he went to Blenheim Palace, Woodstock—a place that required much tact to sustain. Much exhibiting was done at the Royal Horticultural Society, South Kensington (then in its greatest prosperity), Crystal Palace, Royal Botanic, Manchester, Oxford, and other shows; Silver Cups and Medals being awarded, including the blue riband at the International Potato Show, Crystal Palace, and, what was most appreciated of all, Messrs. Webber's packing prize, twice in succession. Blenheim Orange Melon, which still holds its own, was raised, exhibited, and received First-class Certificate, R.H.S., during the seven years of his tenure of office as head gardener. In the year 1883 he removed to Madresfield Court gardens, in succession to the late Mr. W. Cox. The place is noted for its excellent soil for fruit growing, which always had a special attraction for Mr. Crump. Large numbers of trees are produced annually for tenants, and distributed gratuitously. There is also an interesting experimental plot, where some 250 varieties of Apples, 80 of Pears, and 50 of Plums are on trial. One of the Victorian Medals of Honour was awarded to Mr. Crump in 1897. Mr. Crump has done excellent service in working up an efficient auxiliary of the Gardeners' Royal Benevolent Institution at Worcester, and has been the means of adding many annual subscribers, and £300 in cash in three years. Oh, that gardeners in other counties would do likewise!—it only requires the will.

GLOXINIAS.

Having been unusually successful in the cultivation of these beautiful plants, it may prove of use to some of our readers if I describe my methods of cultivation. It is at this season that the foundation of a good summer display is laid. Some years ago the Gloxinia was considered a somewhat troublesome plant to grow, chiefly, I believe, on account of the tedious process of propagation from leaves, &c. ; whereas now, seed is chiefly relied upon, and Gloxinias can be made to produce their flowers within six months of sowing the seed. If the seed be of the best strain, the plants will possess fine foliage and lovely blossoms. The first sowing should be made in the present month in pots filled to within half-an-inch of the rim with a compost consisting of two parts loam, one part each of leaf-mould and silver-sand, which should be made fairly firm by hand-pressure. The seed, being very small, requires care in the sowing, so that it may be evenly distributed. It must be very slightly covered with fine soil or sand. The pots should then be well watered, and, if possible, they should be plunged in bottom-heat of 65° to 70°, and each should be covered with a sheet of glass. The water should be applied with the finest rose, and in a slow, gentle manner, so as not to float the seeds above the soil. In a week or ten days the seedlings will begin to appear, when the glass should be tilted slightly, the amount of air being gradually increased, so as to permit the seedlings to gain strength. It is advisable to prick them off into a pan as soon as it is possible to handle them, as to allow them to get drawn is to spoil them. The soil in the pricking-off pans should contain rather more loam than that in the seed-pans. The plants should at all times be carefully shaded from the sun, and a genial, humid atmosphere provided, the temperature being kept at about 70°. When the plants have made three or four leaves, they should be potted-off singly into small 60's, and in doing this the lower leaves should rest on the mould. The compost for this potting and the last one should consist of sound turfy loam two parts, decayed manure one part, and sand one part. The drainage of the pots must be thorough, Gloxinias taking a large quantity of water when growing freely. A sprinkling of the leaves on bright days is beneficial to the plants up till the time the flower-buds show colour. When the first pots get fairly filled with roots, the plant should be shifted into 48's, or if extra fine specimens are desired, then into 32's. When well established in this size of pot, liquid manure is of use in giving greater substance to the leaves and flowers; and it may be applied weekly, once or twice. A small quantity of Clay's Fertiliser sprinkled on the soil is a good form of manure. Care should, however, be taken not to let any of the manure touch the foliage, or spots may appear thereon. When the flower-buds begin to exhibit colour, it is time to remove the plants to a house with a cooler, drier atmosphere, damp injuring the flowers. For a succession, seeds may be sown in February and March. After flowering, the foliage should be induced to wither and drop off by gradually withholding water until they are quite dried off, when they may be placed, with the pots lying on their sides, under the stage in a cool greenhouse till they are again started into growth the next year. To do this the tubers should be shaken free from all the soil, and placed in boxes embedded in cocoa-nut fibre refuse, and exposed to a moist heat in quantity according to requirements. When growth is well advanced, the tubers may be potted into 48's and 32's as the size of the tuber may require, and treated as they were the previous year. *C. Buckland, F.R.H.S., Datchet.*

HERBACEOUS AND TREE PÆONIES.

ONE of the best known Pæonies is P. officinalis. In the dormant state this variety shows the eyes above its thick and fleshy roots; the foliage dying down to the ground every season at the approach of winter. It is found in greatest profusion in the Orient, Japan, and China, and while also found in various districts of Europe and North America, the great range of colour and form is only found in the Far East. There are found the single sorts resembling the Lotus-flower, a set of silken petals surrounding a corolla of rich yellow stamens. The colours of the flowers embrace pure white, delicate rose, rich pink, lilac, soft and rich ; deep crimson, maroon, variegated, pale blush. Then we find the semi-double kinds, with petals whorled, fringed, slashed or smooth, rivalling in richness of colour and variegation the single sorts. The full double kind is often found with petals oddly cut and high centres, recalling the richness of the double Poppies. A beautiful novelty in this class is a velvety blood-red with odd white splashes, really a royal blossom.

Propagation is effected by division of the roots, which, however, should not be done too often, as it weakens growth.

Another well-known Pæony is P. Moutan, or the tree Pæony. This is a shrubby plant, grafted on the roots of P. officinalis. The grafting is best effected in the month of August. The flowers of this class, with proper treatment, attain immense dimensions, flowers of 10 to 12 inches and over being common. The range of colouring is as rich, if not more so, than in the herbaceous sorts. Over fifty distinct and beautiful kinds are now cultivated in Japan for export. The colours are pure white, white shaded lilac or rose, scarlet and rose shading, brilliant carmine, carmine with white edges, pink with lilac edges, maroon, velvety lilac, deep purple, rich rose ; the flowers being single, semi-double, and double, with crimped, smooth, and serrated petals. The P. Moutan attains its highest perfection in Japan, where its cultivation amounts to a regular worship. For the grand exhibitions held yearly, a gardener will devote months of patient labour and care to this flower. Each separate plant is placed under a straw-thatch, and given proper nourishment, sunlight and shade, and the result—well, it beggars description. I wish my friends could follow me to the great Pæony-show held yearly by the gardeners in Yokohama. Benches are staged upon benches, and upon these are exhibited these gorgeous flowering-plants in pots. Such size, such glowing colours, and such skill in blending the colour-masses in preparing the exhibition ! The whole show is held in a long building erected of Bamboo-poles, and sheltered with Bamboo-mats— the great building material of the Orient.

All through the day, and far into the night, when the whole is illuminated with gay lanterns and torches, the place is thronged with the flower-loving people, and every European inhabitant of Yokohama is sure to visit the exhibition. Tea, the national beverage, is served to the visitors by smiling little Japanese maidens ; while the men drink to each other solemnly, the stronger Saké, a native spirit prepared from Rice.

Pæonies need but little care. Planting in the open ground can be done either late in "fall" or early in spring. They require a deep rich soil, well trenched, with old rotten manure well incorporated. A top-dressing of manure is beneficial. A partially-sheltered position is desirable. As a foreground to large shrubberies, or in a wide border, or in beds by themselves, they form a beautiful feature in a garden. In winter, in exposed localities, they should be protected by a litter of straw, brush, or mats.

The florists' harvest, however, lies in forcing these royal blooms in pots for Easter. To attain the best results, the dormant plants should be potted, the roots as tightly as possible wedged in the pots, which should be provided with good drainage. The soil should consist of well-rotted old sod and old manure, filling well every interstice. Kept at first in a temperature of 45° to 50°, the plant can, as the leaf-buds swell, be brought into a slightly higher atmosphere. At no time must a Pæony be brought into too high a temperature, as this causes the buds to wilt and dwindle. As soon as the colour shows, liberal doses of manure-water can be given ; in fact, the treatment given the Chrysanthemum to attain the best results answers marvellously well for the Pæony. Also the petals of Pæony flowers, being very delicate, they should be hardened off before being brought to market. Plants of Pæonies which have been forced one year had better be planted in the open ground in "fall," and allowed to rest a season or two.

These royal plants are sure to find a ready sale by those who look for something out of the beaten routine in Easter-flowering plants. *H. H. Berger of New York, in "The Florists' Exchange."*

THE ROSARY.

NEW ROSES OF 1896, 1897, AND 1898.

I DO not propose to discuss more than a dozen of the varieties introduced to commerce during the last three seasons. We naturally know more of the 1896 Roses than others of subsequent date, and there are several really first-class varieties that were introduced during that year. I have fourteen upon my list, but will select the six most distinct. Antoine Rivoire is a variety the result of crossing Dr. Grill and Lady Mary Fitzwilliam. It is a large and full almost Camellia-shaped flower, and in colour is clear flesh-pink with a yellow base, occasionally flushed with carmine. In this Rose we have the free-growing and flowering habit of Dr. Grill, with the erect habit and massive flowers of Lady Mary Fitzwilliam ; it is a grand Rose for cultivation in pots, and can scarcely be put in the wrong position. Ellen Drew is a sport from Duchesse de Morny, and is an exact counterpart of that variety, except that it is clear silvery-pink in colour. Lawrence Allen is rather lighter in shade than Baroness Rothschild, and considerably larger and more full; it has a most delicious perfume. Muriel Grahame needs no further comment than to mention that it is a sport from Catherine Mermet, pale blush-white in colour, and even more free than its parent. Queen Mab is not a good grower, but it is free-flowering, and a useful bedding Rose; the flower is deep apricot in colour, tinged with metallic-red and coppery-salmon. Souvenir de Catherine Guillot is one of the most distinct Roses grown; it is very free, being almost always in flower. The foliage is a deep purple and copper-red, and the buds are long, and produced in trusses. Its colour is difficult to describe, having coppery-red, salmon, crimson, and yellow all mingled together; it is quite one of the best garden and decorative Roses we have.

Out of the twenty varieties upon my list for 1897, I consider the two following most distinct: Duchesse Marie of Ratibor, a cross between Dr. Grill and Kaiserin Augusta Victoria. Both of the parents grow and flower freely, and the offspring retains the parents' characteristics. The flowers are large and well formed, and, like those of K. A. Victoria, they last well. The colour is a clear creamy-yellow, with a reddish-crimson centre. Emanuel Geibel is a decided improvement upon Madame Falcot. The colour is even darker than in that old favourite, while the bud is longer, and develops into a flower full enough for exhibition.

There are fourteen in my list for 1898, and four of them deserve special notice. Beryl affords a golden-yellow shade found in no other Rose. The buds are long, and though not very full, the flower keeps well, and it is a delightful button-hole Rose. It is a very free grower, exceptionally sweet-scented, and is sure to be most popular as a variety for bedding and forcing. Grand Duc Ernest Ludwig is a seedling from Maréchal Niel and General Jacqueminot, retaining the good qualities of both its parents. The plant is of climbing habit, and the flowers are as large and full as those of Maréchal Niel, but of the deep shade of crimson seen in General Jacqueminot. It is a decided acquisition to the climbing varieties, and likely to be much grown in connection with its deep yellow parent. Killarney has long flower-buds, of good form, is soft flesh-salmon and pink in colour, very distinct, and free. Purity makes a grand pillar Rose, is an exceptionally free and early bloomer, and one of the purest whites we have. *A. P.*

Reliable Roses.

The present season is not very favourable for planting Roses—in Scotland at least—by reason of the prevalence of excessive rains. Those cultivators who have unwisely delayed this important work till the month of January, will be beginning by this time to regret their procrastination. Doubtless hybrid perpetuals and hybrid Teas can be planted up to the end of February, under favourable conditions, with comparative safety; but, as a general rule, it is much wiser to plant them on the confines of November, before the season of floods has fairly set in. At present, the weather is a series of unsuccessful attempts at frost, followed invariably by deluges of rain. As those Roses are the most valuable, in this exacting climate, which thrive best under such conditions as these, I have pleasure in recommending to my readers the varieties which have, during the last decade, been most enduring and successful here.

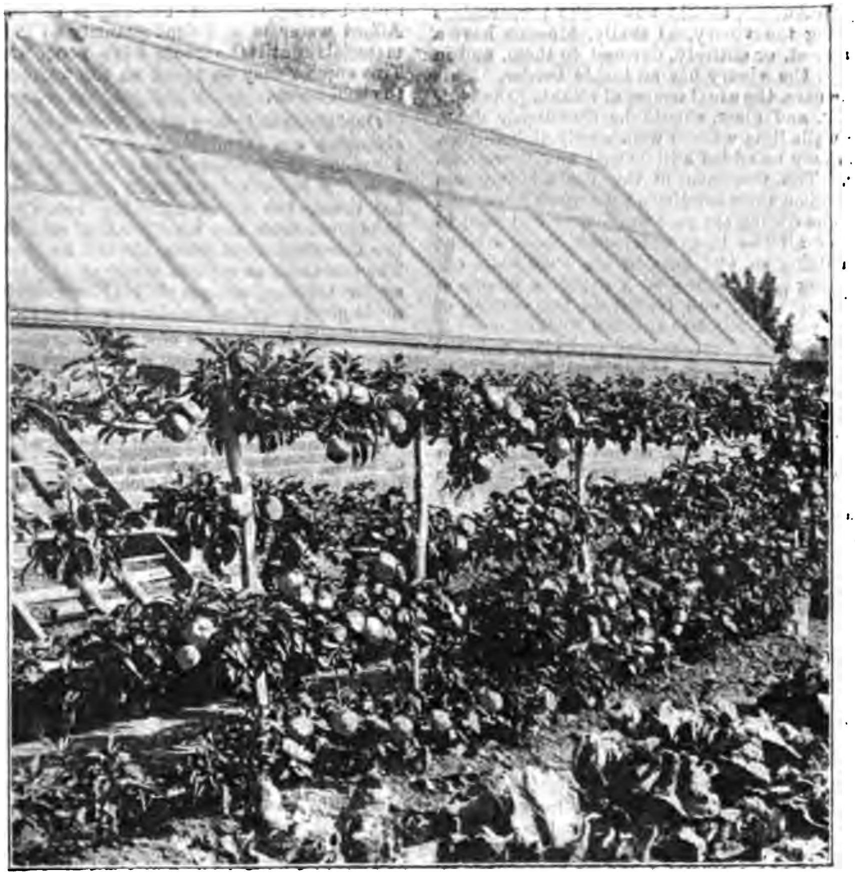

Fig. 18.—An espalier apple-tree at Madresfield Court.

(See p. 50.)

Among hybrid perpetuals, some of the most reliable are Alfred Colomb, A. K. Williams, Beauty of Waltham, Captain Hayward, a very brightly-coloured, free-flowering variety, of recent origination, larger than Mr. Cranston's Crimson Bedder, and equally fragrant, but not so full; Charles Lefebvre, whose popularity knows no diminution either with exhibitors or ordinary cultivators; Cheshunt Scarlet, a precious garden Rose; Crown Prince, Duchess of Bedford, Duke of Edinburgh, and Duke of Wellington, all of which may be described as indispensable. Almost as much may be said of General Jacqueminot, from which many of the grandest of our dark crimson Roses have been derived; Margaret Dickson, almost pure white, and very commanding; Helen Keller, a most beautiful pink Rose, of perfect formation; Earl of Dufferin, Jeannie Dickson, Lady Helen Stewart, and Mrs. Sharman Crawford, raised by the Messrs. Dickson of Newtownards, whose latest productions, such as Ardsrover, Meta, Beryl, Killarney, and Countess of Caledon, are likely to sustain their great reputation. Also much to be commended, after long experience of their capabilities, are Pride of Waltham, Spenser, Clio, and Salamander, Prince Arthur, a distinguished derivative from General Jacqueminot, Susanne-Marie Rodocanachi, an effective contrast in colour to these; Sir Rowland Hill, and Reynolds Hole. Perhaps I should mention, as a warning to cultivators, that the variety last mentioned is not always to be relied upon, as, unlike the majority of its dark crimson contemporaries, it is easily affected by atmospheric influences. In this special respect it much resembles Abel Carrière, and the greatly over-estimated Prince Camille de Rohan.

As a general rule it is advisable, for the sake of root-formation, to transplant hybrid perpetuals once in five years. I find they are, in most instances greatly benefited, both as regards vigorous growth and floral productiveness, by a change of soil.

The most easily cultivated and most profitable of all Roses to the ordinary cultivator, are the hybrid Teas. Of these the finest are the fragrant La France, and her beautiful variations, Augustine Guinoisseau and Duchess of Albany; Caroline Testout, invariably large and imposing in aspect, whose origin has not been very clearly ascertained; Kaiserin Augusta Victoria, a German Rose of exquisite primrose-hue; Viscountess Folkestone, of charming fragrance and marvellous floriferousness; Grace Darling, another very fine production of the late Henry Bennett; Mrs. W. J. Grant and Marquis Litta, both of them recent and great acquisitions; White Lady, the handsome daughter of Lady Mary Fitzwilliam; Barden Job and Gustave Regis, of highly effective and strongly contrasted hues; and those universal favourites, Clara Watson and Gloire Lyonnaise.

China and Polyantha Roses can always be depended upon. They seldom fail. More capricious are the somewhat delicate Noisettes, with a few notable exceptions, such as Aimée Vibert and Caroline Kuster. The greater number of the Tea Roses are now marvellously hardy in their nature, and during the winter require little protection, and the following varieties can be planted as late as the end of February, with every hope of success, viz.: Souvenir d'un Ami and Souvenir de S. A. Prince; Catherine Mermet and The Bride, both of which are of vigorous constitution; Gloire de Dijon, and its more attractive descendants, Bouquet d'Or, and Belle Lyonnaise; Hon. Edith Gifford, Madame Lambard, which flowers luxuriantly, early and late; Madame Hoste, Madame Bravy, and Marie Van Houtte; the artistically-tinted Madame de Watteville; Anna Olivier, a profuse and constant bloomer; Madame Charles; Medea, a superb lemon-coloured variety; Enchantress, Princess Vera, Innocente Pirola, and Perle des Jardins. Pre-eminent among reliable climbing Roses are William Allen Richardson, L'Idéal, Turner's Crimson Rambler, Bouquet d'Or, Climbing Niphetos, Reine Marie Henriette, and Madame Bérard. *David R. Williamson.*

NOVELTIES OF 1898.

(Concluded from p. 34.)

The following novelties and rare plants were illustrated in the *Gardeners' Chronicle* in 1898 (for Orchids, see *ante*, p. 19):—

Alocasia Wavriniana, April 23, p. 243.
Althea × Primrose Gem, August 13, p. 115.
Amaryllis Belladonna, Kew variety, October 29, p. 315.
Anthurium crystallinum illustre, December 10, p. 417.
Adiantum Hemsleyanum, Supplement, May 28.
Asplenium Mayi, June 18, p. 371.
Asplenium nidus multilobulum, January 8, p. 21.
Acalypha Godseffiana, April 23, p. 242.
Acalypha hispida (= Sanderi), April 23, p. 248.
Auricula Abbé Lizst, May 7, p. 285.
Carnation Queen of the Yellows, August 13, p. 125.
Calochortus Purdiei, June 25, p. 395.
Campanula mirabilis, July 9, p. 33.
Ceratolobus Micholitzianus, April 23, p. 251.
Chrysanthemum Golden Shower, December 3, p. 405.
Chrysanthemum R. Hooper Pearson, November 19, p. 369.
Chrysanthemum What Ho, December 3, p. 401.
Chrysanthemum nipponicum, Nov. 12, p. 349.
Dahlia Fantasy, September 24, p. 239.
Davallia fijiensis effusa, May 28, p. 323.
Deutzia corymbiflora, October 8, p. 267.
Dracæna Bromfieldi, Supplement, April 23.
Furcræa Watsoniana, April 23, p. 243.
Geonoma Pynærtiana, April 30, p. 258.
Galanthus cilicicus, February 5, p. 79.
Gymnogramma chrysophylla grandiceps, June 18, p. 373.
Hyacinthus azureus var. giganteus, September 10, p. 191.
Hypoxis longifolia, September 3, p. 177.
Kentia Kersteniana, November 26, p. 391.
Kæmpferia Ethelæ, February 12, p. 94.
Lachenalia pendula Aureliana, April 2, p. 195.
Leea sambucina var., April 23, p. 245.
Ligustrum Walkeri, October 15, p. 282.
Lilium rubellum, May 28, p. 335.
Lobelia Rivoirei, September 24, p. 233.
Lonicera Hildebrandiana, September 17, p. 219.
Linospadix Petrickiana, October 22, p. 299.
Narcissus Lady Margaret Boscawen, May 7, p. 275.
Nepenthes ventricosa, June 18, p. 379.
Passiflora im Thurnii, Mast. sp. n., May 21, p. 307.

Panax Mastersianum, April 23, 242.
Pandanus Sanderi, Supplement, April 23.
Polypodium grande nigrescens, November 19, p. 362.
Pteris serrulata gracilis multiceps, June 18, p. 375.
Pteris cretica Summersii, June 18, p. 370.
Ptychosperma Warleti, April 23, p. 244.
Ptychosperma Sanderi, December 17, p. 435.
Platycerium angolense, March 12, p. 155.
Primrose Evelyn Arkwright, May 7, p. 277.
Phlebodium Mayi, Supplement, May 28.
Pelargonium Spotted Beauty, June 4, p. 349.
Restio F. W. Moore, April 23, p. 251.
Rose Dawn, Supplement, July 23.
Rose Milton, Supplement, July 30.
Rose Enchantress, July 30, p. 89.
Rose Edith Turner, Supplement, August 6.
Rose Psyche, Supplement, May 7.
Veronica Dieffenbachi, August 27, p. 155.
Veronica Lindsayi, November 5, p. 331.

COLONIAL NOTES.

WEST INDIES.

WE have received from Dr. Morris, the Imperial Commissioner of Agriculture, some details of the means he is taking to organise his department. The following is a list of representatives who were invited to attend the first agricultural conference held at Barbados on January 7 and 9, 1899:—

Jamaica.—The Director of Public Gardens and Plantations (William Fawcett, Esq., B.Sc., F.L.S.); the Government and Agricultural Chemist (Francis Watts, Esq., F.I.C., F.C.S.); the Principal of University College, Kingston (Rev. William Simms, M.A.).

British Guiana.—The Government Botanist and Superintendent of the Botanic Gardens (C. S. Jenman, Esq., F.L.S.); the Government Analyst and Professor of Chemistry (Professor J. B. Harrison, M.A., F.I.C., F.C.S.); the Principal of Queen's College (J. A. Potbury, Esq., M.A.); Agricultural and Technical Chemist, Plantation Diamond (William Douglas, Esq., F.I.C., F.C.S.); Agricultural and Technical Chemist to the New Colonial Company, Ltd. (Frederic J. Scard, Esq., F.I.C., F.C.S.).

Trinidad.—The Superintendent of the Royal Botanic Gardens (J. H. Hart, Esq., F.L.S.); Government Analyst and Professor of Chemistry (Professor P. Carmody, F.I.C., F.C.S.); the Inspector of Schools (R. Gervase Bushe, Esq., M.A.); the Principal of Queen's Royal College, (W. Burslem, Esq., M.A.); the Principal of the College of the Immaculate Conception (Rev. W. Caroll).

The Windward Islands.—The Curator, Botanic Station, Grenada (W. E. Broadway, Esq.); the Curator, Botanic Station, St. Vincent (Henry Powell, Esq.); the Curator, Botanic Station, St. Lucia (J. C. Moore, Esq.); the Inspector of Schools, St. Lucia (F. E. Bundy, Esq.).

The Leeward Islands.—The Inspector of Schools for the Leeward Islands (F. H. Watkins, Esq.); Dr. H. A. Alford Nicholls, C.M.G., M.D., F.L.S., &c., author of *Tropical Agriculture*; the Curator, Botanic Station, Dominica (Joseph Jones, Esq.); the Curator, Botanic Station, St. Kitts-Nevis (William Lunt, Esq.).

Barbados.—The Island Professor of Chemistry in chemical charge of Sugar-cane Experiments (Professor J. P. d'Albuquerque, M.A., F.I.C., F.C.S.); the Agricultural Superintendent of Sugar-cane Experiments (J. R. Bovell, Esq., F.L.S., F.C.S.); the acting Chairman of the Education Board (the Hon. W. H. Greaves, Q.C.); the Principal of Codrington College (the Rev. Canon Bindley, M.A., B.D.; the Head Master of Harrison College (Horace Deighton, Esq., M.A., F.R.A.S.); the Inspector of Schools (Rev. J. E. Reece, M.A.).

The proceedings at the Conference were to consist of the reading of brief and well-digested papers, followed by discussion on subjects of immediate interest, the object being to secure common action in ripening questions of great importance to the West Indies. It is desirable, for instance, to arrange for a rapid and economic interchange of seeds and plants between the various botanic centres, to discuss the cultural and chemical experiments to be undertaken during the next few years to improve the saccharine contents of the Sugar-cane, and to sketch the lines on which it may be possible to establish the scientific teaching of agriculture in colleges and schools. Other subjects for discussion are the means to be adopted for securing a more skilful treatment of the soil and the use of manures, a selection of the most suitable economic plants for cultivation in various parts of the West Indies, the establishment of school-gardens, securing effective means for training boys in agricultural pursuits, and the desirability of concerted action to prevent the too rapid spread of fungoid and insect pests.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge.

The Muscat Vinery.—Muscat Vines require a long season of growth, and those cultivators who require ripe fruit at the end of the month of July, or early in August, should now make preparations for starting the vinery. Usually, Muscats have a vinery almost, or entirely, devoted to them, and in most cases the vinery has an inside border. This being the case, the usual course of cleaning the roof, woodwork, and glass, should be thoroughly done, and the walls lime-washed with newly-slaked lime, to which may be added a little soot and flowers-of-sulphur. The treatment of the Vines themselves will depend on their condition: if insects have been troublesome during the past year, they will need to be freed of all the loose outer-bark, using a blunt knife in doing so, and cutting the stem-roots off. The clearing away of the bark deprives insects of their hiding-places, and facilitates the coating of the Vines with a mixture adapted to the case. If mealy-bug infests them, gas-tar and clay, reduced to paint-like consistency, is the best kind of mixture, using half-a-pint of tar to a bucketful of clay and water. Though it is a disagreeable preparation to apply, every part of the rods, except the actual buds, should be carefully coated with it, which will soon eradicate mealy-bug, provided the house is otherwise well cleansed. Sulphur and clay makes a good basis for red-spider, thrips, or scale-insects. To this mixture may be added with advantage Gishurst Compound-soap, Fir-tree oil, or sulphide of potassium, in quantity recommended in each by the vendors. The borders should afterwards be lightly pointed up, and as much of the old soil as can conveniently be shovelled up should be taken away, before any new soil is brought in. Muscats delight in heavy soil, kept in a porous state by ample quantities of lime-rubble, old plaster, whether used in extensions of the original border, or as a top-dressing; wood-ashes, as affording potash and charcoal, as tending to keep the soil open, and to retain moisture, and in decay furnishing carbonic acid, by being combined with oxygen. These substances need only to be mixed with the new soil in small quantity. A sprinkling of the artificial manures recommended for Vines may be sprinkled on the border previously, and covered with soil; or the same amount may be well mixed in the compost-heap by turning it over several times. If the border is found upon examination in several parts to be dry, it should be moistened to its full depth with tepid water, but at this early date no more than this should be done. A mulch of fresh stable-litter will tend to prevent a too rapid evaporation of moisture, and reduce the need for repeated applications of water for some time. Having carried out these details, the vinery may be closed, though fire-heat may remain in abeyance for a few days afterwards, and then only be applied to raise the temperature a few degrees. If available, a bed of fermenting leaves and stable-litter would supply the requisite degree of warmth for a time without making use of the apparatus; removing it, however, when leaf-growth has taken place, the exhalations from manure sometimes having an unfavourable effect on tender foliage. Bend the rods of young Vines, these sometimes breaking irregularly; and in all cases, it is well to allow the ends of the rods to hang lower than their usual position. Vines that are growing solely in outside borders, or those having access to outside ones, should be provided with a warm covering, which must be replenished with hot manure as it cools. The warmth in such coverings can be maintained for a long time if shutters, lights, or tarred-felt be used over them. An outside border may be top-dressed similarly to an inside one. In cases where new turf has recently been added to the surface, its removal on outside borders is not advised now, as it does not so soon become sour and exhausted as is the case indoors.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Odontoglossum Edwardi.—This species will probably require attention at this season, as new roots will be emerging from the partially-developed young growths. If the plants have sufficient root-space, and the drainage is ascertained to be in good condition, top-dressing with equal parts of fibrous peat and sphagnum-moss only will be needed, after having picked out a portion of the old materials; on the contrary, if the drainage is imperfect, and the compost sour, carefully remove the plant from its receptacle, pick out the whole of the material about the roots which is not attached to growing roots, remove all decayed roots, and repot in a clean, suitably-sized Orchid-pot, in which the drainage should occupy about two-thirds of the depth. Afford water in sufficient quantity to moisten the materials until the roots have penetrated them. This species may be stood at the warmest part of the cool-house.

Oncidiums.—Among other Orchids that may need attention are O. macranthum, O. undulatum, O. Leopoldi, O. zebrinum, and others of the same type. A large proportion of moss should be used for them, the roots rambling readily in living sphagnum-moss, and a very moist, cool position in the Odontoglossum-house should be given them. The same rule as regards water should be observed as for Odontoglossums, but after the roots have made good progress abundance will be needed.

Miltonia vexillaria is now in an advanced stage of growth, and watchfulness on the part of the cultivator will be needed to ease with the budding-knife all leaves whose edges are stuck together. The plants should be afforded full light, and be kept on the dry side all through the winter months, or weak, sickly growth will result, and, before the flower-spikes show, the black spot would appear. Afford light fumigations frequently as a preventative of thrips. Plants of Miltonia Clowesii growing in the Cattleya-house are now making roots, and if new materials are needed, the present is a good time to afford them. From the time the flower-spikes were cut, our plants of this species have been kept fairly dry at the root, but now that rooting has begun, more frequent and more applications of water will be made.

Deciduous Dendrobiums.—Under this heading, a large number of valuable spring-flowering plants are included, of which Dendrobium Wardianum is doubtless the best; then D. crassinode, whose variety Barberianum is a high-coloured form. Both plants are now showing flower-buds, and breaking into growth. To prevent these young growths making untoward progress, the plants should still be kept in a light, cool, well-ventilated house, and only afforded water when the last-made pseudo-bulbs show signs of shrivelling. The Hawthorn-scented D. aureum, now in bloom, may remain in the East India-house the whole year, but excepting when rooting freely, it will need water but seldom. Plants of D. Bensoniæ, if thoroughly matured, will very seldom require water during the resting period, neither will those of D. Parishi and D. polyphlebium. Dendrobiums primulinum, crepidatum, cretaceum, Devonianum, Boxalli, transparens, and lituiflorum, are resting at the cooler part of the Cattleya-house, and are afforded just enough water as will prevent much shrivelling. Here I grow B. chrysanthum, which is now beginning to grow, but which will take no harm if kept dry at the root for some considerable length of time yet.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to the DOWAGER LADY HOWARD DE WALDEN, St. James's House, Malvern.

Richardia Elliottiana.—Old tubers of this plant which have been kept in a dry state may now be examined, and those showing signs of starting into growth should be potted. The dormant tubers may be left until a later date, if a long succession of spathes is required; but in no case ought the repotting to be delayed after growth commences. A suitable compost consists of three parts turfy loam, one part peat or leaf-soil, and some silver-sand. In potting, half fill the pot with soil, and press it firmly, and upon this basis place the tuber, sprinkling it with silver-sand, and then fill the pot with soil to within 1 inch of the rim. Place the pots in the stove, and afford water very carefully till the roots reach the sides of the pots, in order to guard against decay. Once started, the growth is rapid, and plenty of water is required. When the flowering stage is reached, the plants should be removed from the stove to an intermediate temperature in order to lengthen the life of the spathes. When the foliage begins to turn yellow, the amount of water afforded should be reduced; and by the time it has died down, the soil should have been allowed to get quite dry. It is most important that it be kept in that condition until the tubers again start of themselves into growth. Speaking roughly, Richardia Elliottiana requires the same sort of treatment as Caladiums.

Phyllocactus should be very sparingly watered during the winter, otherwise they are apt to get into a sickly condition, consequent upon a loss of roots. It will be sufficient for the present if just enough water is afforded to keep the foliage in a plump condition. Plants which have got into an unhealthy state should have the soil shaken from the roots, dead portions of the latter removed with the knife, and the plants re-potted, using as small a pot as possible, and a compost afforded which consists of loam, a little peat, and a liberal allowance of sand and finely-broken brick-rubble or crocks, and be placed near the glass in a temperature of from 50° to 55°.

Libonia floribunda and L. Penrhosiensis ×.—When these very useful winter-flowering plants go out of flower the shoots should be cut back, and the plants introduced to heat, in order that they may produce shoots fit for making cuttings. These strike readily, and when rooted they should be potted into small pots and grown on in heat for a time, taking the points out of the shoots occasionally, so as to induce bushiness.

Tuberous-rooted Begonias.—Seed should now be sown if good-sized flowering plants are required in the current year. The seed-pots should be half filled with crocks, and filled up to within half-an-inch of the rim with a finely-sifted mixture of equal parts sandly loam and leaf-soil, with silver-sand in sufficient quantity to make the whole porous. Press this down evenly with the flat bottom of a flower-pot, sow the seed thinly, and cover it with a slight sprinkle of silver-sand; then afford water by holding the seed-pot in a pailful of water which must come upwards through the hole in the bottom until the sand upon the surface appears damp. It is best to afford water in this manner till the seedlings have taken firm hold of the soil, the seeds being so minute that they are liable to be washed from one side of the pot to the other each time water is afforded through a rose, however fine it may be. Cover the pots with a piece of glass, and place them in the stove or on a hot-bed, and shade carefully.

THE KITCHEN GARDEN

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

French Beans.—I was never very successful with the forcing of French Beans during the most sunless part of the winter, the crop, as a rule, being scanty indeed, and scarcely worth the trouble and expense of cultivation; but as the light increased the crops were more plentiful, and the pods had more substance. The variety Ne Plus Ultra is one of the most valuable varieties for an early crop, usually producing great quantities of straight pods. For the first crop the use of pots is to be recommended, placing four to six beans in each according to size of pot used; 24's are sufficiently large for the early crop. The compost used should be sweet and moderately light, and may consist of loam mixed with spent Mushroom-bed manure, or leaf-mould, not much decayed. The pots should be well drained, and then filled to within 3 inches of the rim, and having made firm, press the seeds into the soil 1 inch, or sow on the surface and cover to that depth. Stand the pots in a temperature of 60° to 65°, with a brisk rise with sunshine. Keep the atmosphere moist. Unless the soil gets very dry, afford no water till the young plants show through the soil; and when the plants are well up syringe with tepid water moderately twice daily in bright weather. Tap the pots frequently, affording water when required; and before the plants fall over and get damaged, put twigs round the pots to support the plants, which will allow of the syringe being used with force, otherwise red-spider and thrips will put in appearance and give the gardener much trouble. When the plants are in bloom, lessen the amount of humidity in the air, and dispense with the syringe till the pods have formed, when the previous treatment may be resumed. If suitably heated pits or small span-roofed houses are at command, French Beans do well planted out singly at a distance of 6 to 7 inches from bean to bean, and 12 inches betwixt the rows. Beans require ventilating to keep the plants healthy, but it should be done so as not to chill them. If a bed is not at liberty, sow half-a-dozen seeds in a sufficient number of large 60-pots, and plant out those with as little disturbance of the roots as may be, later on.

Broccoli.—The self-protecting autumn varieties being now over, the next to follow will be Snow's Winter White, the stock of which should be looked over at short intervals of time, and the leaves turned over such heads as are of suitable size; or dig up the plants, and replant closely together on a south border, or lay them in by the heels in frames where in severe weather they may be protected.

Beet.—Although the roots are usually taken up early in the autumn and placed under cover, I much prefer to select the more suitable size, and lay-in close together in trenches on a sheltered border, and protect them with litter, bracken, or fine coal-ashes. By this method they keep fresh, and of good flavour. Carrots, Parsley, Salsafy, and Parsnips may be wintered in a similar manner.

Potatos.—Let the tubers in store be examined on wet days, removing decayed ones, and rubbing off the sprouts. Seed Potatos should be laid out thinly, so that sprouting will be delayed to the latest date. Keep all Potatos cool, short of freezing.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener, Dropmore, Maidenhead.

Raspberry Plantations may yet be made in open weather if the ground be not too wet for manipulation, and all work of this kind should be finished off within the next few weeks at the latest. Raspberry-plants being usually allowed to remain five or six years without disturbance, the ground should be trenched 2 feet deep, and heavily manured at each spit dug. Soil of a light nature rather than clayey is the best adapted for Raspberry culture, and where the latter prevails, leaf-mould, charred garden-refuse, lime-rubble, sandy road-parings, and such like should be incorporated with the staple in lieu of heavy manure, the latter being used with advantage on light soils. Assuming that the trenching has been finished long enough, a week at least, to allow of a settlement of the soil to take place, the planting the canes may then be carried out. The manner of training to be adopted must, to some extent, regulate the manner of planting, and canes of medium strength should be chosen. One of the simplest methods of training is to tie the canes to a couple of lengths of galvanised iron wires stretched horizontally, using a sufficient number of upright posts to ensure stability, the end posts being stouter than the others. The rows may be 5 feet apart, and the single canes 2 feet. The canes should be tied loosely to the wires, and in a few weeks they may be cut down to within two or three eyes, or about a foot of the soil. If grown in clumps of canes fastened to stakes, three canes should be planted together at 4 feet apart in the row, or these may be tied over eventually half to the right and to the left, in the form of an arch when tied together, to the point or crown of which a stake is placed to tie the canes to, thus forming a series of low arches. Market-growers plant thus, but usually cut the canes to about 3 feet in height, and use no supports.

Varieties. — The largest-fruited Raspberry is Superlative, a strong grower and heavy cropper, of fairly good flavour, and useful for dessert. Baumforth's Seedling is a large and free-fruiting variety, of good flavour; while Carter's Prolific is older, and one that is largely grown for market purposes. Semper Fidelis is a useful and heavy-cropping variety; the fruits are of a bright colour and acid, but making an excellent preserve, and one of the best for making Raspberry-vinegar. It is also a rather later fruiting variety than either of the preceding, and should be grown where a long season of these fruits is desired. Belle de Fontenay is the best of the autumnal fruiting kinds. All newly-planted canes should be mulched with half-rotten or rather littery manure

The Pruning of Outdoor Grape-vines should be carried out now, before the sap begins to flow. The aim of the pruner should be to secure a good quantity of well-ripened young shoots, and ample space should be allowed between the branches to admit of light and air to reach them. Old and much spurred-in branches may be removed, thus making room for young, strong, well-ripened, fruitful wood. A rich top-dressing should also be applied to the border if growth is unsatisfactory, some of the old soil being removed down to the roots, and new loam and bone-meal substituted. A mulch of half-rotted manure may be given. The Sweetwater is the best outdoor variety of Grape.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

Japanese Maples.—These small-growing Japanese trees are admirably adapted for planting in groups, and as single specimens on lawns. They are low-growing deciduous trees, with erect stems; the branches are spreading, and furnish the tree down to the ground. Some we have planted in sheltered positions, but our finest specimens are planted on the lawn, fully exposed to the wind and sun. These are 15 feet high, and 42 feet in circumference. Acer palmatum has seven-lobed leaves, elegantly notched and toothed, and when planted in the open the leaves are of a bronzy-green colour. The best varieties are Acer p. atropurpureum (the boldest of the type), having deep purple leaves; A. p. sanguineum, similar to the former, with leaves of a deep blood-red; A. p. ampelopsifolium, very fine in growth, of more spreading habit, leaves purple in spring, bronzy-green in summer, and superb crimson colour in autumn; A. p. dissectum, leaves of a deep red colour, finely cut and serrated, resembling a Fern; A. p. palmatifidum, similar in growth and habit to dissectum, leaves green; A. p. septemilobum, leaves green in summer, turning to a brilliant crimson colour in autumn; A. p. roseum and A. p. roseum marginatum are of too delicate a constitution to be planted outside, but, succeed well when grown in pots. Acer japonicum and its variety A. j. vitifolium are less hardy than A. palmatum, but planted on elevated ground and in less exposed positions they may succeed. It has handsome Vine-like leaves, which assume a very rich colour in autumn. These Maples thrive best when planted in a good rich, sandy loam about 3 feet deep. The soil should be made firm by treading before planting, to prevent the tree from sinking. Abundance of water should be given during a dry season. The severest winters do not harm them, but late spring frosts about the second week in May will kill the young growths. The lower placed buds then burst into growth, and the trees soon recover. Do not prune, as doing so spoils the character of the trees.

Bedding Plants.—A number of plants of which the stock is usually raised in the spring from cuttings, or is insufficient in point of numbers, should be placed in gentle warmth, say, that of a vinery recently started, in order that they may make growth ere cuttings are taken. These may consist of zonal Pelargoniums, Ivy-leaf, variegated, and sweet-scented Verbenas, Lobelia Erinus varieties, Fuchsias, Heliotropes, Gazanias, Jacobeas, Sweet Aloysia, &c. It will suffice to sprinkle the plants night and morning. Afford them water in increasing quantities as growth progresses, but do not divide up potfuls of cuttings till the first crop of shoots has been taken. Dahlias, of which but few examples exist, may be put into flat hampers or deep cutting-boxes, and covered with leaf-soil, in order that they may push early shoots fit for making cuttings. Lantanas, handsome either in vases as centres of beds, and subjects for planting in hot corners, may be placed in heat to push out shoots. These plants should not be cut back more than once, or they will flower badly. The current season's struck plants are not to be depended upon to flower much, but there are some new varieties which bloom well the first year. Seeds of the Canna may now be sown in hot-beds, also those of Wigandia caracasana, and the large-growing foliage Solanums, continue to cultivate the seedlings in a good degree of warmth till the middle of March, the object being to secure large plants by May.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	JAN. 28	—Royal Botanic Soc. meet.
TUESDAY,	JAN. 31	—Royal Hort. Soc. Committees.
THURSDAY,	FEB. 2	—Linnean Soc. meet.

SALES.

MONDAY,	JAN. 30	Roses, Lilies, Gloxinias, Hardy Border Plants, &c., at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 31	Carnations, Lily of the Valley, Pæonies, at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 1	Japanese Lilies. 1000 Roses, Shrubs, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 2	Hardy Perennials, Spiræas, Roses, Carnations, &c., at Protheroe & Morris Rooms.
FRIDAY.	FEB. 3	Pæonies, Hollyhocks, Hardy Border Plants, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—39·1°.

ACTUAL TEMPERATURES:—

LONDON.—*January* 25 (6 P.M.): Max., 41°; Min., 32°.

PROVINCES.—*January* 25 (6 P.M.): Max., 47°, Valentia; Min., 32°, Aberdeen.

Easterly winds, bright, fine, slight frost.

Mr. JOHN LEE.

THE death, on the 20th inst., of Mr. JOHN LEE, of Hammersmith, in his ninety-fourth year, is, in many ways, a notable circumstance. To the younger members of the present generation JOHN LEE was as a name only; he had outlived most of his older associates, and for the last few years had rarely been seen among us. Nevertheless, there are very many who remember him as the genial President of the Horticultural Club, and still more who associate him with the "Gardeners' Benevolent." He lived scarcely a day after the annual meeting noted in our columns last week. For how many years he had been a member of the Society we do not exactly know, but until the last three or four years he had never missed attendance at the annual meeting for a period of at least fifty years. He was, in fact, the Father of the Society, and we have heard him allude to the anxiety which he and his associates felt in the very early days of the Institution lest the funds in hand should not be adequate to the payment of the pensions to the two or three annuitants who then were the only members of the pension list.

He lived to see the Institution in its present flourishing condition, and had the satisfaction of knowing that he himself had, by his own exertions, largely contributed to make it what it now is. A legacy of £100, free of duty, shows that he did not wish his interest in the Institution to be terminated by his death.

JOHN LEE, from the great age to which he had attained, and the abundant experience he had enjoyed, had encyclopædic knowledge which he was always pleased to impart to his younger associates. Up till the last few years he was a constant visitor at the meetings of the Royal Horticultural Society, and was enabled to render great service to the Fruit Committee from his extensive knowledge of the history and the comparative merits of fruits.

In 1877 a dinner, presided over by Dr. HOGG, was given in his honour by the members of the Horticultural Club, on the occasion of his retiring from business; and in 1882 a similar compliment was paid to him, when a service of plate was presented by the officers of the Gardeners' Benevolent, in recognition of his having acted as Trustee for forty years, and as Chairman of the Committee for nearly the whole of that period. The latter office, indeed, he filled up to the last few years. His portrait hangs in the meeting-room of the Horticultural Club; and a photographic illustration was given in our columns in 1893, p. 259.

At the funeral on the 25th inst., in Brompton Cemetery, the Gardeners' Royal Benevolent was represented by Messrs. H. J. VEITCH, SHERWOOD, MONRO, INGRAM, and others. Mr. OWEN THOMAS, R. M. HOGG, Mr. WRIGHT, Dr. MASTERS, and others were also present. One of the wreaths, consisting of white Arums, Eucharis, Lilies, Lilies of the Valley, Azaleas, &c., was sent by the Committee, "In Memory of the Father of the Gardeners' Royal Benevolent Institution."

JOHN LEE was originally connected with the famous firm of nurserymen at Hammersmith. Together with his brother CHARLES, who died in 1881, he successfully conducted this great business, but retired some years since. The Hammersmith nurseries — the original nucleus—have long since been built over. A similar fate has overtaken the nurseries of the firm at Ealing, but a large business is still carried on at Feltham.

Lee's nursery was one of the "all-round nurseries" which are now rapidly disappearing. Nurserymen now-a-days have to specialise and devote their attention principally to one or to a comparatively few subjects. The result is not altogether satisfactory in one respect, as the knowledge of plants in general now possessed by the men of business is necessarily less than it was in the times of their predecessors.

The Hammersmith nursery in bye-gone days was the source whence numerous "new plants" from the Cape of Good Hope were distributed, MASSON and other collectors having relations with the firm. The founder of the firm was JAMES LEE, who, as JOHNSON tells us in his *History of English Gardening*, was for some time with PHILIP MILLER at Chelsea, and afterwards gardener to the Duke of ARGYLL at Whitton Park, where a fine collection of trees was got together. Subsequently, in connection with KENNEDY, he established the Vineyard Nursery at Hammersmith. His death took place in 1797.

A short statement relating to the further history of the firm was given in our columns in a former volume. It is of such interest that we feel justified in reproducing the substance of it at the present time:—

"Mr. JAS. LEE, who established the nursery, was born at Selkirk in 1715. When he first came to London he was employed at Syon, and afterwards at Whitton, by the Duke of ARGYLL. About the year 1760 he entered into partnership with Mr. LEWIS KENNEDY, gr. to Lord BOLTON, at Chiswick, and commenced a nursery, in what was called The Vineyard, at Hammersmith. About the middle of the last century this vineyard produced annually a considerable quantity of Burgundy wine. A thatched house was built in the grounds; the upper part was used as a dwelling-house, and for selling the wine, and underneath were the wine-cellars. The house was formerly occupied by WORLIDGE, the celebrated engraver, and here he executed the most valuable and admired of his works. Mr. LEE was patronised by the Earl of ISLAY, afterwards Duke of ARGYLL, the planter of Whitton, who died in 1761, and other noblemen; he corresponded with LINNÆUS, and compiled from his writings *An Introduction to Botany*, published in 1760, which went through five editions, and for many years was in the highest repute. He died in the year 1795, at the age of eighty years, his partner, Mr. KENNEDY, having died previously.

The nursery was carried on by the sons of the two founders till 1817, when they dissolved partnership. It then became the sole property of JAMES LEE, the second, who died in 1824, leaving it to his family. In 1827 JOHN LEE was joined in the conduct of this important business by his brother CHARLES, who was born at the Royal Vineyard Nursery on February 8, 1808, and died on September 2, 1881. The firm was conducted under the title of JOHN & CHARLES LEE till 1877, when Mr. JOHN LEE retired, and WILLIAM LEE, the son of CHARLES, joined his father in the management of the business. In 1881, however, upon the death of CHARLES LEE, the veteran JOHN again, for a time, accepted harness, coming to the assistance of his nephew, who was very deeply affected by the loss of his father.

Besides an extensive correspondence, and a [illegible]lant attention to procure every new plant as [illegible] as it was introduced by others, Messrs. L[illegible] KENNEDY introduced many plants into the cou[illegible] through collectors whom they had sent abroad, [illegible] through foreign botanists. They maintain[illegible] collector in America, who sent home several [illegible] Oaks, and in partnership with the Em[illegible] Josephine, one at the Cape of Good Hope, who [illegible] home many new Ericas, Ixias, and other [illegible] plants. To this firm it is, also, we owe the [illegible] Fuchsia, and what that means to the sum of hu[illegible] happiness, every gardener, every cottager even, [illegible] appreciate. They also had the first China Rose, [illegible] 1787."

LINNEAN SOCIETY.—At the evening meeting intended to be held on Thursday, February 2, 1899, at 8 P.M., the following papers will be read:—1, "Notes on the Genus Nanomitrium, Lindberg," by Mr. E. STANLEY SALMON. 2, "On the production of apospory in Athyrium Filix-fœmina var. uncoglomeratum, an apparently barren Fern," by Dr. F. W. STANSFIELD. 3, "On the Genus Lemnalia, Gray, with an account of the branching systems of the order Alcyonacea," by Mr. GILBERT C. BOURNE, M.A., F.L.S., &c.

ROYAL HORTICULTURAL SOCIETY.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, Jan. 31, in the Drill Hall, James Street, Westminster, from 1 to 4 P.M. This will be the last meeting of the 1898-99 committees, the new ones coming into office on Feb. 14. A lecture on "Twelve Months among the Orchards of Nova Scotia," will be given by Mr. CECIL H. HOOPER, F.R.H.S., at 3 o'clock: and Mr. ARTHUR SUTTON will give details of some of his remarkable experiments with Potatos at the Scientific Committee at 4 P.M.

GRANT OF £100 TO THE ROYAL BOTANIC SOCIETY.—The London County Council has just given its second annual contribution of £100 to the "practical gardening school," which is held in the gardens of the Royal Botanic Society at Regent's Park. This grant is made yearly on condition that the school receive a number of boys up to ten, who are to undergo a three-year course of instruction in all branches of practical gardening.

LODDIGES' LIBRARY.—It is singular that at a time when we are recalling memories of a famous nursery at Hammersmith, we should also have our attention called to a nursery that once enjoyed the highest reputation at Hackney. An announcement of the sale, at PUTTICK & SIMPSON'S, of the library of the late C. LODDIGES, who died in 1846, will bring to the mind of some the then wonderful collections of Orchids, Succulent plants, Palms, and other exotic plants, many of which figures were given in LODDIGES' *Botanical Cabinet.* The library to be sold comprises among other things: *Curtis's Botanical Magazine*, 93 vols.; *Paxton's Magazine of Botany; Sloane's Jamaica; Elliott's Botany of South Carolina; Lindley's Rosarum Monographia; Parkinson's Herball; Roxburgh's Plants of Coromandel; Plantes des Brasiliens; Andrews's Engravings of Heaths*, 4 vols.; *Gerarde's Herball*, 1636; *Flora Peruviana et Chilensis*, 4 vols.; *Edward's Botanical Register*, 34 vols.; *Andrews's Roses and Geraniums; and Chandler's Illustrations of Camellias.*

HONOURS TO FRENCH HORTICULTURISTS.—M. CHARLES JOLY.—It is with a feeling of satisfaction that we learn that this energetic horticulturist has been nominated a Chevalier of the Legion of Honour by the French Government. It is a matter for surprise to outsiders that this distinction was not conferred long ago; but in any case they desire to participate in the congratulations tendered to this zealous friend of horticulture.

M. HENRI LÉVÊQUE DE VILMORIN has been promoted to the grade of "officer" of the "Mérite Agricole;" but no honour of this kind, in the case of M. DE VILMORIN, can add to the esteem in which he is held by his fellows on this side of the Channel.

SCOTS FIR CONES AND THE PINE GROSBEAKS.—Mr. F. B. DOVETON, Karsfield, Torquay, in a communication addressed to the editor of the *Westminster Gazette*, January 18, says:—"It may interest your readers to learn that I saw a pair of Pine Grosbeaks (Loxia enucleator) in a road close to this on the 10th inst. They were feeding on the cones of a Scotch Fir, and excavating them with their sharp beaks, now and then dropping them on the ground. They were very tame, and I could hardly be mistaken, as I watched them for some time, and was very close. They resemble and are allied to the loopbills, but are larger and more slender. The male might have been from 7½ to 8 inches in length. His head, throat, and breast were of a bright carmine, and his back of a dusky-red. The female was more of a greenish-yellow all over, and wanted the carmine on the head and breast. These are birds of the North, and are very rare visitors to this country, I believe."

RHODODENDRON CILIICALYX.—This is the name of a new Rhododendron discovered by the Abbé Delavay, in Yunnan, and figured by M. ANDRÉ, in the *Revue Horticole* of the 16th inst. The leaves resemble those of R. ciliatum, and the flowers, which are between 4 and 5 inches across, are widely campanulate and white, flushed with violet. The calyx is less than a quarter-of-an-inch long, with rounded lobes, bordered with long hairs. The plant has flowered in the garden of M. MILNE EDWARDS. R. ciliicalyx, with no fewer than thirty-five other species from the same region, was described by M. FRANCHET, in the *Bulletin Soc. Botan. France*, xxxiii., p. 223, and yet there are those who consider that there are no more worlds to conquer in the department of systematic botany!

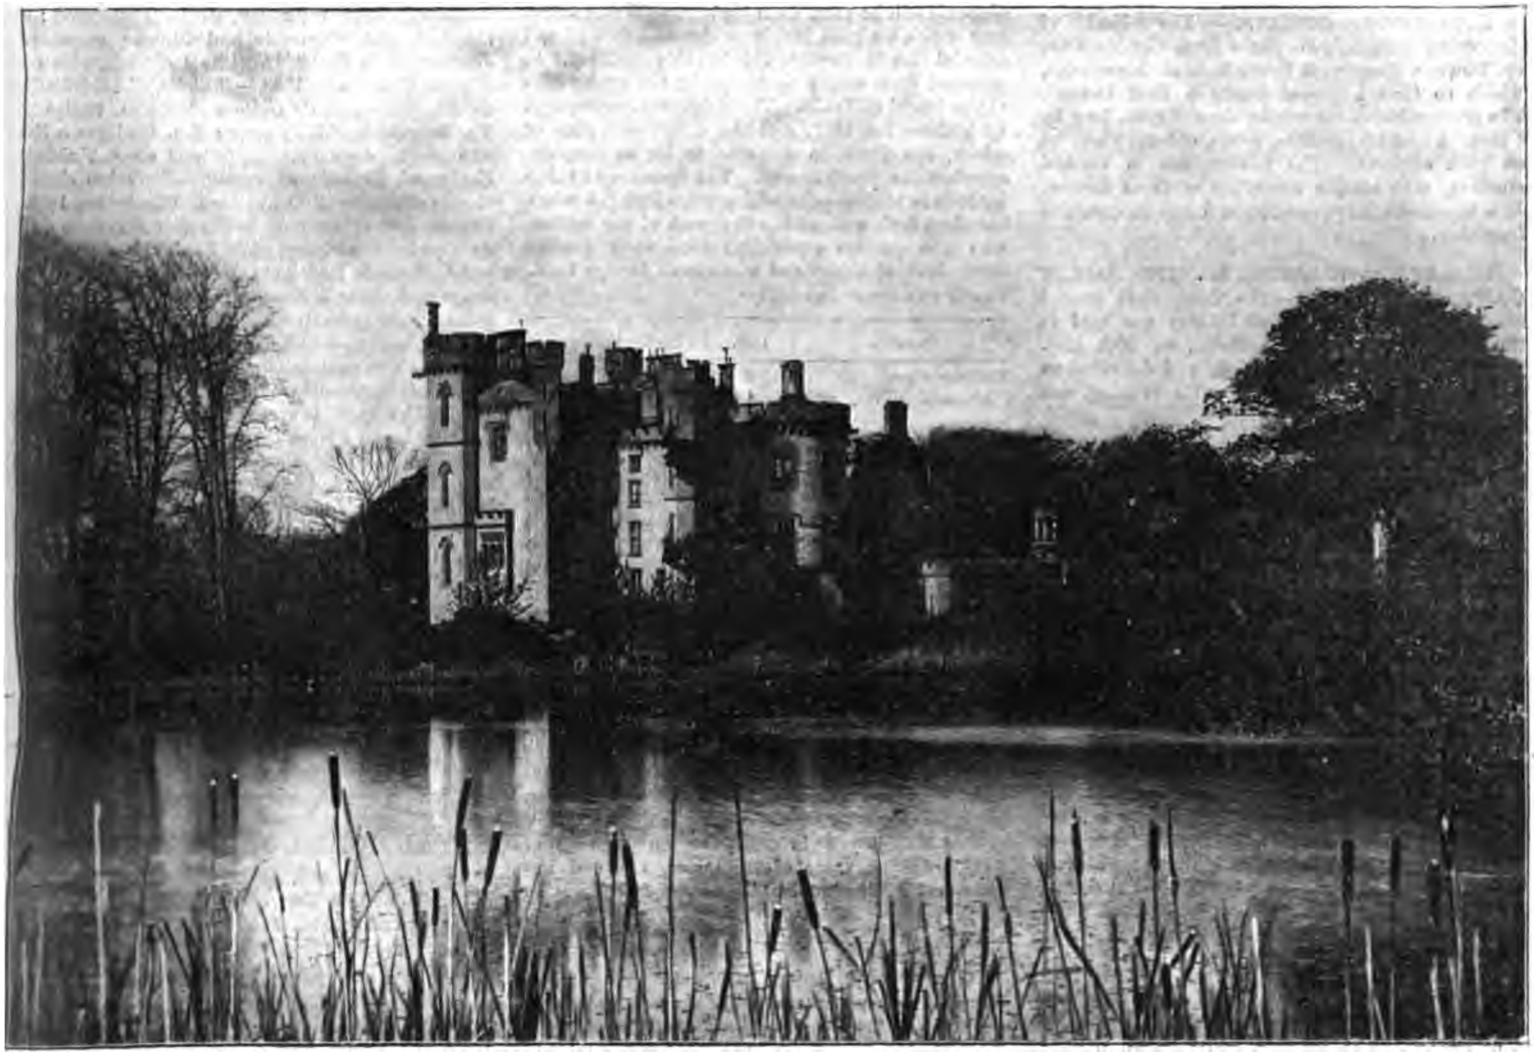

FIG. 19.—DUNS CASTLE, BERWICKSHIRE. (SEE P. 49.)

DATE OF FLOWERING OF THE SNOWDROP.—The Snowdrop was first observed in bloom in a Middlesex garden on Jan. 22 this year. In the same garden and in the same border the dates of flowering since 1890 were as follows:—1890, Jan. 9; 1891, Feb. 6; 1892, Jan. 22; 1893, Jan. 30; 1894, Jan. 21; 1895, Jan. 17; 1896, Jan. 16; 1897, not recorded; 1898, Jan. 18; 1899, Jan. 22; the 9th of Jan. being the earliest date; Feb. 6, or the thirty-seventh day of the year, the latest. The Hazel was observed in bloom on Jan. 21, but was seen some days earlier in the same neighbourhood. In 1894 the Hazel was recorded to be in bloom on Dec. 30, the usual dates being among the earliest days in February.

EUROPEAN ORCHIDS.—M. CORREVON, of the Jardin Alpin d'Acclimatation, 2, Rue Dancet, Geneva, is about to issue, if a sufficient number of subscribers be forthcoming, a series of sixty octavo coloured plates, representing the hardy terrestrial Orchids of Central Europe, with accompanying text. We have seen some of the plates, and can speak favourably of them as accurate representations of the plants. A subscription of 17*s*. will ensure the possession of what will evidently be a very useful publication.

EUCALYPTUS CORDATA. — The Earl of ANNESLEY obligingly forwards from Castlewellan, co. Down, a spray with flower-buds of this species, which so far has proved hardy in East Ireland. The mature leaves are sessile, about 5 cent. long by 4 cent. in breadth, cordate, ovate, obtuse, glaucous on both surfaces. The flowers are in stalked clusters, each cluster consisting of three flowers. It is handsome in appearance, and has an aromatic fragrance.

PAISLEY HORTICULTURAL SOCIETY: PAISLEY GARDENERS' RÉUNION.—The thirty-sixth annual *réunion* of the gardeners of Paisley was held in the "George" Temperance Hotel, on 20th inst. Mr. JAMES ANDERSON presided, and delivered an interesting address. An enjoyable evening was spent.

SCIENCE TEACHING IN HORTICULTURE.—A meeting will be held to arrange preliminaries for a class, at 2, The Broadway, Hammersmith, on Monday, January 30, at 8 P.M. The class is intended as a preparation for the Royal Horticultural Society's examination; it will meet on two nights a week, and will be conducted by WILFRED MARK WEBB, F.L.S., late assistant-biologist in the School of Horticulture of the Essex County Council, Chelmsford.

THE GARDENS AND GARDENER AT COMBE ABBEY.—In reference to an article under the above heading which appeared in our issue for Sept. 24 last, it may be interesting to state that Mr. WILLIAM MILLER, who has since resigned the superintendence of these gardens, is now busy forming a nursery for the cultivation of choice hardy plants. Mr. MILLER has built a very charming residence a short distance out of Coventry, and it is surrounded by several acres of land. His address is now "Raylands," Berkswell, near Coventry.

THE EFFECTS OF THE MILD WEATHER are, in some instances, very striking, as we are told by a correspondent at Backett, Shrivenham, that at that place a pyramid Pear-tree in an exposed site is covered with open blossom; at Walcott Hall, Stamford, a young tree of Apple Deux Ans is bearing a second crop of fruit, and two fruits are sent, one 2 inches in diameter, and another half that size. In the same gardens, Strawberries have set two dozen fruits per plant—of course, only to succumb later.

TRADESCANTIA VIRGINICA.—Microscopists of the middle of the waning century, and of earlier periods, will remember how they were wont to examine the movement of the juices in the cells springing from the stamens of this plant. A complete anatomical monograph of the plant, from the pen of M. GRAVIS,* the Professor of Botany in the University of Liège, will be referred to with great interest. The introduction supplies an historical summary of the principal publications relating to the histology of monocotyledonous plants in general, and of the Commelynaceæ in particular, a summary which will be of great utility to students. M. GRAVIS then proceeds to give an exhaustive account of the anatomy of Tradescantia virginica in all its stages of growth, and concludes with a *résumé* of the principal results and conclusions arrived at, and especially those which possess novel features. A full bibliography is given, and the subject is illustrated by twenty-seven quarto lithographic plates. To discuss the details of such a work of *longue haleine* as this is impossible in this place. Suffice it to say, that the work is a monument of painstaking research, which, like the similar monograph of Urtica, redounds to the honour of Belgian science, and to the credit of M. GRAVIS.

VALUE OF FRUIT IMPORTS.—Almost at a glance it will be seen, from the accompanying table, how much we paid last year for the foreign and colonial fruits imported into this country, as reported from month to month by the authorities of the Board of Trade. These figures are compared with those for 1897, and the differences, plus or minus, are given, in order to, as far as possible, complete the year's record. The decrease in value for 1898 is trifling—the selling price brought much excellent fruit well within the reach of the masses, who (the juniors especially) voraciously availed themselves of cheap and wholesome foreign fruit. The figures are as follows:—

IMPORTS.	1897.	1898.	Difference.
Fruits, raw:—	£	£	£
Almonds ... ... value	436,428	553,431	+117,003
Apples ... ... "	1,187,303	1,107,058	−80,245
Cherries ... ... "	178,131	230,828	+62,697
Grapes ... ... "	495,017	549,513	+54,496
Lemons ... ... "	410,150	439,286	+29,136
Nuts, used as fruit "	501,356	575 598	+74,242
Oranges ... ... "	2,266,920	1,986,160	−260,760
Pears ... ... "	377,909	221,772	−156,128
Plums ... ... "	497,783	434,666	−63,117
Unenumerated, raw "	695,159	870,711	+175,552
Total £	7,046,147	6,969,023	−£77,124

We may be permitted to add here the values of the following items, to complete the tale, for the year, as told month by month. Thus, in 1897, Onions were imported to the value of £760,560, against £792,907, an increase of £32,347. The Potatos imported in 1897 were valued at £1,200,328, against £1,913,912 in 1898, or an increase of £713,584; the value of vegetables, raw and unenumerated, amounted to the sum of £1,456,701 in 1897, against £1,680,734 in the year following, showing an increase of £224,033.

GARDENERS' ROYAL BENEVOLENT.—At the dinner of the committee, held after the business of the annual meeting had been concluded, Mr. HARRY VEITCH, the Treasurer, announced the establishment of a Samaritan Fund, the interest of which would be distributed among unsuccessful candidates who had not been subscribers, the Victorian Era Fund being reserved exclusively for the benefit of those who have been subscribers. It was announced that the Earl of DERBY would preside at the annual dinner on July 28.

PUBLICATIONS RECEIVED. — *Nature Notes*, Jan. 1899.—*Contributions to the Flora of New Guinea and Queensland*, by F. Manson Bailey, F.L.S.—Extracts from the *Queensland Agricultural Journal*, vol. iii., parts 3, 4, and 5, for September, October, and November, 1898.—*Preliminary Study of the Prickly Pears naturalised in New South Wales*: J. H. Maiden, Department of Agriculture, Sydney, New South Wales. — *Proceedings of the Tenth Annual Meeting of the Association of Economic Entomologists*, U. S. Department of Agriculture, Division of Entomology, Bulletin No. 17.—*Selleriplantens, Historie, Udbredelse og Anvendelse*, Carl Hansen, Copenhagen. — *Botanisches Centralblatt*, Band LXXVII, No. 1, 1899; Westnik, Transactions of the St. Petersburg Horticultural Society.—*Transactions of the English Arboricultural Society*, vol. iv., part 1. Including the report of the seventeenth annual meeting at Penrith in August last, and papers on: Different Methods adopted in the Measurement of Standing and Felled Timber, by T. Bright; Planting, Maintenance and Management of a Plantation for the first Twenty-five Years, by Edward Dalglish; and on various allied subjects.—*Chemical Manures and Garden Crops*, lecture by F. W. E. Shrivell, Golden Green, Tonbridge, delivered before the Devon and Exeter Gardeners' Association, November, 1898.—*Proceedings and Journal of the Agricultural and Horticultural Society of India*, July to September, 1898.—*Agricultural Gazette of New South Wales*, November, 1898. This contains articles and notes on the Ramie Fibre Plant, by H. V. Jackson; Pine-apple Growing; Aspinwall Potato Planter, J. L. Thompson; the Orchard, and Vegetable and Flower growing.—*Journal de la Société Nationale d'Horticulture de France*, December, 1898.—*Bulletin d'Arboriculture de Floriculture et de Culture Potagère*, rédigé par Fr. Burvenich, Ed. Pynaert; Em. Rodigas & Hub. van Hulle, January.—*Tijdschrift voor Tuinbouw* Zesde und Zevende aflevering.—*Bulletino della R. Societa Toscana di Orticultura*, Dicembre, 1898.—*Plantas novas Cultivadas no Jardim Botanico do Rio de Janeiro*, descriptas, classificadas e desenhadas, por J. Barbosa Rodrigues, VI.—*Plantæ Mattogrossenses ou Relacao de Plantas Novas*, colhidas, classificadas e desenhadas, por y. Borbosa Rodrigues (Directeur du Jardin).—*Wells Chrysanthemum Calendar*. A large sheet containing directions as to the cultivation of Chrysanthemums in each month of the year. The sheet is given an imposing appearance by the large illustrations of half-a-dozen or so selected novelties. Useful for posting in the potting-shed or garden-office. (W. Wells, Earlswood, Redhill.)—*On Lawns and Lawn Tennis, Cricket, Golf, and other Grassy Grounds*, by Jas. Carter & Co., High Holborn, London, W.C.—*Isle of Wight Horticultural Improvement Association Almanack for* 1899. A large sheet Calendar, containing a list of the membership of the society, and much information, more particularly interesting to gardeners living upon the island. A Calendar of garden operations for the year, &c. The sheet is illustrated by a photograph of Sir Chas. Seeley, Bt., president of the society, and a scene from one of the island gardens.

ROYAL HORTICULTURAL SOCIETY.

THE following extracts are taken from the report of the Council for the year 1898-99, to be presented to the Annual general meeting of Fellows, to be held at the Society's offices, 117, Victoria Street, Westminster, on Tuesday, February 14, 1899, at 3 P.M.

The year 1898-99 has been one of increased prosperity for the Society.

The Council have felt justified in spending a considerable amount on the Lindley Library, namely £170, to assist the Trustees in completing and publishing a catalogue of the library, and also in purchasing various books which the catalogue showed to be wanting.

The catalogue was published in December at a price of 2*s*. 6*d*. in the hope that many Fellows would purchase it, not only to inform themselves what books the library contains, but also because it forms in itself a sort of reference list to the bibliography of gardening. Some Fellows might also take note of books still wanting to the library, with a view to presenting them.

During the past year valuable books have been presented by the director of the Royal Gardens at Kew, Dr. Maxwell Masters, F.R.S., T. J. Bennett Poë, Esq., Miss Ormerod, Mrs. Holborn, Signor Alñio, and many others, to all of whom the best thanks of the Society are due. A full list will be published on April 1 in the Society's Journal, vol. xxii., part 4. Acting in conjunction with the Trustees, the Council have purchased for the library

---

* *Recherches Anatomiques et Physiologiques sur le Tradescantia virginica.* . . . Par A. GRAVIS, Professeur à l'Université de Liège. (Bruxelles, HAYEZ, Rue de Louvain, 112.)

-*The Silva of North America*, Prof. Sargent; *The Flora of Northern America*, Britton & Brown; *Nature*, from its commencement, 56 vols.; *Flora f Tropical Africa; Flora Germanica*, Reichenach, 22 vols.; *Flora Pyrenaica*, Bubani; *Atlas es Plantes*, Bois; *The Water Garden*, Tricker; *Flora of Berkshire*, Druce; *Chemistry of the Garen*, Cousins; *Garden Making*, Prof. Bailey; *British Orchids*, Webster; and others.

Under the head of ordinary expenditure at Chiswick £1,850 has been spent on the general work and maintenance of the gardens. Amongst other work, House No. 9 and the potting-shed attached thereto have been painted and thoroughly repaired; Houses Nos. 3, 14, 16, and 21 have all been repaired and painted, as have also many of the frames. All this work has been done by the Society's own staff of men. The receipts by sale of surplus produce amount to £357, making the net ordinary cost of the gardens £1,493.

At Westminster, twenty-two Fruit and Floral Meetings have been held in the Drill Hall, James Street, Victoria Street; and seven Committee Meetings have been held at Chiswick, besides the larger Shows in the Temple Gardens on May 25, 26, and 27; and at the Crystal Palace on September 29, 30, and October 1. Lectures have been delivered at nineteen of the Meetings. The number of awards granted by the Council, on the recommendation of the various Committees, has been as follows:—At Provincial Shows, 17; Affiliated Societies, 70; Fruit Committee, 173; Floral Committee, 432; Orchid Committee, 193; Narcissus Committee, 21; Total, 906.

In addition to the above, 1 Silver-gilt Flora Medal has been awarded to Miss O. Harrisson for having passed 1st in the Society's examination, and 4 Hogg Memorial Medals have been awarded; 85 Bronze Banksian Medals have also been granted to Cottagers' Societies.

The Council are fully aware (as all Fellows visiting the Drill Hall shows must also be) how very meritorious the groups of flowers, fruits, and vegetables, &c., are, and how thoroughly, as a rule, they deserve the medals recommended by the committees. The Council entirely recognise the difficulty of the work of the committees in decreasing the number of medals they recommend. At the same time they feel it their duty to urge upon all the committees, and upon the individual members thereof, the necessity of gradually but continually raising the standard of excellence which they set before themselves in recommending awards.

Another point which the Council desire to suggest to the committees, is whether groups exhibited by the horticultural trade, and groups exhibited from amateurs' gardens, should be judged by exactly the same standard of excellence? Whether (except in cases of open competition for prizes), some slight favour should not be shown to encourage the latter?

During the past year the Society has been presented with the dies of a very fine medal, which has been struck and subscribed for by numerous friends, in memory of the late Dr. Robert Hogg. The Council have decided to restrict the use of this medal to the Fruit and Vegetable Committee, with which committee Dr. Hogg was so intimately and specially connected from its very foundation in 1858.

On Tuesday, July 5, the Council invited all the members of the several committees to lunch with them at Chiswick, and to examine the Gardens. An account of the proceedings will be found in the *Journal*, vol. xxii., p. 257.

An International Conference on Hybridisation has been arranged for July 11 and 12, 1899, to commence with a luncheon at Chiswick, to which all the committees of the Society will be invited, and to close with a banquet in the Whitehall Rooms, Hôtel Métropole, in honour of the distinguished foreign guests who are expected to attend the Conference. Full particulars concerning the Conference will be found in the Society's Book of Arrangements for the year 1899. Any Fellows desiring to be present at the banquet, and wishing for tickets for ladies or gentlemen, should communicate with the Secretary before July 1; the price of the tickets will be 21*s*.

The Council desire to draw the attention of all Fellows of the Society to the more extended use which the Scientific Committee might be to them if they availed themselves more freely of their privileges in submitting instances of diseases of, or injuries to plants, caused by insects or otherwise. The Scientific Committee is composed of gentlemen qualified to give the best advice on all such subjects, either in respect to the prevention or cure of disease. The committee is also glad to receive specimens of any subjects of horticultural or botanical interest.

That Fellows, whether near or at a distance, may derive as much benefit as possible from their connection with the Society, the Council last year appointed Dr. J. Augustus Voelcker, M.A., consulting chemist to the Society. They have renewed their arrangement with him whereby all Fellows who are amateurs or *boná-fide* gardeners, may obtain, at very small cost, analyses of manures, soils, &c., or advice as to what description of chemical manure will be most suitable and profitable for application to any particular soil. The Council wish again to draw particular attention to the following points, viz.:—

(i.) That Fellows desiring an analysis must follow explicitly and exactly the directions laid down in the book of arrangements, 1899; and

(ii.) That Fellows who are in any way commercially interested in any artificial manure trade or horticultural business cannot claim Dr. Voelcker's assistance as Fellows, but if they wish to consult him, must do so in the ordinary way of business.

The Society's Great Show held in May (by the continued kindness of the Treasurer and Benchers) in the Inner Temple Gardens, was as successful as ever, and it is a matter of satisfaction to the Council to find that this meeting is now universally acknowledged to be the leading horticultural exhibition of this country. The best thanks of the Society are due to all who kindly brought their plants for exhibition, or otherwise contributed to the success of this show.

The Exhibition of British Grown Fruit held by the Society at the Crystal Palace on Sept. 29, 30, and Oct. 1, was, considering the very unfavourable season, most satisfactory. Full particulars will be found in vol. xxii., Part 4, of the *Journal*, which will be issued in the course of a few weeks.

As an object-lesson in British fruit cultivation, this annual show stands unrivalled, and is of national importance. The Council invite Fellows and their friends to support it, for it cannot be too widely known that the continuance of the show is absolutely dependent on at least £100 being raised by subscription each year towards the prize fund. The show involves the society in a very large expenditure without the possibility of any return.

A deputation was sent by the council, at the invitation of the local authorities, to attend the great summer show of the Northumberland, Durham, and Newcastle-on-Tyne Botanical and Horticultural Society in July. Full particulars of this visit will be found in the society's *Journal*, vol. xxii., p. cxiii. The council desire to record the very great pleasure which this visit gave them, and their appreciation of the great courtesy and hospitality with which they were received.

An invitation has been received and accepted for sending a small deputation to visit a show of Daffodils and other early spring-flowers and produce, to be held at Truro on March 21 and 22, 1899.

The *Journal* of the Society has been continued, so as to enable Fellows at a distance to enter more fully into and reap the benefits of the study and work of those actively engaged at head-quarters. Vol. xxi., part 3, and parts 1, 2, and 3 of vol xxii., were issued during the year, and vol. xxii., part 4, will be ready on April 1.

It is gratifying to record that the enquiry for the Society's Leaflet on Fruits for Small Gardens, Cottagers, and Farmers continues. An entirely new and enlarged edition has been published, and may be obtained at the office at cost price.

The first edition of the Book of Rules for Judging, and Hints to Schedule Makers, which the Society drew up in 1896 has been exhausted. They have therefore been revised and reprinted, and an Appendix on point-judging and point-value has been issued, price 1*s*. 6*d*.

An examination in the Principles and Practice of Horticulture was held on April 5, concurrently in different parts of the United Kingdom, a centre being established wherever a magistrate, clergyman, schoolmaster, or other responsible person accustomed to examinations would consent to superintend one on the society's behalf, and in accordance with the rules laid down for its conduct. No limit as to the age, position, or previous training of the candidates was imposed. 190 candidates presented themselves for examination. The names and addresses of those who succeeded in satisfying the examiners, together with the number of marks assigned to each, will be found in the society's *Journal*, vol. xxii., p. 94.

It is proposed to hold a similar examination in 1899, on Tuesday, April 11. Candidates wishing to sit for the examination should make application during February to the secretary, Royal Horticultural Society's office, 117, Victoria Street, Westminster.

The thanks of the Society are due to all the members of the standing committees, viz., the Scientific, the Fruit and Vegetable, the Floral, the Orchid, and the Narcissus Committees, for the kind and patient attention which they have severally given to their departments.

The thanks of the Society are also due to all those who, either at home or abroad, have so kindly presented plants or seeds to the Gardens. A list of the donors has been prepared, and will be found in the Society's *Journal*, vol. xxi., part 4, 1899, which will be issued on April 1.

The Council wish to express, in their own name and in that of the Fellows of the Society, their great indebtedness to all who have so kindly contributed, either by the exhibition of plants, fruits, flowers, or vegetables, or by the reading of papers, to the success of the fortnightly meetings in the Drill Hall. They are glad to find by the increased and increasing number of visitors that the Society's fortnightly meetings are becoming better appreciated by the Fellows and public in general.

A desire having been expressed that the so-called fortnightly meetings should be actually fortnightly throughout the whole year, it will be found by referring to the Book of Arrangements, 1899, that the Council have acceded to this request, as far as it was possible to do so, having regard to such obstacles to absolute regularity as the Temple and Crystal Palace Shows, and the occurrence of Bank Holidays.

The Council have the sad duty of recording the death of forty-seven Fellows during the year, and among them they regret to find the names of Baron Ferdinand de Rothschild, M.P.; the Lord Newton, Mr. Christopher Sykes, the Earl of Sefton, the Earl of Lathom, Lady Cromer, Lady Repton, Sir Richard Quain, Sir Stuart Knill, Bart.; Sir James Bain, Hon. E. S. Parker Jervis, Professor Dr. Allman, Mr. Latimer Clarke, M. C. Bernardin, Dr. Johan Langé, Rev. D. A. Beaufort, Dr. l'Anson, Mr. H. M. Matheson, Mr. G. T. Clarke, Mr. Edmund Tonks, Mr. Chas. Sharpe, Mr. T. B. Potter, and others.

The following figures will show the Society's progress in regard to numerical strength during the past year:—Fellows elected, 619; deduct by resignations and deaths, 119; numerical increase, 500.

The Council recommend that (with the exception of the Secretary) the salaries of the principal officers of the Society—the superintendent, the cashier, and the assistant-superintendent, should continue as heretofore. The Secretary having now completed ten years of service to the Society, the Council recommend that an addition of £50 a year be made to his salary.

The balance-sheet shows a credit balance of £1293 7s. 4d.

FLORISTS' FLOWERS.

AURICULAS.

The months of January and February do not bring the florist much work among Auriculas, and beyond keeping them healthy by the admission of air when there is no frost, little can be done. Continue to afford water very cautiously; only enough to keep the soil from getting dust-dry being needed for the present. The plants will be getting into growth slowly as the season advances, and more moisture at the roots may then be afforded. In applying water, avoid wetting the leaves and spilling water amongst the pots needlessly. Carefully remove all dead or decaying leaves from the plants, and moss from the surface of the soil. On the slightest sign of aphides, fumigate the frame, &c., with tobacco; or, when a few plants only are infested, brush off the insects with a camel-hair brush. The weather in the south has become more seasonable than of late, and means should be taken to ward off frost by covering the glass in case of sudden frost, covering being, for Auriculas, preferable to artificial heat.

The plants should be top-dressed about the middle of February, if the weather should be mild, therefore it will be well to have the compost in readiness. The potting-compost should consist of turfy loam two parts, decayed dry cow-dung half a part each, and a small quantity of leaf-mould. The compost should be placed under cover where it will not freeze, so as to mellow by the time it is wanted for the repotting.

Hollyhocks.

Seeds from a trusty source may be sown forthwith in pots filled with light loamy soil, and placed in a house with a warmth of 65° or 70°. From out of this sowing the strongest plants will bloom the first year, and the remainder the following year. If the seeds are of the best kinds, both single and double flowers will appear. In my next note, I will touch upon the treatment required after germination. *E. Molyneux.*

MR. A. McKENZIE, THE LATE TREASURER, SCOTTISH HORTICULTURAL ASSOCIATION.

Many readers of the *Gardeners' Chronicle* will be glad to learn that the retirement of Mr. McKenzie from the post of treasurer was not caused by failure of bodily strength or lack of interest in the affairs of the association, but from a desire to see a younger man, with heart and soul in the carrying on the good work of the association. A few words concerning Mr. McKenzie's career will be of interest to many. His gardening training began in Belladrum Gardens, Inverness-shire, in 1848. After having undergone the usual experience of young gardeners in Scotland in quest of further knowledge, he settled for some few years on the shores of the Clyde, where he was engaged in gardening, farming, and almost every other aspect of rural life. Here it was that he laid in a stock of knowledge which has stood him in good stead. In 1868 Mr. McKenzie entered the Leith Walk Nurseries, waiting, as many others had done before him, for something suitable to turn up. At that time, the late Baillie Methven acquired the Warriston Nursery, and young McKenzie was sent to look after it, and there really began his life's work. A few weeks ago he was the recipient of a handsome silver tea-service from the Messrs. Methven, as a memento of his thirty years of faithful service and friendship. Although business claimed much of his time, he was at all times one of the staunchest supporters of the Scottish Horticultural Association, to which he devoted much of his leisure. I would refer to the early days of the association. In 1877, a few kindred spirits led by Mr. Robertson Munro, then of the Abercorn Nursery, conceived the idea of holding monthly meetings, at which subjects of gardening interest were to be discussed, and at which plants, fruits, and vegetables of merit exhibited and recognised by awarding the best of them Cultural Certificates. The Association prospered fairly well for about nine years, when some of the more ardent members advocated the holding of a Chrysanthemum exhibition. Here I would like to mention that Mr. Carruthers, of Hillwood, and Mr. McMillan, of Trinity, in particular took up this matter so strongly, with the result that in 1886 the first exhibition was held in a small hall in George Street, Edinburgh. Since that year an annual show has been held, and on the suggestion of the late Mr. Wm. Thomson, of Clovenfords, a centenary exhibition was held in 1889. The magnificent success which attended this exhibition gave an impetus to practical horticulture in Scotland, especially to Chrysanthemum culture, and that of other winter-flowering plants. It demonstrated the practicability of holding a large and interesting exhibition in the dead of winter, and its shows have established the Chrysanthemum in popular favour.

MR. A. McKENZIE.

The Association has distributed the sum of £3550 in promoting the interests of gardeners and gardening during the last ten years. In providing high-class music—for this is as necessary for the success of the shows as the plants and flowers themselves—it has spent £3775. On printing, advertising, and other necessary outlays, such as making the Waverley Market comfortable and attractive, a large sum has been expended. The Association has also devoted to charitable institutions, chiefly those connected with gardening, £550; whilst it has reserved against unforeseen contingencies the modest sum of £790. Many will ask what influences contributed to this large measure of success. I once asked Mr. McKenzie the same question, and he promptly replied—"In the first place, to that love of the beautiful in Art or Nature which prevails among all ranks of the inhabitants of Edinburgh, and it is this alone that draws the thousands to admire the choice productions of the gardeners' art, and to listen to good music. The second cause, I think, will be admitted to be the facilities afforded by the Waverley Market as a site for an exhibition." And personally, I must assign much to the enterprise and liberality of the Council in offering inducements to all classes of grower and to the care, ability, and promptitude, whic Mr. McKenzie has bestowed on the finances of th Association. *J. W. McHattie, Strathfieldsaye.*

THE HISTORY OF GARDENS.

Mr. Albert Forbes Sieveking, F.S.A., delivere a lecture on "Gardens; their History and Liter ture," illustrated by limelight pictures, at th London Institution, on Thursday, January 1 After defining a garden etymologically as a "yard but "touched with emotion of poetry," he diffe entiated the formal or architect's garden (a sort o open-air extension of the house, with its clipped hedges and trees of topiarian art) from the natural, irregular, Chinese, English, or landscape garde and pointed out how Milton had "trimmed" a "hedged" his Garden of Eden between the schools. He then showed the design of an ancie Egyptian garden from a tomb in Thebes. The proble of the "hanging-gardens" of Babylon he declared t be still in "suspension;" and passing by the ancien Persian gardens he showed three views of existin ones, including the Shah's gardens at Teheran. Th gardens of Homer and of the philosopher Epicurus brought him to the "built" garden magnificence of the Roman Empire, to illustrate which, he showed Lucullus's villa at Baiæ, a trellised garde from a wall-painting at Herculaneum, and the restoration of Pliny the younger's Tusculan villa from his own detailed description, and pointed out how this contained the essence of the formal style and the germ of the natural or landscape school. Of monastic gardens he showed a plan of the abbey of Saint Gall by a monk in the IXth Century, and pictures of the monasteries of Saint Germain des Prés and of Ashridge, in Herts. Mediæval gardens were represented from the "Roman de la Rose" and the "Garden of Love," the earliest known engraving—Blois and Gaillon and St. Germain en Laye, from Ducerceau's Architecture—and De Vries's "Hortorum Formæ" to illustrate Palissy the Potter's "Jardin Délectable." Of early Tudor gardens he showed the still existing "Pond Garden" at Hampton Court; and then, turning to Spain, he showed pictures of the Alcazar, the Genealife, and Aranjuez, where Velasquez painted. Italy furnished the terraced gardens of the Villa d'Este and Albani after Piranesi's engravings, an Mr. George Elgood's beautiful pictures of th Villas Borghese Aldo-brandini, Palombo, [illegible] Lante, and the Boboli Gardens. Of Elizabethan gardens he showed De Caux's Fa of Wilton (with Taylor, the Water-poet's euphuistic description), a plate from Crispin de Pass's "Hortus Floridus" and Sir Philip Sidney reclining in the "pleached" garden at Penshurst. Of herbals, the title-page of Gerard's first edition was shown with brief allusion to the physic gardens of Europe. De Serre's "Théâtre d'Agriculture," and Mollet's "Parterres de Broderie" led the way to Le Notre's masterpiece at Versailles illustrated by Perelle's engravings. John Ev was not forgotten, and the Dutch style was illustrated by the garden of the Count de Nassau Kip's Hampton Court, with its grand semi-circ parterre of 9½ acres. Stowe was given as left Bridgeman and sung by Pope, one of the pion of modern gardening. The old gardens of Ox and Cambridge, Badminton, Chatsworth, Chevening paved the way to the English landscape garden, derived from the Chi Emperor's "Garden of Gardens," from which "willow pattern" plate became the type European garden, abhorring straight lines, substituting park for garden scenery. Hor Walpole, Kent, "Capability" Brown, and Hu phrey Repton were all passed in review; Esher "where Kent and Nature vied for Pelham's love" being chosen as the typical landscape garden after Whateley's "Observations on Modern Gardening." The symbolical character of Japanese gardens was pointed out in two examples. Shenstone was cited as the exponent of what Mr. Sieveking called th

"Jardin Larmoyant," or Emotional and Sentimental garden, at the "Leasowes;" and Walter Scott was praised for holding the balance between the rival schools, while Gilpin, Uvedale Price, and Payne Knight re-acted against the extreme theories of the naturalists.

In addition to the sources named, Mr. Sieveking was indebted for some of his illustrations to Miss Amherst's (Mrs. Evelyn Cecil's) *History of English Gardening;* for the views of Persian Gardens, to Miss Ella Sykes (authoress of *Through Persia on a Side-Saddle*); and for some other scarce prints to Professor Brinckmann, Director of the Hamburg Museum of Arts and Crafts, who most kindly placed at Mr. Sieveking's disposal a selection from the unique historical collection of engravings of gardens, formed by the Museum.

A tribute was paid to Mr. William Robinson's natural and wild gardening, and Mr. Blomfield's and Mr. Inigo Thomas's advocacy of the formal garden, and Mr. George Elgood's beautiful pictures illustrated English old-world gardens, and Drummond Castle, Balfour, and Stobhall gardens (by Mr. Fred Walker, A.R.A.) represented Scotland. The lecturer took no side in the controversy between the natural and formal styles, preferring a judicious eclecticism, with the formal garden near the house, and passing, by harmonious transitions, to the park or landscape garden—from perfect art to wildest nature. He declared his belief that the garden-lover could not go far wrong if he would let nature be his religion, beauty and art his creed, and took for his oracle Pope's verse: "Consult the genius of the place in all." We understand that an improved and enlarged illustrated edition of Mr. Sieveking's *Praise of Gardens* (which first appeared in 1885, and has long been out of print) will be published by Messrs. J. M. Dent & Co. in the spring.

PRESENTATION TO MR. ALEXANDER YOUNG, ANNESLEY PARK, NOTTS.

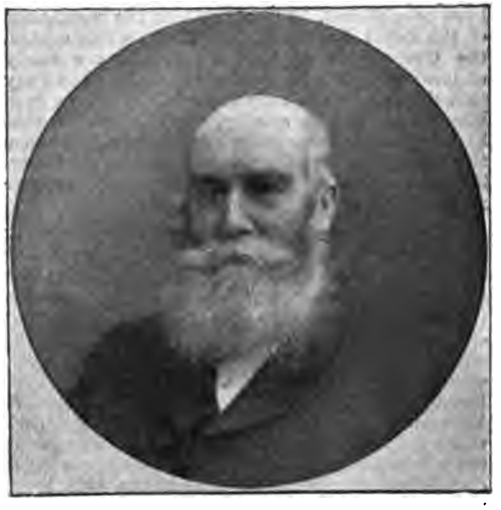
On the afternoon of Wednesday, January 11, an interesting ceremony took place at Annesley Hall, when Mr. A. Young was made the recipient of a large portrait of himself, from which our illustration is copied, and a purse containing £60, subscribed for by the members of the Chaworth-Musters family, the tenantry on the Chaworth-Musters estates of Tithby, Edwalton, and Annesley, together with other friends at Nottingham and Annesley.

Four years ago Mr. Young completed his fortieth year of service at Annesley, and in memory of this event he received from his employer, J. P. Chaworth-Musters, Esq., a handsome silver tea-service. Through the liberality and consideration of his employer he has now been able to retire from active duties, and Mr. George Chaworth-Musters has taken this opportunity for organising and carrying out a scheme for showing in a tangible way the respect in which Mr. Young is held by all classes.

Mr. Young was born near Coldstream, in Berwickshire, in 1829, and after the usual experiences as journeyman, was sent by Mr. Macnab, of the Botanic Gardens, Edinburgh, to Minto House, near Hawick, under Mr. Williamson, then gardener to the Earl of Minto. After a short residence there, acting on Mr. Macnab's advice, he proceeded to Tynninghame House, the seat of the Earl of Haddington, as foreman under the late Mr. Lees. He occupied this post for two and a half years, when he was appointed head gardener to the late John Chaworth-Musters, Esq., and entered on his duties at Annesley Park Sept. 16, 1855. Under his superintendence the gardens at Annersley were greatly enlarged and beautified, and in 1868 he was appointed estate steward. This post he held until August, 1898, when he was succeeded by his son-in-law, Mr. W. M. Geddes, who was for some years head gardener to the late Earl of Macclesfield, Shirburn Castle, Oxon; and for fourteen years estate steward to Lady Byron, Thrumpton, Derby.

The subscribers to Mr. Young's testimonial were entertained at the Hall by Mrs. J. P. Chaworth-Musters, and the presentation was made by Mrs. Chaworth-Musters, of Wiverton, who spoke of the high esteem in which Mr. Young was held by all classes, his loyalty to his employers, his high reputation, and the good influence exerted by him upon all with whom he came in contact; and said, that the hearty response given to Mr. George Chaworth-Muster's proposal had been most gratifying.

In replying, Mr. Young said it had always been a great pleasure to serve the family, and he thanked most heartily his employers, the tenantry, and his fellow-servants who had united to do him such a signal honour. After drinking the health of Mr. Young, several short speeches were made by various tenants on the estates, and Mr. Chaworth-Musters then spoke of his personal indebtedness to Mr. Young, who had always had the fullest confidence of his father and himself, and expressed the wish that he might live many years to enjoy his well-earned rest.



MR. ALEXANDER YOUNG.

HOME CORRESPONDENCE.

CHRYSANTHEMUMS FOR BUSH CULTURE.—There are comparatively few of the Japanese varieties that are unsatisfactory when treated as "bush" plants, providing that sufficient thinning be practised. If exhibition varieties are preferred for the purpose, the cultivator should aim to obtain plants with from six to twelve shoots, and thin the flowering-buds to one upon each shoot. The majority of novelties exhibit a better habit of growth for the purpose, being sturdier and shorter, than many of the older ones. It would be safe to try any Japanese variety as a bush-plant of the above description, if its height when grown for the production of exhibition flowers does not exceed 5 feet. Some of them will give better results than others, of course, according to their tendency to flower freely, but there need be few failures. But if bush-plants are required to produce "sprays" of blooms, then the field of choice is a less wide one, and those known as "decorative" or "market" sorts will give the greatest amount of satisfaction. The question, however, suggests itself, whether it is worth while to choose large-flowering exhibition varieties for a system of culture in which no thinning is done. The result can hardly be other than flowers totally devoid of character. *R. H. P.*

EUCALYPTUS IN IRELAND.—It may interest some of your readers to know that some varieties of Eucalyptus are hardy in Ireland. In the year 1876 the Earl of Annesley planted in his grounds at Castlewellan, co. Down, a collection of about two dozen varieties of Eucalyptus, which did very well for a few years till the first severe frost set in, and killed all except three varieties, namely, E. coccifera, E. cornigera, and E. urnigera. These varieties have not suffered from frost since they were planted twenty-three years ago, so I think they may be looked upon as being hardy. Some of them are now more than 50 feet in height, and they flower and seed regularly. A good many other varieties of Eucalyptus have been planted at Castlewellan since 1876, and the following species have stood the severe winters of the past ten years: E. cordata, E. gomphocephala, E. piperita, E. resinifera, E. rostrata, and E. saligna. *T. Ryan, The Gardens, Castlewellan.*

—— On p. 43, Mr. A. R. Pearce says he has only known E. Globulus to flower in the open in maritime counties. It may interest your numerous readers to know we have two growing in different parts of the grounds here. They were planted out at the end of May, 1895, and are now over 35 feet high, and are freely covered with curious shaped knobs on last season's growths (shoot enclosed), which I presume are flower-buds [seed-vessels. ED.]. The last three winters have been comparatively mild, but we have bound the stems for about 10 feet up each winter with hay-bands. *F. Knights, Bitteswell Hall Gardens, Lutterworth, Leicestershire.* [The specimen sent is not E. Globulus; we will endeavour to identify it. Our correspondent must have overlooked the flowers produced last summer. ED.]

MUSHROOMS SPOILED BY OTHER FUNGI.—Herewith I am sending three Mushrooms attacked apparently by some other fungus. I have had several patches, particularly in one bed, but cannot assign a cause. The dung was, as far as I know, in good condition, and the soil used for casing was virgin soil. In all other respects the beds have done well, the crop being quite up to the average. The beds from which these Mushrooms were taken are situated in a vinery lying idle. But I have had the same thing on the outside beds. It appears to spread very rapidly, attacking Mushrooms in all stages of growth, and spreads also after they have been cut and cleaned for market. If you can send me any advice as to how to cure and prevent this disease, I shall feel extremely indebted to you. *F. Freeman Page, January* 7. [To this communication, which we sent, together with the Mushrooms, to Dr. M. C. Cooke, we received the following reply. ED.]:—

"Mushrooms received from Mr. Page are diseased in a manner familiar to us for many years, but which to a considerable extent remains a mystery. The affection presents itself on the under surface at first, and the gills are covered and distorted by the development of a white mould, which up to the present has not produced spores or conidia, although the inference is that the mould is a conidial stage of a Sphæriaceous fungus belonging to the genus Hypomyces. All the species of this genus hitherto known are produced as parasites on other fungi, such as Agarics, Russulæ, Lactarii, Chantarelles, &c., growing specially on the gills, which are thereby distorted, and ultimately producing the capsules or perithecia of imbedded Sphœriæ, resembling Nectria, enclosing sporidia enclosed in asci. In the present instance the perfect fruit is unknown, but the mouldy or conidial stage is precisely analogous to that in other species. The development of this parasite is destructive to the Mushroom, not only spoiling its appearance but so altering its character as to prevent its use as food. The predisposing cause of this phenomenon is yet unknown, the spawn being uniformly good, the culture normal, and the conditions apparently healthy; and yet, when the parasite appears it takes possession of the entire bed, and there is no alternative but to break it up and effectually destroy the entire bed and its produce, so as to eradicate all germs of the disease. No efforts have proved successful in checking the disease when once it makes its appearance, and as the cause remains a mystery prevention is equally impossible. We are inclined to think that some peculiar conditions of culture must be the basis of the infection, such as too close and humid an atmosphere, or some conditions which serve to lessen the vitality of the Mushrooms and encourage parasitism. From the analogy of other species, growing spontaneously, and developing moulds, we have observed that infected plants grow in unusually damp places, where the water is stagnant, and that the mould makes its appearance upon sickly and unhealthy-looking Agarics, but never, as far as we have seen, upon strong and vigorous hosts. If these observations are correct, then the only remedy to be found lies in a closer attention to the conditions of culture rather than to any deficiency in the soil, or deterioration of the spawn, which may originally have been of the best quality. *M. C. C.*"

TOMATOS TRAINED SPIRALLY.—In reply to "A. D.'s" remarks in the *Gardeners' Chronicle*, p. 13, vol. xxv., I suppose he would observe that the word fine was a printer's error, and should have read "those planted in the open received support from five stakes;" and as "A. D." justly remarks, three or more must have been employed to form the needed columnar support. When "A. D." visited the garden here three years ago, I remember his getting quite enthusiastic regarding our method of Tomato and Melon cultivation, which was thoroughly investigated, and which makes me, as it should also all other readers of the *Gardeners' Chronicle*, appreciate the facts supplied by him from time to time. I may inform him that the crop gathered from the plants trained spirally on the open border far surpassed those grown on the walls three years ago, so far as I can recollect; but it must be remembered that the past summer was an exceptionally good one for the Tomato out-of-doors, provided a good supply of water was afforded the plants. I hope as time goes on to see my method generally adopted; and I am certain that if cottagers and allotment-holders were to adopt it, they would be amply repaid for their trouble and labour, as they could gather from their Tomato-plants fruit for at least three months if the season were at all favourable. *George MacKinlay.*

JADOO FIBRE.—I was much interested in the note on this subject at p. 42, sent from France—rather far from home for such intelligence, because it seems to present a somewhat singular phenomenon. For here we find a Vine, either originally absolutely rootless, and later forming roots only on the side on which Jadoo fibre was placed; or if having normal roots, then must those on the undressed side have turned round to the dressed side in search of the feast the Jadoo was supposed to furnish. If that does not indicate on the part of Vine-roots a very high order of intelligence, what can do so? Still, we might have expected, seeing how long the Jadoo fibre has been with us, to have heard of numerous similar cases at home, where Vine culture is pursued with such remarkable persistence and ability. But 999 out of every 1000 of our Grape growers stupidly continue to prefer turfy or fibrous loam to Jadoo fibre for Grape production. Possibly, after reading the note referred to, we shall find them utilising Jadoo universally. If they have it not, and lack fibre, they will find an admirable substitute in peat-moss soaked with sewage, and then turned once or twice, to partially heat and sweeten it before using it. But as a test of the relative merits of Jadoo fibre and pure turfy loam in the culture of Vines, I should like to see a few young ones put into 12-inch pots with Jadoo only, and others with turfy loam only and devoid of any other compound, and then grown on as ordinary fruiting canes and fruited the following year. That would be a description of test of the merits of these two soil compounds that would admit of neither amusement nor of scepticism. *A. D.*

PEA GRADUS.—As a first-class early wrinkled Pea this is one of the best in regard to quality, cropping, and its usefulness for exhibition. The pods are very large and well filled, and its height is 3½ feet. I grew a quantity last season, together with other sorts, on a heavy clay soil, and I consider it worthy of recommendation. *A. R. Pearce, Braymead Gardens, near Maidenhead.*

BEGONIA GLOIRE DE LORRAINE.—My friend, "A. D.," at p. 44, says—"This plant is, I understand, so far asexual (*sic*), that it produces only male or barren (*sic*) flowers." Well, "A. D.'s "asexual," was, I suppose, a slip of the pen for uni-sexual; but it would be a poor look-out for our friends the hybridists and cross-breeders, if even male or polleniferous flowers were "barren!" So far as Begonia Gloire de Lorraine is concerned, there are a good many exceptions to its bearing male flowers only. That its male flowers are numerically in excess of the female ones I willingly admit, but they can be found in most gardens wherein it is grown, when really sought for. When I saw the single female flowers on the plant at Chiswick on December 30 of last year, I also thought it rather uncommon, having never seen one before. On going to see my friend, Mr. Hudson, at Gunnersbury, I said something about it to him, or one of his men, and I believe female flowers were found there. On my return home I looked at my own plants, and found a female flower on a plant in a basket, though none on plants in pots further from the glass; and all other gardeners who grow this beautiful winter-blooming Begonia to whom I have spoken on the matter, have found one or more female flowers, or seed capsules, when they looked carefully for them. I should like to hear what Mr. H. B. May has to say on this point, and whether female flowers have been noticed on the great batches of this plant, which he cultivates so well? One practical advantage possessed by this plant is, that it is a constant bloomer, flowering practically all the year round, and this persistence may be, and probably is, due in some measure to the comparative paucity of seed-bearing flowers, which leaves more energy available for the production of male flowers. Can anyone kindly tell us of the parentage of this exquisite Begonia? Is it a hybrid between B. socotrana and B. Dregeana, or some other species? Whatever its parentage may be, it is undoubtedly one of the best winter-flowering plants of recent introduction to our gardens. The whole genus Begonia is a very interesting and variable one in habit and foliage, as well as in flowers; and remembering the all-the-year-round types of beauty so well shown in the old Begonia-house at Kew some twenty-five or thirty years ago, I think if I were rich enough to devote houses to any special order of plants, I should prefer Begonias to Orchids, even for their ever-varying phases of beauty and charm. I believe the day of the Begonias has yet to come. *F. W. Burbidge.*

GRAPE JUDGING.—"Ayrshire Lad" seems to find it difficult to understand what is referred to when I recently wrote, "The judges can with fixed maximums vary the points." If I had said that the judges could vary the maximums, it would have been absurd. But seeing that the regulations of the Royal Horticultural Society, which control the Grape judging at Shrewsbury, are easily understood, and also fixed maximums, when I say that the judges can vary the points given to each bunch according to quality, what I convey is that knowing they cannot in any case give points above the maximum specified, they can give fewer, if the bunches shown are of medium or inferior merit. I think that is clear enough.

—— Permit me to point out to Mr. Kirk, of Alloa, who seems alarmed lest in the judging of the decorated great Grape class at Shrewsbury, in August next, the decorative effort may, in the judges' estimation, outweigh the cultural excellence of the Grape, that if he will read the conditions of the class as found in the show schedule, he will find that whilst the twelve bunches may obtain a possible maximum of 110 points, those possible for decoration are limited to six points only, a very infinitessimal number of the whole, and showing that the effect of the introduced decorative material is rather to help break up the monotony seen in long lines of Grapes on boards, and not to lend to the fruit any extraneous and unmerited points. *A. D.*

WINTER ACONITES.—I note by the correspondence in the *Gardeners' Chronicle*, that some surprise has been expressed at the lateness of the flowering of the Winter Aconite this year. A row of this plant is growing in these gardens on a Rhododendron bed facing due south, and open flowers were observed on January 15; they were planted five years, and this will be the fifth season they have flowered. They have not been disturbed since they were planted. *W. G. Bushell, Rownham House Gardens, Southampton.*

—— In this garden the Winter Aconites opened their first flowers on the 18th inst. The plants are growing on a south border. In places about the gardens where Aconites usually appear, I cannot find a single flower-bud. I am unable to say whether Aconites are this year unusually late, as usually about this date the ground is more or less covered with snow; but with its disappearance towards the end of the month, and aided by a few sunny days, Aconites have appeared in abundance. Snowdrops are freely coming into flower. *H. Fisher, Flixton Hall Gardens, Bungay, January* 23.

EARLY FLOWERS.—In addition to the other interesting notes on Winter Aconites and other flowers which appeared in the *Gardeners' Chronicle* for last week, I send you a list of plants in flower at the present time at Woking:—Hepaticas, single and double-flowered; Iris stylosa and its white variety, Omphalodes verna and O. v. alba, Phlox verna, Galanthus Elwesii, Gentiana acaulis, a few solitary flowers; Primula acaulis, P. a. alba plena, P. a. lutea plena, P. a. Creusseri plena, and Tussilago fragrans. The last-named plant has been exceedingly fine this season, owing to the mildness of the weather, its fragrance being delightful. Saxifraga Burseriana, Anemone blanda, and Morisia hypogæa are in bud. Among shrubs, the following are noticeable:—Hamamelis (Wych-Hazel), Jasminum nudiflorum, and Garrya elliptica. The last-named is exceedingly profuse this season, its catkins being of great length; while on a wall I noticed Forsythia suspensa commencing to expand. *E. Scaplehorn, Woking.* [A correspondent from Inverness sends us Adonis autumnalis in bloom! Ed.]

SPIRÆA DISCOLOR (ARIÆFOLIA).—I endorse all that has been recently published in the *Gardeners' Chronicle* about this species. Mr. Divers' advice, printed in your last issue, to plant it in shady positions, is quite to the purpose. There are several planted here in the shade and exposed, but those in the shade are of a purer white, and keep fresh longer than the others. He tells us that the plant does well on cold clay soil at Belvoir, but in reality they do not seem to be particular as to soil. We are situated on limestone, and some of our plants are about 14 feet in height, and they bloom profusely every year. *D. Elkins, Trewsbury Gardens, Cirencester.*

CURIOSITIES OF ORCHID BREEDING.

(*Concluded from p.* 37.)

Fertility of Hybrids.—The question of the fertility of hybrids is a highly interesting one, and especially important to the student of evolution; and I venture to think that recent experiments in Orchid hybridisation have added considerably to our knowledge of the subject.

One of the principal objections to Darwin's theory of the origin of species was the supposed general sterility of hybrids.

Darwin fully appreciated this difficulty, and, after a careful and most elaborate survey of the whole question of hybridism, came to the following conclusions:—"First crosses between forms sufficiently distinct to be ranked as species, and their hybrids are very generally, but not universally sterile. . . . The sterility is of all degrees" (*Origin of Species*, 6th ed., p. 262). Again:—"The sterility of distinct species, when first united, and that of their hybrid offspring, graduates by an almost infinite number of steps from zero (when the ovule is never impregnated, and a seed capsule is never formed) up to complete fertility. . . . This high degree of fertility is, however, rare" (*Animals and Plants*, 2nd ed., vol. ii., p. 163). Some fifteen years later, Dr. Alfred Russel Wallace took up a somewhat similar but more definite position. He writes: "One of the greatest, perhaps we may say the greatest, of all the difficulties in the way of accepting the theory of natural selection as a complete explanation of the origin of species, has been the remarkable difference between varieties and species in respect of fertility when crossed. Generally speaking, it may be said that the varieties of any one species, however different they may be in external appearance, are perfectly fertile when crossed, and their mongrel offspring are equally fertile when bred among themselves; while distinct species, on the other hand, however closely they may resemble each other externally, are usually infertile when crossed, and their hybrid offspring absolutely sterile" (*Darwinism*, 1890, p. 152). Since that time, hundreds of hybrid Orchids have been raised in gardens. As we have already seen, there are now on record some 500 distinct primary hybrids raised from distinct species; also some 300 secondary and tertiary hybrids from distinct crosses, raised from parents themselves hybrids.

In the face of these facts, therefore, we can hardly maintain that "distinct species . . . are usually infertile when crossed," and still less can we assert that "their hybrid offspring are absolutely sterile." As it is with Orchids, so it is with other garden plants that have been hybridised, e.g., Roses, Rhododendrons, Dahlias, Chrysanthemums, Carnations, Begonias, Pansies, &c.; the wonderful forms seen in gardens at the present day are all hybrids of many generations, being the known product of more than one species, and these are all fertile in the production of seeds. Darwin seemed to attach much importance to the different degrees of fertility in hybrids, ranging from complete fertility down to absolute sterility. At present we have no means of ascertaining the relative fertility of hybrid Orchids with that of ordinary species, owing partly to the fact that very few crosses have been made in gardens between varieties of the same species, and partly to the fact that many thousands of seeds are contained in one capsule, being practically innumerable. But through the kindness of Mr. Reginald Young, of Liverpool—an enthusiastic connoisseur in Cypripediums—the writer has been able to work out certain statistics bearing on the question of the comparative fertility of hybrids (see *Journ. Roy. Hort. Soc.*, vol. xxi., April, 1898).

The voluminous records in Mr. Young's stud-book cover a period of about five years, and were specially selected by the writer on account of the reputation of the breeder as a careful observer and a precise recorder. Out of the 577 crosses made by Mr. Young, among thirty distinct species and fifty-three distinct hybrids of the new genus Paphiopedium, no less than 78·3 per cent. proved fertile, i.e., produced good seeds.

Of these, the crosses between distinct species only, 95·2 per cent. were fertile, while the crosses in which a hybrid was concerned in the parentage, 71·8 per cent. proved fertile.

This seems to show that crosses between distinct species are almost if not quite as fertile as crosses between varieties of the same species (taking the latter at complete fertility, i.e., 100 per cent.); while crosses with hybrids, though fertile to a high degree, are yet rather less fertile than crosses between species. A further analysis of the figures shows, that while hybrids crossed with pollen of pure species give 89·5 per cent. fertile, yet pure species crossed with pollen of hybrids give but 56·7 per cent. fertile. This points to the conclusion that the slight decline in the fertility of hybrids is due in a large measure to the loss of power in the pollen of hybrids.

Why the male element in hybrids should be so much less potent than the female element I cannot pretend to say.

Evolution of Species by Natural Hybridisation.

The experimental demonstration of natural hybrids shows clearly that intercrossing between different species is carried on in a state of Nature to a far greater extent than was formerly supposed; and the comparative fertility of these natural hybrids would be of vital importance to them in their struggle for life.

If, as seems highly probable from the above experiments with Orchids, it is the pollen only of hybrids that is impaired, and the capacity of the hybrid to bear seed crossed with the pollen of pure species remains practically unimpaired, it is quite clear that the natural hybrid has a part to play in the evolution of new species.

As we have already seen, hybridisation tends to increase variation, especially beyond the first generation; and, naturally, the more variable the offspring, the better fitted would they be to adapt themselves to changed conditions of life.

If the circumstances changed rapidly and considerably, the variable offspring of the hybrids would stand a better chance in the struggle for life than the more uniform offspring of the parent species, which were themselves specially adapted to the old conditions. In this way, as conditions changed, new species would be evolved more fitted to the new conditions of life than the old species, which they would gradually replace, and I venture to suggest that natural hybridisation is the most rapid of Nature's means towards that end. *C. C. Hurst, in "Nature."*

SOCIETIES.

LINNEAN.

December 15.—Mr. H. J. Elwes, F.R.S., F.L.S., gave an account of the Zoological and Botanical results of a recent journey to the Altai Mountains.

As regards the Zoology of the particular district explored by him, little was previously known; for with the exceptions of Major Cumberland, Mr. St. George Littledale, who accompanied Prince Demidoff last year, and Mr. Rew, who travelled very rapidly through the country *viâ* Kuznetsk and Kobdo to Irkutsk, no Englishman had in recent years visited the Altai, or written on the natural history of that region. He understood by the term "Altai," the western extension of the great mountain-range which is entirely cut off by the Desert of Mongolia and the Irtysch Valley, from the Mountains of Turkestan, the Himalayas, and all the great mountain-ranges of Central Asia, though it extends under the name of the Sayansk Mountains as far east as Lake Baikal.

One of his chief objects was to visit the head-waters of the Yenisei, almost unknown even to the Russians; a great valley 300 miles wide by 200 miles long, scarcely inhabited, and almost unknown. His journey commenced practically at Moscow, in the middle of May, and extended from the Ural Mountains through Omsk to the River Obi, across a vast and unvarying steppe to Büsk, where his natural-history collecting began. After describing the general appearance of the country and the vegetation, Mr. Elwes stated that he had brought home about 180 species of butterflies out of a possible 200 (of which 141 had been collected by himself), and 80 species of moths.

As regards plants, finding the flora pretty well known through the labours of Ledebour, Bunge and Tchihatcheff, he thought it preferable to collect the plants of a small typical valley rather than attempt a general collection made at random. Unfortunately, owing to an accident when crossing a river, the greater part of that collection was lost. He was much struck with the extraordinary beauty and abundance of the alpine plants in certain marshy valleys from 6000 to 7500 feet in altitude. There was a remarkable absence of peat-plants, and hardly any Ferns were seen in the Tchuja Valley between the Katuna River and the upper Tchuja Steppe, a plateau about 6000 ft. above the sea, south of which the greater part of the observations were made. From this plateau he journeyed to the high mountains of the south in quest of the famous wild sheep, Ovis ammon of Pallas, of which he secured three specimens, which were now exhibited, one having a measurement of 62 inches round the curve of the horn, which is about the largest on record for this species. He mentioned the scarcety of game-birds in the Altai, though Tetraogallus altaicus was often seen at an elevation of 8000 to 9000 feet, accompanying the Ibex (Capra sibirica) as in the Himalaya and Caucasus. He mentioned the breeding on the mountain lakes of Oidemia Stejnegeri, a North Pacific species allied to our velvet scoter.

The Great Stag of the Altai, of which several heads were shown, was evidently an Asiatic form of the Wapiti, the antlers having a remarkably long fourth tine, and the peculiar back tine at the top, characteristic of the American animal, and not observable in the European red deer. These were compared with four adult pairs of horns of the Mantchurian Cervus Lühdorfi, which had been kindly sent to him by the Duke of Bedford. Though much smaller than either the American or Altai stag, these horns showed the same typical Wapiti character, and it appeared as though the races inhabiting the N.W. coast of America and the N.E. coast-region of Asia more closely resembled each other than they did the other races of their own continent.

He exhibited a series of heads of the Siberian roedeer, which were compared with typical heads of the European roedeer, from which it was considered specifically distinct.

DEVON AND EXETER GARDENERS.

January 18.—At the meeting held on the above date at Exeter, Mr. R. W. Hodder, gr. to Mrs. Trevor Barclay, Ponsonby, Torquay, gave a paper on "The Fungus Pests of Our Gardens."

Mildew was described as subsisting on the leaf-tissues of its host, as when removed by any of the common remedies it did not reappear from the same mycelium, though a fresh attack might come from the original source. In this way mildew was not such a dreaded pest as other fungus diseases. The damping-off of seedlings (pseudo-commis) [?] was shown to be the result of an attack of fungus, and it was advised that not only should the plants so attacked be at once removed, but that the soil under and around them should also be taken away, to prevent a spread of the disease. If the plants were under glass, a drier atmosphere should be given them. For mildew on Onions, a good dusting with soot early in the morning was recommended, when the foliage was damp; or, in very dry weather, a gentle spraying with water, and then a dusting with soot. Another remedy was to dilute sulphide of potassium into a paste by adding water, and applying it to plants so attacked.

As a remedy for the Carnation-disease, the following recipe was given:—Dissolve 3 lb. sulphate of copper in 1½ gal. of boiling water, stirring well until the copper is dissolved. Then, with this liquid slake half a bushel of lime, or as much lime as is necessary to bring it to a fine powder. Dust the plants with this powder, and, forty-eight hours afterwards, syringe them with clean water. Repeat the application to any plants still showing "spot." Referring to the Potato-disease, the burning of the haulm after the lifting of the crop was insisted upon as a preventive to its perpetuation. Treating the seed-tubers with any of the well-known fungicides was also recommended as a means of prevention of the disease. The most effectual remedy yet discovered for Potato-disease was the Bordeaux Mixture. Where "finger-and-toe" appears, the crop had better be burned outright, and the land cropped for the next two or three years with something entirely different, so as to starve out the disease. As a prevention of leaf-blight in Tomatos, there should be a perfect circulation of air in the house, nothing conducing more to the blight than stagnation of air. Fresh soil every year was recommended.

Chrysanthemum Leaf-rust.

After giving his experience with many remedies, the lecturer said the most effectual of all was a mixture he prepared as follows:—Boil 1 lb. of whale-oil soap in a ½-gallon of water until the soap is thoroughly dissolved. To this add 1 gallon of best petroleum. Boil, and keep boiling, for ten to fifteen minutes, stirring all the while, until the liquid is of the consistency of gruel, then add a lump of 2 to 3 oz. of ammonia carbonate. When cold, put into jars for future requirements. For use, mix one part of the emulsion with fifteen parts of water, and spray the plants with it once every three or four weeks. He thought all fish manures should be avoided in Chrysanthemum culture, as in moist weather they engendered mildew on the plants. In using the remedy suggested, Mr. Hodder said it should not be applied to cuttings until they were well rooted, and he did not think it would be necessary to apply it when the plants are in flower.

WARGRAVE AND DISTRICT GARDENERS.

January 18.—The annual meeting was held in the Parish Room, the President, H. Nicholl, Esq., of Bear Place, being in the chair. Nearly every member was present.

The minutes of the last meeting were confirmed, and the officers and committee for the present year were elected; after which the Hon. Secretary (Mr. H. Coleby) read the annual report, reviewing the work of the Association for the past year. Mr. J. W. Groves (Hon. Treasurer) read the financial statement, which showed a good balance in hand. The Treasurer was authorised to pay the prize-money to the various exhibitors. Mr. W. Pope had gained the highest number of points.

A paper was read by Mr. F. Pether, gr. to F. Lark, Esq., Wargrave, on the "Culture of the Primula." He advocated the double-flowering varieties as useful for providing flowers for cutting, and the single-flowering varieties for use as decorative plants. Cultural directions were given for seed-sowing, potting, and their subsequent management.

Mr. W. Pope exhibited a nice group of Cyclamens, and Mr. Pether some excellent Primulas.

FRENCH NATIONAL CHRYSANTHEMUM.

Considering the very short time this Society has been n existence, the executive have every reason to be proud of the progress the Society has made. *Le Chrysanthème*, the official organ of the Society, has been regularly published, and has now reached its twenty-fourth number. The membership has passed a total of 500, inclusive of thirty-one affiliated Societies. Three Conferences have been held, at which important questions relating to the popular flower have been dealt with; and judging by the balance-sheet now presented there remains in hand a sum equal to nearly £50 in English money.

In the December number of *Le Chrysanthème*, which contains about 70 pages of printed matter, we find a list of newly-elected members, some short notes on different topics connected with Chrysanthemums, the concluding portion of M. Salète's report of the Royal Aquarium Show last November, and a rather full account of the proceedings at the Troyes Conference, with the text of the papers read and discussions arising thereout. Such a publication as this must of necessity greatly interest members living at a distance from the seat of the Society's operations, and might well be imitated by other and older Chrysanthemum societies here in England. *C. H. P.*

NORTH PECKHAM AMATEUR CHRYSANTHEMUM.

January 21.—At the annual meeting held on the above date it was stated that the income of this Society, which was established in 1894, was £172 11s. 3*d*.

There is a balance in hand of over £50, and numerous special prizes are being contributed for competition next November.

CHESTER PAXTON.

January 21.—The first usual fortnightly meeting of the year was held in the Grosvenor Museum on the above date, when Mr. E. Stubbs, gardener to Mrs. Hudson, Bache Hall, read a paper upon "Chrysanthemums." In the absence of the President, Mr. J. Jackson presided.

Mr. Stubbs has for some years been recognised as one of the most successful Chrysanthemum growers in the district, he having upon various occasions carried off the highest honours for

Chrysanthemums at the society's annual exhibition. It was from an exhibitor's point of view that Mr. Stubb's dealt chiefly with his subject; and in the course of his remarks he gave in minute detail his methods of culture, which were greatly appreciated by those who were present. An interesting discussion followed, in which other growers took part; and the meeting closed with a very hearty vote of thanks to Mr. Stubbs for his carefully-prepared paper.

THE ROYAL SCOTTISH ARBORICULTURAL.

January 24.—The annual general meeting was held at 2 P.M. on the above date in the Y.M.C.A.'s Rooms, St. Andrew's Street, Edinburgh. The president, Colonel Bayley, occupied the chair, and among those present were the Earl of Mansfield, who succeeded Colonel Bayley in the presidentship; Mr. Monro Fergusson, of Nuvar; M. P. Sheriff Mackay, The Hon. George Waldgrave, Sheriff; Mr. John Methven, Mr. W. Welsh, Liberton; Mr. Cork, Armiston; Mr. Pitcauthly, Scone; Mr. David Laird, Mr. M'Kinnon, Mr. Loney, Mr. Dunn, and a large number of foresters and others interested in forestry, including three ladies.

Thirty-eight new members were elected, bringing up the total membership to 802, fifty-nine new ones having been added during the year. We will refer further to this meeting next week.

Fruit from the Cape Colony.—Mr. George Monro, Covent Garden, writes:—"In reference to the article referring to the arrival of Cape fruit, the importations are much earlier this year than last, as I received Plums on the 16th inst., and have both Peaches and Plums in the *Scott*, which is due on Friday, January 27. Plums on the 16th made 6s. per dozen, which is, I think, a record price."

Obituary.

George Lambert.—We regret to record the death of Mr. George Lambert, at the advanced age of eighty-one years. For forty-nine years he had charge of the gardens and woods at Oakwood, Chichester, for the late John Baring, Esq. The deceased as a young man was principally engaged in landscape-work for Messrs. Page, nurserymen, of Southampton; and on the completion of the various alterations at Oakwood, superintended by him, he was offered and accepted the position of gardener and forester at that place. Forty years ago he was a well-known exhibitor of vegetables, fruit, and especially of Show and Fancy Pelargoniums and herbaceous Calceolarias, at Chichester, Brighton, and the Crystal Palace Shows. His eldest surviving son is gardener at Powis Castle, and an occasional correspondent of this journal.

GARDENING APPOINTMENTS.

Mr. H. E. Kennedy, lately employed at Halton, Bucks, as Head Gardener and Steward to Sir Alfred West, Bart., Kilcroney, Bray, near Dublin.

Mr. E. G. Wheeler, for the past eleven years Gardener to A. J. Lewis, Esq., Moray Lodge, Kensington, as Gardener to D. W. Freshfield, Esq., Kidbrooke Park, Forest Row, Sussex.

Mr. A. Young, for nearly five years Head Gardener at Marston House, Frome, has been engaged by Sir J. Heathcote Amory, Bart., Knightsayes Court, Tiverton, Devon, in a similar capacity, and enters on his duties on February 9 next.

Mr. Marshall has succeeded Mr. Miller as Gardener to the Earl of Craven, Combe Abbey, Coventry.

Mr. J. Swanwick, for the past five and a half years Gardener to C. H. Oaks, Esq., Holly Hurst, Riddings, as Head Gardener to C. Tylden Wright, Esq., Mapperley Hall, Nottingham.

Mr. G. D. Chisholm, for the past six years Gardener to Major Middleton, Acacia, Roundhay, Leeds, as Gardener to Mrs. Illingworth, Thornton-le-street, Thirsk, Yorks.

Mr. William Harrison, formerly Foreman at Shirburn Castle Gardens, Wallingford, Oxon, as Head Gardener to Col. Archer Houblon, Hallingbury Place, Bishop's Stortford, Essex.

Answers to Correspondents

Books: *Nemo.* Lindley's *School Botany* (Bradbury, Agnew & Co.).

Cape Gooseberry: *C. B.* See an article in our number for September 18, 1897, p. 202.

Dark-coloured Honey: *Lucy M. Baines.* Dark sections are always a very difficult thing to dispose of, and the past year has been very exceptional in that respect. The best way is to extract them, because now honey dark-coloured can be more easily disposed of; it can also be used for making candy-cake if no sale can be got for it after it has been run out.

Diseased Seakale: *W. S. H.* The roots sent appear to be healthy, except in the blackened parts you mention. In these black parts a fungus is everywhere present, and is the only likely source of mischief we can find. Owing to the position of the fungus near the sap-carrying vessels, it could easily extend upwards into the young growths. You could propagate from the stock by using parts free from black; place them in good fresh soil, and otherwise keep the new crop carefully away from the old.

Durham, Northumberland and Newcastle-upon-Tyne Horticultural Society: *W. Fulford.* J. J. Gillespie, Jun., secretary, Cross House Chambers, Westgate Road, Newcastle.

Moles and Tennis Lawn: *D. H. D.* There remains nothing but trapping; or watching the animals at work, and throwing them out of the soil with a dock-spud.

Names of Fruits: *J. P. & Sons.* Apple: Dumelow's Seedling.—*J. M.* Apple: Striped Beefing.—*J. C.* Apple: Mère de Ménage.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*S. C.* Dendrobium aureum, oftentimes called D. heterocarpum, a very pretty flower, with much fragrance.—*Tar.* Muscari racemosum, Starch Hyacinth, British.—*Dr. H. M.* 9, Abies grandis; 10, Retinospora squarrosa of gardens; 11, Retinospora plumosa of gardens, both these are forms of Cupressus pisifera; 12, Cupressus macrocarpa; 13, Cupressus Goweniana; 14, Juniperus chinensis; 15, Abies magnifica, it may be the fine variety called shastensis. In the absence of cones, these identifications are more or less conjectural, but we have compared them with our specimens.—*C. B.* The plant of which you now send cones is Cupressus lusitanica, the Cedar of Goa. The name formerly given in the absence of cones was wrong. Without the fruit the identification of Conifers must be conjectural. The cones will be ripe in a few weeks apparently, and the seeds should be sown in spring in light open soil, in pans in the greenhouse, and pricked out as soon as the plants are big enough to handle. It will not be hardy so far north.—*J. M., Nottingham.* 1, Asparagus; 2, Fittonia argyroneura; 3, F. Pearcei; 4, Davallia bullata; 5, Rohdea japonica variegata.—*A. C.* Muehlenbeckia complexa, a hardy trailing-plant.—*W. G. S.* Calanthe vestita luteo-oculata.—*W. W.* A bad flower of Lælia anceps.—*W. H. D.* 1, Begonia Dregii; 2, B. Digswelliana; 3, B. Ingrami.—*R. C. W.* A form of Calanthe × Veitchi, remarkably distinct from that generally cultivated.—*South Wales.* Cryptomeria japonica.—*Amateur.* Adonis autumnalis.

Nottingham Catchfly: *C. B.* Herbaceous perennial, 2 to 3 feet high, with viscid oblong leaves, and loose panicles of drooping flowers; grows on the cliffs, near Dover. Its Latin name is Silene nutans.

Palms Damaged: *C. J.* The specimens sent show some error or accident in the cultivation. The appearance of the foliage suggest that they have been kept too cold at the roots, and too hot overhead. Or they may have been watered with some strong chemical manure.

Seeds: *C. B.* So far as we can tell, the seeds are those of some Lily. Another time, please write separate questions on separate pieces of paper. To mix up numerous questions on different subjects on one piece of paper is to give us more trouble than is necessary.

Strawberries Dying Off: *W. W.* The roots and roots-stocks sent show injury from insects, probably weevil grubs, and weevils themselves, although we could only discover young earthworm in the package. Will you kindly send other plants, taking them up with a ball of earth, packing them securely in a box, when, if insects, grubs, &c., are found therein, we may be enabled to identify them. In any case, the plants are not likely to be of any service, and they should be dug out of the land intact, and thrown on the garden "smother-heap," so as to make sure that they are destroyed. Then afford the land a dressing of quick or gas-lime. If the dressing of the latter be a heavy one, let the land lie fallow for six months, or trench it three spits deep, so that a vegetable crop may be taken at an earlier period. Permanent wire protection over Strawberry-beds may have some advantage over fishing-nets; but the evils that follow the shutting out of the insect-eating birds, more than counterbalance them. If you do not remove this wire-netting entirely, the birds might be allowed access to the area covered by leaving the ends and sides open at all seasons except the fruiting one.

Tomato-seed Cleaning: *H. H. R.* There is no better method than to let the fruits decay to a considerable extent before washing out the seeds, which is then very readily done in a fine wire sieve, held over a tub filled with warm water. If the fruit is allowed to decay in a cold place there is no chance of the seeds germinating in the pulp.

Tuberoses: *H. I J.* It does not pay to grow on the offsets till they come to flowering age. It can be done, doubtless, in the warmest parts of the country, but imported roots are so cheap, that it is scarcely worth the trouble. Forced bulbs are of little use, offsets being weakened by the forcing they have undergone; although offsets from plants grown cool might not suffer deterioration.

Violets: *J. L.* Better few and good than a great number of varieties. *Early, single*: California, Devoniensis, Victoria Regina (very early), The Czar, Princess of Wales. *Double*: Comte de Brazza (white, fragrant, large), De Parma, Lady Hume Campbell (late), Marie Louise (lavender-blue and white), Neapolitan (mid-season).

"Worms" in Manure: *H. O. E.* Species of Gordius. These creatures exist on decaying substances, and, like the millipedes (Julus), they are not injurious to living vegetation.

Gardeners' Chronicle

No. 632.—SATURDAY, FEB. 4, 1899.

ROME.

THE FLORA OF THE COLOSSEUM.—I was told before visiting Rome again, after an absence of some years, that a very sad change would present itself to me, and this in more ways than one, which must be seen to be realised. This anticipation has been fulfilled to the letter. When you come in from the north by the railway, and still more when you begin to wander about the place on arrival, you see at a glance how different the "setting" of the whole thing now is from what it used to be, and how much there is to be deplored. A great sea of houses quickly run up, badly finished, and far from being all occupied, gives a mournful aspect to the city. If ever speculation has run riot in this world it certainly has done so in Rome, to the detriment of every interest that was concerned. But while so much must be said in a very lugubrious strain, there is an infinitely comic incident that is mingled with it. It is absolutely true that some of these miserable houses of which I have spoken, have never come to completion, and that Ivy, which is ever on the alert to cover up all deformity, has seized on these buildings, and has thrown over them a sort of air of antiquity, and made them respectable in spite of themselves. But did Ivy ever have to fulfil such an office before? It has given a sort of stamp of age to the erections of yesterday, which are modern in every sense of the word; they have actually become ruins before they have been anything else. But if these lamentable rows of ill-finished houses offend and sadden you, there is one great shock which goes beyond all others, and which completely beggars description in the sight of the Colosseum in its present abject and dishonoured condition, it used to be so touchingly beautiful; indeed, "shock" is no word for the mental surprise and the feelings of keen regret when the well-known spot is revisited. "The vegetation has been torn away from the Colosseum." I could hardly believe my eyes when I saw the very same object which used to have such a tender and pathetic appearance, now standing up against the sky, gaunt, naked, and even cruel in the sort of demeanour which it has—I use the last adjective with intent, as it so graphically describes the present harsh condition of the Colosseum, and one now realises (as you could not under the old state of things) the barbarous use for which the building was originally intended. It is this aspect of savagery which offends one so dreadfully, its very worst side is put foremost, and all the hallowing associations, the ennobling victories of faith of which it was the scene, are forgotten entirely; the plants and the trees, the shrubs and the Ferns, which used to live there so lovingly and thrive in such delicious abundance, were serviceable not only for their own intrinsic beauty, but they threw as it were a veil over the dreadful deeds of the past, and the events came down to you in such a softened way, you could bear to think of them. But all that is altered. The Colosseum seems now to say—and as far as it goes, it says nothing else at all—here bloodshed in ten thousand instances was rife, here tyranny went to every imaginable excess, and these bare walls, as they are crumbling into dust, record some of the vilest usages of mankind. Of beauty, as beauty, there is very little left to discover; and a writer in the *Times* only a very short time ago, though he used an unpleasant simile, was not at all going too far when he said that the Colosseum of Rome "looks at present like a great decayed tooth, both in form and in colouring." It may be added to this, that it is suggestive of a fang in the uses to which it was applied. I sometimes wonder what Lord Byron would say if it were given to him to behold the object which he loved so well. I know what he would not say: "A noble wreck in ruinous perfection."

Years ago, when I last spent a winter in Rome, I well remember the interest which was taken in the flora of the Colosseum. One of the English physicians in residence here worked it up well, and Dr. Deakin's little book was of great use to all who cared for it. Now that book is all but forgotten in the place, and I could only get a sight of it again after a great deal of trouble by the kind assistance of the Vice-Consul, who gave me an introduction to the authorities of the Collegio Romano, where an old copy was disinterred. Dr. Deakin in his lifetime was worried by the premonitory symptoms of the flood of vandalism which was so soon to set in; but he never thought how far it would rise, for he says in his preface to the *Flora of the Colosseum of Rome*, May, 1855: "The collection of the plants and the species noted has been made for some years, but since that time many of the plants have been destroyed by the alterations and restorations that have been made in the ruins—a circumstance that cannot but be lamented. To prevent a further falling is most desirable; but to carry the restorations and the brushing and cleaning to the extent to which it has been subjected, instead of leaving it in its wild and solemn grandeur, is to destroy the impression and salutary lesson which so magnificent a ruin is calculated to make upon the mind." These words now read almost as if they were prophetic; but they are left far behind in the wholesale destruction that has ensued. It would be enough to make Dr. Deakin turn in his grave if he could now see things as they really are.

Of course, there might have been some consolation in the thought that an imperious necessity had brought all this about; but even this is denied to us. It is gravely asserted by competent persons (see p. 17 of *Walks in Rome*, by Augustus Hare), that so much harm accrued to the building by the ruthless manner in which the plants and shrubs were exterminated, that a like deterioration would not have occurred in 500 years if they had been left to themselves. No discrimination of any sort was displayed, and tender flowers, as much as strongly-rooting shrubs, were alike torn up and destroyed.

The Colosseum of Rome is a grand place in its capacity for embracing the most varied vegetation. It is, I believe, a fact, that there are 6 or 7 acres available in it for the cultivation of shrubs and plants, though it does not look so to the eye—or, at any rate, to my eyes. Dr. Deakin gives that as the estimate; and I asked his successor, in the way of interest in the Flora of the Colosseum—Mr. Dwight Benton—of whom more anon, what he thought on this point, and he said that he endorsed the assertion, for if all the available places, the steps and the corridors, the walls and the passages, were spread out upon a level, they would amount to nothing less. But these 6 or 7 acres are arranged so that the idiosyncrasies of all sorts and kinds of plants are provided for. Variety is predominant; and not only is it the case that there are innumerable nooks and corners where the rays of the sun can hardly penetrate, but high up in the walls there are cracks and crevices which are exposed to the fiercest blaze that could be imagined, and between these two there are all sorts of gradations and differences, so that if a plant were ill at ease in one situation, it soon found out another, where it got all that it could desire. And in the case of some few plants which can manage to live anywhere, such as the common Speedwell, there seems to be a kind of difference of habit which they have assumed, according to the elevation at which they grow, or the low-lying spot in which they have found a home. Dryness and wetness, a thin or a deep soil, exposure to the winds of Heaven, or a delicious shelter in many a favoured nook, heat and cold, all these, and other considerations, I should imagine, have made the Colosseum to be the finest "Linnæa" in the world, for it might be a chosen home for some of the most beautiful shrubs and plants that could be named. It is a fact that in Dr. Deakin's time no fewer than 420 different species were here congregated together. Now, if twenty of these, which were rather strong-growing, such as Figs, Olives, and Cherry-trees, had been condemned, at least 400 might have been left unmolested to live on, and would have done no harm whatsoever.

That some idea may be given of the floral treasures of which the Colosseum was full, let the few following names be taken at random out of many others. Here were found Anemone hortensis, Geum urbanum, Dianthus prolifer, Viola odorata, Vicia cracca, Cyclamen hederæfolium, Arabis, Draba, Cheiranthus cheiri, Rosa sempervirens, Cistus salvifolius, Phytolacca decandra, Trichonema columnæ, Adiantum capillus veneris, Lonicera Caprifolium, Papaver dubium, Acanthus mollis, Lathyrus Aphaca, Ferula communis, Capparis spinosa, and very many others which equally deserve to be mentioned. The Colosseum seemed to focus a large proportion of the flowers of Italy, and what was rather strange was that some things were to be seen growing there which are not enumerated in the *Flora Romana*. How they got there is rather a puzzle, unless human agency was employed; but in one way and another, by the birds, by the winds, it may have been in some cases by the intentional scattering of seed, there was a delightful collection of things brought here which held its own, and by the selection of the fittest, covered those old walls with a drapery that brought grace to the ravages of Time, and charmed away some of the most dreadful memories of which the place is full. All this is at an end, the place looks utterly denuded, though Mr. Dwight Benton has been able, after long searching, to put his hand on about 200 different specimens of the glories of the past which are still growing here and there in some unnoticed spots. *Henry Ewbank.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT FREELAND, PERTHSHIRE, N.B.

THE princely estate of C. L. Wood, Esq., is situated some four miles south of Perth. Every department of gardening is well carried out there, and Orchids are cultivated with conspicuous success. I have visited the gardens occasionally for many years, and have watched the growth of several species with great interest. Fig. 22 represents a specimen of Odontoglossum crispum that had thirteen spikes of bloom. A plant of O. Pescatorei also had 200 flowers, and is shown in fig. 23. In no other collections do the Odontoglossums succeed better. I have seen hundreds of spikes of bloom at one time, and they are generally arranged in a span-roofed house, interspersed with specimens of the best Masdevallias, and so they make a fine display, as may be seen on reference to fig. 24. Other species of Orchids, such as Cattleyas, Lælias, Cypripediums, Dendrobiums, Oncidiums, Vandas, Aërides, &c., also succeed admirably. Many dozens of grand Orchid flowers have been sent from this collection to adorn the Queen's table at Perth Station Hotel when Her Majesty has been dining there. Mr. William Sharp, the head gardener, has had full charge of the collection for many years. *A. Outram, Fulham.*

CYPRIPEDIUM × LUCIENIANUM.

This undoubtedly pretty hybrid has always been looked upon as a sort of puzzle. When Messrs. Linden originally named it, and published some remarks on it in the *Journal des Orchidées*, its parentage was presumed to be between C. villosum and C. × œnanthum superbum, and that hypothesis has been considered correct by experts in this country, although there were not wanting some who thought that the firm substance of the flowers, and some other peculiarities, rendered it possible that it might be a C. bellatulum cross, the lack of traces of that species in the progeny being due to the strong individuality of C. villosum, being exercised as it is generally in crosses with Zygopetalum Mackayi. This view was strengthened by the fact that the raiser always maintained that it resulted from C. villosum × C. bellatulum. The question is again raised by J. Leemann, Esq., the owner of that fine collection of Orchids at West Bank House, Heaton Mersey, who sends a flower closely approaching that of C. × Lucienianum, figured in *Lindenia*, viii., t. 362.

Mr. Leemann, in his letter, says :—"The plant, of which I send you a flower, together with four more seedlings of the same batch of hybrids, has been raised in this country, and the vendor and raiser, from whom I got these plants only quite recently, is most positive in his assertion that C. bellatulum, and not C. œnanthum, is the pollen-parent. Out of my five plants three were in flower when I bought them. All were fine, though different from each other in some degree."

The flower sent may be likened to a very large C. villosum in its general form, but with much larger dorsal sepal, the base of which is greenish-yellow, with many heavily marked lines of dark purple spots, which change their hue to rose-crimson as they spread over the broad pure-white margin. The petals and lip are whitish-yellow, tinged with purple, and the whole surface of the flower is very glossy. The staminode, which I have compared with forms of C. villosum and C. Boxalli, seem to be but little different from that of the typical C. villosum, viz., large, fleshy, and yellow, with a raised green-tipped keel from the centre to the front. This is what one would expect if C. × œnanthum superbum (Harrisianum × insigne Maulei) were one of the parents, as through C. × Harrisianum it receives a second infusion of C. villosum, and in C. insigne the staminode is of a similar form. Following this line, Hansen, in his *Hybrid Orchids*, suggests that C. × Lucienianum is a form of C. × nitens, which it is not. Perhaps some reader may give evidence on the knotty point. *James O'Brien.*

CALADIUMS.

OF late years the Caladium has become more extensively cultivated, and is accepted as a useful and handsome plant, serviceable alike as a specimen in the stove, and as a decorative plant for use in dwelling-rooms. The excellent groups of these plants exhibited at the great shows of the Royal Horticultural Society in the Temple Gardens, and at the principal exhibitions in the provinces, have, doubtless, contributed largely to the increased desire for new varieties, which is likely to continue so long as raisers meet with anything like the success that has attended their efforts during the past few years.

In making a selection of the best of the introductions of late years, I would mention the varieties Lady Northcote, Pantia Ralli, Sir Oswald Moseley, Marquis of Camden, Mrs. McLeod, Lord Penrhyn, Ladas, Silver Cloud, Lord Rosebery, J. Pierpont Morgan, and Her Majesty. These are possessed of leaves of infinitely finer and more delicate markings than many of the older forms ; and after a year or two, when the severe strain of excessive propagation upon their constitutions has been overcome, they will, I believe, be found to be thoroughly fit for the purposes named above, provided the plants are properly prepared before they are subjected to the unfavourable conditions inseparably connected with any system of indoor furnishing. The varieties Mrs. H. Veitch, Louis A. Van Houtte, Michel Buchner, Gaston Chandon, Charlemagne, Madame Alfred Magne, Gaspard Crayer, Lymington, Golden Queen, Gerard Dow, candidum, and Isis, form a dozen of the older sorts, sufficiently diverse in character to form the nucleus of a collection, and their constitution is too well known to need speaking to here.

If it be contemplated to form a collection of Caladiums, the present is the best time in which to purchase the plants, as dormant bulbs can be secured at a slightly lower figure than later, when they have been potted up. They will need to be potted as soon as they are received from the nursery.

A light compost, such as would be formed of leaf-soil, loam, peat, and sand, in equal parts, I find to be best at this stage. This should be passed through a ¼-inch sieve. If a bulb has several crowns, and it is desired to increase the stock, cut out the single crowns and rub the wounds thus made well over with charcoal-dust, to arrest bleeding and prevent decay. A close case is essential to a successful start, especially if the tubers have been severely divided. If bottom-heat be also available, then by all means use it, as this will facilitate growth, and a good start thus given the plants is noticeable throughout the season.

After a fortnight the strongest varieties will have made sufficient growth to admit of their being removed to the stage, thus making room for others of the many plants that require a close atmosphere at this season. Thumb-pots having been used in the first instance, a shift into 48's (4½ inch) pots should be given as soon as the plants require it. Provide abundant and carefully-laid drainage, and use clean pots. The soil for this second potting should consist of fibrous loam and peat in equal parts, to which a portion of horse-droppings, sand, and charcoal should be added, and thoroughly mixed. Moderately firm potting must be practised if the best results are to be obtained. A slight spraying amongst the pots with the syringe should be used in place of the water-pot for a few days, but when water is given the roots, let it be in a tepid condition, and apply sufficient to saturate the whole of the soil and roots. A temperature of 65° to 70° by day during January and February will be a safe figure of heat in which to keep the plants, and 5° more may advantageously be added in March. A further shift will in most cases become necessary during the season, but no potting should be done after the middle of July, as growth becomes slow after this date.

At no time should the foliage be sprayed or syringed overhead. Such a practice very soon disfigures the leaves, and in the case of many of the finer leaved kinds, it destroys the leaves entirely. Abundant atmospheric moisture is, nevertheless, absolutely essential to high culture. This may be brought about by spraying amongst the pots, paths, and any such surfaces. When damping down the houses for the night, I have found a spraying of weak liquid manure beneficial, but this can only be done when the houses in which the plants are cultivated are situated at a distance from the mansion. Weak farmyard manure-water, with a very slight amount of soot added, makes an excellent tonic when the plants are in need of such, and the pots are well charged with roots. Clay's Fertiliser used about once fortnightly is also to be recommended at the rate of a teaspoonful to a 48 (or 4½-inch) pot. The plants delight in copious supplies of water when growing freely, but as soon as it is observed that growth is less quick than formerly, great care in its application is necessary; and as the plants show signs of going to rest, the supply must be materially decreased. It is well, however, to still maintain a brisk temperature, as otherwise damping may set in, and effect much damage before it is noticed. As soon as the leaves are in a sufficiently ripened state to be removed, the pots should be laid on their sides in the stove in a site free from drip, in which position they may remain ; during winter they may be shaken out and placed in pots containing dry sand and cocoa-nut-fibre refuse. *J. F. McLeod.*

GARDENING IN THE CHANNEL ISLES.

GUERNSEY.—In the gardens of Captain Corre, Rohais, I found many rare and choice plants and shrubs of unusual size, existing without any protection whatever. Many had been planted in spots suitable to their requirements, indicating in the possessor a knowledge of the needs and peculiarities of the respective subjects. Now after some years, the freedom and vigour of the whole of them are very marked. Here were choice species of Bamboo, some of great size and height ; B. Simoni is 20 feet high, in immense beds and clusters ; Dracæna indivisa, that must have been fine trees previous to being cut down by the severe winter, three years ago last March, the stem as shown by the old stump must have been 4 to 5 feet in girth, and from this base numerous young plants, in some cases ten to twenty, have shot out, which are already 8 to 10 feet in height. Many such clumps may be seen about the ground, and one could not help feeling sorrow that such fine trees should have been killed by the 17° of frost experienced. Pavia macrostachya is a big shrub with numerous spikes of flowers similar to those of the Horse-Chestnut ; Magnolia grandiflora is represented by trees 35 feet high, covered at the time of my visit with its massive white flowers ; Erica hyemalis grows here to a height of 20 feet ; Edwardsia grandiflora attains a height of 20 feet ; a noble pair of Chamærops excelsa, that have stood out many years, and whose stems and crown of leaves are of a most robust character. These plants are about 20 feet high, and quite in keeping with their neighbours. Close by a clump of Helianthus autumnalis superba, 5 feet high, was covered with yellow flowers ; Aralia Sieboldi, represented by a large specimen in flower ; and in close proximity were Spiræa Lindleyana and S. ariæfolia. The purple bracts and flowers of Leycesteria formosa were arching over fine clumps of the Belladonna Lilies, and adjoining were bushes of Azalea indica alba, and of numerous Ericas.

In a rockery close by, which extends some length, was discovered a choice collection of hardy Ferns, as the term is usually understood ; but amongst them were many that often receive intermediate-house and stove treatment. As samples, I may mention Lomaria nuda, Drynaria pustulata and Billardieri, Lomaria chilensis, and Woodwardia radicans, whose pendent fronds imparted an air of singular attractiveness. Rambling over the rocks were masses of Pteris scaberula, and plants of Polypodium vulgare cambricum were very abundant; Beschoneria yuccoides had produced a spike 8 feet long, and already several young plants have pushed up at the side of the base of the flowering crown, which will soon die away. Adjoining these were numerous Retinosporas of large size and intensiveness of leaf colour; and Arundo conspicua had grown to very large dimensions, for there were just fifty plumes waved in the breeze.

In the herbaceous borders I notice fine clumps of Lobelia cardinalis Fire King, the flowers intensely brilliant in the strong sunshine. Watsonias in variety had been very full of flower, whilst of Gladiolus the spikes and flowers were especially fine. Beds of Tigridias next came into view, these plants being in thorough keeping with other bulbs already mentioned. Fine Palms, Dracænas, Eucalyptus, met one at almost every turn, and coming o the end of the rockwork again we observed many of the choice varieties of Athyrium f. fœmina, as well as the better kinds of Lastræa filixmas. Truly, a lovely and interesting spot.

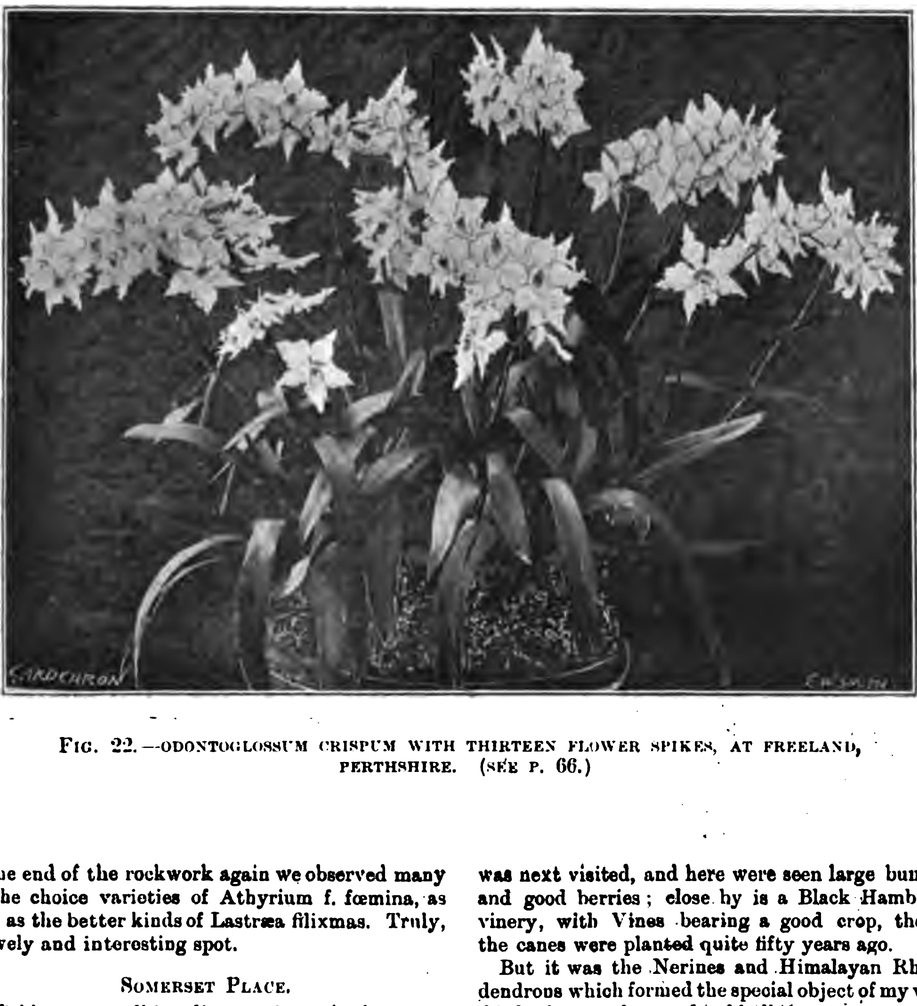

FIG. 22.—ODONTOGLOSSUM CRISPUM WITH THIRTEEN FLOWER SPIKES, AT FREELAND, PERTHSHIRE. (SEE P. 66.)

SOMERSET PLACE.

Within easy walking distance from the foregoing is the residence of J. L. Mansell, Esq., whose house, covered densely with Ampelopsis Veitchi, was just then very attractive. Here Mr. J. Marsham is the head gardener. The garden is of medium size, and tastefully laid out, and it was so completely planted and cropped in every portion that much more may be seen here in the small area than on many gardens of twice the size. There are arches over the paths in several parts of the kitchen-garden, and very beautiful they are covered with climbers in bloom, and so numerous are the flowering plants in this portion, that it almost seems like growing fruits and vegetables in broad herbaceous borders.

On some of the arches, plants of Solanum Jasminoides form very dense growth, and flower freely, on another the orange-scarlet flowers of Bignonia radicans covered the entire top of the arch. This was a very interesting object, and to be informed that this plant had stood 17° of frost, when the upper part was all killed, but that it broke very freely again from the root, was a piece of information such as is seldom obtained. Another archway was clothed with Mina lobata. These plants were sown in March last, and planted out in May; they certainly have grown well, for their quaint yet pretty flowers appear all over the archway. Beds of Phlox Drummondi, of Zinnias, Marigolds, Asters, &c., were very fine, the colours of the flowers intense. Ceanothus azureus and C. Veitchi planted against the walls were flowering beautifully; Kerria japonica, Cotoneaster horizontalis, also on walls, was densely covered with its small scarlet berries; the white varieties of Nerium Oleander Madame le Grand, purpurata striata, rose-coloured; and aurantiacum, yellow, were represented by nice plants.

A capital vinery planted with Muscat Grapes was next visited, and here were seen large bunches and good berries; close by is a Black Hamburgh vinery, with Vines bearing a good crop, though the canes were planted quite fifty years ago.

But it was the Nerines and Himalayan Rhododendrons which formed the special object of my visit. Of the former thousands of bulbs are grown, among them being a large number of hybrids raised on the place. Some of the plants were already in flower, but the larger proportion were just beginning to push up their flower-spikes. Many of these plants had not been repotted for years, and the bulbs as they are formed, and yearly increase in size, were clustered above those of the previous years. N. Manseli has been grown here for thirty years, and is now represented by many plants. N. Correi, a cross between Fothergilli and Sarniensis; and other named sorts are N. Plauti, N. coruscans major, N. atrosanguinea, N. flexuosa, N. Moorei, N. Cammi, N. cœrulea, N. amabilis, N. pudica, and N. Elwesii. These with the hybrids now coming on will make a glorious show in a short time. The intense beauty of many of these I could gather from pictures painted by Mr. W. Caparn, who kindly showed me a large collection of them. He also showed pictures of choice Daffodils grown on the island. That these Nerines are beautiful objects for conservatory and house decoration is generally accepted, and the many forms grown are of especial interest. Magnificent Cannas were growing in a large glass-house close by, with large plants of the blue and white Campanula pyramidalis, 6 feet high, with from twenty-four to thirty stems apiece.

Daffodils in quantities, and of choice varieties, were planted, for here as at many other places it is necessary that the best only be grown, and plenty of them. Montbretias are grown in large beds, and spikes by the hundred are continually cut from them. On entering a stove-house close by, I noticed the roof was covered with several climbers; among them, Aristolochia elegans was flowering, with its singular purple-spotted, trumpet-shaped flower; Bougainvillea glabra, Allamanda Hendersoni, Thunbergia fragrans, and T. grandiflora—the beauty of these latter ones is very great, their pale sky-blue flowers were very numerous, and of large size.

The Rhododendrons are planted in a different part of the gardens, and are pictures of health; in the early summer they had been objects of beauty. A plant of A. Falconeri was some 6 feet high, with large leaves, and bearing creamy-white flowers, which come densely placed in globose heads; R. Shilsoni, not yet flowered; Mrs. Butler, pale pink, and with fragrant blooms; fragrantissimum, white; barbatum, scarlet; argenteum, full of buds; campylocarpum, yellow, a most beautiful and distinct variety; Princess Alice, white flowers, a grand plant; Thompsoni, deep red and glossy; Aucklandi, having immense white flowers, tinged with pink, and spots of a darker colour; calophyllum, white, tinged with yellow; Countess of Haddington, a large plant full of vigour, flowers rosy-pink; Assamicum, and others, all in most remarkable health and vigour, being dense bushes 5 and 6 feet high.

Near by was a fine plant of Magnolia conspicua, which in the early spring had been full of flowers. The Dracænas, Chamærops, and other sub-tropical plants in the borders surrounding the flower-garden, added a singular charm to the place, and this and every other portion was in good keeping, and reflected great care and diligence on the part of the gardener. *W. Swan.*

THE BULB GARDEN.

MUSCARI RACEMOSUM CARNEUM.

This variety of the large, deep-coloured Grape Hyacinth is well deserving of the notice of those who care for this pretty class of plants. It comes, so far as the writer is aware, nearer a true pink colour than any other Muscari. The variety of M. botryoides named carneum is very much lighter than this, and is altogether a less "effective" plant, if we may use such a term regarding these modest flowers. I believe it originated in the garden of Messrs. Dammann & Co., of San Giovanni à Teduccio, Italy, from whom I had it several years ago. I afterwards lost it, and two years ago, when I ordered it elsewhere, the common deep blue M. racemosum was sent. I hope, however, that I have now obtained the true pink variety.

SCILLA LILIO-HYACINTHUS ALBA.

Some years ago, Mr. William B. Boyd, of Faldonside, Melrose, sent me a bulb of this Squill, informing me at the same time that it was very rare. Mr. Boyd also stated that he had found it in an old garden in Berwickshire. Before it flowered, in going through an interesting old garden in the Stewartry of Kirkcudbright, I came upon some clumps in bloom. When the bulb got from Mr. Boyd flowered, it proved to be the same as those in the Kirkcudbrightshire garden. The typical blue Scilla Lilio-hyacinthus is not a particularly desirable plant, and one would be inclined to say that the white variety is inferior to the white varieties of Scilla campanulata. Its rarity is, however, a consideration; and it is, upon the whole, a desirable plant to have in a collection of Squills. Its broad leaves and scaly bulbs make it very distinct from other species. S. Lilio-hyacinthus albus was known to Miller, who also mentions a red variety, which I would like to meet with. He also suggests raising this Squill, known to him as Lilio-hyacinthus—the Lily Hyacinth—from seeds, in order to obtain varieties.

SCILLA ITALICA ALBA.

Through seeing this rare variety of the Italian Squill in Maund's *Botanic Garden*, the writer has been induced to try to obtain it, and has, through the kindness of a correspondent, been able to do so at length. The type, which, by the way, never seeds in my garden, is not sufficiently well-known by bulb-growers. It is quite hardy, and increases fairly rapidly. The variety under notice is not so effective perhaps, but it is yet pleasing enough to be prized. Maund tells us that he owed both the varieties to the Rev. W. Bree, of Allesley.

A few years ago, a Dutch bulb-grower, from whom one can often obtain out-of-the-way plants, offered S. italica alba in his catalogue. I succeeded in obtaining a bulb, but lost it soon after, probably owing to the border in which it was planted being too dry. It was not again offered, and for some time I was without it. Through the kindness of a well-known lady gardener in Surrey, and that of a Suffolk gentleman, I have not only again been successful in obtaining this Scilla, but I have also ascertained that their stock came from the garden of the late Rev. John Nelson, of Aldborough. The latter, from whose garden have come so many interesting things, told one of my correspondents that this white Scilla was "unique." It does not appear to have become more plentiful since that time—some fifteen years ago. I am told, however, that it is not difficult to grow, and as the type does well, one is in hope that this plant, so long coveted, may grow as satisfactorily in a similar place. There is no reason why a pink or flesh-coloured variety of Scilla italica should not be in existence as well. *S. Arnott, Carsethorn, near Dumfries, N.B.*

DUNS CASTLE.

(Continued from p. 49.)

THE approaches to the Castle from the town are by two avenues—the north and the south—and here again the timber which has made the estate famous throughout the south of Scotland, attracts the attention. The south approach is about a mile in length, and is through an avenue of magnificent Beeches which effectually screen the building, until a graceful and natural sweep brings the visitor in full view of the structure. The north approach is not quite so long, and here again, on nearing the Castle, a stately avenue is passed through—this time of Limes. Of this avenue more than a passing word must be said.

On October 14, 1881, a terrible gale swept the south-east coast of Scotland, resulting in an appalling loss of life to the dwellers in the villages engaged in the herring fishing in these parts, and, sweeping across the country, did irrevocable damage to woodland and property. Exposed to the fury of this hurricane, the avenue under note—then a veritable bower, the branches meeting overhead from end to end—suffered severely, many mighty monarchs being then uprooted and laid side by side. At the end next the Castle, on one side, for almost half the length of the avenue, not a tree was left standing, and the spectacle presented when the fury of the gale was expended was indeed a pitiable one. The late Mr. H. J. Hay, a most enthusiastic arboriculturist, was in despair at the ruin of one of the most beautiful features of his estate, but determined if possible to raise the trees, and so in some measure repair the havoc wrought. Experts were of opinion that, with trees of such age, the experiment was hopeless; but, nothing daunted, the idea was entertained and persevered in, and after considerable thought, a machine was constructed by which the trees could again be set on end, and it but remained to decide on what was the best treatment to ensure their recovery when again perpendicular. Large limbs were removed almost close to the trunk, the roots were carefully trimmed, and large circular holes taken out for the reception of the ball of the tree, on which was retained as much of the soil as possible. Into these holes—and herein doubtless lies the crux of the success of the whole matter—a large quantity of rich prepared soil was put, and into this the roots immediately struck with great vigour and freedom. So successful was the treatment accorded the fallen monarchs, that of all those raised not one succumbed, but they continue to flourish, and are now, after seventeen years, as healthy and vigorous as the remainder of their more fortunate brethren. To secure the trees against future storms three stout wires were attached to each, some 6 feet from their summit, and these wires were carried down and secured to stout posts driven into the ground at equal distances from each other, some 15 or 18 yards from the base of the tree. From whatever direction the wind might be blowing, therefore, a restraining influence was exerted on the trees, and "a threefold cord is not easily broken." The operations excited much interest at the time amongst arboriculturists, and many experts visited the estate whilst the work was being carried out.

At the back of the Castle, reaching up to the Lammermoor Hills, stretch hundreds of acres of woods, which, under the management of Mr. Skeldon, the head forester, are in excellent condition, and the estate of Duns Castle presents to the thoughtful mind an instructive lesson in the successful management of woods and forests.

Through the courtesy and generosity of the proprietor, Mr. R. M. Hay, the public are allowed to ramble through the grounds at will, after having provided themselves with a pass, which may be obtained on application at the estate offices in the town; and let us hope that the day of the birth of that vandal or those vandals be far distant, who shall by their conduct deprive the public of a privilege which is so much appreciated, alike by dwellers in the district and visitors from afar. *A. A.*

FLORISTS' FLOWERS.

AURICULAS.

THE Auriculas, owing to the mildness of the weather hitherto, have been more or less active, and in another month the blooms will begin to open, unless February proves more wintry than January; and when a little artificial warmth is applied growth is quicker.

As the exhibition of the National Auricula Society is fixed for so early a date as April 18, and further, as there is much probability of a cold spring retarding the blooming season when the grower depends on cool treatment, those who can apply heat to assist in the expansion of the pips should not fail to use it.

When the plants commence to grow, the leaves, which during the winter formed a kind of hard knot, curl backwards, and enlarging, take on an intense light green or snow-white mealy foliage. Then the plants should be afforded water more or less in amount according to the state of growth, and none should be kept dry, nor, on the other hand, should they be kept wet. Air without cold draughts is necessary, and also full exposure to sunshine, and top-dressing the plants with fresh soil. This was a time-honoured practice, but it is not as much followed as it was; still, it may be necessary in certain cases, such as when roots show at the surface. The pots should be cleaned, and the drainage of each examined.

When March opens, if the weather be genial the growth of this plant will be rapid, and in the course of that month most of the flower-heads will be visible, and a few early varieties will be almost in full flower. Much, however, will depend upon the temperature maintained in the house. No grower attempts to force his plants; it simply means the keeping of a genial temperature, and it is usual to afford a little fire-heat when spring growth has set in. *R. D.*

HOLLYHOCKS.

Directly the seedlings of the Hollyhock appear above ground, the pots should be placed on a shelf near the glass, and when they have emerged into the rough leaf they must be inured to cooler conditions. The choice varieties are mostly increased by cuttings, and to do this readily the stools should be afforded a temperature of 50° by night, and 60° by day. As soon as the shoots are long enough, that is, about 3 inches, remove them off with a heel of older growth, and place each singly in a small pot in light sandy soil, with a pinch of sharp sand at the base. Afford water, and after plunging the pots in a bottom-heat of 70°, cover the cuttings with a hand-light or big bell-glass. Much care must be exercised in preventing damping, by removing condensed moisture from the glass, and water should be sparingly used.

TUBEROUS-ROOTED BEGONIAS.

Whether for pot-culture or bedding, these plants should have attention forthwith. Such really good flowers are now obtainable from seed of both double and single varieties, that it is scarcely necessary to keep up a named collection. The present time is very suitable for sowing seed. Let a sufficient number of well-drained 5-inch pots, or small seed-pans, be filled with finely-sifted fresh sandy soil; press this firmly, and afford a plenteous watering, covering the surface with sand, and proceed to sow the seed thinly and evenly, and place the seeds in a house having a warmth of 65° or 70°. Let each pot or pan be covered closely with a piece of glass. A gentle hot-bed in which to half-plunge the pots will hasten germination. The seedlings through the soil, remove the glass and stand the pots on a shelf in a warm house near the glass. As soon as any of the seedlings can be handled, prick these out into 4-inch pots, in a compost of half loam, leaf-mould, and sand. Form a slight mound with the soil in the centre of the pot, which is a capital preventive of damping, a malady the tiny seedlings are prone to during the earliest stages of growth. In removing the fit do not disturb the unfit. The seed-pots and pricked-off plants should be afforded water by dipping. Seedlings raised thus early begin to flower in June, and continue until the autumn.

THE CULTIVATION OF FREESIAS.

THERE is probably no winter or early-spring flowering bulbous plant more generally beloved than the Freesia. The flowers are pretty, deliciously fragrant, and owing to their erect, stiff stems, are very useful when cut. The plants are equally ornamental as specimens in pots. Though many gardeners cultivate them with success annually, we have many times known them to occasion some little trouble. The following hints upon the culture of Freesias we have extracted from a paper upon the subject, delivered by Mr. G. Carpenter, West Hall Gardens, Byfleet, before a meeting of the Woking Horticultural Society.

"Freesias may be cultivated from seeds. The seeds should be sown during August or September, and those sown in August may possibly flower the following spring. If the seeds be produced at home, sow them as soon as they are ripe. When once a stock has been obtained, it will not be necessary to obtain a fresh supply of seeds or bulbs each year. The seeds should be sown thinly in sandy loam and leaf-mould, in order to avoid the necessity for transplantation. The pots or pans should be placed in some sunny position in a cold frame, and as soon as the young plants appear, tilt the back of the frame to admit fresh air. The seedling plants should be thinned out to eight or nine in each 5-inch pot, and when once established afford them plenty of air to induce a sturdy growth. Shade the frame slightly during the hottest part of the day. When the plants have filled the pots with roots, they will require a good supply of water, and a little liquid-manure occasionally will be beneficial. The supply of water will need to be decreased gradually as soon as the plants show signs of resting. The most important detail in Freesia growing is to obtain a thorough ripening of the bulbs. In too many cases, when the flowers have passed, or have been cut, the plants are cast into an out-of-the-way corner, and neglected. Such practice means failure next season. When the foliage has become quite yellow, place the pots on a shelf in a vinery or in some other position facing south, where they will receive full sunshine. Have no fear that they will become over-ripened. Later, when the bulbs have ripened as much as they are likely to do, turn them out and sort them into three different sizes. Store them in a cool, dry place until required again for potting-up. Those which have been grown from seed will be found to include some of very good size.

"The next stage in their cultivation will be to repot them. This must be done at intervals, so that they may flower in succession. When once Freesias have been potted, it will be found difficult either to hurry or retard them to an appreciable extent. The first batch may be potted-up during August, and the next a fortnight or three weeks later, and so on. The largest bulbs should be put at the rate of six or seven into 5-inch pots, and those of the second size at the rate of nine or ten bulbs. But the smallest may be put thinly in pots or pans, to be grown on as the seedlings were, and they will produce good bulbs for flowering the next year.

"The best soil to use at this time of potting is composed of sandy-loam, leaf-mould, and well-decayed manure; the two first-named ingredients in equal parts. The bulbs will not require any water until growth has commenced, and a frame from which frost is excluded, or a shelf in a cool-house will afford the most suitable place for them. In a light position, with plenty of air during mild weather, they will thrive well. When the flowers appear, a little more heat may be given to a portion of the first batch, and the others will form a succession. In this way each of the batches I have mentioned previously may be again divided.

"The extra heat must be applied with great care. If too much be given, the plant will become spindly, and the flowers when cut and placed in water will soon fade. Freesias are naturally weak-growing plants, and should be supported by neat stakes before they can fall over. If they be permitted to fall about, they soon turn their heads up to the light again, and crooked stems are the result.

"The foliage of the Freesia is very delicate, and will not permit of strong fumigation, even with XL-All Vaporiser. The ill effect may not be noticed at the time, but will be seen a few days later, when the leaves turn yellow at the tips. The plants had better be kept clean by spraying and syringing with XL Liquid Insecticide, one of the best and safest insecticides of which I know."

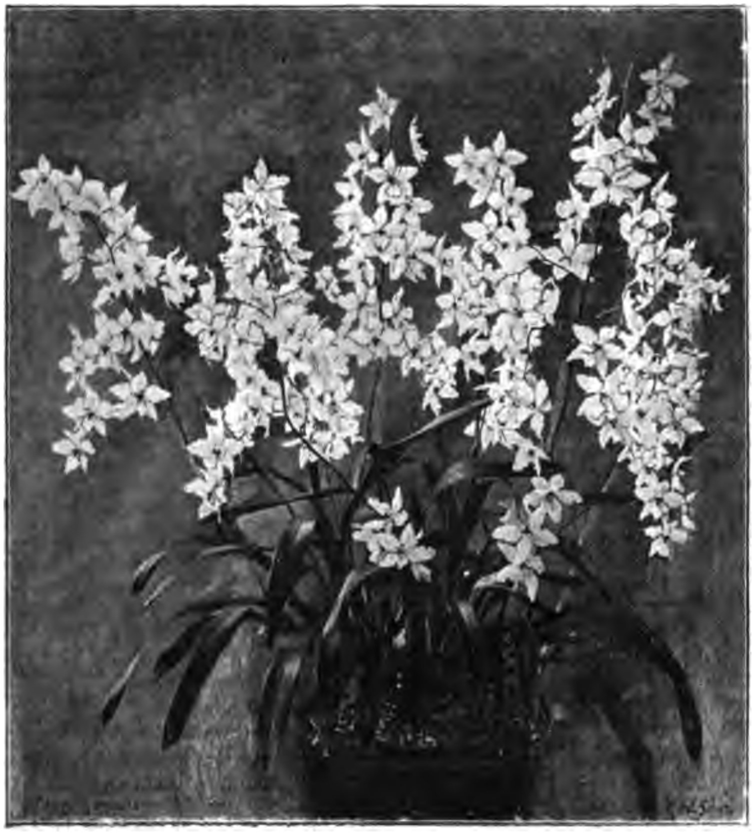

FIG. 23.—ODONTOGLOSSUM PESCATOREI WITH TWO HUNDRED BLOSSOMS AT FREELAND, FORGANDENNY. (SEE P. 66.)

LILAC FORCING IN GERMANY.

IN general, there is to be remarked considerable progress and improvement, together with an increase in the business of Lilac forcing in the whole of the country in later years; yet in the past season, up to Christmas, there was noticeable a general scarcity of fine-cut Lilac. It is not improbable—indeed, it is quite on the cards—that until the spring the inquiry for cut Lilac bloom, and specially the pure white form of it, will greatly exceed the supply. Not alone is cut bloom lacking in quantity and quality, but flowering Lilac in pots is very scarce in Hamburg, and probably everywhere in the whole of north-western Germany. This scarcity is due, chiefly, to the wet, cold summer of 1897, the like of which has rarely occurred in that region. The summer of 1898 was the exact opposite. The unfavourable weather conditions are certainly responsible for the greater proportion of the failure in this year's forcing, not only in Lilac, but in Hyacinths, Lily of the Valley, &c. Should this mischief gradually disappear as the season advances, and flower-buds in some of the unforced plants and bulbs become more fully developed, it cannot do so, or only partially, in the case of forced Lilac. Such as formed satisfactory flower-shoots, but did not mature, will not give favourable returns; and this is the case with many double-flowered varieties, as Charles X. and Marie Legraye.

The winter of 1898 being mild, and spring weather commencing early, the Lilac plants grew at first quite normally, the young shoots deveveloped gradually, and grew till well into the summer without ceasing and without setting flower-buds. The potting of the plants was, as a consequence, delayed to a later date than usual. Varieties such as Charles X., Marie Legraye, and several others, also double-flowered varieties, formed numerous, or at the least, a sufficient number of flower-buds on plants that had not been cut back too severely; still, owing to the fact that in late summer, while in full growth, it was necessary to afford them water in larger quantities, and for a longer period than usual, it was scarcely possible to get the wood matured. Further, no actual frosty weather, but only night frosts occurred to sufficiently check the flow of the sap.

The Marly Lilac, which begins to grow at an early date, can only be ripened in good time by keeping the soil about the roots very dry, if it is to be used to good effect for autumn and early spring forcing. And it is in this respect that the best forcing Lilacs differ so essentially from each other; for should Charles X. be treated like the Marly in the matter of ripening the wood, the worst results would be sure to follow. Pot-plants of Charles X. and Marie Legraye, which in ordinary years can be very easily and surely forced into flower by the third week in December, were last year very poor, the plants made shoots without expanding the flower-buds; and other plants showed very unsatisfactory development of the flowers and flower-spikes, with small crippled flowers set close together in bunches. The colour was likewise unsatisfactory. Complaints of faulty developmen are common in many parts of the continent. *Herr Fr. Harms in Möller's "Deutsche Gärtner Zeitung."*

CULTURAL MEMORANDA.

PAVETTA BORBONICA

THE usefulness of this plant can scarcely be over-estimated. The chief features of Pavetta are the markings of the leaves, and when grown with a single stem it is very effective as a table-plant, and for decorating generally. The ground-colour of the leaves is dark green, thickly studded with white spots, with a mid-rib of salmon-red. The soil best adapted for its growth is loam and peat, in equal ratio, with a dash of sharp sand. Cuttings should be taken about March, inserted in small pots, and placed in a brisk heat. When sufficiently rooted they should be potted-off, and grown on accordingly. It delights in a strong heat when growing, and well exposed to the sun; if much shaded, the leaves are not so bright and well defined. *P. Bolt, Wentworth Gardens.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.

Acer platanoides (Norway Maple) is a very ornamental tree of vigorous growth, and possesses bold foliage. When planted amongst the dark-leaved Pines, or in the park in the foreground, the greenish-yellow flowers early in the spring are very effective. The varieties A. p. aureo variegatum, leaves yellow and green; A. p. dissectum, deeply cut leaves; A. p. laciniatum (Hawk's-foot Maple), leaves lacerated; A. p. Reichenbachi and A. p. Schwedleri have both rich purple leaves in spring, and those planted as a background to Laburnums make a charming contrast.

Acer Negundo, fine lively green in summer; A. N. variegatum, silver variegation; and A. N. aureum variegatum, stand out boldly amongst the dark green leaves of other shrubs. The whole of these Acers thrive in a good soil of retentive character.

Iris germanica (the German Flag Iris), planted on the edge of shrubbery borders, in beds, in woodland walks, and on the margin of lakes, make a fine show of bloom during the months of May and June. They succeed best in a light sandy soil, enriched with thoroughly rotten leaf-mould and manure. Plant them so that the large fleshy rhizomes will creep upon the surface of the ground. They require but little attention afterwards, simply to keep them free from weeds, and provide them with a slight dressing of old spent Mushroom-manure annually. They may be ordered now, and planted as soon as they arrive. They are now classified into seven groups, viz., Iris germanica, with standards and falls of the same colour; I. g. amœna, standards white, slightly shaded with blue, falls same colours, veined white; I. g. aphylla, standards white, margined with blue and violet, falls similar; I. g. neglecta, very handsome, standards principally of a blue and pine-lavender colour, falls purple, blue, and violet, reticulate, white; I. g. pallida, standards and falls of the same colour; I. g. squalens, standards dull bronzy yellow, tinged with lilac, falls velvety-crimson and yellow. This is by far the handsomest of all the groups.

Abutilons.—Mother-plants of Abutilons, if these plants are used in bedding, should soon be placed in heat so as to afford cuttings, also India-rubber plants. In mild weather clean and air the stock of bedding-plants standing in pits and green-houses; and if mildew has appeared on any of them, do not delay to use flowers-of-sulphur.

Beds of Bulbs alone, and Biennials and Perennials Mixed.—Let the ground be stirred with the hand-fork, and vacancies filled up from the reserve-garden, and as in the case of Carnations, making the plants firm about the collar. If slugs are troublesome, sprinkle quicklime on the soil at sunset, and set traps for them.

Bedding Plants.—Seeds of the tuberous and fibrous-rooted Begonias may now be sown, in order to have strong plants for summer bedding. The seed of these can be purchased in distinct colours. When sowing the seed, carefully crock small pots, fill them with a mixture of finely-sifted loam, leaf-mould and sand, pressing the soil firmly, and sprinkling with a fine-rose watering-pot, then scatter the seed evenly over the surface, and leave uncovered; place a sheet of glass over the pots for protection. If stood in a moist place with a temperature of 65°, the seed will soon germinate. Sow seeds of the dwarf Antirrhinums, Yellow Prince, White Queen, and Crimson; these are excellent plants for bedding.

Alternantheras should be shaken out of the store pots, planted singly in a mixture of loam and leaf-mould, with a bottom-heat of 75°, slightly damped overhead, may soon root freely, and produce plenty of strong cuttings. Heliotropes, Fuchsias, Ivy-leaved Pelargoniums, &c., intended as specimen plants for beds should, if pot-bound, be given a liberal shift, placed in a humid atmosphere, tied neatly to stakes and exposed to light. Any of the flowering Pelargoniums, the leading shoots of which are not required for cuttings, should be pinched-back to make them break and form bushy plants.

Carnations.—The yellow-flowered and yellow-ground varieties that are of too delicate a constitution to withstand frost, but must be wintered in cold frames, should be lifted, and some fresh ashes and a good sprinkling of soot placed under them. This will prevent the ravages of slugs, and sweeten the atmosphere. Afford plenty of air to prevent them growing, and thoroughly harden them off before planting outside. Carnations in the open borders should be made firm in the ground, and any that may be affected by fungoid diseases, should be taken up entirely and burnt.

Hellebores, known as Lenten Lilies, are fast throwing up the flower-spikes; these should be dusted over with a mixture of soot and lime. This will prevent the slugs and mice eating the flowers, and act as a stimulant when washed into the soil by the rain.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

Tomatos.—Strong plants grown from seeds sown in the autumn, and now occupying 6 or 7-inch pots, may be transferred to the pots in which they are to fruit, placing them in a warm house, where there is abundant light. The side-shoots, as they appear, should be removed, and the plants neatly staked. As the flowers open, let these be fertilised daily at an hour when the pollen is quite dry. Fruiting Tomato plants should be afforded manure-water frequently, or top-dressings of bone-meal or other artificial compounds may be substituted. The younger seedlings may be potted as they become fit, and more seeds sown. Challenger, Ham Green Favourite, Duke of York, and Frogmore Selected are excellent varieties for present sowing. Do not sow the seeds thickly, or let the seedlings become crowded, and stand the seed-pans on a shelf near the light in a warm house. The plants should be potted as soon as two or three leaves have been made. In potting Tomatos in this stage, use a light and fairly rich compost broken up into a fine state, and warmed previously to being made use of, chills being very detrimental to the well-being of the plant. Press the soil only moderately firm into the pots, so as to avoid injury to tender stems.

Later Peach-houses should be kept cool, letting them remain open at night as well as by day, this being very essential this mild year, for exposure to some degree of frost will act as a check on growth. The gardener should make every effort to finish the pruning and tying of all the trees in the first week of the present month before the buds move. Though trees in these houses may be dormant, and the buds may not be dropping, the trees will be much weakened if the soil is allowed to get dry, even in the winter.

Melons.—The earliest plants, if not already planted in the hot-beds, should soon be ready for planting, and provision should be made for doing so. A Melon-bed may be made over a heated chamber, or on an ordinary hot-bed. If the first crop is taken from pot-plants, these should likewise be got in readiness. The Melon likes good drainage, and loam of a heavy nature, and nothing more is necessary than a small quantity of lime, mixed with it. It is important that the hillocks, the bed, or the potful of soil, should be made firm at the time of planting, and allowed to get warm before the plants are put out. In planting do not break the root-mass, but press the soil close about it, and let the top of the ball be flush with the surface. Place a neat stake to each plant, reaching to the trellis. Let succession plants be potted or repotted, never letting them get pot-bound, and afford them a place in the fullest sunshine, and as near the glass as possible; therefore, an ordinary frame or brick-pit is the most suitable place for the young plants. Sow seeds at short intervals, using small 4-inch pots, filled with loam and sand, sowing one, or at the most two, seeds in each.

Late Grapes. — The bunches should now be removed from the Vines, with about 6 inches of wood attached, and placed in wine-bottles filled with clear water, and hung up by a bit of string passed round the neck, or stood slantingly on a rack, with the bunches neither touching each other or the bottles in which they are put. Any room in which a cool uniform degree of temperature can be obtained makes a suitable Grape-room. The ordinary fruit-room, unless it be large and dry, does not make the best Grape-room. It is very necessary to examine the bottles at short intervals, and to keep them nearly filled, to remove decaying berries, and to get rid of moisture by keeping quicklime in pails or boxes in the room. Be careful not to let dust enter the room. It is to be feared that Grapes will not keep satisfactorily this year, and a good deal of attention is sure to be required. The earlier that the late Vines are pruned, now that we have entered the second month, the better, no benefit accruing from further delay, and bleeding, the outcome of late pruning, will thus be averted. Keep the late Vines cool till starting time arrives, in the meantime cleaning the Vinery, renovating the borders, and generally following earlier directions for Vines about to be forced.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Souvenir de la Malmaison Carnations.—The strongest of the autumn-struck plants being now well rooted, may be shifted into 5 or 6-inch flower-pots, leaving the weaker and less-rooted plants to be repotted towards the end of the present month. Afford the plants a compost consisting of two parts good loam, neither too retentive nor too light, and one part leaf-soil, adding sufficient silver-sand to keep the whole porous. Afterwards let the plants stand as near the glass as possible, in a greenhouse or cold pit, affording them ventilation pretty freely when there is no frost.

Tree or Winter-flowering Carnations.—In order to have plants for flowering next winter, cuttings or pipings of these should now be inserted. As cuttings, choose young growths which spring from the stems of the old plants, neither too gross nor wiry, detaching them with the fingers, and consequently they will in each case be furnished with a heel, and having removed a few of the lower leaves, they are ready for insertion. As a soil in which to strike them, use three parts loam, one part leaf-soil, and plenty of silver-sand; fill some 4-inch pots with this, pressing it firmly, sprinkle some silver-sand on the surface, and dibble in eight or ten cuttings, taking care that the base of each rests on sand. Having afforded water, place the cutting-pots under a handlight or bell-glass, in a temperature of from 55° to 60°, and daily wipe the moisture from the inside of the bell-glasses. When all the cuttings in each pot have taken root, remove the pots from the cutting-frame to a cooler one, and having hardened them off a little, they may in a few days be potted in 3-inch pots, using this time rather more leaf-soil. When they are well rooted, remove them to a still cooler house or pit.

Fuchsias and Abutilons.—A few old plants of each of these may be placed in heat to provide an early batch of cuttings. Repot autumn-struck plants of the former as fast as the roots take full possession of the soil, and, if the object is to obtain specimen-plants, choose for that purpose plants which show promise of producing side-shoots from the top of the pot upwards. This does away with the necessity of stopping the leader, and allows the plant to attain its full height. Grow on in a house having a temperature of 50° to 55°, and considerable degree of humidity.

Show and Fancy Pelargoniums, and Cinerarias.—Keep a sharp out-look for aphis on these plants, employing Richards' XL-All Liquid upon their first appearance, repeating the operation if necessary till the plants are quite clean. Let these plants be grown in a cool, well-aired greenhouse or greenhouse-pit, affording them a minimum temperature of 45°. The Fancies, if there is the convenience, may be grown in a house slightly warmer. Cinerarias which are throwing up their flower-stems, may be assisted with applications of weak liquid-manure, particularly plants that are in comparatively small pots.

Clerodendron fallax, and Justicias.—As soon as strong cuttings of these plants can be obtained from the old plants started in moist heat, they should be inserted in sandy soil in small pots, and plunged in a propagating-frame. The first-named may also be increased from seed, which should be sown forthwith.

Gloxinias and Tuberous-rooted Begonias.—It is often found that some of the tubers of Gloxinias and Begonias have started prematurely, it is then the best course to shake the old soil from them and repot in quite small pots, and place them in a temperature of 55° to 60°, and later shifting them into larger pots. Such plants become drawn and leggy if they are kept back until the bulk of the plants are started into growth, but treated as described, they make early flowering plants.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener, Dropmore, Maidenhead.

Canker in Apple and Pear-trees.—A good remedy for canker in Apple and Pear-trees that are otherwise healthy, consists of scrubbing the infected parts with a little soft-soap and water, at a temperature of not less than 130°, and when dry applying a dressing of Stockholm-tar and tallow, brushing it well into the cankered parts with a half-worn-out painter's brush. To seven parts of Stockholm-tar add two parts of Russian tallow, and warm in an old saucepan, stirring it well till incorporated. This may be applied without the least injury to the bark at the present season.

The Blackberry.—The treatment accorded the Raspberry will in most particulars suit the Blackberry. Its fruits make an excellent preserve and jelly, and they may be used mixed with Apples in tarts. As with the Raspberry, its canes may be planted during the next few weeks, weather permitting, and thereby many waste spots may be made profitable that would be otherwise waste. The best results are obtained in rather light and stony soil of fair depth, with moist surroundings in the shape of springs or pools; and where such situations are obtainable, the plants may be allowed to grow in a somewhat natural manner, the more so as much pruning and tying is not being adapted to its requirements. There appears to be a good demand for fine Blackberries, as a Buckinghamshire market-grower a short time since assured me he could always find a ready sale for his Blackberries when put up in 1 lb. punnets, at 6*d*. per lb. This grower cultivates either a seedling or selected form of our British variety, Rubus fruticosus, on land similar to that described above. The plants produce long growths, which are allowed to arch over after one tie is afforded to a central stout stake at about 5 feet in height, growths from 12 feet to 15 feet or more being made, the points of which are allowed to bend over and touch the ground, where by pegging them down, roots are quickly formed, and the top furnishes eventually a strong young plant for removal to another position. The old canes are cut away annually, but other than the removal of the rooted points, no shortening of the young growth is permitted, and by this method wonderful crops are obtained. The varieties most grown in gardens are Rubus laciniatus, the Parsley-leaved Bramble, and the American-raised Wilson Junior. Both are strong-growers, and should be given the support of a trellis or stakes, as above, and treated similarly. The Wilson Junior especially should be planted in a warm situation, such as a bank or border sloping to the south. Digging among the plants should not be practised, but a slight surface-stirring and good mulching of rotten manure may now be applied as a winter-dressing.

Protecting the Fig.—In the event of severe frosts occurring, it will be advisable to have some material in readiness for the protection of out-of-door Fig-trees. For this purpose thatched hurdles, or strips of stout wood nailed together and similarly thatched, that may be stood just under the wall-coping to a yard from the wall at the base, will be suitable, to be removed when not frosty, as the trees are best if exposed in mild weather.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Winter-flowering Cattleyas and other Species.—Among these plants Cattleya Trianæi takes the first place, with C. quadricolor (chocoensis), and C. Percivaliana as useful companions. When the flower-buds are apparent in the sheath, the cultivator should afford them a more generous supply of water till the flowers expand, when, for the welfare of blooms and plant, a very restricted quantity is desirable; and this kind of treatment should continue until the new breaks have made considerable progress. In order that exhaustion should not occur, the flowers should be removed about ten or twelve days after the opening, for they will last as long in a cut state when placed in water as on the plants. C. Warneri and C. maxima commence to grow early in the new year, and it will be well to let the plants occupy a light position, and not to hasten growth unduly, or failures are almost sure to follow, loss of flowers being the least. A very limited supply of water should be afforded them, the time when and the quantity being determined by the condition of the pseudo-bulbs, whether shrivelled much or little. C. Luddemanniana, which we keep in the East-Indian-house the entire year, requires a severe course of resting to induce the plant to flower.

Winter-flowering Lælias and Others. — Those species which flower during our winter are mostly natives of Mexico, hence the term "Mexican Lælias" given to L. anceps and its white and other varieties, autumnalis, albida, Eyermanniana, purpuracea, and rubescens. Most of these having now finished flowering, they should have a decided rest before the work of next season commences. With this object in view, dryness at the root is essential; also dryness of the air, so long as the pseudo-bulbs are not dried so much as to cause shrivelling to an excessive degree. The first-named species and its varieties will, before long, begin rooting anew, and in their case a moister condition of the materials is desirable. L. majalis may even now be showing signs of activity; but disregarding this fact, the plants must be kept very dry, or they will be induced to grow prematurely, and without flowering. L. crispa in numerous instances will be in a forward state of growth, and so soon as new roots are detected, any top-dressing that is needed should be done, first picking out as much of the old material as possible. Water should be very sparingly applied, even after new material has been added, or the young growths will rot off; a light and warm position in the Cattleya-house should be selected for this species now that it is growing. L. pumila, præstans, and Dayana, which should be grown in a house having a few degrees less heat than the above, and where more shade is afforded during the summer, will now require careful treatment in the matter of water, to prevent the plants breaking into growth anew before they have recovered from the efforts of flowering. It is not advisable to allow the potting material to remain dry for any great length of time; still, it should not be thoroughly saturated.

Cœlogyne cristata is a most attractive, useful, and easily-cultivated Indian Orchid, which any gardener might cultivate and flower successfully, providing a glass structure exists in which a temperature of about 50° may be maintained during the winter, and shade afforded in summer. The plant is now in bloom, and preparations for the next season of flowering must be taken into consideration. No water having been supplied since some time previous to the plant's flowering, immediately after the racemes are removed the soil should receive a thorough application of rain-water, and be allowed to become moderately dry before affording another, and which need not be so liberal.

THE KITCHEN GARDEN

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Mushrooms.—In order to keep up a regular supply of Mushrooms, it is necessary that a bed or beds be made up at intervals of four weeks. In the making of Mushroom-beds, only sweet and well-prepared materials should be employed, and these should contain a good proportion of the dung of corn-fed horses, together with the shorter strawy litter, and a small quantity both of fresh loam and cow-dung. It is the rule to collect daily what stable-manure there is available on a private place, and throw this into a heap, and when enough to form a bed or two beds, to spread it out a foot thick on the floor of an open shed for a week to let it part with its rankest heat, then throw it again into a heap, and turn it once or twice, and in about one week it will be fit for making into a bed. Let this be put firmly together when the heat, as tested by the thermometer, stands at about 80° or 85°; insert pieces of the spawn, in pieces the size of a hen's egg, at intervals of a foot, all over the bed, and "case" the surface with sifted loam. Some gardeners leave the final covering for a week; but if there is no risk of the heat becoming too excessive, the beds may be finished when spawned. Keep the temperature of the structure from 55° to 60°, and in about six weeks Mushrooms should be springing up all over the bed. A slight covering of hay will help to retain heat and moisture in the beds, and hasten the appearance of the crop; but this must be lightly put on, and should be once a week lifted up. The thickness of a bed in the Mushroom-house proper need not exceed 14 inches. Ascertain if beds in bearing are suffering from lack of moisture, and when moisture is required, let it be afforded by means of a fine-rose watering-can at a temperature of 70° to 75°.

Hints on current operations.—The spell of frosty weather has rendered the wheeling of manure on to the vegetable quarters an easy matter. If a piece of ground is not cleared of its last crop, wheel the manure to a spot adjacent to it. When the frost disappears, the main Onion quarter should be partly got in readiness for sowing at a later date. The land for this crop should be heavily manured, and brought to a fine tilth; and if the maggot was troublesome last year, afford a heavy dressing of fresh soot and quick-lime just before the drills are opened. In the meantime, the dressing of manure should suffice. Onion-land needs deep digging, but this is best performed in November, and it is very necessary that it should be consolidated before the sowing is made, and that cannot be the case if it have to be trenched at this date, although land simply dug can be made firm enough. Late keepers are James', Bedfordshire Champion, a very good and reliable variety, and both grow large enough for ordinary purposes; and Giant Zittauer; and, for early drawing, the silvery-looking Queen.

THE APIARY.

By EXPERT.

Candy.—As a further help to candy-makers, I beg to add that we boil our candy for ten minutes after it has reached the boiling-point, and by strict attention to details get our cakes of just that nice firmness requisite to stand a two-mile shake up to the out-apiary without collapsing into an unstable mass, yet soft enough to allow the finger to be easily pressed into the cakes, or to melt in one's mouth without mastication or sucking. When removed from the fire, the saucepan is placed in a vessel of cold water, the water reaching to the height of the liquid candy inside. This is left a few minutes while the moulds are being lined with paper to receive it when ready. I then commence stirring until the contents of saucepan assume a consistency which just allows it to run into the mould before the mixture stiffens. Beginners are apt to handle their bees too frequently; and it should be remembered that disturbance causes abnormal consumption of food, with the consequent distention of the viscera, in seasons not permitting of a cleansing flight. Draught or damp also lead to the same effect, ending in so-called dysentery. Many old-fashioned bee-keepers feed all winter, causing excitement and other evils. If feeding be absolutely necessary, it should be done by giving a full comb of food from another stock, or a cake of soft candy. Too much unsealed honey, or badly-made food which ferments in the cells, unwholesome natural food, or even an undue quantity of pollen, all lead to the evils of bowel-distention and death. Prevention is better than cure in these cases; therefore, attention should be given at the proper time, that all food may be sealed over before bees settle down for winter. A few days' neglect in failing to examine doorways in midwinter sometimes ends in the suffocation of the stock. Strong colonies may have their doorways left open 6 or more inches. Weak stocks, or any where signs of robbing are seen, should have the entrances covered with perforated zinc, in which a doorway about an inch long is cut.

Damp.—This may arise from a leaky roof, or one that is not freely ventilated; or it may be caused by floor-boards resting too near the damp ground. Hives without legs should always be raised a foot or so in winter.

THE ROSARY.

ROSE "PAPA LAMBERT."

The last issue of the *Rosen Zeitung* contains a figure of "Papa Lambert," a H. T. with rich rose-coloured flowers. It originated from the pollination of White Lady H. T. by Marie Baumann H. P. together with pollen of Oxar Cordel. Whether both putative pollen parents exercised any influence is surely doubtful.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

APPOINTMENTS FOR FEBRUARY.

SATURDAY,	FEB. 4	Northamptonshire Horticultural Society's Meeting. Isle of Wight Horticultural Improvement Society's Meeting.
MONDAY,	FEB. 6	National Chrysanthemum Society's Annual Meeting, at the Royal Aquarium, at 7 P.M.
TUESDAY,	FEB. 7	Scottish Horticultural Association, Meeting. National Amateur Gardeners' Association, Meeting. Loughborough Gardeners' Meeting. Bolton Horticultural and Chrysanthemum Society's Meeting.
WEDNESDAY,	FEB. 8	—Renfrew Gardeners' Meeting.
THURSDAY,	FEB. 9	Manchester Horticultural Improvement Society's Meeting.
SATURDAY,	FEB. 11	Royal Botanic, General Meeting. Dutch Gardeners' Society's Meeting at Richmond.
MONDAY,	FEB. 13	United Horticultural Benevolent and Provident Society's Committee Meeting.
TUESDAY,	FEB. 14	Royal Horticultural Society's Committees. National Rose Society's Committee Meeting. Royal Horticultural Society of Ireland, Meeting.
THURSDAY,	FEB. 16	—Linnean Society, Meeting.
FRIDAY,	FEB. 17	Royal Gardeners' Orphan Fund: Annual Meeting and Election of Pensioners, at Anderton's Hotel, Fleet Street, E.C., at 3 P.M.
MONDAY,	FEB. 20	Shirley Gardeners' and Amateurs' Improvement Association, Meeting.
TUESDAY,	FEB. 21	—Loughborough Gardeners' Meeting.
WEDNESDAY,	FEB. 22	—Renfrew Gardeners' Meeting.
THURSDAY,	FEB. 23	Annual General Meeting of the Kew Guild, in the Garden Library, at 8 P.M.
SATURDAY,	FEB. 25	Royal Botanic Society, Meeting. Dutch Gardeners' Society's Meeting at Richmond.
TUESDAY,	FEB. 28	Royal Horticultural Society's Committees.

SALES FOR THE ENSUING WEEK.

MONDAY,	FEB. 6	Roses, Gloxinias, Spiræas, Pæonies, &c., at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 7	Hardy Perennials, Carnations, Dahlias, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 8	Japanese Lilies, Iris, New Violets, Tuberoses, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 9	Hardy Border Bulbs, and Plants in variety, at Protheroe & Morris' Rooms.
FRIDAY,	FEB. 10	Anemones, Roses, Carnations, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—39·2°.

ACTUAL TEMPERATURES:—

LONDON.—*February* 1 (6 P.M.): Max., 41°; Min., 35°.

PROVINCES.—*February* 1 (6 P.M.): Max., 42°, Scilly; Min., 35°, E. Scotland.

Slight frost, easterly winds, fine.

Cross-Breeding.

IN looking forward to the arrangements for the present year at home and abroad, there is nothing of so much intrinsic importance as the Conference on Hybridisation, to be held under the auspices of the Royal Horticultural Society in July next. We have already published the details of the programme so far as they can be arranged so long beforehand. They comprise two meetings—one at Chiswick, the other in the Lindley Library, or, as we suppose, in the Drill Hall, if the exhibits are very numerous. At these meetings points of great scientific interest and practical importance will be discussed. It is not probable that the programme as printed can be carried out in its entirety, but that is of the less consequence as the papers will be printed at length in the Society's *Journal*.

It rests with the exhibitors to render their part of the work a success; and considering the fact that the progress of horticulture of late years has depended so greatly on the practice of cross-breeding, we cannot doubt but that the exhibition will be one of the greatest interest.

New plants, in the sense of new introductions, have of late years fallen off, except in the one case of Orchids. New plants raised by the skill of the experimental gardener have vastly increased, and wonderfully added to the beauty and interest of our gardens. Varieties and species and genera only differ in degree one from another, and the limitation of the groups in question is very much a subject of personal judgment. Hence the terms "cross-breeding" and "hybridisation" are often used indiscriminately, though, as a rule, the first term applies to the intercrossing of varieties, the second to that of species. When the cross is effected between species belonging to what are considered two genera, the result is a bigener or bigeneric hybrid.

In the old days, when "species" were looked on as something sacrosanct, some good people deemed it presumptuous, or almost impious, to attempt to interfere with what they considered was the order of Nature. The naturalists of the day naturally also objected strongly to the procedures of the hybridists, which broke down the barriers between species and species, and upset the carefully-framed systems of classification—so much the worse for the system, as we now think. Dean HERBERT it was who combated the narrow views of those who objected to hybridisation on the score of presumption. He it was who pointed out that so far from being presumptuous, the hybridisers were really extending, deepening, and making more widely-known the limitless marvels of creation. He had no difficulty in showing that the truest religious feeling in this matter was with the experimenters. What is more to our purpose, he showed that hybridisation occurs naturally. He first of all suspected that certain wild forms of Narcissi were of hybrid origin, and then he proved the correctness of his suspicions by crossing the species one with the other, and obtaining the same hybrid by artificial means. When it was thus shown that hybrids occurred in Nature, and further, that they were by no means always sterile, but frequently fertile, there was an end of the fictitious religious difficulty.

Among Orchids, REICHENBACH described very many as hybrids, because, in his judgment, they combined the characteristics of two species known to grow in the same vicinity.

Messrs. VEITCH and other experimenters have in many cases proved the correctness of REICHENBACH'S conclusions, by producing in their establishments the self-same hybrid that was at first only known in the natural condition.

HERBERT anticipated DARWIN in many of his speculations, but his work is not sufficiently appreciated even now. KOLREUTER, and GAERTNER, and SPRENGEL, are known to our botanical students, nourished on pabulum made in Germany; and far be it from us to suggest, even remotely, the belittling of these great pioneers. What we want to do is, to direct the attention of the students to the work of our own countryman, HERBERT, as set forth in the *Journal of the Royal Horticultural Society*, and elsewhere. If those works are carefully considered by our students, they will, we think, be somewhat astonished at the way in which HERBERT anticipated the knowledge of the present day.

THOMAS ANDREW KNIGHT, so long the President of the Society, was another hybridiser who worked with a purpose: his aim was mainly practical, and some Apples, such as Downton Pippin and others, remain to this day, as does Knight's Monarch Pear; while his Marrow Pea may be taken as the origin of many of our best modern varieties.

Before his time, PHILIP MILLER was at work crossing Tulips at Chelsea, and THOMAS FAIRCHILD of Hoxton has the credit of raising the very first artificially-produced hybrid known, in the shape of a mule Pink, produced by crossing D. barbatus and D. caryophyllus.

Coming now to our own times, is there any more remarkable experiment, or series of experiments, on record, than those which have secured to us the possession of the tuberous Begonia! So great is the change brought about by JOHN LAING and VICTOR LEMOINE, that a new genus—or, shall we say, a group, equal in value to a genus—has been framed to receive them, and the name Lemoinea × assigned to it.

Without doing more on this occasion than make passing allusion to the now numerous bigeneric hybrids among Orchids, we may mention as striking illustrations of the results of cross-breeding, the magnificent series of greenhouse Rhododendrons issued by Messrs. VEITCH, and the fine series of Clematis sent out by Messrs. JACKMAN.

Among the so-called florists' flowers, cross-breeding of varieties has given us the astonishing Dahlias and Cinerarias of the present day, and the still more remarkable Chrysanthemums.

It is needless to cite other illustrations, such as might be given by the score; it is enough to say that progress in this department of horticulture has been more marked than in any other. We can indeed, hardly conceive a limit to our progress in this matter, for, if we find ourselves baulked in one direction, there are endless other avenues open to us. It is confidently expected that the Hybridisation Conference will show this, and especially that it will be the means of guiding and directing experiment in the most likely channels, so as to avoid waste of time and energy, prevent the pursuit of phantasms, and tend to the development of degrees of beauty and utility now undreamt of.

LINNEAN SOCIETY, JAN. 19: WILLIAM CARRUTHERS, F.R.S., Vice-President, in the Chair.—Mr. A. J. MASLEN read a paper on "Lepidostrobus." After remarking that the late Professor WILLIAMSON'S collection of fossil-plants in the Natural History Museum contained a number of slides which he had associated with Lepidostrobus, but which could not be referred with certainty to the particular vegetative organs to which they belonged, while it was difficult also to refer isolated sections of the same type of Strobilus to one another, he explained that the present paper gave the result of a re-examination of WILLIAMSON'S slides of Lepidostrobus, undertaken at the suggestion of Dr. D. H. SCOTT. His object and endeavour had been to make out, if possible, at least some distinct forms; but he had found great difficulty in determining whether the observed structural differences in isolated sections were really of specific value or not. He considered it safer to adopt WILLIAMSON'S Lepidostrobus Oldhami for a common type of structure, and by comparison to describe three marked variations (α, β, and γ). A clearly distinct form he described as a new species, under the name Lepidostrobus foliaceus. A discussion followed, in which the Chairman, Dr. D. H. SCOTT and Mr. W. WORSDELL took part.

ORDER OF ST. MICHAEL AND ST. GEORGE.—At Osborne, on Monday last, January 30, the QUEEN conferred the honour of knighthood on WILLIAM TURNER THISELTON DYER, Esq., Director of the Royal Botanic Gardens, Kew, in recognition of services rendered to Colonial Governments. The new knight was then invested with the Riband and Badge, and the Star of his dignity in the Order was affixed to his left breast by HER MAJESTY.

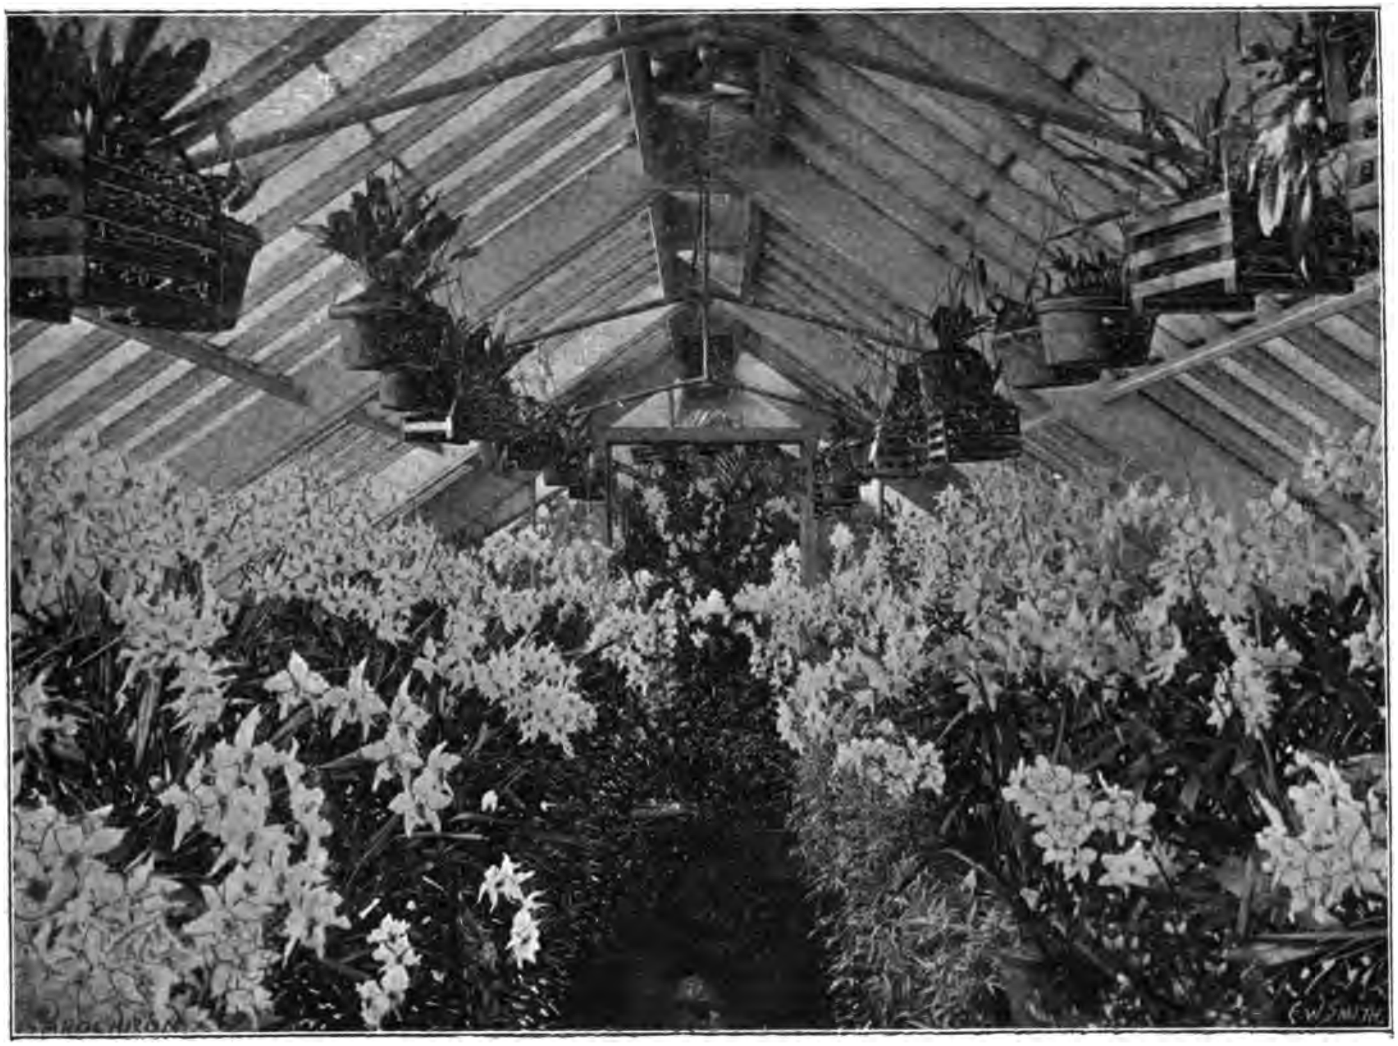

FIG. 24.—ODONTOGLOSSUM-HOUSE IN THE GARDENS AT FREELAND, PERTHSHIRE. (SEE P. 66.)

ROYAL BOTANIC SOCIETY.—A course of lectures and demonstrations, as has been previously stated, on the subject of seed-testing and seed-control, by Mr. D. FINLAYSON, is being delivered in the Museum at the Society's Gardens on Monday afternoons until March 21, the first of the series having been given on Monday afternoon, Jan. 23, at 3.30, for the benefit of students of agriculture, horticulture, landscape gardening, and of botany generally. The second of the series was given on Jan. 30, dealing with the effects of age of seed, suitable soils, change of seed and the reason for it, quantity of seed per acre, &c. The subject chosen was Grass-seeds, Alopecurus pratensis, Dactylis glomerata, and Festuca elatior. Impurities were specified and described. On Monday, 6th inst., other species of grasses will be taken and dealt with similarly.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are desired to correct a misstatement made in our last issue in regard to the date of the annual dinner, which was announced for July 28 instead of June 28. The secretary desires us to state that the following sums have been given towards the completion of the Victorian Era Fund:—Mr. W. G. MONRO an additional £50, Mr. OSMAN £10, and Mr. E. C. MOTT £5 5s.

THE CHELSEA GARDEN.—We are glad to find the *British Medical Journal* and the *Pharmaceutical Journal*, whose opinions on such a matter are necessarily weighty, endorsing our remarks as to the desirability of providing for due instruction in systematic botany.

ROYAL GARDENERS' ORPHAN FUND.—The annual general meeting of the subscribers to this Fund will be held at Anderton's Hotel, Fleet Street, London, E.C., on Friday, February 17 next, for the purpose of receiving the report of the committee, and the accounts for the past year; to elect officers for the ensuing year; to elect nine children to the benefits of the Fund; and to make the following alterations in the Rules, viz.:—Rule V. Line four, after the word "purpose," to omit the words, "All donations and legacies;" and to insert the following: "All receipts, except legacies and donations, specially given as such for investment, shall be considered as subscriptions, and be available for current expenditure. All legacies and special donations." Rule XI. Line five, after the word "require," to make the following addition:—"Not more than two children of the same family can be in receipt of the benefits of the Fund at the same time." The chair will be taken at 3 o'clock. The poll will close at 4.30 P.M., after which no votes will be received. The voting-papers have all been issued, any subscriber not having received one is requested to communicate with the Secretary. By order, A. F. BARRON, Secretary.

SCIENCE TEACHING IN HORTICULTURE.—A class for instruction in the principles of horticulture will be held by Mr. WILFRED MARK WEBB, F.L.S., at 2, The Broadway, Hammersmith, on Monday evenings, at 7.30 P.M., commencing on Monday, February 6, the fee being 10s. for the ten lectures (including any extra meetings found necessary as the time for the holding of the Royal Horticultural Society's examination approaches). Application should be made to the lecturer at the above-mentioned address.

Mr. J. G. Baker.—On the occasion of the retirement of this gentleman from the post of Curator of the Herbarium at Kew, his old colleagues, the members of the staff, presented him with an address expressive of their affectionate respect. A representation of the elegant Bromeliad, called Bakeria tillandsioides, drawn by Miss Smith, the botanical artist, served to frame the address. The signatures were confined to permanent members of the staff and to one or two regular visitors to the Herbarium. Had it been otherwise many others would have been proud and pleased to have had the opportunity of adding their tribute of respect and gratitude to one who has done so much for botany and gardening.

Chambre Syndicale de Gand.—On Sunday, February 5, at 2 P.M., a banquet will be offered at the Hôtel de la Poste, Ghent, to MM. E. Bedinghaus, Fr. Crépin, Rom. De Smet, A. Hoste, J. Hye de Crom, P. Nicaise, E. Pynaert, H. Van Hulle, and Ch. Vuylsteke, all of whom received honours during the year 1898, for their services to horticulture.

"Gardening for All."—A copy of the second edition of this useful little book, *Gardening for All*, has been sent to the Queen by the author, Mr. J. Udale, of Droitwich, the gardening instructor for Worcestershire. Mr. Udale was graciously thanked by Her Majesty, through the Master of the Household, for his present.

The Surveyors' Institution.—The next ordinary general meeting will be held on Monday, February 6, 1899, when the adjourned discussion on the paper read by Mr. Wm. Weaver (Fellow) at the meeting of December 12, 1898, entitled "The London Building Act, 1894, and the Official Supervision of Buildings," will be resumed. The chair will be taken at 8 o'clock. Members who are Graduates of any of the recognised Universities of the United Kingdom are requested to intimate the fact to the Secretary of the Institution, in order that the same may be indicated in the next issue of the list of members.

Plums from the Cape.—An admittedly early (if small) consignment of fruit has reached us, per a "Union" steamship, from the Cape; it consisted of first-class Plums, and the import manager, in advising us of the matter says:—"The steamer brought eight boxes of Plums, twenty-four Plums in each box; these were all in excellent condition, and were considered to be the best Plums ever brought from the colony. They were sold privately at Covent Garden, and realised a very high price." A very good start for the season.

Pharmaceutical Students working in London are, says the *Pharmaceutical Journal*, favoured by the addition of a new feature to the Museum at 17, Bloomsbury Square, in the shape of a Wardian-case containing living medicinal plants. The idea—originating with the Curator, Mr. E. M. Holmes—is that an additional interest will be imparted to the study of vegetable materia medica if as many as possible of the plants yielding medicinal products can be seen in the living condition by students. The first lot of specimens exhibited includes Eucalyptus Globulus (Myrtaceæ), with flowers and flower-buds gathered at Cannes, and sent by Mr. R. Goodwin Mumbray of Kew; Smilax aspera (Liliaceæ), the root of which is used in Italy in the same way as Sarsaparilla, also gathered at Cannes, and gathered by Mr. Mumbray; and Hamamelis virginica (Hamamelidaceæ), from the Cambridge Botanic Garden.

New York Botanic Garden.—On January 3, a beginning was made with the range of glass-houses to be erected in the garden. The illustration given in *American Gardening* shows a glass and iron, dome-shaped structure in the middle, with a wing on each side terminating in a large pavilion. The garden occupies an area of 250 acres. The Director in chief is Dr. N. L. Britton. We tender our respectful congratulations to the citizens of New York, and specially to the Torrey Botanical Club, and to the Director, on the prospect before them of a botanic garden worthy of the nation, and which cannot fail to be of the greatest service to botany and horticulture.

Proposed Testimonial to Mr. Turton.—We understand that it is proposed to present Mr. T. Turton, who, for a period of twenty years, was gardener at Maiden Erlegh, near Reading, and now fills a similar post at Sherborne Castle, Dorset, with a testimonial, in recognition of his services to horticulture in the district. The following gardeners and others have consented to serve on the Committee:—Mr. J. W. McHattie, Mr. G. Stanton, Mr. J. Tegg, Mr. T. Neve, Mr. F. Bright, Mr. G. Trinder, Mr. J. Bowerman, Mr. A. Dean, Mr. W. Heath, Mr. J. Hudson, Mr. F. Cole, Mr. J. Coombes, Mr. W. Lees, Mr. J. Woolford, Mr. J. Martin, treasurer, and Mr. J. Pound, hon. sec., who will be pleased to receive subscriptions; or they may be forwarded direct to Mr. J. Pound, hon. secretary, 47, Donnington Road, Reading. Those who feel disposed to subscribe, must do so before February 11, on which day it is proposed to close the fund.

Open Spaces.—There has for some time past, we believe, been some friction between local and municipal authorities as to the keeping up of small open spaces, and to set the matter at rest and on a satisfactory basis, a conference was held on the 26th ult. representative of the London County Council and the local governing bodies of London, to consider the whole matter. A resolution was ultimately passed declaring that the control of such spaces should be undertaken by the sanitary authorities for the various districts, the cost being met by annual payment from the Council. It will be necessary, we suppose, to lay down rules for the guidance of the "authority," else the proposed new order of things may not prove the success it is designed to be.

Flowers and Vegetables in Tibet.—Messrs. James Carter & Co. write from 237, High Holborn:—"Although many parts of this enormous Central Asian territory have not yet been trodden by Europeans, it may interest you to know that we have a lady customer at Yatong—the only British resident, we believe, in that city—who possesses a garden and grows vegetables and flowers. Her communications reach us with regularity *viâ* Darjiling. Quite recently we have received a report upon the value and adaptability of these products in that climate, 10,000 feet above the level of the sea, where snow falls sometimes in May, and begins again in October. Amongst the information given, we are told that Tomatos produce flowers but no fruit, Onions decline to form a bulb; Cabbage, Carrot, Turnip, and Mustard-and-Cress are excellent. Peas are good at certain times. Nearly all our common garden flowers proved a success."

When is a Gardener not a Hired Servant?—Important License Case. A prosecution, instituted by the Inland Revenue authorities at Manchester last week, has raised the question, whether or not, a gardener employed by a nurseryman to do work in a private garden, is a male servant for which a licence should be held by the nurseryman. The defence was that the agreement between the defendant (nurseryman) and Mr. Estcourt, the proprietor of the garden, was of the nature of a contract to do work required upon a certain area. The defendant was not required to complete the work in a given time, or to supply only a particular individual to execute it, therefore he could not be held liable under the Act. As a matter of fact also, the workman had not worked a full day at Mr. Estcourt's garden. The stipendiary magistrate found that defendant was liable for the licence, and inflicted a nominal fine of 5s., and costs. Leave was granted to state a case for appeal; and it is hardly likely that nurserymen will submit to this new item of taxation until a decision has been obtained from the highest courts.

AMERICAN NOTES.

THIRTY THOUSAND DOLLARS FOR A NEW CARNATION!

When the late Mr. Bennett sold the Rose Her Majesty to an American for 10,000 dollars it was thought that the price paid was phenomenal, and would stand as a record-breaker for generations. During the past week, however, a new Carnation, named Mrs. Thomas W. Lawson, raised by Mr. Peter Fisher, of Ellis, Mass. (a very intelligent Scotsman, who has already introduced some good novelties in Carnations), was sold to Mr. Thomas W. Lawson, a well-known Boston banker, for 30,000 dollars. The Carnation in question was named in honour of Mr. Lawson's wife, and several offers had been made for the stock of the plant by New York and Chicago magnates. To show that Boston could appreciate and pay for a good thing as well as her more populous if less refined sister, Mr. Lawson made his magnificent offer, which was accepted. The new Carnation in question was raised from a batch of seedlings four years ago by Mr. Fisher; he has worked up a stock of 8000 plants during that time, and the flowers bring a higher price than any other Carnation on the market, bringing three dollars per dozen at retail, while the average varieties net only from fifty cents to one and a half dollars per dozen. The flower is of a rich, dark-pink colour, calyx very stout, and stem very long and stiff; it has secured Certificates, Silver Cups, and Silver Medals wherever exhibited. Mrs. Lawson is a free and persistent bloomer, and has created a greater stir than any other Carnation raised here. It is not yet known what Mr. Lawson will do with his new purchase; it was Mr. Fisher's intention to hold it until 1900 ere disseminating it, but the new owner may decide to place it on the market, and will unquestionably get most of his purchase-money back through sales of rooted cuttings, besides an immense amount of gratuitous advertising throughout the length and breadth of the country. If 30,000 dollars can be had for a new Carnation, what may not the raiser of a blue Rose or Chrysanthemum hope to get in the future? *W. N. Craig, Taunton, Mass., U.S.A., January* 22, 1899.

NOTES FOR NOVICES.—II.

Potting.—Unless an exception be made in the case of watering, it may be doubted if there is any operation in the whole range of gardening which necessitates more practical experience for its successful prosecution than does potting. To attempt to instruct a pupil in the best method of potting an Orchid, or any other plant, by books alone, would therefore be absurd. But although there are considerable variations in the method of potting, according to circumstances, the diverse nature of particular plants, and the purpose for which they are grown, yet, just as in the case of digging, there are certain general principles which are common to all cases. The pupil needs to have a good grasp of these principles, so as to be able to apply them properly, and adapt his methods of procedure in accordance with them, and in conformity with the particular requirements of the case.

The first thing to remember is the very artificial nature of the procedure. We do not grow plants so much for their own benefit, as to supply our own requirements. Can we imagine any plant liking to have its roots cribbed, cabined, and confined within the limits of an earthen pot. As growth in pots is necessarily an artificial procedure, and one very likely, if ill done, to bring about injury to the plant, it is surely our duty to avoid this, by making the plant as comfortable as possible under the circumstances. The plant is a living being, and demands from us in its degree that consideration which it is our duty to extend to our fellow creatures of all descriptions. Some may think this rather far-fetched, but it is true in substance and in practice; the more nearly and completely we can act up to it the better in all cases will our cultivation be.

RIGHT AND WRONG METHODS OF POTTING.

Culture in pots, then, resolves itself in the first instance into the best means for promoting the growth and the action of roots under particular conditions. The conditions are the same as were alluded to in a previous note when the question of digging was under consideration. The roots are alive—very much so; they are so sensitive as to be almost intelligent, and they are endowed with a considerable amount of locomotion, which enables them to thread their way between the particles of soil in their search for air and water. Light is of little use to them directly, but a certain degree of heat is absolutely necessary to their welfare. These conditions are satisfied by careful potting. The admixture of loam, leaf-mould, or peat and pure sand, in varying proportions, forms the basis of most potting composts, and supplies the requirements of the plants. The soil is made permeable enough to permit the free access of air, which is essential if the plant is not to be suffocated. Provision is also made for the passage of water which must be provided, or the plant will die of inanition. Hence, the directions given to employ none but clean pots, so that nothing may obstruct the passage of air or watery vapour, and hence, also, the care required to crock the pots properly, and to obviate anything like stagnant water, which, as has been said, kills the plant by suffocating it. The water, even when it does not run away freely, is always passing by evaporation. That evaporation, unless means be taken to obviate it, is necessarily attended with a loss of heat, the unfortunate plant gets a chill—takes cold, in fact. We may see the consequences of this in arrested growth, yellow colour of the leaves, and other evidences of disturbed health.

The soil-food is supplied by the compost, the loam furnishes the potash, the phosphates and the lime that are required; the leaf-mould yields nitrates and perhaps carbonic acid, though the greater part of the carbon in plants is derived directly from the air by the agency of the leaves. It is easy to add to the soil food by the occasional application of liquid-manure after the potting has been accomplished, or infinitessimal quantities of sulphate of ammonia, nitrate of soda, potash, or phosphate of lime may be used singly or in combination with the potting-soil. Preferably, these ingredients may be used as a top-dressing subsequently, but some gardeners mix them with the potting-soil; or they may be inserted in the form of little capsules, as in the method employed by M. Georges Truffaut, the contents of the capsule being varied according to the plant to be cultivated. The mechanical texture of the soil, whilst fulfilling these requirements, also secures a free passage of the rootlets in all directions, so that they may thoroughly permeate the soil and reach the sides of the pot, where the circulation of air and moisture is freest.

In gardening books directions are given to pot firmly or moderately, to use small-sized pots to begin with, and to shift the plant when necessary into other pots not much larger than the original one. In other cases large shifts are prescribed. These and similar directions have principally reference to the nature of the roots, and to the purpose for which the plant is grown. The fine, hair-like, spreading roots of a Heath, for instance, require a different style of potting from that required by the thick, fleshy roots of a bulbous plant, which go straight downward. The creeping roots of an Orchid, with their spongy coat, full of air, and their green tips, indicate the necessity for allowing the freest access of air, and in this case even of light. When a plant is required to grow freely, its roots must not be allowed to become too densely matted, or they will strangle one another. They will become spirally twisted, and when the shift is made into another pot, or into the open ground, the plant leads a miserable existence for a time, and succumbs to the first strain. But there are frequent cases where it is more convenient to us to keep the plants in small pots, and to restrict the natural growth of the roots; and there are cases where a plant flowers all the sooner, and all the better for being "pot-bound." Experience alone can teach the way of applying the general principles before mentioned to these particular cases, but in no case is it judicious to bury the "collar" too deeply, or to suffer the soil to become hardened or "baked," as it may do if the proper texture of the soil is not attended to, and if water be improperly administered.

As a rule, the best time for potting is in spring, just as growth is beginning to manifest itself. If done later, when growth is in full activity, growth is checked, in the same way as it is in the case of root-pruning. This arrest may in some cases be desirable, and tend to induce the production of flowers.

The soil used for potting should always be approximately of the same temperature as the air. As potting is usually done under cover, this requirement is easily fulfilled, and the requisite bottom heat is readily supplied in the plant-houses.

Out-of-doors, it is often advisable to plunge the newly-potted plants into a bed of coal-ashes, or to sink them in the border, with a view to equalise the temperature and moisture, and to obviate undue evaporation from the pot, and consequent chill.

Other practical hints may be derived from an inspection of our illustrations (figs. 25—33), copied from a volume of *American Gardening*. *S. Retsam.*

HOME CORRESPONDENCE.

A WINTER FLORAL TREAT.—On January 17, I took advantage of the invitation given in the *Gardeners' Chronicle* by Messrs. Sutton & Sons, to call and see their show of Cyclamens and Primulas, and I must certainly congratulate them on such a fine display. There were from 2,000 to 3,000 Cyclamens in full bloom, in many shades of colour, and the beautiful mottled foliage was quite a feature. Among the varieties that took my special attention were Salmon

Queen, Vulcan, with dark crimson flowers; the Giant White, and some with flowers of several shades of deep purple. Very interesting were some French plumose varieties, grown for hybridising purposes. The Primulas are very interesting in shades of white, crimson, purple, and blue, both double and single-flowered, but these latter were, as yet, hardly at their best. *R. M., Newbury.*

BEGONIA GLOIRE DE LORRAINE.—Replying to Mr. F. W. Burbidge, I may say that this beautiful Begonia was raised by Messrs. V. Lemoine & Sons, of Nancy. I find in their Catalogue they state that it is a hybrid between B. socotrana and B. Dregei. It received a First-class Certificate from the Royal Horticultural Society in 1893, but it was some time after this date that it became generally known. It is remarkable that a plant capable of giving such an abundance of bloom with little trouble should have proved a failure with so many growers. Upon recommending it to a French nurseryman, I was told it was of no use whatever in France. However, on seeing a good batch of plants in flower, he was induced to try it, and has since bought some hundreds. I find it has also been taken up and grown successfully by some American nurserymen. Although it is quite the exception for this Begonia to produce female flowers, I have found a number on different occasions; but although it has been attempted to fertilise them, I have never seen good seeds. The yellow anthers are very conspicuous, but I have never been able to discover any real pollen. I have seen the plant at Chiswick with the seed-vessel (referred to by "A. D."), which has all the appearance of being fertile, but judging from my own experience, I am afraid it will prove abortive. *A. Hemsley.*

THE CURRENT YEAR'S ONION CROP.—The recent heavy rainfall will no doubt cause some delay in preparing the ground for seed sowing, &c. I would suggest, therefore, the necessity to forward such vegetables as early Peas, Broad Beans, &c., by sowing enough of these in pots to make a first batch, and to plant them out afterwards, when danger from frost has passed. But my particular reason for writing this note has reference especially to the Onion crop. Onions are in request all the year round, and great inconvenience may be caused by loss of crop through the attack of the Onion-fly. The seed should be sown now in boxes, and afterwards placed in a temperature of 60° until they have germinated; the boxes should then be shifted into a house or pit a few degrees cooler. Keep them near the glass, and gradually harden off ready for planting out into well-prepared ground towards the end of April. The plants will not feel the check, but start right away, and make nice bulbs by the end of the season, providing a little attention in regard to root watering be given them for a short period following transplantation. The little extra trouble caused by raising the stock of Onions in this way is amply repaid by the comparative certainty of a good crop of bulbs, which will ripen earlier in the season than those sown in the ordinary way, which may therefore be harvested in a better condition for keeping. Onions sown in this manner have always, in my experience, escaped the Onion-fly, while those sown out-of-doors have invariably suffered from it in a more or less degree. This was strikingly illustrated to me in 1880 by two beds of Onions adjoining each other, one of which was autumn and the other spring-sown. And whereas the whole of the latter was completely destroyed by the maggot, the former, through being too large for the purposes of the fly, entirely escaped. Since that time, I have always sown the bulk of our Onion-seed in boxes at the end of January. They have been transplanted towards the end of April, and none of the subsequent crops have been affected by maggot. Our Onion-quarter here consists of twenty-three beds, each of which requires 720 plants, and with the exception of the loss of a few plants when they are moved, the remainder produce good, serviceable, well-ripened bulbs. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent.*

MUSHROOMS.—In reference to Mr. Kneller's letter upon "Mushrooms in Pastures," I may say that the season here was a short one, there being but few until after the rainfall on October 12. Good gatherings then continued only for about a fortnight. Last spring we procured 2 bushels of spawn from a first-class London firm, and used it in different parts of the park and grounds, placing it about 2½ inches under the turf, and putting a little old Mushroom-bed manure with the spawn. The turf was then firmly replaced. The lines or rows were 6 feet apart, and the spawn was inserted at distances of 3 feet. This was done at the end of April. One part was fenced off and mown for hay, a second was grazed by cattle, and the third part being within the grounds, it was kept mown. In neither case has there been a Mushroom. I have been most successful with Mushrooms indoors, but in this case, if the result be not due to the dry weather, then I am, like Mr. Kneller, "in a fog." *J. Batters, Gillingham Hall Gardens, Norfolk.*

LARGER EXHIBITS.—I am not at all surprised to read the comments of "W. S." on my remarks on the above subject if he be an exhibitor. However, there may be some among the far-seeing members of the horticultural world who will agree with me. No doubt there are some—for their own personal interest—who would like to see the number of exhibits greatly reduced. In my opinion there is nothing awkward (as "W. S." terms it) in gardening or shows if there exists a determination to carry out a new project, but some men get into a groove out of which it is impossible to move them. With regard to "W. S.'s" ideas that small exhibits represent a man's ability in every way, is simply nonsense—how can it do so?—every expert gardener knows that in order to produce larger exhibits, far higher talents, greater foresight, and more energy are required than to produce a smaller one. I wish to point out the improvement that would accrue, and the advantages following the practice of larger exhibits. We should remember there are the visitors and patrons of our shows who should be catered for, for it is by their help that our flower-shows are kept up; therefore, we should do all that is possible to make the shows worthy of their patronage. *A. J. L., Wyfold Court.*

CHRYSANTHEMUMS AUSTRALIE AND MR. T. CARRINGTON.—The Classification Committee of the National Chrysanthemum Society has bracketed these two varieties as being either "synonymous, or too much alike." This surely is a mistake; or is it an attempt to disparage a really valuable variety? Notwithstanding this classification, Mr. T. Carrington will make a reputation for itself, and will continue to occupy a prominent position; and it is quite distinct from Australie in colour and form. The former is richer and clearer in tint, the florets are smoother and more even, and they are less whorled, and no competent judge would have any difficulty in discriminating between them. They are, I think, much more distinct than Pride of Madford and Duke of York, or Mrs. Mease and G. J. Warren; in fact, a bloom from an early bud of the latter could easily be shown as Mrs. Mease, and doubtless this has been done successfully. Of course, I do not argue that G. J. Warren and Mrs. Mease should be bracketed as "too much alike," but that the Classification Committee in bracketing Australie and Mr. T. Carrington acted with undue haste. *W. J. Godfrey.*

ROSE W. ALLEN RICHARDSON.—One of the most useful outdoor crops I am able to produce is the buds of Rose W. A. Richardson, the first of which are fit for cutting in May. The plants are trained to the outer wall of a heated pit, and they are pruned not later than the second week in January. A slight divergence occurs in different years as to the time the earliest blooms are ready, but in favourable seasons I have cut hundreds of buds in May; and early in June we have the above and other varieties always in quantity. I am aware that pruning Roses in the depth of winter is supposed to be attended not only by a modicum of risk, but almost with the certainty of losing the Roses altogether. It is, however, a supposition that may, in not a few instances, be safely ignored. Old rosarians performed Rose-pruning in autumn; with Roses, no doubt, of a less susceptibility to the changes of weather and climate than many of our present-day Roses possess. But so well does the above-named Rose respond to early pruning, when trained to a warm wall, as also Souvenir d'un Ami, and Souvenir de la Malmaison, each of which is a favourite at Tynninghame, that I have no hesitation in recommending others to make a trial. In pruning, as much old wood as possible should be removed, and strong, well-ripened shoots extended over the wall. From these are secured not only the greatest quantity of bloom, but also buds of the finest form. It is also worthy of note, that a plant of W. A. Richardson, if well thinned of exhausted and weakly growths after the first flush of bloom is past, will uninterruptedly bring a succession of flower-buds until the autumn. *R. P. B.*

CLEMATIS VITALBA, well known in southern England as a denizen of the hedge-row and woodland, is not plentiful in the north, but it is a plant that should be found a place in the shrubbery. At Belvoir there is a plant of this species, which is 20 feet in height and 30 feet in diameter, that is much admired in the winter months for the down-like wings of the seeds, which give it the appearance of being covered with white flowers when seen from a distance. This plant is growing over a Yew-tree, which has been much damaged in consequence. A better plan than this is to partially cut the Clematis down once in two years, and to thin out the young growths soon after. I know of no other plant which will cover arbours, pergolas, &c., so quickly as this; unfortunately, for this purpose, it has the disadvantage of being deciduous. One can easily understand why it is called Old Man's Beard, but the reason for its other common name, Traveller's Joy, is not so apparent. Can it be because the thick canopy forms a good shelter for the night's repose? *W. H. Divers, Belvoir Castle Gardens.*

LEPTOSPERMUM SCOPARIUM.—A small plant received by us from New Zealand early in 1896, through the kindness of Mr. Allen, is now in full flower outside at Belvoir, notwithstanding that 12° of frost were experienced on Jan. 25. So far it is quite hardy, planted in a warm corner. The leaves, when rubbed, gives off a pleasant odour, resembling that of Diosma fragrans, but scarcely so powerful as in the case of that plant. The figure of L. lævigata, in *Nicholson's Dictionary of Gardening*, gives a good idea of the flowers of my plant, but the leaves are quite different. *W. H. Divers, Belvoir Castle Gardens.*

EUCALYPTUS GLOBULUS.—An interest being evinced in the age and dimensions of species of Eucalyptus growing in these islands, I wish to state that I saw a very fine specimen of E. Globulus last summer in the gardens at Meadfoot Rock, Torquay; and Mr. Sloman, the gardener at that place, kindly sent me the age and height of this tree, viz., 20 years and 50 feet respectively. Spreading circumference of the trunk at the base is 3½ feet. *C. L. Branson, Coleshill Park.*

—— We have several in different sizes growing in pots, and they are all of the same character, but they seem to have altered very much since planted out in shape and colour of foliage. During the winter months they are much less glaucous than in summer, perhaps owing to low temperature and heavy rains. The suggestion that they are from seed taken from the mountains of Tasmania is interesting. They certainly are more hardy than one would expect; the first winter they were out we had some rather sharp frosts, over 20°, and the tops were crippled for a space of one yard, but in the spring they soon made new leaders and went away very rapidly. One is planted on the grass facing south-east, the other on a border facing south, but there is very little difference to be seen in their height; the stems are naked for a height of about 10 feet. *F. Knights, Lutterworth.* [A more careful examination of the specimen sent reveals the fact that the knotted bodies referred to are really flower-buds and not seed-vessels, and that the plant is really Eucalyptus Globulus. That it should be hardy and produce flower-buds in the midlands is very interesting. Ed.]

THE ROYAL GARDENERS' ORPHAN FUND.—The ballot papers with names and subscriptions of the ninteen candidates for election on February 17, have just been issued, and subscribers have ample opportunity of determining which in their estimation seem to be the most necessitous and deserving cases. Certainly some seem to be much less so than others, but personal bias will no doubt cause them to be as warmly supported as will others of a more desirable nature. But after carefully scanning the description given of each candidate's surroundings, I do not find one instance in which the words "father a subscriber to the Fund" appears. That is so painful a fact, that existing conditions seem almost to put a premium on neglect to do so much; and I think it is high time some conditions were inforced that should compel, on the part of gardeners, and especially those having young families, the giving of a small annual sum to the Fund, to entitle the children to become eligible. Charity is good, but if it encourages carelessness, to make some provision for orphans in such a case, then getting on to the Fund is being made too easy. It is worthy of note, that out of the nineteen applications, it is shown very properly in italics, that in six cases members of the families are already in receipt of relief from the Fund. In one case, which I can hardly regard as decent, with only two children in the family, both are nominated. That is rather hot work, and very improper. Probably it is in view of the growing effort thus to put so many children from one family on to the Fund that the Committee propose at the general meeting to amend Rule 11 by inserting the words "not more than two children of the same family can be in receipt of the benefits of the fund at the same time." No doubt that amendment will be adopted; but to check this effort to make the fund a sort of family relief in aid, I think it would have been better to have gone further, and have said that not more than one child from a family of not more than three children, not exceeding twelve years; or, two from a family of five children, not exceeding twelve years of age, can be in receipt, &c. It does seem to be needful to make the fund secure from being preyed upon by persons who would willingly see an entire family supported by it, whilst other more deserving cases are left vainly crying in the wilderness of neglect for the fund's benefits. *A. D.*

MOULDS ON MUSHROOMS.—In noticing F. F. Page's inquiry in *Gardeners' Chronicle*, January 28, p. 61, *re* fungus on Mushrooms, I would advise him, when preparing the soil for casing the bed, to mix about two or three shovelfuls of fresh lime with the soil. I have found this the only remedy for it. *C. D. Cowley.*

SOCIETIES.

ROYAL HORTICULTURAL.

January 31.—The second meeting of the committees since the commencement of the year was held on Tuesday last in the Drill Hall, James Street, Westminster. Though the Hall was better furnished with exhibits than was the case three weeks previously, the display was not by any means a large one. Orchids were not numerous, but there were some interesting varieties and hybrids of this genus, and several Awards of Merit and a First-class Certificate were recommended by the Orchid committee.

Before the Floral Committee there were large groups of choice varieties of the Chinese Primula; also collections of miscellaneous plants, Ferns, and a remarkable one of Rondeletia cordata. Hardy spring flowers, including the Narcissus, have made their appearance, but they are but specimens that have been obtained by frame or house-cultivation; still, these are the prelude to the season, and the enterprise of the hardy-plant cultivators will most likely provide plenty of such flowers at future meetings until the last of the latest flowering Narcissus has yielded its bloom in the open ground in May. Illustrations of the art of setting up cut-flowers were provided by an exhibit of considerable extent from Messrs. Miller & Co.

The Fruit Committee had little to do, their chief work being the testing of a new Apple, which was given an Award of Merit; and of appraising the Medal value of a collection of choice Apples from the Sawbridgeworth Nurseries.

A lecture upon the orchards of Nova Scotia was delivered by Mr. Hooper at 3 P.M.

The meeting of the Scientific Committee, at 4 P.M., was of more than usual interest. Mr, A. Sutton gave some interesting information regarding a series of experiments that Messrs. Sutton & Sons have lately made in respect to the Potato, details of which are given below.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. O. Thomas, H. B. May, R. Dean, W. Howe, C. Jeffries, J. Fraser (Kew), E. T. Cook, J. Hudson, J. Jennings, T. Peed, R. B. Lowe, C. E. Pearson, W. Bain, J. D. Pawle, R. W. Ker, J. Walker, C. E. Shea, J. W. Barr, H. J. Jones, H. J. Cutbush, C. Blick, and G. Paul.

A collection of Ferns from Messrs. J. Hill & Son, Lower Edmonton, including a number of good specimens of choice species and varieties. Particularly noticeable were Nephrolepis Duffi, Pteris tremula and Smithiana, Davallia pallida, a fine lot of the dwarf Adiantum capillus-veneris imbricatum, Gymnogramma calomelana, G. schizophylla gloriosa, Nephrolepis davallioides furcans, the pretty Cheilanthes myriophylla elegans, &c. (Silver Flora Medal).

Messrs. John Laing & Sons, Forest Hill Nurseries, London, S.E., contributed a group of miscellaneous plants. These were mostly stove species, and included finely-grown Codiæums and Cordylines, some of the choicer species of Palms and Begonias, Gloire de Sceaux, and B. Gloire de Lorraine, &c.

Mr. F. Miller, 110, Fulham Road, South Kensington, made an extensive exhibit of bouquets, and of spring-flowering and bulbous flowers, put up in vases and various Bamboo receptacles of miscellaneous devices. Several species of Cape Restiaceæ were used also with considerable effect. The exhibit generally was one of the best of its kind, and good taste was shown in the arrangement of the flowers. A species of shower bouquet was modified with the intention of representing the outline of a butterfly, and described as the "Butterfly" Bouquet. One of these, composed of Lilies of the Valley and Acacia had some merit (Silver Banksian Medal).

There was a grand show of Chinese Primulas from Messrs. H. Cannell & Sons, Swanley. The collection occupied one-half of one of the long central tables, and it was a pity that there was so poor a light in the hall, it being difficult to appreciate the exact shades of colour of the flowers. There were well-flowered plants in 6-inch pots, representing the true double-flowered sorts, as Marchioness of Exeter, white; Annie Hellier, light pink; Earl Beaconsfield, deep pink; King of the Purples, and Princess of Wales, white. Of single-flowered varieties, Kentish Queen was a very large flower, of pure white, freely flowered, and of good habit; Victory is a purple shade of crimson; nigrifolia oculata has exceedingly dark, beautifully-cut foliage, and compact trusses of white, much-crimped flowers, with a large centre of greenish-yellow; White Perfection has a very prettily-formed flower of purest white, and is of good habit; the Sirdar is a pretty red in several shades; and in Swanley Blue we have a mauve or light purple shade of colour, approaching the desired blue; Cannell's White is a very good variety of its section, and Eynsford White also. Blue Giant, Emperor Improved, Beacon, Swanley Giant, deep pink or purple; Eynsford White, &c., were others in this collection. Lady Emily Dyke showed the result of crossing "White Lady" with the show varieties, and showed an abundance of charming flowers, of less stiffness than the popular types. All of the plants were furnished with an abundance of healthy foliage, and well demonstrated the decorative value of the Primula (Silver Flora Medal).

Mr. Robt. Owen, the Floral Nursery, Maidenhead, had also a collection of plants of Primula sinensis. These plants evidenced good cultivation, and were representatives of a good strain (Bronze Flora Medal).

Rhododendron flowers (nobleanum ?), gathered from the open garden, were exhibited by Mr. Gabriel, Elmstead, Streatham (gr, Mr. H. Guyett). This is another testimony of the precocity of certain plants, induced by the absence of severe frost.

Messrs. Barr & Sons, 12, King Street, Covent Garden, showed Narcissus minimus, Bulbocodium vernum, Iris histrio and I. histrioides, and Chionodoxa Sardensis, all flowering in pots. Also a plant in flower of Veltheimia viridiflora.

A splendid lot of Daffodil flowers, as market samples, was contributed by Messrs. Collins Bros., Hampton, Middlesex, and Waterloo Road, S.E. They represented the varieties Telamonius plenus, Golden Spur, Spurius, Princeps, and Poeticus ornatus. One and all were very fine large flowers for specimens, forced into flower during January (Silver Banksian Medal).

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, had blooms of varieties of their hybrid greenhouse Rhododendrons. Nothing could surpass these in attractiveness; especially noticeable being Princess Alexandra, white or pale pink; Conqueror, red; Ceres, yellow; Primrose, Purity, Aphrodite, blush, &c.

Messrs. F. Sander & Co., St. Albans, again staged fine specimens of their Acalypha hispida (Sanderi) in flower; also plants of Dracæna Sanderiana, Linospadix Petrickiana, and other new plants introduced to notice last year.

A magnificent group of plants in pots of Rondeletia (Rogeria) cordata was shown by Messrs. F. Cripps & Son, Tunbridge Wells, Kent. Some of these were standards from 4 to 5 feet high. The growths and foliage were most luxuriant, and each shoot bore terminal cymes of the pretty pink flowers. This Rubiaceous plant was introduced from Guatemala in 1844.

Plants Certificated.

Acalypha Godseffiana.—A very ornamental species of Acalypha that has been frequently described in these pages, and of which a figure was given in the *Gardeners' Chronicle*, April 23, 1898, p. 242 (Messrs. F. Sander & Co., St. Albans).

Lapageria rosea var. "The Knoll."—A large and free-flowering variety of this well-known greenhouse trailing plant. (Sir T. Lawrence, Burford).

Orchid Committee.

Present: Harry J. Veitch, Esq, in the chair; and Messrs. Jas. O'Brien (hon. sec.), Sydney Courtauld, F. Mason, De B. Crawshay, J. Douglas, E. Ashworth, T. W. Bond, C. Winn, E. Hill, F. J. Thorne, W. H. Young, H. J. Chapman, J. Gabriel, J. Jaques, H. Little, H. Ballantine, and H. M. Pollett.

Cattleya Trianæi was the principal of the showy kinds exhibited, and of these Elijah Ashworth, Esq., Harefield Hall, Wilmslow (gr., Mr. Holbrook), staged two remarkable forms, the finest of which was C. T. Ernest Ashworth and C. T. albida var. E. Ashworth, a very large white flower, with slight blush tint on the front of the lip.

F. Knight, Esq., Thundersley House, Thundersley, Essex (gr., Mr. E. Marston), was awarded a Silver Banksian Medal for a pretty group of excellently well-grown and flowered varieties of Cattleya Trianæi, ranging from the light forms to some with intensely richly-coloured crimson fronts to the lip, the whole serving to demonstrate what a splendid winter flower C. Trianæi is when properly developed.

Philip Crowley, Esq., Waddon House, Croydon (gr., Mr. J. Harris), showed Cattleya Trianæi Waddon House variety, of a delicate shade of peach blossom.

Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, also showed a very handsome blotched form of Odontoglossum crispum, O. Andersonianum Schusterianum, of a bright yellow, with peculiar reddish markings; Cypripedium insigne Luciani of the C. i. Sanderæ class, but of a darker yellow; and a singular hybrid, said to be between Zygopetalum crinitum and Batemannia Colleyi, and provisionally named Zygo-Batemannia × Mastersii. It approached nearest to the section of Zygopetalum represented by Z. Murrayanum (*Bot. Mag.*, t. 3674). Sepals and petals greenish, with purplish markings; lip white, with purple-tinted callus.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Odontoglossum crispum Imperatrix, a large, perfectly-shaped white form, with red-brown blotch on the lip, and a smaller blotch on some of the lower sepals.

J. Gurney Fowler, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), showed C. × Chamberlaino-Leeanum, and a collection of cut-flowers of varieties of Lælia anceps, and a good Cypripedium × Chapmani.

Norman C. Cookson, Esq., Oakwood, Wylam (gr., Mr. Wm. Murray), showed a flower of his remarkable Calanthe × Oakwood Ruby, the cold in the north preventing the plant from being sent. It is a remarkable instance of what perseverance and selection may do; for in this case, the C. vestita rubro-oculata begun with years ago, has been changed in a remarkable manner, from a white flower with a dark blood-red spot in the centre, to a flower wholly of a rich blood-red colour, with a small white eye—the original state reversed. Its pedigree is, first, C. vestita rubro-oculata × rosea, which resulted in C. × Veitchi, Oakwood var., this crossed again with C. vestita rubro-oculata, brought C. × Alexandri, which was again crossed with rubro-oculata, and the progeny seeded from for several years, the darkest being selected for seeding each time with the remarkable result named.

Mr. Jas. Douglas, Edenside, Great Bookham, was awarded a Silver Banksian Medal for an effective group of cut Orchids, among which were fine forms of Lælia anceps, hybrid Calanthes, Cypripedium Boxalli, Cœlogyne cristata, his pretty pale yellow Lælia × Brysa, &c.

H. F. Symonds, Esq, Woodthorpe, Beckenham (gr., Mr. Geo. E. Day), showed a pretty group, made up of very fine specimens of Dendrobium Jamesianum, Lycaste Skinneri alba, Odontoglossum crispum, O. Andersonianum, O. mulus, Cœlogyne cristata, and some Cypripediums, among which was C. × Almos, apparently a good form of C. × Sallieri (Silver Banksian Medal).

Messrs. Hugh Low & Co., Enfield, showed Phalænopsis × Wiganiæ, said to be between P. Schilleriana and P. Stuartiana. The sepals and petals were white, with a bright rose-pink glow in the centre, the lower halves of the lateral sepals being spotted with dark rose colour; lip white, with a yellow callus and many crimson spots. Messrs. Low also showed Cypripedium insigne Sanderæ.

H. S. Leon, Esq., Bletchley Park, Bletchley (gr., Mr. Hislop), showed Cattleya × Hislopi (Lawrenceanum × Luddemanniana Ernsti). The flower, which was of an uniform tint of rose colour, darkest on the lip, showed traces of C. Luddemanniana in the lip, and when strong will doubtless develop more marked characteristics.

Mr. W. Driver, gr., Longford House, Minchinhampton, sent Cypripedium villosum.

Awards.

Lælia anceps Amesiana, Crawshay's variety.—This variety has previously been given an Award of Merit, and upon the flowers obtaining full colour, a First class Certificate was awarded. Its distinguishing characteristics are the depth, brightness, and richness of its colour, which far surpasses the original. It was figured in our columns January 22, 1898, fig. 22, p. 59. From De Barry Crawshay, Esq.

Cypripedium Miss Louisa Fowler (Chamberlainianum × insigne var.).—A very pretty hybrid, of which the suggested cross with a form of C. insigne, is doubtless correct. The upper sepal was pale green, with lines of heavy purple blotches, those nearest the edge being smallest. Lower sepal green, with a few purple dotted lines, petals curved forward, and suggesting C. Chamberlainianum in form; the edge wavy and ciliate, tinged and veined with purple; lip bright light rose; staminode cushion-like, and yellow. From J Gurney Fowler, Esq. (Award of Merit).

Masdevallia Curlei (M. macrura and tovarensis).—A very remarkable hybrid, with the long wax-like flowers of M. macrura, and white-like M. tovarensis. From Sir T. Lawrence, Bart. (Award of Merit).

Epidendrum umbellatum.—A species with fleshy-green leaves and flowers in few-flowered umbels succeeding each other, and of a pale green colour. From Messrs. Stanley, Mobbs & Ashton, Southgate (Botanical Certificate).

Cypripedium × Wiertzianum (Rothschildianum × Lawrenceanum).—A showy hybrid, with white upper sepal bearing a number of purplish-chocolate lines; the petals are white, with purple spots, and a faint rose tinge; the lip a dark purplish-rose. From Messrs. Linden, Parc Leopold, Brussels (Award of Merit).

Cattleya Trianæi var. E. Ashworth.—A noble flower, with pure white sepals and petals, the latter being over 3 inches wide. The base of the lip was blush-white, the disc bright yellow, and the front lobe an intense purplish-crimson colour, with narrow white margin. From E. Ashworth, Esq. (Award of Merit).

Cattleya Trianæi var. Memoria Lindeni.—A grand form, resembling their C. T. Imperator, and having a similarly coloured rich claret-crimson lip. From Messrs. LINDEN, Parc Leopole, Brussels (Award of Merit).

Fruit Committee.

Present: Philip Crowley, Esq., chairman; and Messrs A. F. Barron, W. Poupart, W. Wilks, Alex. Dean, J. W. Bates, F. Q. Lane, G. Reynolds, and J. Willard.

Messrs. T. RIVERS & SON, Sawbridgeworth, had a table of magnificent fruits. These were chiefly Apples, and the following varieties were noticed:—Gloria Mundi, Buckingham, Gascoigne's Scarlet, King of Tomkins Co., Belle de Pontoise, Nancy Jackson, Melon, Wagener, Reinette du Canada, Reinette Doree de Hensgen, Lord Derby, Bijou, Bailey's Sweet, Wadhurst Pippin, Lewis' Incomparable, and Emperor Alexander. The quality of these fruits was remarkable, and some of the varieties are less common than they might be. Some fruits and sprays of foliage of varieties of St. Michael's Orange were very attractive (Silver Knightian Medal).

W. ROUPELL, Esq., Roupell Park, S.W., showed a few samples of Newton Wonder, Smart's Prince Albert, and Annie Elizabeth Apples from his suburban garden, within the five miles radius. The fruits were in a good state of preservation.

AWARDS.

An Award of Merit was recommended to a new seedling Apple, named Lady Pilkington, from the Southport and Churchtown Botanic Gardens. In appearance it is exceedingly like to Dumelow's Seedling, but the flesh is softer and more agreeable to eat. The eye is less open also.

Scientific Committee.

EXPERIMENTS ON CROSS-BREEDING POTATOS, ETC.

AT the meeting of the Scientific Committee on Tuesday last, Mr. A. W. SUTTON exhibited the results of his experiments, which were of a very interesting character. They had reference to the grafting of a scion from the Tomato on to the haulm of a Potato stock; a similar engrafting of Solanum nigrum and of Solanum esculentum. The Potato in each case was grown in a pot, the haulm cut back and worked with the Tomato or the Solanum. Further experiments were made in fertilising the flowers of a Potato borne on a Potato-scion engrafted on a Tomato-stock, and reciprocally. Tubers of uncrossed and of crossed Solanum Maglia were also shown, together with tubers of Solanum etuberosum and other varieties. The following details refer to the specimens exhibited:—

Potato Grafts.

No. 1.—Typical sample of the old Paterson's Victoria Potato.

Potato Victoria grafted with a scion of Tomato.

No. 2.—In 1895, a plant of Victoria Potato was grafted with a scion from the Tomato (variety Maincrop), and all the Potato stems other than the one grafted with Tomato were carefully removed. The graft was made about 3 inches above the soil. The tubers produced by this plant in 1895, '96, and '97 were certainly small, and in striking contrast to the typical Victoria. The tubers now sent marked No. 2 are a fair sample of those grown last season, for comparison with type No. 1. [Very small].

Potato Victoria grafted with scion of Solanum nigrum.

No. 3.—In the same year (1895) another plant of Potato Victoria was grafted in the same manner, but the graft in this case was Solanum nigrum. The tubers marked No. 3 of crop 1898 do not differ from the type No. 1 (ordinary Paterson's Victoria).

Potato Supreme grafted with a scion of the Egg-plant (Solanum esculentum).

No. 4.—In 1895, a typical sample of Potato Supreme was grafted with a scion from the Egg-plant. In this case also the character of the Potato has been unaffected by the graft.

No. 4A.—Are tubers grown in 1898 from the grafted plant.

Experiments in Cross-fertilising Potato-flowers borne upon the Tomato-plant grafted with Potato.

No. 5.—A typical sample of the old Potato Woodstock Kidney.

No. 5A.—In 1895 a stock of Tomato, Earliest-of-All, was grafted with a scion of Potato Woodstock Kidney. The Potato flowers produced on the scion were fertilised with pollen from the Tomato Earliest-of-All, and seed saved in the summer 1895. The seed sown in March, 1896, produced tubers mostly small and diseased. In 1897 the crop again was very small and diseased. In 1898 the crop was a good one, the tubers being almost or quite round, not unlike a handsome Tomato, but this contrast to the shape of Woodstock Kidney is not greater than is constantly seen in seedling Potatos, where no cross-fertilisation has taken place. There is no apparent difference between the foliage of 5A and that of many other Potatos.

No. 5A was the only seedling considered worth keeping in the autumn of 1896. All the other seedlings were discarded as very unpromising.

No. 5B.—Tomato, Earliest-of-All, was grafted with a scion of Potato Woodstock Kidney, in 1895. The Potato flowers in this case were fertilised with their own pollen. The seed was sown in 1896, and the tubers were very similar in type to Woodstock Kidney. In 1898 the trial report on the seedling was "a medium crop of tubers resembling Woodstock Kidney." In this case also only one seedling was kept in the autumn of 1896.

From a comparison of 5A and 5B, it would certainly appear that the Tomato pollen had affected the seedling resulting from the cross.

Solanum Maglia Hybrids.

No. 6.—Typical tubers of Solanum Maglia grown from the Kew stock.

No. 6A.—In 1887, some hundreds of flowers of Solanum Maglia were fertilised with pollen from cultivated Potatos, but the only cross effected was with pollen taken from an unnamed Potato seedling, and this cross resulted in two seedlings, but one of these was so weak that, notwithstanding every care, it was lost. The other produced tubers the first year corresponding to sample 6A, and as the result of careful cultivation it has increased in size during recent years, as shown by sample 6B. The general constitution of the seedling is weak, and as a variety of Potato, it will not for a moment compare with the ordinary Potatos of commerce.

Solanum etuberosum.

No. 7.—Solanum etuberosum received in 1887 from Mr. Lindsay, of the Royal Botanical Gardens, Edinburgh, which have been grown each successive year. The tubers when received were very small, about the size of No. 7, but flatter, and have increased in size during the intervening years, until they have now reached the size of marketable Potatos, as represented by the sample 7A.

Curious Varieties of Potatos or distinct Species.

No. 8.—In 1888, Mr. Sutton received from a correspondent a distinct variety of Potato from Africa, the shape being somewhat similar to the Fir-apple Potato, but mottled in colour. The foliage is exceedingly dark in colour, and distinct from any other with which I am acquainted. The stems are erect and very bushy, and the leaves are so round as to appear at first sight entirely unlike those of the Potato, and rather resemble those of the Urtica dioica, the common Stinging-nettle. At a distance one would hardly think the foliage could be that of a Potato.

No. 8A.—The tubers, as received, were about the size of sample No. 3, but as a result of good cultivation they have now reached the size represented by sample 8A.

No. 9.—Specimens of the large white Fir-apple Potato.

No. 10.—Specimens of the small white Fir-apple Potato.

No. 11.—Specimens of the red Fir-apple Potato. These three Potatos produce flowers, but no berries. The foliage generally speaking, corresponds with that of other Potatos, and is quite unlike No. 8.

Results of sowing Tomato-seed saved from Potato-plant Grafted with Tomato.

1895.—In this year a scion of Potato Victoria was grafted with Tomato Maincrop. Seed was saved in the autumn of 1895.

1896.—Seed sown, several plants raised, and seed again saved.

1897.—Seed from last year's trials sown in the spring, and ten or twelve plants put out in the open in June. It was evident on comparing these plants with several trials of the true Maincrop Tomato growing alongside that the graft had materially affected the variety, which happens to have very distinctive characteristics, the leaves of Maincrop being exceptionally large, massive, and almost entire in outline, generally at least three times the size of those of the ordinary Tomato; the plants of the seedling appeared quite distinct from the true Maincrop; there were many more fruits on each plant, and these fruits were decidedly smaller and earlier, and more corrugated. The leaves, however, were similar in character, but decidedly smaller. Seed was again saved from these plants.

1898.—Seed sown again, and the same number of plants put out in June. The 1897 notes were entirely confirmed, but the contrast between these plants and those of the true Maincrop Tomato growing alongside was perhaps more marked than in the preceding year.

Lecture.

A YEAR AMONG THE ORCHARDS OF NOVA SCOTIA,

given by CECIL H. HOOPER, M.R.A.C., F.S.I.

On Tuesday afternoon, January 31, at the Royal Horticultural Society's meeting, Mr. HOOPER began by describing the geography, climate, and soil of the Annapolis valley, the renowned fruit-belt of Nova Scotia. The extent of the valley is about one hundred miles, its width about ten, most of which is adapted to Apple-raising. In the centre of the valley is a peaty soil over sand, where an important Cranberry industry is beginning. There are about 200 acres at present devoted to Cranberry bog, which give excellent monetary returns. Mr. Hooper is of opinion, than Cranberries would make a remunerative crop on some of the English and Scotch moor and heath land, as it is apparently on similar land that the Cranberry thrives so well in Nova Scotia. He said that the two chief manures used in the orchards were bone-meal, about 5 cwt. per acre, muriate of potash 20 cwt.

He went fully in the method and details of spraying combinedly for fungi and caterpillars with copper-sulphate, lime, and Paris-green; he exhibited a spraying-pump, such as is commonly used in Nova Scotia, capable of delivering a fine spray at 20 or 30 feet from the ground. Grease banding is practised to a small extent in Nova Scotia, but it is generally considered that if spraying is thoroughly done at the right periods, the bands are not necessary, their greatest use being on tall trees, difficult to spray thoroughly. The Nova Scotia orchards are ploughed, and during the summer are either cropped with vegetation requiring frequent cultivation, as Potatos, Maize, and Beans; or, if uncropped, they are frequently harrowed, to maintain a fine tilth 3 inches deep.

A full description of the sorting and barrelling of the Apples was given. His opinion of the fruit and orchards was, that the fruit was generally large, well-coloured, and abundant; but with the exception of the Gravenstein Apple, he considered the flavour not quite so good as the best English Apples. The trees appear to grow rather larger than in England; and he gave an example of a Nonpareil Apple-tree at Cornwallis Rectory having a circumference of 10 feet at 1 foot from the ground, which, during the last twenty years, has yielded from 2 to 14 barrels, and averaged 9 barrels of 120 lb. each. The orchards generally he considered better cultivated and cared for than those of England, and the produce was certainly better in size and colour than the fruit of England generally; but the best English orchards and finest English fruit equals anything he saw in Nova Scotia.

Mr. Hooper dealt at some length with the work of the Nova Scotia Fruit-Growers' Association, and its School of Horticulture at Wolfeville, as a good example of farmers combining for the welfare of their industry; also with the work of the Office of Agriculture of Nova Scotia, with its model farm and dairy school at Truro, and the Provincial Experimental Station at Nappan for the trials of different varieties of corn, vegetables, and fruits, under the Department of Agriculture of the Dominion. The School of Horticulture is attached to the Wolfeville University, and is managed jointly by the Fruit-Growers' Association and the Nova Scotia Office of Agriculture; its course is from the beginning of November to the end of April. The classes are free, and they consist of classes for botany, microscopical botany, and horticulture; in the latter, the propagation of plants and fruit growing are chiefly dealt with. The school consists of a class-room, with a good library of English, Canadian, and American books and horticultural journals, and microscopes. There is a potting-shed and workshop, a root-cellar for Apple-stocks to be root-grafted during the winter; a glass-house with ornamental plants, flowers, and fruit-trees for grafting and budding, and a propagating-bed. The school is surrounded by ornamental grounds, and has a fruit-tree nursery attached. Farmers are invited to look round at any time, to attend any class or lecture that may be going on, and to bring specimens for identification, or to ask questions.

THE ROYAL SCOTTISH ARBORICULTURAL.

(Continued from p. 64.)

JANUARY 24.—Perhaps the most important incident in the report was the presentation of a Forestry bursary of £30 by Mr. MONRO FERGUSON, M.P., and permission to the forestry students to make visits to study in the woods of Martly, thus taking the initiative in establishing a school of forestry, and for which a Government grant is expected. The Treasurer's report, which showed a balance in hand of £124 6s. 9d., was approved.

COLONEL BAILEY referred to the general reports that timber-growing did not pay in this country. He assured his hearers that there was, however, little or nothing the matter with our soil or our climate telling against the growth of timber-trees; we had as much sunshine as North Germany or the shores of the Baltic. He also wanted to know where we could find worse soil in this country than the French forest country, or the shores of the Bay of Biscay, consisting of from 94 to 95 per cent. of silica. Of course, we may place forests too high for the production of good timber; but on the flanks of hills, and on the sides of valleys and streams, timber-trees grow well. The fact was, that profit on timber was not the chief object of the owners of woodland, but rather it was shelter from the wind, the rearing of game-birds, and obtaining picturesque effects, and each of these militated against profitable forestry.

For more than thirty years this Society had been urging the application of sylvicultural methods to the growth of timber, and a school or schools for the training of young foresters was one of the great needs of the day. In 1882, the Council of the Society recommended the establishment of a forestry school. In 1889, the present Forestry Lectureship was founded in the Edinburgh University. In 1891, efforts were made to raise the Lectureship to the dignity of a Professorship, but this had not yet been done. During the current year the Society addressed a memorial to the Minister of Agriculture, urging him to secure a small State forest, which should serve the following ends: firstly, to show what could be done by sylvicultural methods, and their monetary results; secondly, to present the landlords and foresters a successful object-lesson, showing them how the best results were to be obtained; thirdly, to provide an efficient training-ground for forestry students; and fourthly, to provide a State forest in which researches could be carried out, and for the compilation of accurate forestry data for the country at large. Unfortunately, the Minister's reply was a polite refusal. This was specially unfortunate, as, perhaps, there is no art which needs practical demonstrations more urgently than scientific forestry; and this was one of the chief objects in establishing a State Forest School near Edinburgh. As yet we had not felt a pressing need for timber grown at home, good foreign wood being cheap and plentiful. But the consumption of wood was increasing, and in some directions the demand greatly exceeded the available supply. Mr. Mungo Ferguson had kindly allowed them, for educational purposes, the run of the woods of Martly, some 800 acres, which, with the woods at Novar, would be worked on a systematic plan, and would go far to enable them to answer the question, whether the cultivation of timber trees is a paying business. The Colonel concluded by proposing the Earl of Mansfield as his successor.

The EARL OF MANSFIELD, who accepted the chair, thanked the Society for their kindness in electing him, and said he had partly accepted office to oblige his old friend Mr. Munro Ferguson; but apart from that, he felt honoured in being appointed to the office, and would do what he could to be a satisfactory president of the Society.

Office-Bearers.—Colonel Bailey, Mr. Malcolm Dunn, and Mr. Methven, were elected vice-presidents. Messrs. C. Buchan, Penicuick; William Gilchrist, Leuchars; Wm. Makinon, nurseryman; John T. McLaren, Polmaise, Stirling; and John Methven, nurseryman, Edinburgh, were proposed for the Council. Mr. Waldegrave Leslie thought there were too many Edinburgh nurserymen on the Council. On being put to the vote, 22 voted for Mr. Boyd, and 19 for Mr. McLaren. Mr. Munro Ferguson was re-elected honorary secretary, and Mr. Robert Galloway treasurer and secretary, both being thanked for past services.

The excursions undertaken next autumn are to be made to Ross-shire and Sutherland, the Novar, Skits, and Lovat estates; and to France next year during the great exhibition in Paris, the time devoted to it being probably a fortnight.

An interesting letter was read from SIR JAMES GIBSON CRAIG, Bart., of Riccariton, giving particulars of a venerable Scottish Fir which was blown down recently, and thought to be 270 years old.

At the conclusion of the ordinary business, Colonel BAILEY gave an instructive and interesting account of a recent visit he had made to Canada, illustrating it with maps and lime-light views. He explained that Britain imported annually £18,000,000 worth of timber, having added some £2,000,000 within the last eight years, of which £3,500,000 came from Canada, £4,000,000 from Sweden, £4,000,000 from Russia, and £2,500,000 from the United States. One third of these imports came across the Atlantic. The United States also imported from Canada twice as much wood as they exported to this country. An official of the Canadian Government reported in 1895 that the country contained 250,000 square miles of forests, a large portion, however, had not got timber ever likely to be exported. Timber supplies were also being constantly reduced by settlers burning their clearings, the needs of the new railway lines, &c. For all that, Canada had still great resources in timber, which, if wisely managed, and the cutting effectively controlled, will ensure plenty of wood for themselves and for us for a long time to come.

The annual dinner took place at the North British Hotel in the evening, the Earl of Mansfield taking the chair.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT.

THE members of the Isle of Wight Horticultural Improvement Association recently visited Southampton to inspect the warehouses of the Messrs. Toogood & Sons, Royal Seedsmen; and the manure works of Messrs. Spooner & Bailey.

They were met at the pier by the Messrs. Toogood, and driven to the firm's Chapel seed-packing warehouse, which has a floor area of 388,800 square feet. Much interest was felt by the visitors in watching the actual work of seed-cleaning and packeting. The shop and offices were next visited, and the members of the Association were then entertained to luncheon by the Messrs. Toogood.

The visit to the manure works of Messrs. Spooner & Bailey was interesting. The manufacture of sulphuric acid was fully shown and explained, also of various other manures, and the mixing of special manures.

THE PEOPLE'S PALACE HORTICULTURAL.

JANUARY 26.—The members of this Society dined together at the Three Nuns Restaurant, Aldgate, on the above date, under the presidency of E. Flower, Esq., M.P., one of the Hon. Secretaries, and also one of the founders of the Society.

The Society, which is doing much good work in the district, in encouraging a taste for window and other forms of gardening, was founded in 1887. It adds yearly to the number of its subscribers, and has held several shows annually, and last year to the number of four, considerable sums in prizes being awarded. The President, in the course of his remarks, dwelt on the fact that it was to a large extent a self-supporting and self-governing Society. The membership was now 510 strong.

In proposing the health of the acting Secretary, Mr. C. E. Osborn, the Chairman bore testimony to the value of his work; the success achieved had largely resulted from Mr. Osborn's warm interest in the work.

Obituary.

MR. JOHN NICHOLL.—Many readers of the *Gardeners' Chronicle* will regret to learn the death of Mr. John Nicholl, nurseryman, of Redruth, which took place January 25, 1899. He was for many years the owner of the Redruth nursery, and had a wide experience as a landscape gardener. Many hundreds of acres of plantations now adorning the hills and dales of Cornwall were planted by him, or under his directions. Well informed on many matters, and always courteous, a chat with him was very entertaining. The deceased was eighty-four years of age. He will be greatly missed by a wide circle of friends. *J. M.*

MARKETS.

COVENT GARDEN, FEBRUARY 2.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

FRUIT.—AVERAGE WHOLESALE PRICES.

POTATOS.

Beauties, Saxons, Giants, Up-to-Date, &c., according to sample, 60s. to 80s. per ton; Dunbar Main Crops, 90s. *John Bath, 32 and 34, Wellington Street, Covent Garden.*

REMARKS.—On Saturday, January 28, some fine stout, capitally-grown Seakale was on sale in the Market, and realised 14s. per dozen punnets. The Cape Peaches were stated to be good in quality, and other importations are expected to arrive. Shallots are a very slow trade. Tomatos from the Canaries are now coming in fine condition. The Potato trade is slow.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

	s. d. s. d.		s. d. s. d.

		Scarlets, per doz.	4 0- 6 0

SEEDS.

LONDON: *February* 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that there is now a good inquiry for bold, clean samples of new English Cow-grass; medium and lower qualities, however, meet with less attention. There is no change this week in American red Clover seed; and as regards Alsyke, White, and Trefoil, values keep steady. Perennial and Italian Rye-grasses point upwards. An improved business as a result of the recent cold snap must be noted in Blue Peas, Haricot Beans, and Spanish Lentils. Bird seeds, in the absence of transactions, call for no remark. Full prices are asked for both Mustard and Rape seed. New Scarlet Runners, being cheap and good, meet with favour; but more money is asked for Canadian Wonder Beans.

FRUIT AND VEGETABLES.

GLASGOW: *February* 1.—The following are the averages of the prices recorded since our last report:—Apples, per barrel, Canadian, Baldwins, 23s. to 26s.; Greenings, 20s. to 21s.; various, 18s. to 21s.; Americans—Californian, Newtown Pippins, 11s. per case; Lemons, Messina, 6s. to 8s. do.; do., Palermo, 7s. to 9s. do.; Grapes, home, 1s. 3d. to 1s. 9d. per lb.; Oranges, bitter, Seville Bitter, 11s. per box; Oranges, Jaffa, 7s. 6d. to 8s. per case; do., Valencia, ordinary, 420's, 5s. to 6s. do.; do., fine selected, 6s. 6d to 7s. do.; do., large, 5s. to 8s. do.; do., extra large, 9s. to 12s. do.; do., large, 714's, 6s. 6d. to 7s. 6d. do.; Onions, Valencias, 4's, 10s. to 10s. 6d. per case; do. 5's 11s. to 12s. do.; Tomatos, Teneriffe, 3s. do.; Cabbage, Savoys, 1s. 3d. to 1s. 9d. per dozen; Cauliflowers, 1s. 6d. to 2s. do.; Parsnips, 3s. 6d. to 4s. per cwt.; Herbs, 1d. to 2d. per bunch; Mint, green, 6d. do.; Leeks, 1s. 6d. to 2s. 6d. per dozen bunches; Parsley, 1s. 6d. to 1s. 10d. per stone; Potatos, best, 5d. to 6d. do.; Carrots, 2s. to 4s per cwt.; Artichokes, 1s. 6d. do.; Cucumbers, 9d. to 1s. each; Horseradish, 1s. 9d. to 2s. per bundle; Mushrooms, 1s. to 1s. 3d. per lb.; Beetroots, 6d. to 7d. per dozen; Brussels Sprouts, 1s. 3d. to 1s. 6d. per stone; Turnips, large, 2s. 6d. per dozen bunches; Sea Kale, 1s. 9d. to 2s. per bunch.

LIVERPOOL: *February* 1. — *Wholesale Vegetable Market*:—Potatos, per cwt., Giants, 2s. 2d. to 2s. 4d.; Main Crop, 2s. 6d. to 3s. 2d.; Bruce, 2s. 4d. to 2s. 8d.; Turnips, 8d. to 10d. per dozen bunches; Swedes, 1s. 2d. to 1s. 4d. per cwt.; Carrots, 2s. 9d. to 3s. 3d. do.; Parsley, 8d. to 1s. per dozen bunches; Onions, English, 6s. 3d. to 7s. per cwt.; do., foreign, 5s. to 5s. 9d., do.; Cauliflowers, 1s. 9d. to 3s. per dozen; Cabbages, 8d. to 1s. do.; Celery, 8d. to 1s. 6d. do. *St. John's*:—Potatos, 10d. to 1s. per peck; Grapes, home, 2s. 6d. per lb.; do., foreign, 8d. do.; Pines, home, 5s. to 6s. each; Cob-nuts, 6d. per lb.; Asparagus, 1s. to 3s. per bundle; Cucumbers, 1s. each; Mushrooms, 1s. 3d. per lb., and basket.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending January 28, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.		1899.		Difference.		
	s.	d.	s.	d.		s.	d.
Wheat	34	6	26	7	—	7	11
Barley	27	8	27	9	+	0	1
Oats	17	2	17	0	—	0	2

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

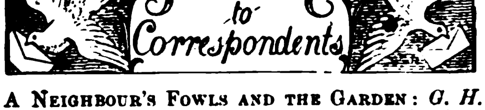
The following summary record of the weather throughout the British Islands for the week ending January 28, is furnished from the Meteorological Office:—

"The *weather* was mild, unsettled, and rainy at the commencement of the period, but soon became much colder, dry, and very fine generally. Over the north of England and the south of Scotland, however, a good deal of fog or mist was experienced.

"The *temperature* was much lower than that of any previous week during the present winter. In 'England, E.,' it was 2° above the mean average, and just averaged it in 'England, S.,' but elsewhere it ranged from 1° below the normal in the 'Channel Islands,' to 4° below in 'Scotland, N.,' and 'Ireland, N.,' and to 6° below in Scotland, E.' The highest of the maxima were recorded on the 22nd, and ranged from 55° in the 'Channel Islands,' and 54° in 'England, E. and S.,' and to 45° in 'Scotland, N.' The lowest of the minima, which were recorded during the middle or latter part of the week, ranged from 10° in 'Scotland, E.' (at Braemar), 12° in 'Scotland, N.,' and 15° in 'Scotland, W.,' to 28° in 'England, S.,' and to 32° in the 'Channel Islands.'

"The *rainfall* was less than the mean in all districts. The fall over the greater part of the Kingdom was very slight, and took place on the 22nd or 23rd.

"The *bright sunshine* was greatly in excess in all districts. The percentage of the possible duration ranged from 26 in 'England, N.E.,' and 30 in 'Scotland, N. and W.,' to 45 to 47 in Ireland, 56 in 'England, S.W.,' 59 in 'England, S.,' and 60 in 'England, E.'"



A **Neighbour's Fowls and the Garden**: *G. H.* The law does not allow you to kill the fowls, these being domestic animals. Your proper course, after doing what is required, by fencing, &c., to keep out the birds, is to warn the owner, and if the depredations still continue, to sue him for the amount of damage done. A little friendly remonstrance would, we should suppose, suffice to abate the nuisance.

Books: *Charles Brown.* The latest we know of is Dr. Udo Dammer's *Palmenzucht und Palmenflege* (propagation and cultivation of Palms), published by Trowitzsch und Sohn, Frankfort. It was reviewed in these columns Feb. 5, 1898.

Buck-wheat: *E. B.* Ordinary Buck Wheat is, botanically, Polygonum or Fagopyrum esculentum, a European and northern Asian plant, growing to an elevation of 14,000 feet. It can be raised as a first crop on newly broken-up sandy land, but not too dry heath land, and may be ploughed in as green manure. Growth being extremely rapid, it can be grown at a great elevation, and in climates where the summers are short. In Norway it grows to lat. 67° 56′. The grain can be made into palatable food by boiling or baking, and it is good in meat-soups, used similarly to pearl-barley. On very rich soil the plant yields much foliage, but less grain, than on poor soil.

Caper Bush: *W. L. L.* The plant is too tender for outdoor culture in this country. In the south of France the plant is extensively cultivated out-of-doors. The young berries, preserved in salt and vinegar, form the capers of commerce. The plant, which is a trailing bush, would grow in the greenhouse, and outside against a warm wall, as at Kew and the Oxford Botanic Garden.

Drain from Stables: *Constant Reader.* To enable the drain to clear itself, a fall of not less than 2 inches in a yard run would suffice, and this for half the distance traversed, that is, to about the beginning of the steep descent of the road would involve digging the trench ten feet deep at the lowest part, and gradually working up to the stable floor. Down the descent from the point where the bottom of the drain comes to within 1½ feet of the surface, the drain may generally follow the fall of the road at a depth of 1½ or 2 feet. Ordinary drain-pipes cannot be recommended, for however well they may be laid the sewage will escape into the ground at the joints, and in course of time cause a nuisance; iron-pipes, or glazed earthenware-pipes with collars, which can be filled with cement are preferable, especially the first named.

Dyed Flowers in a Wreath: *Irvine.* A Gnaphalium, or similar Composite, deeply stained with violet dye.

Liliums, Tuberoses, &c.: *A. S. W.* There appears to be no disease affecting the one or the other, and the failure must therefore be sought in some of the details of the cultivation afforded them being unsuitable. Failure in respect of Tuberoses very frequently arises from the fact that the tubers make considerable top-growth before there are sufficient roots formed to support it. As in the case of most bulbous plants that are subjected to such severe drying-off as are Tuberoses, very great care is needed to prevent top-growth bring excited thus prematurely, and until roots are somewhat plentiful very little water indeed should be afforded the plants. If the pots be plunged in a higher temperature than that of the atmosphere it will be a great advantage. In the matter of Lilium lancifolium var. Harrisii, we believe the trouble to be due to a check to growth at a time when the flower-buds had just formed. Perhaps you may be able to detect how this has arisen.

Lime, Nitrate of Soda, and Sulphate of Ammonia, &c.: *T. E. S.* As you omit to state the kind of soil to which the above substances are to be applied, we may say briefly that lime is most beneficial on land containing much vegetable matter—such, for instance, as peat, and, with the sulphate of iron nearly always present in such soils, decomposes them, and combining with the liberated sulphuric acid evolved, forms sulphate of lime—a valuable fertiliser. Clay soil is rendered more friable, and not so liable to be baked in the summer. Lime consolidates sandy soils, causing a greater retention of moisture. The quantity of quicklime per acre may range from 100 bushels to 400 bushels, depending on the depth it is ploughed in—the more the deeper. As a rule, for surface-dressings to be carried to the roots by rain, it is better to afford mild dressings at intervals of a few months, but not during hot weather. Lime used with nitrates would be a wasteful practice. Common salt is better, in the proportion of two of lime to one of salt, and applied at the rate of 40 bushels per acre. Sulphate of ammonia should be applied to orchards in just sufficient quantity to produce healthy and vigorous growth without causing over luxuriance. Potash (nitrate of) is a good manure for almost all kinds of fruits, but it should not be used in greater quantity than 1½ cwt. per acre; but carbonate and muriate of potash may be afforded in the way of wood-ashes, especially those of green wood, applied at the rate of 40 bushels per acre.

Moss on Lawns: *H. G.* When the mossiness is not due to lack of drainage, scratch off as much of the moss as possible with an iron rake, then dress with wood-ashes made from green trimmings and branches of trees and shrubs. In the month of April prick up the bare spots, and spread loam over them, sowing lawn-grasses and fine Clovers over the loamy patches, raking the seeds in and rolling the ground. When the drainage is bad, this must be seen to. Rubble drains 3 to 4 feet deep are better than pipes or tiles if there are trees and shrubs near to or on the lawn.

Names of Fruits: *J. D.* The specimen is not sufficiently good. Send earlier next season.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. E. K.* Probably a species of Zanthoxylum, specimen insufficient.—*H. P.* 1, Acacia armata; 2, A. saligna; 3, Veronica salicifolia; 4, Daphne odora; 5, Eupatorium ageratoides.—*H. H. T.* A very handsome flower of Cattleya Trianæi.—*G. M., Arbroath.* Send when in flower; 2, Toxicophlæa spectabilis, otherwise, Acokanthera spectabilis.—*M. R. M.* The plant you mention is probably mentioned as Cattleya guttata Leopoldi. It is a very easy plant to grow and flower. It usually blooms in summer.—*P. P.* Richardia africana, so-called Arum Lily, because it is not an Arum, and certainly not a Lily! A double spathe is not unusual.—*Ajax.* It is difficult, and sometimes impossible, to name small scraps of Conifers without cones. 1, Pinus insignis; 2, Abies Pinsapo; 3, A. nobilis; 4, A. Nordmanniana; 5, Pseudotsuga Douglasii; 6, perhaps Cedrus Deodara.—*M. C., Rothesay.* Petasites (Tussilago) fragrans, the Scented Coltsfoot. See *Bot. Mag.*, t. 1338.

Orchid Collectors: *Gaspary.* These persons are usually sent out by great nursery firms, and directors of botanical gardens, and they are usually intent on obtaining certain species or new species of Orchids. The ordinary resident collector or trader cannot be depended upon to send any plant that is likely to live, or which is worth cultivating. Far better obtain established plants of known species from European firms.

Palm-leaf diseased: *G. B.* The leaf sent is affected by a fungus, Pestalozzia phœnicis, which was figured and described in the *Gardeners' Chronicle*, Oct. 4, 1884, p. 429. Any of the usual remedies against parasitic fungi may be employed.

Palm Seed: *C. B.* Sow forthwith in pots of sandy loam, singly in small pots, if not many are sown, otherwise from ten to twenty in 6-inch pots. The seeds must be kept close in a temperature of 65° to 70°.

Gardeners' Chronicle
No. 633.—SATURDAY, FEB. 11, 1899.

SOIL *VERSUS* CLIMATE IN THE CULTURE OF ROSES.

BEFORE entering upon this subject, let me say that I have solely in view what are called exhibition Roses, the successful cultivation of which has so materially advanced the culture of the national flower in all its branches, and the subject of enquiry is this—whether the goodness of the soil or the mildness of the climate has most to do with this success? I know that very varying opinions are held, and my own opinion, which may be taken for what it is worth, has always been that much more depends on the climate than on the soil.

Two circumstances have brought it more prominently before me of late, one has been the publication of an interesting *brochure*, by Lord Brougham and Vaux, *Roses of Cannes*, an attempt not to enter into details of Rose culture, but simply to give the Rose-loving public an idea of what Roses are in that favoured locality. Lord Brougham has, as your readers have been told, made himself famous for his success in flowering for the first time in Europe that grand single-flowered species, Rosa gigantea; but the book is mainly occupied with the Roses he grows at Cannes, somewhat in the style of the chapter on "Manners and Customs" in Mr. Foster-Melliar's classic book on the Rose.

The other circumstance is, that Mr. Alexander Hill-Grey, a most enthusiastic grower, has placed in the hands of the committee of the National Rose Society the sum of £5 5*s.* to be by them expended in obtaining an analysis of Rose soils from some of the best Rose-growing districts in the country. We may thus be enabled to see what charm there is in the various "Rose" soils.

But it seems to me, in my ignorance, that there is a preliminary question of no small importance. Roses are but little grown on their own roots; they mostly have foster-parents—the Briar (whether wild or cultivated, seedling or cutting), the Manetti, the La Grifferaie, &c. Surely it ought to be a question whether it is the soil that suits these various stocks that ought to be considered. Take, for instance, the Manetti: this has been much condemned of late years, and yet but for its introduction Rose-growing would hardly have attained its present dimensions; but if the Manetti is planted in what one has always regarded as a true Rose soil—viz., a rich unctuous loam, it acquires such vigour that, without very careful management, it is apt to overpower the Rose budded on it, especially if the latter have any delicacy of constitution.

On the other hand, if the soil is light and gravelly, I believe Roses will do as well on it as on any stock; and I have before my mind a garden where the portion devoted to Roses was of this character, and yet the flowers staged from it generally occupied a foremost place at exhibitions. May it not be, then, that the stock has much more to be considered than the Rose?

Again, if we take the Briar: of late years we have had the cultivated seedling Briar, and the Briar cutting introduced as the stock for dwarf Roses. The seedling Briar spreads out its roots, and is therefore generally considered to be better for lighter soils; while the Briar cutting sends its roots deeply down, and so is better adapted for a true Rose soil. I have mentioned all these matters because, as I have said, the stock has a more important part to play than the Rose. It is manifest that if this be true, the cultivator has very much the matter in his own hands, and he will be regulated in his choice of stocks by the character of his soil, but he has no power whatever over the climate—this he must be content to take as he finds it.

There are some parts of the kingdom where it is impossible to grow Tea Roses in the open, owing to the coldness and bleakness of the situation; while there are others, as in some parts of Cornwall, where it is impossible to grow hybrid perpetuals with any degree of excellence. As the late Hon. and Rev. J. T. Boscawen used to say to me, "I can grow Lapageria rosea and Camellias in the open air, but I cannot grow a decent Marie Baumann." This does not always depend on latitude, for in the south-west of Scotland, where the influence of the Gulf Stream tells, I have seen as grand plants of Roses as I ever saw in my life: I have seen a stand of twelve prize blooms of La France taken off one bush; but get further inland, and you will find what a different matter it is. Go to Perthshire, for instance, where Mr. Hill-Grey for years pitched his tent and tried to grow Tea Roses, but he was so entirely beaten by the climate, that he struck his tent, and came down south, bent upon obtaining a place where he could grow them; and we all know how successfully he has accomplished this in the genial climate of Bath.

I have already alluded to Lord Brougham's description of the manner in which Tea Roses succeed in the Riviera; we have often been told from competent eye-witnesses something of the same kind. Some years ago, for instance, the late Dr. Henry Bennet gave an interesting account in the *Rosarian's Year Book* of his experience there in Rose-growing; while Mr. Alexander Hill-Grey has, in the same publication, detailed the growth of Chromatella, or Cloth of Gold, in the Azores. But neither of them has entered so much into detail as Lord Brougham, and some of his descriptions will astonish growers of Tea Roses in this country. He gives, for instance, an illustration of Marie Van Houtte. The plant figured is seven years old, and covers a piece of ground 70 feet in circumference! We have often seen fine plants of this variety in England, but they are all dwarfs and pigmies in comparison with this one. Of Chromatella, or Cloth of Gold, although he thinks they are distinct, he gives a glowing description of a plant he saw years ago which had taken possession of an Olive-tree, which it had covered with its shoots and beautiful flowers, although he adds, strangely enough, the Rose does not appear to flourish there as it did formerly. Of Papa Gontier, he says that it attains the height of 25 feet, and a diameter of 7 feet, and that a couple of years suffices to turn a single plant into a large bush or tree.

I might multiply instances illustrating the effects of the genial climate of the South of France, and establishing my point that climate has far more to do with the successful culture of the Rose than soil.

Now, let us look to our own country. East Anglia has generally been regarded as one of the most successful centres of Tea Rose growing in the kingdom, and it has the driest, sunniest climate in England; and when my friend, the Rev. F. R. Burnside, lived in the mild and damp climate of Herefordshire, he could only grow his Teas successfully by planting them in an elevation of some 300 or 400 feet above sea-level.

Hybrid perpetuals are, perhaps, not so much influenced by climate as Teas and Noisettes, though they are unquestionably so to some extent. I have seen gardens where the soil was poor in the extreme, but where, the climate being good, magnificent results were obtained. That ardent rosarian, the late Mr. Geo. Baker, at Reigate, made, with a great expenditure of time and money, a splendid Rose-garden out of very unpromising materials. I do not think he would have ventured on this but for the assurance that he had, that the salubrity of the district would be all in his favour. Another proof of the correctness of my position is, the comparative scarcity of amateur growers in the North, and the manner in which they are handicapped in the annual contests of the Rose. So much is this the case, that at Rose-shows held in the North, a much greater number of the best prizes is awarded to southern growers; and this year no northern show is to be held at all, because no place is willing to run the risk of incurring the responsibility, financial and otherwise, of holding a Rose exhibition.

I have thus endeavoured to give the pros and cons in this disputed matter. I am not an exhibitor, and have no personal interest in the question; and I should be very glad if the observations that I have made should lead to a further discussion upon the subject. On this, as on every point connected with gardening, opinions will differ, and nothing but good can result from ventilating them. *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

PASSIFLORA "MARGARET WILSON."

THE Passion-flowers form, in many respects, a remarkable group of flowering plants. The structure of the flower attracted notice long ago, and suggested the adoption of a symbolical designation for the order. Many of the very numerous species, all exotic, have found their way into cultivation. The most familiar one is the widely-grown Passiflora cœrulea, a south Brazilian plant, with constitution so hardy as to enable it to withstand, with a little shelter, the winters of the south of England, and the winters of Scotland also when they are open. The white variety of this species, Constance Eliott, differs from the type in lacking the "cœrulean" colours of the radiating coronal filaments, the petals and sepals being almost the same in both. The leaves of P. cœrulea are commonly 5-lobed, the branches sub-terete, obscurely angled, and the stipules large and aristate. The flowers are 3 to 3½ inches in diameter, the perianth flat or recurved, and the coronal rays straight. The odour is faint and unpleasant.

In another section of the genus, the species have leaves simple and ovate, branches quadrangular and winged, and stipules small and tapering. P. alata and P. quadrangularis are well-known warm-greenhouse examples of this section.

The peculiar traits of certain species evidenced by their reluctance to set seed with their own pollen, and yet be readily susceptible to cross-fertilisation, have engaged the attention of skilled observers. Among the numerous hybrids secured, there is one of special interest in the present connection, viz., P. Buonapartea. This beautiful

Passion-flower is commonly understood to be a hybrid between the above-named quadrangular-stemmed species. The perianth is 5 inches in diameter, fleshy, deep red, and never flattened out. The long wavy coronal rays form a deep basket, barred and dotted with "red, white and blue," enclosing the conspicuous reproductive organs. To add to its attractiveness, the odour is powerful and pleasant.

The new hybrid (fig. 36, p. 89) is from P. Buonapartea, fertilised by P. cœrulea. One seed only germinated out of many taken from a fine fruit. While bearing resemblance to P. Impératrice Eugénie and others derived by crossing P. alata or P. quadrangularis with P. cœrulea, it is quite distinct from, and in many features, bears very favourable comparison with these. Its fine lilac-rose colour, its pleasant and not too penetrating perfume, its shapely leaves, and very robust and floriferous habit, render it a desirable addition to the list of indoor climbers.

It possesses many characters of botanical interest, its hybrid nature being very manifest in every structural, even microscopical, detail. It may suffice at present to mention one interesting feature, in which ocular demonstration is afforded of a remarkably precise solution of an arithmetical problem. The leaves of the one parent have, so to speak, one lobe, the other five lobes, and the hybrid three. The result of the blending of parental characters can be expressed arithmetically, thus,

$$\frac{5+1}{2} = 3.$$

Description.—Young stem and branches distinctly 4 to 5-angled, often purplish; leaves glabrous, three-lobed; petiole 1½ to 2 in. long, bearing four glands, two of which are placed near the top, and the other two about mid-length; lamina, 5 to 6 in. long, 7 to 8 in. broad, base cordate, lobes ovate-acute notched near the angles; stipules, ¾ inch long, ½ inch broad, oblique, serrate, acuminate; peduncle 1 to 1¼ inch long; bracts foliaceous, ovate-cordate, crenulate, 1 inch long. Flowers, 4¾ to 5 inches diameter, odoriferous; perianth lilac-rose, sepals oblong, fleshy, cuspidate; petals oblong, spreading, paler underneath, often cucullate at the apex; faucial corona of four series of filaments, the outer double series alternate, eighty to ninety-five in number and 1½ to 1⅝ inch long, deep purple-brown at base, further up banded with pure white, the distal-half bright purple-blue, often undulate, tip whitish, glandular; the inner series ½ inch long, straight or slightly bent, very deep brown purple; median corona forming below a membranous red tube inclining towards and enclosing the base of the gynandrophore, receding above in a whorl of short, almost black filaments; the infra-median annulus, fleshy, incurved; basilar corona, a cup-shaped dilatation of the base of the gynandrophore; anthers somewhat aborted; pollen deficient; ovary elliptical, light green; stigmata, purplish-drab. *John H. Wilson, D.Sc., St. Andrews.*

KEW NOTES.

Coleus thyrsoideus.—Note of the introduction of this new species of Coleus was made in the *Gardeners' Chronicle* last February, p. 79, on its flowering at Kew. It was then described as a showy blue Labiate which was likely to prove a useful winter-flowering plant for the greenhouse. Several plants raised from cuttings struck in spring and grown on in a warm greenhouse in summer have formed shapely bushes 2 feet high and wide, and in December they developed terminal thyrsoid panicles 9 inches high of flowers of the brightest gentian-blue colour, which have been an attraction for nearly two months, and are still good. I know no plant that is more effective in the winter; certainly no plant at Kew has been more admired. No doubt in a clearer atmosphere than we have at Kew in winter this plant would be better even than it has been here. It is worth the attention of all who are interested in winter-flowering greenhouse plants. The leaves are bright green, coarsely serrated, and about 3 inches long and wide.

Pycnostachys urticifolia.

This is another handsome blue-flowered Labiate from British Central Africa, whence numerous interesting plants have lately been introduced to Kew, mainly through the energy of the botanical department recently established at Zomba. The Pycnostachys was, however, first sent home by Dr. Livingstone, who sent seeds of it to Messrs. Backhouse, of York, in 1861, from which plants were obtained which flowered in January, 1863, and were figured in the *Botanical Magazine*, t. 5365. It does not appear to have become established in gardens, notwithstanding that it was then described by Sir William Hooker as "well worthy of cultivation from the size and beauty of its flower-spikes. We are much mistaken if it does not become a great favourite in our gardens before long." •Grown in pots at Kew it was not a success, but planted in the border in a sunny position in the new Mexican-house, it has formed a tall, loose shrub, with long leafy branches, not unlike a big Nettle, as its specific name suggests, whilst each branch is now terminated by a Lupin-like head of rich mazarine-blue flowers.

Lobelia Rhynchopetalum.

Good seeds of this, the "Gevara" of Abyssinia, have lately been presented to Kew by A. B. Wylde, Esq. The only plant I ever saw of it used to be in the Kew collection, but it died about ten years ago. It is by far the most remarkable of the woody-stemmed Lobelias, of which the Indian L. excelsa (nicotianæfolia) is often met with in gardens, and which develops a tall stem, like a huge Cabbage-stalk, 6 feet or more high, bearing lanceolate leaves a foot or more long, and an erect branched raceme, a foot long, of pale lilac flowers. It flowers almost annually in the houses at Kew. L. Rhynchopetalum is, or was, a slow grower under cultivation. It is described in the *Flora of Tropical Africa* as a tall woody plant, with the habit of a Palm, having a stout hollow unbranched stem, 12 to 15 feet high, naked in the lower part when in flower, densely leafy towards the top, and terminating in a long simple dense spiciform bracteate raceme of greyish-violet flowers, clothed with a felt-like tomentum, each 2 to 3 inches long. It used to be known as Rhynchopetalum montanum Mr. Wylde says it grows on the high mountains of Abyssinia, where frost and snow occur, and thinks it might therefore prove hardy in England.

Begonias from China.

The genus Begonia is but poorly represented among the plants discovered in China, only nine species being enumerated in Hemsley's *Index Floræ Sinensis*, and of these B. Evansiana (discolor) is the only one known here as a garden plant. About half a dozen promising additions have, however, lately been made by Dr. Henry, who sent seeds of them from Tonking to Kew, from which plants have been raised. One of these has lately flowered, and it proves to be B. sinensis. It is a slender species about a foot high, with herbaceous stems, bearing pale green leaves, like those of B. Evansiana, but smaller. The flowers in erect axillary racemes. are nearly an inch across, their colour is bright pink. In habit the plant resembles B. gracilis. The other plants raised from Dr. Henry's seeds are quite distinct from all other cultivated Begonias: one has crowded digitate leaves; another large velvety green, oblique-lobed leaves; another is a large bushy plant 5 feet high. A Chinese Begonia, called fimbristipula, which used to be in the Kew collection, is remarkable for the fragrance of its flowers. It is worth re-introduction; probably Mr. Ford, of Hong Kong, could send it. *W. W.*

WHAT CONSTITUTES ODONTOGLOSSUM WILCKEANUM?

Recently, an Odontoglossum bloomed by Mr. R. Brooman White, at Arddarroch, has been noted by Mr. Rolfe (*Orchid Review*, January, 1899, p. 10), the description of which again raises a question discussed in these columns in 1896 (November 21, p. 632), and followed up by Mr. Rolfe in *Orchid Review*, March 1897, p. 73 (*et seq.*). Mr. White's new arrival will, I hope, set at rest all doubts that may be left in the minds of our "experts." It is a pure yellow, spotless form of O. Wilckeanum, which can be imagined from the following description:—Sepals and petals pale canary-yellow, spotless. Lip of a deeper shade, which completely spreads over its whole surface. Under the central teeth of the crest is a very small brown mark, and four or five pairs of faint brown lines in the channel below the column. The column is pale creamy-white, having three or four cirrhi on each wing. In form, the flower is like an ordinary narrow crispum, whose sepals and petals just overlap; the petals have the halbert-shaped outline of those of luteo-purpureum; the lip is oblong, with nearly parallel sides, which are slightly contracted one-third up from the short stiff apiculus.

The important botanical feature is the crest. The central teeth are bright yellow, short, and sharply pointed; the first three pairs of filaments are extended beyond the plate, though far less than in many blotched Wilckeanums, which is natural, and to be expected, because this variety has more than half crispum parentage in its constitution, as is proved by the "total absence of spots." Had I first published this variety, I should have named it "immaculatum," as this varietal name would have clearly explained its "total absence of spots," all Wilckeanums being more or less yellow; but Mr. Rolfe, who publishes it (*Orchid Review*, January, 1899, p. 10), follows on with Reichenbach's varietal name, which he gave to it in 1880 (*Gardeners' Chronicle*, xiii., 41, and 232), when he erroneously called it "crispum flaveolum." Afterwards, the late Mr. George Hardy's plant was figured in the *Orchid Album*, pl. 43, showing it to have unspotted sepals and petals, but three or four small brown spots in the lip. As some may not see the *Orchid Album*, I quote Mr. Rolfe's note *in extenso*:—

> "Odontoglossum Wilckeanum flaveolum.
>
> "A very pretty Odontoglossum is figured at t. 43 of the *Orchid Album*, under the name of O. c. flaveolum, Rchb. f. A very similar form has appeared in the collection of R. Brooman White, Esq., of Arddarroch, but a comparison with the numerous forms of O. Wilckeanum shows so many points of resemblance as to leave little doubt that it also belongs to this polymorphic hybrid. The general resemblance to O. crispum, and the total absence of spots, has probably led to its being considered a yellow form of that species; but the shape of the lip, the lateral teeth of the crest, the narrow toothed column wings, as well as the shape and ground-colour of the sepals and petals, all show an approach to O. luteo-purpureum. Indeed, it is nearer to O. Wilckeanum sulphureum, Rchb. f., than to O. crispum, and I suspect that all the so-called yellow forms of O. crispum are of hybrid origin."

Here Mr. Rolfe is clear in his new definition of Wilckeanum, even though they have "a general resemblance to O. crispum, and total absence of spots;" therefore I presume that now he would possibly class as a Wilckeanum a "so-called yellow form of crispum" that agreed with his new definition, and had also a great many spots and blotches. He now tardily admits, though in a manner that appears as if he had never doubted the facts, which have been stated by the writer both in and out of print for years past, and strongly contested by Mr. Rolfe in the *Orchid Review*. He even now only "suspects" it. It has taken him nearly two years to advance from the position of denying a yellow, heavily-spotted form to be a Wilckeanum (*Orchid Review*, March, 1897, p. 74), to that of "leaving little doubt" that a yellow unspotted form is one. When will he feel sure that all these yellow and spotted forms are Wilckeanums?

In discussing "Golden Queen" (*Orchid Review*, March, 1897, p. 74), and commenting on my opinion that it was a Wilckeanum, he said:—"There are both yellow and spotted forms in which I cannot detect the slightest deviation from the typical O. crispum in its essential characters." Clearly from this Mr. Rolfe then thought that colour was not an "essential character." Now he evidently considers it is, for he says in regard to the *Orchid Album* plate, "General resemblance to O. crispum, and the *total absence of spots*" (the italics are mine. Dr. B. C.), "probably led to its being considered a yellow form of that species."

Inversely, this proves him to think at present that a "yellow ground colour" even without spots, is Wilckeanum; perhaps with the spots added he would be sure. It may be inferred from this that he also "suspects" a true crispum has no spotting

What has led him to change his definition, and "suspect that all the so-called yellow forms of O. crispum are of hybrid origin," for anent the "Golden Queen," he says :—"At the first glance I took to be a form of O. × Wilckeanum, but on *careful examination*" (italics are mine. DE B. C.), "failed to find a single character that could be ascribed to the influence of O. luteo-purpureum." Would he now, after a careful re-consideration, come to the same conclusion, that the "Golden Queen," which has "yellow ground colour," "more prominent lateral teeth of the crest," and numerous spots and blotches, is still a crispum, and not a Wilckeanum? These teeth and filaments are far more pronounced in "Golden Queen" than in Mr. White's variety; and in the photograph that Mr. Rolfe mentions (*Orchid Review*, May, 1897, p. 143), taken by Mr. Stevens from the dried bloom which I speak of on the same page, they are better seen than in the figure in the *Orchid Review* (April, 1897, p. 113).

It is often stated that no one but a botanist should name any plant, more especially natural hybrids and "forms," but if the botanist or "expert" does it in this way, we are wise in doing all we can to correctly name them without their aid. Instances could be multiplied *ad nauseam*, to show that it is quite time that "the Orchid Society" was founded, where the *cult* could be centralised, and reliable *data* collected. Thirteen years ago I said the same thing; the need of it is now a thousandfold greater. *De B. Crawshay.*

STINSFORD HOUSE, DORCHESTER.

INDUCED by a recollection of the beautiful blooms of the Catherine Mermet, White Lady, Maréchal Niel, Hon. Edith Gifford, and other Roses, staged by L. Parry, Esq., at the National Rose Society's show at the Crystal Palace, in July of last year, I called late in the summer for a look round the garden whence so many good flowers had come. I was fortunate in finding Mr. Parry at home, and in his Rose-garden attending to very important requirements of some of the younger plants. He, however, relinquished his work kindly, and showed me his garden and greenhouses, gossiping the while on his recent successes in the field of Rose-shows. To have secured a place in the winning-stands was itself a feat of which anyone might be proud, but to win premier honours was a pleasure indeed, and a grateful reward for his continued efforts.

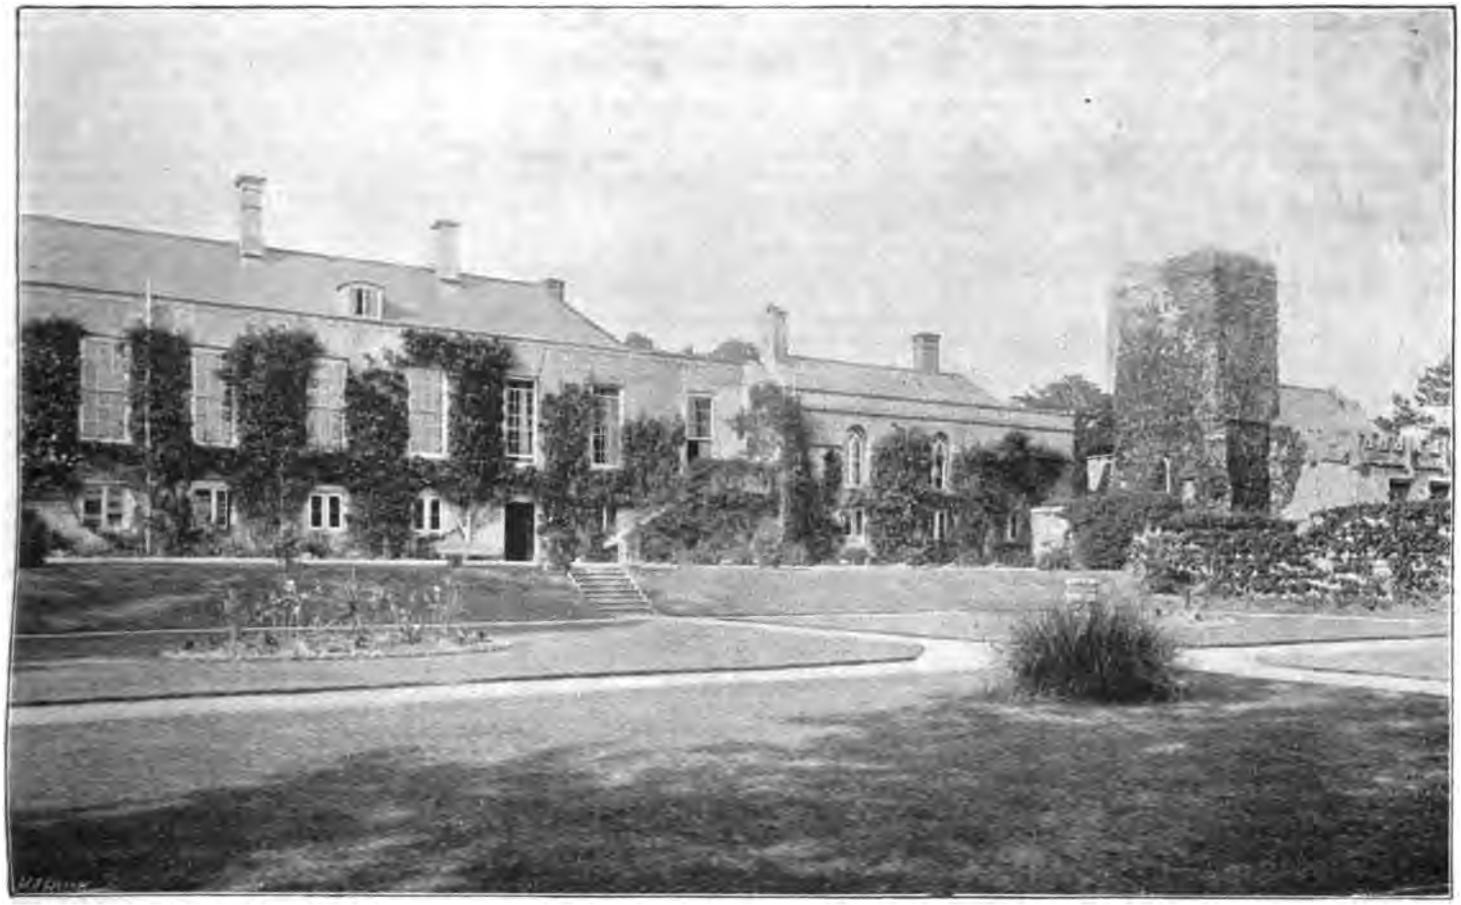

FIG. 34.—STINSFORD HOUSE, DORCHESTER, THE RESIDENCE OF L. PARRY, ESQ.

The rose-quarters are not extensive, but the position is very suitable, being closely sheltered, and yet not too much so, and in the lower part of the garden there is a pool of water. The soil, in consequence of the proximity of this body of water, is constantly moist; yet, the subsoil being gravelly, and the staple light, it is not unduly so. Many of the bushes were still in flower, including the varieties Caroline Testout, Her Majesty, Madame Lambard, Marie van Houtte, and others. The blooms were, although fine in colour, in form and substance inferior to the earlier ones. The operation Mr. Parry was engaged in was the re-budding of stocks, some few of the early-budded ones not appearing satisfactory, fresh buds were therefore being inserted. The Roses were healthy and promising, and it was anticipated that the display of 1899 would be better than that of 1898.

Herbaceous perennial plants are grown in great variety, among them Tritoma Uvaria in large masses. The illustration of the dwelling-house (fig. 34) shows several large Magnolia grandiflora and yellow Banksian Roses, which together cover nearly the whole of the front. The long, low house, with the church on the right, the tower of which is also covered with Ivy and Roses, present, as our readers will agree, a picture of beauty and repose. The church, which was greatly out of repair, is now restored, and service is regularly held therein. The dwelling-house was in olden times a monastery, the church belonging to the same. The photograph, from which the figure was taken, twelve months ago, does not do justice to the two beds as they appear this year. On these two plots of grass there were about twenty small flower-beds, that were filled with flowering plants the year round, but it was thought that these numerous beds were not so effective as larger ones would be, and so they were turfed over, and an oval bed of good size was made in the centre of each area. These beds were, when I saw them, filled with a mixture of sub-tropical and other plants, the outermost line consisting of the old white Pink, then, of course, out of flower—still, a good plant for such a use. Most of the surface in these oval beds was covered with Alternanthera, while round some of the plants a blue Lobelia was planted. The other subjects consisted of Dracæna indivisa, Grevillea robusta, Cannas, variegated Maize, Bamboos, and near the edge, Begonias and Fuchsias. These beds were in capital condition, the tallest plant about 30 inches high, the others slope gradually to the edge.

Planted in a border in the conservatory, a building situated at the extreme left of the house, and not to be seen in the picture, is a large plant of Acacia dealbata, which from Christmas onwards is covered with the bright yellow blossoms. In some of the other glasshouses good crops of Melons were remarked, one house having the Melon-plants planted in borders 4 or 5 feet below the trellises of wire, and notwithstanding this apparently unsuitable arrangement, they were showing well for a late crop; Earl's Favourite is the variety that Mr. Parry prefers.

In the kitchen-garden a fine Onion-bed was noted, the plants having been raised from seed sown on February 4, under glass, and planted out as soon as strong enough. Alongside were rows of onions sown in the ordinary mode at the usual time, and the difference in favour of the former method was very remarkable, these being 10 and 11 inches in circumference, whilst scarcely one of the other rows was as large as a Walnut. Pears trained, as cordons, were fruiting freely in most cases. Among the Apples so trained was Ribston Pippin, unusually good; also on espaliers, were Blenheim Orange Pippin, Prince Albert, Lord Suffield, Mother, King of the Pippins, Egremont Russet, and Cox's Orange Pippin.

The bush fruit had been abundant, and most of the land so planted is covered in with wire-netting of about 1 inch hexagonal mesh, which provides protection from the small birds. A visit to the ancient church with its mementos of other days, and other services held within its walls, appropriately finished up my trip to Stinchcombe and its gardens. The entire place reflects credit on the gardener, Mr. G. Baker. *W. Swan, Exmouth.*

ORCHID NOTES AND GLEANINGS.

A CYPRIPEDIUM CROSS.

WE have in this cross a singular and interesting flower, possibly a second cross of C. × Leeanum, though in most points it bears a close resemblance to C. Spicerianum. It was sent by C. B. Powell, Esq., The Old Hall, Southborough, who purchased it, together with other unflowered seedlings, from Messrs. Charlesworth & Co., Heaton, Bradford. The upper sepal is white, with a light green base, and a purple band up the middle so far as the green tint goes. In it the most remarkable feature is that the edges of the upper sepal, especially at the base, are folded inward instead of backward, as is usual in crosses of the class. The lower sepal is greenish-white; the petals yellowish with small purple spots; lip whitish, tinged on the face with purple; staminode cream-white, with a raised orange-coloured spot in the centre.

AN ABNORMAL DENDROBIUM TETRAGONUM.

The singular Dendrobium tetragonum, a native of Australia, is an uncommon species, and its flowers produced on short racemes from the slender-based four-angled pseudo-bulbs have always a spider-like appearance, due to their narrow yellow and red-brown segments, 2 inches in length. An inflorescence of one normal and one abnormal flower sent by Mr. W. H. Young, orchid-grower to Sir Frederick Wigan, Bart., at Clare Lawn, East Sheen, presents it in a still more extraordinary guise.

In the abnormal flower, the enlarged and flattened ovary tells of the presence of more than one flower, the segments of which have arranged themselves into a somewhat regular form, giving the appearance of a small sparsely petalled Chrysanthemum. The outer segments are five in number, the inner of four narrow ones similar to petals of a normal character, and a treble labellum, each of the three parts partaking of the form of the normal labellum except that the side lobes are imperfectly developed. In the centre of these are two stigmas, each perfect though not of full size.

STENOGLOTTIS LONGIFOLIA.

Not long since it would have raised a smile if anyone had said that the S. African terrestrial Orchids would ever be grown for providing cut-flowers. Nevertheless, so floriferous and easy to cultivate are Disa racemosa, D. tripetaloides, and the garden hybrids raised from them and D. uniflora, that they are now receiving attention from this point of view. Less likely than the Disas, appeared the Stenoglottis, but for some time past Messrs. F. Sander & Co., of St. Albans, have grown a batch of Stenoglottis longifolia, and they find a ready demand for any number of its elegant sprays of rose-pink flowers. At present a quantity of the plants are in flower at St. Albans. They are pretty pot-plants of various sizes, and their flower-spikes spring from the centres of the handsome tufts of green leaves spotted with purple, some of the larger ones having produced more than twenty spikes.

VARIETIES OF LÆLIA AUTUMNALIS.

Flowers of extreme forms of Mexican Lælias sent by H. Cary Batten, Esq., Abbots Leigh, Bristol, serve to show the beauty and extraordinary range of variety there is in them. Two flowers of L. autumnalis represent the darkest and the lightest of the coloured forms. The dark-crimson flower is the L. a. atrorubens, which is the largest and best coloured type, and a local form fairly constant. L. a. delicata is almost like L. a. alba, its flowers being white with a delicate pearly-pink flush.

The variation in Lælia albida is shown by a flower of the typical form with white sepals and petals, and pale-pink lip; and one of L. albida Stobartiana, in which all the segments are heavily tipped with bright rose-colour, the petals having the colour extended inward in a broad band for two-thirds of their length. Last year the flower was not so richly coloured. *J. O'B.*

EUCALYPTUS IN THIS COUNTRY.

WITH reference to the recent notes in the *Gardeners' Chronicle* on the hardiness of Eucalyptus, I believe that more depends on the situation than on the actual temperature experienced. I have often found them killed in winter when planted in cold or undrained soil, or exposed to North winds, when other trees, raised from the same seed and planted in light, warm soil, have been quite unharmed. I have, during the last twelve years, tried between fifty and sixty species of Eucalyptus at Loch Hourn, in Inverness-shire, opposite to the Isle of Skye, where the climate suits the more hardy species, even though the thermometer falls to zero in severe winters, and the strong Atlantic gales try them much. The average rainfall varies from 90 to 140 inches per annum (31·5 inches fell between December 1 and 29 last); they seem to enjoy a heavy rainfall if planted in a well-drained situation, but a cold, undrained soil is fatal in our climate, though in hot climates some species flourish in wet places. At Loch Hourn, by far the hardiest is E. vernicosa which, Sir Joseph Hooker says, is the smallest of the genus, from 1 to 4 feet high, and only growing on the summit of Mount Fatigue in Tasmania, at an elevation of 4,000 feet. I have tried in vain to obtain seed, as I have only one specimen, a small bush, ten years old, and 2½ feet high, but as last autumn it was covered with flower-buds, I hope to save seed this year. It is evidently a rare species, as the botanic gardens at Hobart, Tasmania, were unable to obtain seed for me, and M. Naudin wrote me that he only knew it from dried specimens; but the Edinburgh Botanic Gardens raised some plants from seed a few years ago. The next in hardiness at Loch Hourn are trees raised from seed of Mr. Balfour's tree at Whittinghame, near Edinburgh, of which there was a description in the *Gardeners' Chronicle*, April 14 and May 19, 1888. I do not think that M. Naudin, who is now undoubtedly the highest authority on the genus, would have pronounced it to be E. urnigera, had he seen the tree itself and seedlings from it, as in his monographs on Eucalyptus he says of E. urnigera, "the leaves always green, never glaucous." Now, the young trees raised from Whittinghame seed are very glaucous, almost a grey-blue colour, becoming dark green as they grow older. I have forty or fifty planted out, and cannot distinguish them from E. Gunni growing close by; they are very similar in foliage, both in the young and adult state, flowers, seeds, and habit of growth. If, as I believe, they are E. Gunni, the slightly greater hardiness may be attributable to their being from Scotch-grown seed, and perhaps this may be even more marked in their descendants. I should say that I refer to E. Gunni raised from Australian seed, as those raised from Tasmanian seed differ much from the Australian variety.

E. coccifera, E. Gunni, and E. urnigera are nearly as hardy, but the foliage and young branches were cut in the severe winter of 1894–95, when for days together the thermometer was at or close to zero, and the sea-loch frozen over for 2 miles. I have now several hundred of these three species planted out on the hill-sides. I believe "cornigera," mentioned by Mr. Ryan, p. 61, to be urnigera [a misprint. ED.]. M. Naudin, to whom I forwarded a branch sent me by Mr. Ryan, pronounces it to be "le veritable urnigera." E. alpina, E. angustifolia, E. cordata, and E. viminalis come next; but E. amygdalina, E. coriacea, E. regnans, E. rudis, and E. resinifera, seem not much more hardy than E. Globulus, which is killed at Loch Hourn by 15° or 20° of frost. E. alpina grows only on Mount William in Victoria, at 4000 feet, where it is a bush 3 or 4 feet high; and at the Botanic Gardens, Melbourne, it was only 12 feet high after twenty-five years; but in Scotland at Loch Hourn and in Arran, it grows faster, and the leaves are far larger than as described by Von Mueller, and of greater thickness. One of mine had flower-buds last autumn. I think that in all the species that have flowered at Loch Hourn the buds show for a year before blooming. E. cordata is perhaps my favourite, its silvery foliage and handsome growth are very striking. Von Mueller gives it as very dwarf, but mine grow quickly; the largest had 4 or 5 feet of its top blown off last summer, and by November the loss was hardly to be noticed. I have also many young trees raised from seed ripened at Abbotsbury in Dorset.

Except the foregoing, I have failed to keep any of the others through an average winter. I raise the seedlings in a cold greenhouse, re-potting them two or three times a year before the pots are filled with roots, and planting out early in summer when two years old. They require careful staking for some years, and the fastenings must be frequently renewed, on account of the rapid growth of the stems; and the bark being easily injured by rubbing against the stake, should be protected. *Robert Birkbeck, 20, Berkeley Square.*

IRIS STYLOSA.

THE photograph from which fig. 35 has been prepared, represents a plant of this species in bloom in the open border at Tremough. I think that readers of the *Gardeners' Chronicle* will agree that this is one of the most valuable Irises we have. Although the plant photographed is only about 18 inches in diameter, it is not unusual for us to gather two dozen flower-buds from it at one time, and scarcely a day passes but we use some of the blooms for furnishing the flower-vases. The plant was in bloom at least a month before Christmas, and promises to continue to flower until the end of February. The pale lavender colour of its flowers is very pleasing. Its perfume is also very delicate and agreeable. In order to obtain the fullest enjoyment from the flowers, they should be gathered whilst in bud, and be allowed to open indoors. This will prevent them being damaged by rain, storms, or slugs. *R. Gill, Tremough, Penryn, Cornwall, Jan. 26.*

FLORISTS' FLOWERS.

CARNATIONS AND PICOTEES IN FRAMES.

WHETHER these be intended for culture in pots, or for planting out in borders, the plants will now require some attention. The soil should be kept just moist and no more. Admit abundance of air to the frames on all favourable occasions, it being very unwise to coddle the plants, and thus encourage weakly growth, and subsequently greenfly. Draw the lights off entirely when the weather is very mild, and war against aphides by fumigating the plants as frequently as is necessary. Leaves that have become yellow, or spotted, should be promptly removed to the fire. Stir the surface-soil to prevent it becoming overgrown with moss. Moss is not so likely to grow, however, if the plants are given sufficient fresh air ; nor is frost so liable to injure the plants when the foliage as well as the atmosphere is dry.

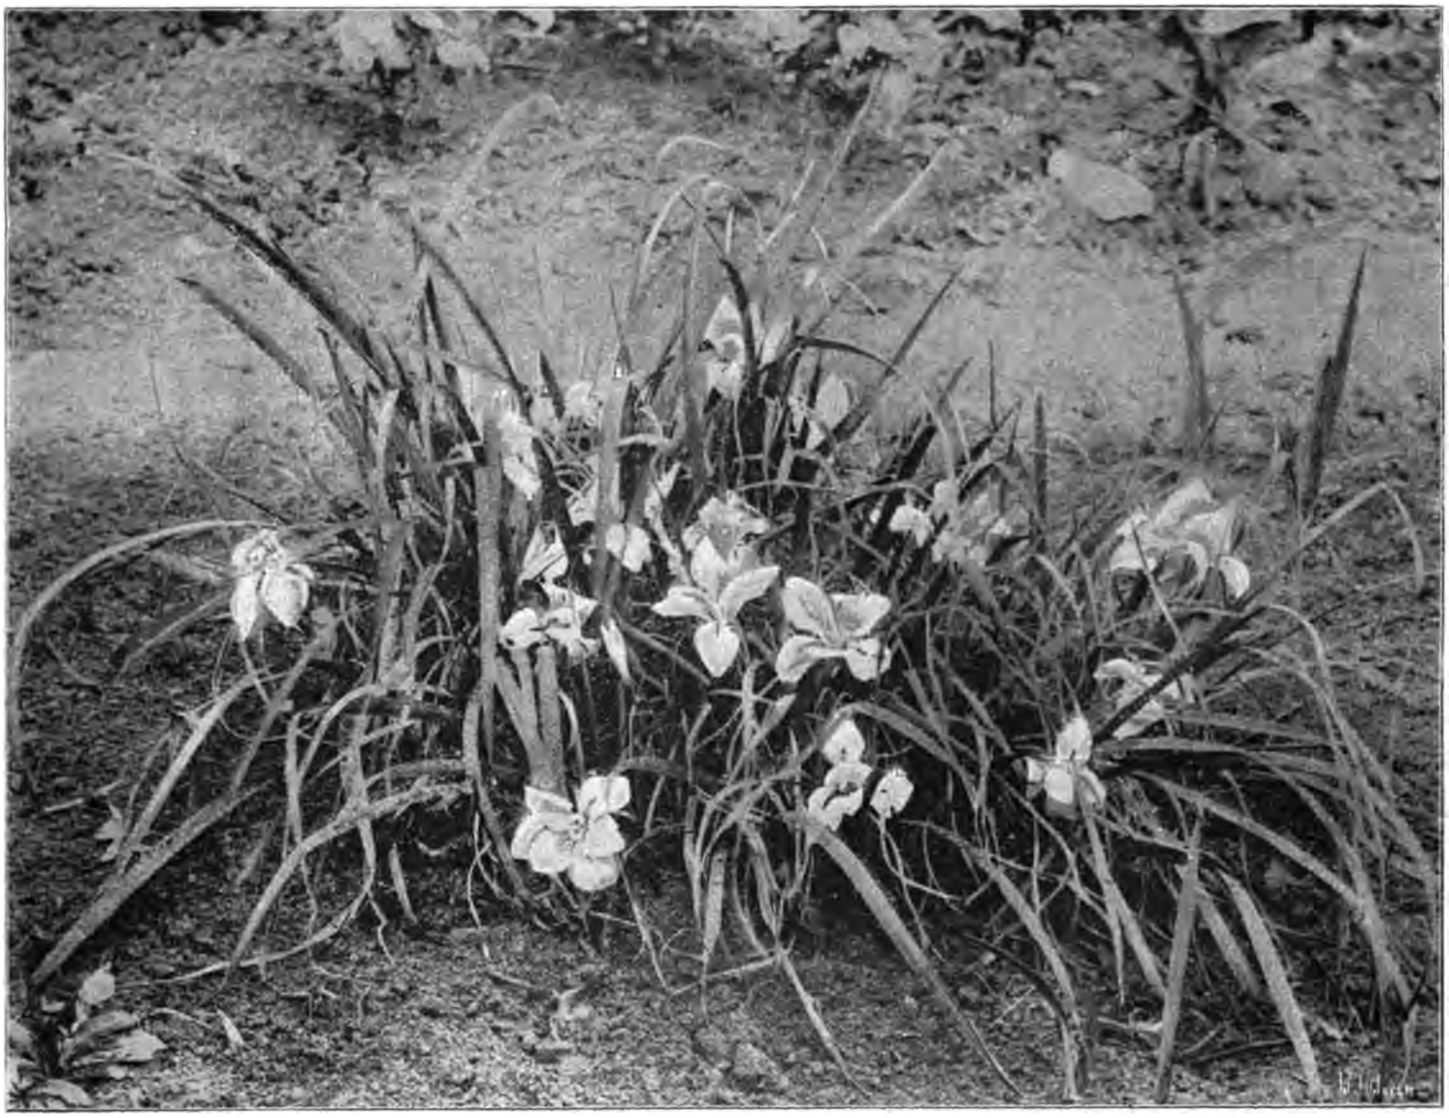

FIG. 35.—IRIS STYLOSA FLOWERING IN WINTER IN THE OPEN AIR AT TREMOUGH, CORNWALL. (SEE P. 84.)

To obtain strong flowering plants of the tree or perpetual-flowering kinds, cuttings of such varieties as Uriah Pike, Winter Cheer, Lizzie McGowan, W. Robinson, Mdlle. Carle, Miss Joliffe Improved, Mrs. Leopold de Rothschild, Reginald Godfrey, Mrs. Moore, and Mary Godfrey, should now be inserted in 4-inch pots. Use a sandy compost, and place a layer of sand upon the surface. The small side-growths make the best cuttings, and as many as a dozen may be put into one pot, if space be limited. Plunge the pots in a gentle bottom-heat in a house having a temperature of 55°. A handlight or propagating-frame hastens the formation of roots, if it be not kept too close. If they be hastened unduly by too much heat and atmospheric moisture, the cuttings may damp off. Directly they are rooted, gradually accustom them to the atmosphere of the house by removing the glass, and ultimately place the plants on a shelf as near to the glass as possible. When they are well rooted, pot them off singly into small pots, and return them to the same temperature until new growth has been made, when they should be gradually removed to cooler quarters.

DAHLIAS.

It is yet too early to commence propagating these, excepting particular varieties that may be scarce. In that case, place the tubers in a gentle heat in pots, pans, or even on the border of a fruit-house, covering the roots with sandy soil, or cocoa-nut fibre refuse. The succulent shoots, as they arise from the base of the old stem, may be taken off with a heel, and inserted singly in several pots. Give these a temperature of 65°, with gentle bottom-heat, and do not keep them too moist. *E. M.*

LATE-FLOWERING CHRYSANTHEMUMS.

The value of late-flowering Chrysanthemums in January is well appraised by the gardener who may have much decorative work to do in that month and early in the present one. Given a sufficient number of these plants, the hard forcing of Azaleas, Lilacs, and the like is not so necessary. Late white-flowering Chrysanthemums were dealt with on p. 20 of the present volume, and I will now merely mention two others not then mentioned, viz., Princess Victoria, a good and pure white when fully expanded, with stout, erect stems. The plant should not be stopped late in the season, the buds being longer in development than some other varieties, and if stopped as late in July as are some others, they do not form at all. Lady Lawrence is the second, and is an old variety, pure white, with large, broad petals, and a stout stem, and this, like the preceding, should not be stopped later than the end of June or the beginning of the following month.

Of yellow varieties, one of the best is King of Plumes, of a rich, deep golden-yellow, belonging to the class of laciniated decorative varieties, of light and graceful appearance, excellent either for cutting or as a plant. From its habit of carrying about three blooms on each growth, it is admirably adapted for furnishing vases, especially where long light sprays are the more suitable, and these may easily be had in good condition up to the end of the month of January. W. H. Lincoln is another well-known yellow kind, largely grown for late cutting ; the petals are rather stiff and erect, and the centres are subject to damp, and also not to open nicely.

The past two seasons I have grown another variety, H. W. Riemann, almost identical in colour, and equally late. The flower is altogether of a more refined character, with broader reflexing petals, and if it does equally well another year, I shall discard the preceding variety.

Waban, which may also be grown as a late variety, comes at this season of a pale lilac colour, inclining to white, with stout footstalks and long, loose petals, slightly incurving at the tips—a good addition to those already enumerated for cutting. Its duration in a cut state is also much in its favour.

There yet seems to be lacking a good late crimson variety, although Cullingfordi may be had up to Christmas. One of the most promising of recent introductions in this class is Julia Scaramanga, in colour reddish-bronze, and when the plant is grown as a bush, and stopped for the last time about mid-July, it furnishes excellent flowers for cutting in December and January, and for this season it is a very desirable variety. Generally speaking, I prefer for this purpose the plants to be grown in pots throughout the season, rather than planted out, some varieties, of which W. H. Lincoln is a notable example, refusing to swell their buds, if planted in a border or in pots under glass, after being lifted. *C. H. D.*

THE HERBACEOUS BORDER.

PAPAVER UMBROSUM.

THIS fine annual (far finer when self-sown in autumn and properly thinned, than if sown in spring) is not allowed by *Index Kewensis* to be a distinct species, but is referred to a garden variety of P. Rhæas. It is, however, described by E. Boissier (*Flora Orientalis*, vol. i., p. 113), under the name of P. commutatum, Fischer, as a distinct wild species, a native of Iberia and Armenia. I have for many years grown it in the same bed as the many-coloured varieties of P. Rhæas, which were first given to me as P. Hookeri, but differ in no way from "Shirley Poppies." P. Rhæas and P. umbrosum do not seem to mix, but each preserves its own characters, growing and shedding seed for the next year together indiscriminately, and I never saw an intermediate form. *C. Wolley Dod, Edge Hall, Malpas.*

THE WEEK'S WORK.

THE KITCHEN GARDEN

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Parsley which has been wintered in cold frames should be cleared of all decaying and old useless leaves, and the spaces between the rows slightly stirred with a pointed stick or a hand-fork. Afford air abundantly whenever the weather is mild, removing the lights when it does not rain hard, and keeping the glass clean. If scarcity of leaves is feared, sow seed in wide pans or boxes, and place in gentle heat, and when the plants are large enough, plant them in well-prepared boxes, at about 3 inches apart, and keep them growing in heat for a week or two, then harden off and plant on a warm border. Parsley plants forwarded in this manner give a good supply of leaves several weeks in advance of plants raised from seed sown in the open ground. To obtain the finest results, Parsley should be grown on a deep well-enriched and somewhat moist soil, the rows being sown 2 feet apart. When gathering the leaves, especially in the winter, only take a few from a plant, and these the nearly full-grown ones.

Basil.—In most establishments the cook requires a pretty constant supply of Basil, either dry or green. If it is the fresh herb that is mostly wanted, sow seeds occasionally in pans, using a sandy soil. After the plants are up, keep the soil moderately dry, to prevent damping-off. The seed-pans should be placed in gentle warmth, and kept therein on a shelf near the glass.

Tarragon.—Let the supply of this herb be kept up by placing boxes filled with the roots in moderate heat, removing the boxes to a less warm pit when strong shoots are started. A good-sized bed of Tarragon should be planted annually.

Spear-Mint.—A quantity of the roots should also be boxed at intervals, and treated similarly to Tarragon.

Horseradish.—Let the Horseradish-patch be trenched, in order to get out every bit of root; then select the most shapely sticks for use, and bed them-in thickly on a border, throwing litter over them in hard weather. The best of the other pieces of 1 foot long, and furnished with a crown, should be planted at 1 foot apart on a new, heavily-manured, deeply-trenched piece of land. Some gardeners put the Horseradish-bed in some out-of-the-way unsuitable spot, but in order to obtain good sticks fresh plantings ought to be made in a good position, at least once in two years. Sometimes the gardener has to make use of small pieces without a crown, and these may be put down from 12 to 15 inches deep in the soil.

Cauliflowers.—Let the young plants raised in heat be well attended to, keeping them near the glass in order to prevent lankiness, and affording air when possible. Later sowings, when they have made a pair of true leaves, should be transferred to pots, putting two plants in each, close to the sides. Let them be afforded a moderately light, rich soil, and be sure that they receive no check from cold. The first size of pot used should be a 3-inch.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Cœlogyne sparsa and Others.—The first-named is a dwarf, compact-growing kind, now about to flower; the flower comes from the centre of each young growth. It is grown here in pans, suspended on the shady side of the Cattleya-house, and in a mixture consisting of one-third fibry loam, one of Orchid-peat, and one of sphagnum-moss, mixed with a small quantity of finely-broken crocks. If any of these plants require more root-space or fresh materials at the surface, both can be afforded in a week or two after the flowers have faded. The plants must not be over-watered after being disturbed at the root. C. barbata, which should be accommodated in an intermediate-house, is now at rest, and will stand in need of very little water whilst in the dormant condition; neither will Cœlogynes ocellata, corrugata, corymbosa, and Schilleriana. The last-named is a warm-growing and deciduous species.

The Potting of Masdevallias.—Many Masdevallias need immediate attention, such are M. amabilis, M. Chelsoni, M. Harryana, M. iguea, M. Lindeni, M. Veitchi, &c., of the strong-growing species; and M. calura, M. infracta, M. muscosa, M. Reichenbachiana, M. simula, &c., of the dwarf-growing species. With few exceptions, Masdevallias thrive in a moist shady house, the temperature of which is about 50° in winter, and 58° in summer. Although a certain amount of fresh air is essential, it need not be admitted in such volume as in the Odontoglossum-house. Masdevallias should not be disturbed in cases where the rooting material and drainage are in sweet and good condition, and the pots or pans are sufficiently large. Merely pick out some of the old material, and replace it with new. But in all other instances the plants must be turned out and re-potted. In the operation of re-potting, remove as much of the decayed material and dead roots as possible, and place the plant in a pot of convenient size that has been filled with drainage material to within about 2 inches of the rim. Put some moss over the drainage before placing the plant, so as to keep it open, and then fill-in with good fibry peat and freshly picked sphagnum-moss, the latter in the greater quantity. Sprinkle in some finely-broken crocks as the operation proceeds. It will be necessary, for various reasons, to divide large specimens, and in making these up anew, the operation should be commenced at one side of the receptacle, and finished at the opposite, carefully spreading the roots, and filling in the peat and moss evenly and firmly. Such dwarf species as M. muscosa, M. Wagneriana, M. tridactylites, &c., are best grown in suspended pans. Newly-potted plants should be carefully and sparingly watered through a fine-rose for some considerable time afterwards, but those that have only been re-surfaced may be given a larger and more frequent supply.

Epidendrum (Nanodes) Medusiæ should be grown in suspended baskets in the Masdevallia-house. It is now beginning to root freely, and should be afforded some fresh moss. Nothing more than this and a few crocks is required as a rooting medium. The plant appreciates a frequent and copious supply of water, and may be immersed almost daily.

Pleione humilis, and others.—P. humilis will, in many cases, need to be repotted. This species may be grown equally well in pots or pans, but in either case the drainage should occupy rather more than two-thirds of the space. Over this place some sphagnum-moss, and use a compost of one-third fibrous loam, one of peat, and one of chopped sphagnum-moss, sprinkling in, as the potting proceeds, some finely-broken potsherds or coarse silver-sand. Instead of inserting each bulb separately, it is better to pot them in clumps; but should there be any single ones, twine the old roots round a little moss so as to form a ball, which will serve to hold it in the new soil. Afford only sufficient water for the present to prevent the surface getting too dry, but when the roots have made good progress, liberal supplies may be given. This species may be grown on a shelf near the glass in the Masdevallia-house the year through. P. lagenaria and P. Wallichiana may soon be removed from that house to a warmer and lighter position. P. maculata is making steady progress on a shelf in the Cattleya-house. In each case water is very sparingly applied, though on no account is the material allowed to become quite dry.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener, Dropmore, Maidenhead.

The Fruit-room.—The chief point in keeping fruit late in the season is the maintenance of an even temperature, and the nearer this is maintained at about 40°, the longer and better may the fruits in season be kept. With a view to preventing the rise and fall of the internal temperature of a fruit-room, the structure should be kept as close and dark as possible, and if ventilated by a window this should be well covered by several thicknesses of sacking or similar material, and all work inside should be carried on by candle-light. If ventilation be necessary to sweeten the room, air should be given when the external temperature corresponds very nearly to that inside the room. Owing chiefly to the hot and dry summer of last year, fruits in general have not kept so well as usual, and with Pears especially the ripening of reputedly late varieties have been very erratic, and in our case the fruits are mostly over. Josephine de Malines, a very late variety, was ripe early in December, and others have been almost equally precocious, a fruit or two from a young tree of Duchess de Bordeaux being the latest to ripen. Apples should be looked over about once in ten days or a fortnight, and any decaying or slightly-spotted specimens removed. Sound fruits should be carefully handled, otherwise if only but very slightly bruised, decay soon sets in. I find this season that specimens of Cox's Orange Pippin from bushes growing fully exposed on all sides lost flavour, and were soft and past their best towards the end of November; while a few others from trees slightly shaded by some large Elms, kept firm and good a month later. Late kitchen varieties, as Lane's Prince Albert, Bramley's Seedling, and Hambledon Deux Ans, are also keeping badly.

Top-dressing the Strawberry-beds.—Strawberry plantations that are allowed to fruit for two or more years should be assisted by the application of a good mulch of short half-rotten manure at this season. Assuming that all runners were cut off early in the autumn, but little cleaning of the ground will be required, and only the dead and decaying foliage and weeds need to be removed, and of the latter the smaller may be left to be pointed in with a fork an inch or two deep; a firm soil suiting the Strawberry, deep digging is a mistaken practice. A little soot and fresh lime in equal quantities, mixed together, should be scattered about the crowns of the plants for the destruction of slugs, before the top-dressing of rotten manure is applied. Where Strawberry-planting is contemplated in spring, the site should, if not already prepared, be deeply dug or trenched after the ground has received a good dressing of manure, rotten cow-manure being that kind used if the land be light. Spring planting should only be done when the land has been occupied with other crops.

the best time for planting being early autumn. Where plants for a full supply are to be planted, three situations should be chosen, so that the fruiting season may be prolonged to as late a period as possible. A border sloping to the south, and backed by a high wall, for the earliest; the more open part of the garden for the main crop, and a border sloping to the north, and shaded by a wall, for the latest supply. Good early varieties are Royal Sovereign and Vicomtesse H. de Thury, the the main crop consisting of the former; Sir Joseph Paxton, President, Veitch's Perfection, Oxonian, and Elton Pine for a late supply.

Cherries.—The pruning and nailing of Morello Cherry-trees will now claim attention in mild weather, for these trees growing usually on a north wall the operation is not a desirable one in cold weather. Any foreright shoots that were not cut or pinched-back at the summer pruning should be shortened to three or four buds, they will then form fruit-spurs for next year's fruiting. Last year's leading growths should be allowed to remain at full length, the aim being to remove old wood wherever possible, and lay-in the young to take its place.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.

Walks.—Nothing adds more to the comfort and pleasure of a garden than good walks, and in order to have them in perfect condition they should be properly made. Main walks should not be less than 8 feet in width, so as to allow sufficient space for three persons to walk abreast; and these walks should lead through the more attractive parts of the garden, and to points where the finest views can be obtained of the surrounding landscape. In making walks, the soil should be dug out 18 inches deep. Drains should be laid on each side and led into main drains, the latter being laid in the more undulating parts of the ground, and where there is sufficient fall to carry off the water rapidly. After completing the drainage, place a 1-foot layer of hard, rough stone on the bottom of the excavation, then one 4 inches thick of smaller stones, breaking these with hammers to make the whole firm; next add 2 inches of finely-broken stone, if the latter be not obtainable, clay burnt into ballast is a good substitute. Roll well to get it to an even surface; finish off by sprinkling evenly 2 inches of fine pit-gravel. A walk of this kind should be 2 inches higher in the centre than at the sides; on falling ground let gratings and catch-pits be placed at distances sufficiently near together to carry off an ordinary rainfall without causing channels to be washed out on the surface. The bottom of a catch-pit should be 9 to 12 inches below the mouth of the drain that carries the water away. The edges of walks should be kept low, for if made deep, they soon get uneven, and they are always unsightly. Walks that have become dirty should have the surface-gravel removed, and if it have been turned once before, fresh gravel should be used in its stead. Always make the surface of a walk made of pit-gravel firm by rolling after rain.

Cydonia japonica, or Pyrus japonica (the Japan Quince), and its varieties, are very suitable to plant against a wall having a southern aspect. If it be slightly sheltered to protect the early flowers, which open in the middle of January, and continue to flower till the end of March, so much the better. When grown as bushes they open their flowers much later, and are at their best in the middle of May. They succeed best in a retentive soil, and those trained to a wall should be spurred back at the end of the year. Bushes need only be thinned and made free from suckers. Of the varieties the best are C. japonica, with bright orange-scarlet flowers; nivalis, white; Cardinale, rich cardinale colour; rosea, rose and white; Simoni, rich dark crimson; and Maulei, the latter a low-growing bush, having small red flowers, and handsome yellow fruits.

Laburnum.—No garden is complete without this noble flowering-tree. It is easy to cultivate, and soon becomes established. The tree becomes established more quickly if planted early in spring, and just before growth commences. I have discarded the variety Adami on account of its being a loose-growing tree, with flowers of a dull purple colour. L. alpinum opens its flowers early, and are often damaged by the frost; L. a. pendulum has pendent branches, and is very graceful both in summer and winter; L. vulgare has pale yellow racemes; L. v. Parkesii flowers a fortnight later, and is deeper in colour; L. v. Watereri is by far the best variety for depth of colour, length of racemes, and lateness of flowering; L. v. foliis aureum has beautiful golden leaves, it should be planted facing north, as the leaves burn when exposed to the sun.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Acalypha hispida (Sanderiana).—This singular and striking plant is very easily propagated by means of cuttings, and if the tops of plants which have become "leggy" are taken off and inserted in small pots, filled with sandy soil, and placed in the propagating-frame, or plunged in a hot-bed, they will strike quickly, and when sufficiently well-rooted may be potted into 48's. Few plants respond more freely to generous treatment than this one; and, although it does not appear to be at all fastidious in the matter of soil, a compost consisting of three parts loam, one part leaf-soil, and one part rotten manure, with sufficient sand to keep the soil open and porous, is a suitable one. After potting, place the plants in a light position in the stove, and afford them several shifts as soon as the roots have taken full possession of the soil of the previous potting; and in the case of strong plants, 7-inch or 8-inch pots may be used for the final shift. Treated in this manner, the leaves will grow to a large size, and be retained down to the base of the plant for a considerable length of time. The long, pendulous flower-spikes, which are produced from the axils of the leaves, should not be allowed to rest upon the surface of the soil, nor upon the stage, or damping of the flowers will take place, but the plants should be elevated on inverted pots, so that the spikes may hang clear. Care should also be exercised, when syringing, not to damp the spikes overmuch, otherwise damping will follow. The old plants from which the cuttings have been taken should be placed in a moist, warm house, where they will soon produce side-shoots, which may, in their turn, be used as cuttings. The plants raised from these side-shoots will not at first be nearly as strong as those produced by the tops; and as it is only from strong plants that the best results can be obtained, every means should be adopted in order to grow them strongly, such as plunging them in mild bottom-heat, removing the flower-stems as fast as they appear, and repotting promptly. When they have grown into strong plants, take off the tops and strike them; these will form the foundation for good plants.

Gloxinias.—Seed of good strains may now be sown in pans, or 4-inch pots filled with finely-sifted soil, consisting of equal proportions of loam and peat, with a liberal allowance of sand. Press the soil firmly into the pots, making the surface level, and upon this sowing the seed thinly, and slightly covering with sand, and affording water in the same way as was advised for Begonia seed in G. C. for January 28. Lay a piece of glass or paper upon the pots, and place them in the stove, or in a hot-bed, and as soon as the seedlings are large enough to handle, prick them off into pans, or into5-inch pots, filled with a mixture of three parts loam, one part peat, and one part leaf-soil, with plenty of sand, and afford them a position near the glass in the same temperature as before. In about three weeks they will be ready to be potted singly into small pots, and when the roots have reached the sides of these, the plants may be transferred to 4-inch or 5-inch pots, in which they may be allowed to flower.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

The Second Early Peach-house.—Where provision is made for a successional supply of Peaches from trees planted in various houses, the time is opportune for closing a house, with a view to its following the first one started. In this case, the forcing may be more moderate, and particularly if the trees have been forced of late years. Assuming that the preliminary work of cleaning the walls and glass, top-dressing the borders, dressing the trees with an insecticide, has been properly attended to, the house may be closed, and the usual course of syringing carried out, once or twice each day, according to the state of the weather, affording air on bright days, and closing early, so as to husband solar warmth. Only sufficient fire-heat to raise a luke-warmness in the pipes should be employed at starting, more than this having a weakening effect on growth. In the case of free-setting varieties, it is advisable to remove all the buds on the under sides and back of the branches, and this done at this period minimises the work of disbudding later on. Shy-setting sorts had better be left until after they have flowered, and it can be seen what is the amount of the prospective crop. Afford water to the border if this has not been done, using it tepid. Young and vigorous trees need only clear water; but old and long-established trees, if not gross, will be benefited by applications of liquid manure in a tepid state, and diluted to a safe strength.

The Propagation of Vines.—The present month is the most suitable for raising Vines from eyes, the plants thus raised being suitable for planting in the borders or in pots. The shoots intended to furnish the cuttings or eyes, that is, cuttings with but one bud each, will have been heeled-in outdoors, with a view to the retarding of growth as long as possible. An eye should be selected only from the best ripened portions of the shoots, the lengths taken being about 2 inches, a cut being made transversly and squarely immediately above the eye, and a slanting one at about 1½ inch in length, in the opposite direction. Place the eyes, when made, firmly in the soil, and just below the surface of the soil. It is an advantage to allow a callus to form under cool treatment, as root action is then more rapid when the pots are plunged in a gentle bark or hot-bed, or over hotwater-pipes. This method is very desirable when good-sized canes are required by the autumn. When needed for planting purposes only, bottom-heat is not strictly necessary in any stage of growth. Pots of about 4 inches in diameter are usually adopted for Vine-eyes, which should be perfectly clean and well-drained. A compost, consisting of two parts good turfy loam to one each of leaf-mould and gritty material, or coarse silver-sand or lime-rubble will be found suitable. With this the pots should be filled, and in the centre of each put a pinch of sand as a base upon which the eye will rest on.

Cut-back Pot-Vines for fruiting next year should be re-potted, and afforded a sunny position in a warm-house. They should not be subjected to hard forcing. Should bleeding occur on any Vine from late pruning, touch the wound from which the sap exudes with a red-hot iron till bleeding ceases. In potting, use the best obtainable soil, and in a fairly lumpy state, mixing with it burnt refuse and charcoal, lime-rubble and leaf-mould, in small quantities. Animal manures are better omitted, bone-meal, or some special Vine-manure being employed instead.

Vine-grafting.—This is adopted in cases where approved varieties cannot be introduced by planting. The better to enable the gardener to graft his Vines, some conveniently-placed shoots of last year should be retained at the time of pruning. The method known as "bottle-grafting" is perhaps the most expeditious and certain. In any case, a tongue is formed as in ordinary side-grafting in scion and stock, each tongue and cut surface fitting exactly one to the other. This prevents the disappointment that sometimes arises through root-growth forming between the juncture of stock and graft, and forcing them apart. Grafting should be done when the Vines are on the point of breaking, the scions being kept in a dormant state till then by being heeled-in in the open ground. Grafting of unripe shoots by approach, or marching, is done in the early summer months.

Orchard-house Trees that are still outside should, unless the fruit is required late, be brought indoors forthwith, the drainage examined, and repotting done where found necessary, and top-dressing applied in other cases. If the orchard-house is a cold one, the starting of the trees should be deferred, so that blossoming may occur at a safer period. Trees standing in unheated houses should still remain, protected by tree-leaves, &c., and in mild weather abundant ventilation should be afforded. The forcing of Pears, Cherries, Plums, and Apples, must be of a very mild description, and during the flowering periods air should be afforded abundantly, so as to favour the dispersion of the pollen. A miscellaneous collection of trees demands much care till the flowering period is passed.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Feb. 11	Royal Botanic Society, General Meeting.
MONDAY,	Feb. 13	United Horticultural Benevolent and Provident Society's Committee Meeting.
TUESDAY,	Feb. 14	Royal Horticultural Society's Committees. National Rose Society's Committee Meeting. Royal Horticultural Society of Ireland, Meeting.
THURSDAY,	Feb. 16	—Linnean Society, Meeting.
FRIDAY,	Feb. 17	Royal Gardeners' Orphan Fund: Annual Meeting and Election of Pensioners, at Anderton's Hotel, Fleet Street, E.C., at 3 P.M.

SALES.

MONDAY,	Feb. 13	Roses, Gloxinias, Carnations, Anemones, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Feb. 14	Hardy Perennials, Iris, Lily of the Valley, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	Feb. 15	Japanese Lilies. Continental Plants, Tuberoses, Stove and Greenhouse Plants, Gladioli, &c., at Protheroe & Morris' Rooms
FRIDAY,	Feb. 17	Great Sale of 10,000 Odontoglossum crispum and 500 Cattleya aurea, by order of Mr. Thomas Rochford, at Protheroe & Morris' Rooms.

Average Temperature for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—39°.

Actual Temperatures:—
London.—*February* 8 (6 P.M.): Max., 55°; Min., 49°.
Provinces.—*February* 8 (6 P.M.): Max., 53°, Bath; Min., 43°, Peterhead

Cultivation of Monstrosities. The *Comptes Rendus* for Jan. 9, contains a paper by Prof. Hugo de Vries, on "The Cultivation of Monstrosities," in which the writer says: It is known that the characteristics of some vegetable monstrosities, such as Cockscombs, are transmitted by heredity, and reproduced by seed, as is likewise the case with Cauliflowers and sundry other plants. But other monstrosities are usually considered as caused by accidents, and as not being hereditary. Their rareness in Nature renders systematic study difficult; usually, their structure is known, but rarely their origin and growth. They are almost wholly inaccessible for physiological experiments.

For some dozen years M. de Vries has been cultivating some of these anomalies, intending to subject them to all the necessary examinations. With the exception of virescence, caused by parasites, they have proved hereditary, and have produced by isolation and selection races more or less perpetual, and sufficiently rich in malformed individuals to answer the required purpose.

In many of these cases, he now possesses the fifth, sixth, or seventh generation even of absolutely biennial forms. They are far from being all entirely constant. They show no more atavism than do the ordinary varieties, while others are only exactly reproduced to the extent of one or two-thirds.

The plants of these latter kinds, which revert to the normal type, frequently preserve certain monstrous characteristics, but in very varying degrees. Often they repeat the abnormality at the top, in the lateral branches. In perennial plants the monstrosity may reappear after two or three years. Occasionally, some plants seem completely normal, but have not lost the faculty of reproducing the monstrosity by means of their seeds

The less in degree the fixity the more inconstant — in other words, the more the cultivation of monstrosities is dependent on external conditions. Abnormal races, even of wild species, require more care than the most delicate decorative plants. It is the germination and development of the young plants which need so much care. In sowing in a greenhouse, and in pricking out the young plants singly in healthy and well-manured ground, the number of hereditary individuals can be doubled. The fasciated variety of Dandelion (Taraxacum officinale), which usually yields about thirty per cent. of fasciated specimens, will, under this treatment, produce eighty-six per cent. in the first flowering season. Crepis biennis fasciata in cultivation bears from twenty to thirty per cent. of fasciated stems; but it has yielded a proportion of from sixty-four to eighty-five per cent. under careful treatment, and a strong dressing, which consisted mainly of eighty-five per cent. crushed horn.

From a physiological point of view abnormalities may be divided into those which are constant, precocious, or tardy. Constant monstrosities show no more atavism than do ordinary varieties, and require the same care. Chrysanthemum segetum fistulosum, which has flowers with long and tubular rays, produced in 1898 ninety-seven per cent. of inherited forms among two hundred specimens. Linaria vulgaris "peloria," a plant but scantily fertile in 1898, had in 1898 only four per cent. of examples reverting to the normal type in a sowing of eighty plants; in the other specimens all the flowers were perfectly peloriated. This form is easily propagated from the radical buds.

Precocious monstrosities are those which appear upon very young plants at the time when they are ready to be pricked out. At this period of their life a selection should be made, only those being pricked out in which the abnormality is well marked. Trifolium pratense quinquefolium furnishes an example; the first leaf, simple in the normal species, bears three leaflets in most plants of this kind. In pricking out, all those plants which have fewer should be eliminated, to ensure a crop rich in five-fold leaves. If this precaution be neglected, a very mixed sowing is the result. The proportion of plants with from four to seven leaves, depends in every case on exposure, situation open to each individual, manuring, and so on.

Tardy or late monstrosities only appear some weeks or months after sowing. The fasciations of Crepis are manifest after four months, those of Taraxacum after five months, and the spiral disposition of the leaves of the twisted variety of Dipsacus silvestris are latent until the age of four months.

The development of abnormalities is mainly dependent on the individual strength of the plants, especially on their vigour during the first weeks of life. Selection of the best seed-producers is of very secondary importance, supposing that they are those of the right kind, and that the seeds are not interfered with by crossing with the normal species or with other varieties.

A sunny situation is necessary, and a healthy and well-manured soil (failing a good manure, a dressing of 100 grammes of horn-shavings per square mètre). The best sowing is that effected under glass in April, and the young plants should be pricked out singly in small pans (four inches) before being set in their places.

As regards the special care to be given to each species, the normal duration of its life must be considered. Annuals are richer in abnormalities in proportion as the seedlings are precocious, and as the growth of the young plants has been accelerated by the temperature of a warm-house and full exposure to light. As examples, may be mentioned Amaranthus speciosus fasciatus and Tetragonia expansa fasciata.

Biennials (Crepis biennis fasciata and Dipsacus silvestris tortus) are most interesting. The fasciations and tortuous growth of them are the more numerous and developed according as the life of the rosettes of radical leaves has been longer and more vigorous before the production of the stem. Too late sowing, a poor or sandy soil, a cramped or shady position, often renders all, or nearly all, the individuals of a large batch raised from the best seeds normal. An average yield of about twenty to thirty per cent. is easily reduced to nought; but it may, on the contrary, be increased by the precautions mentioned to forty per cent. in Dipsacus, and even to from sixty to eighty per cent. in Crepis. But over-manured specimens succumb in winter, especially those of Crepis. Prof. de Vries some years ago favoured us with some seed from this variety, but none of the seedlings, nor of their descendants, has ever shown the slightest sign of torsion.

Species optionally annual or biennial are most variable; for instance, Aster Tripolium fasciatus, and Œnothera Lamarckiana when fasciated. They yield good fasciations on the biennial stems only; therefore they should not be sown too soon, and all those plants should be eliminated which at the time of being set out have already developed stems. The annual stems increase frequently, but are weakly at the summit.

To sum up, the greater proportion of abnormal plants, says M. de Vries, are highly variable, oscillating between nought and often from fifty to eighty per cent. as regards the inheritance. Supposing that the seeds of a well-established race are sown, the variability depends almost wholly on the external conditions of its life, especially when young. The more favourable the conditions, the greater the proportion of abnormalities under cultivation, and the more highly these latter are developed.

Royal Horticultural Society.—The next meeting of the Royal Horticultural Society will take place in the Drill Hall, James Street, Victoria Street, on Tuesday, February 14. The various Committees will assemble at noon as usual, and at 3 o'clock the Annual General Meeting of the Society will be held at the Society's offices, 117, Victoria Street, Westminster, S.W.

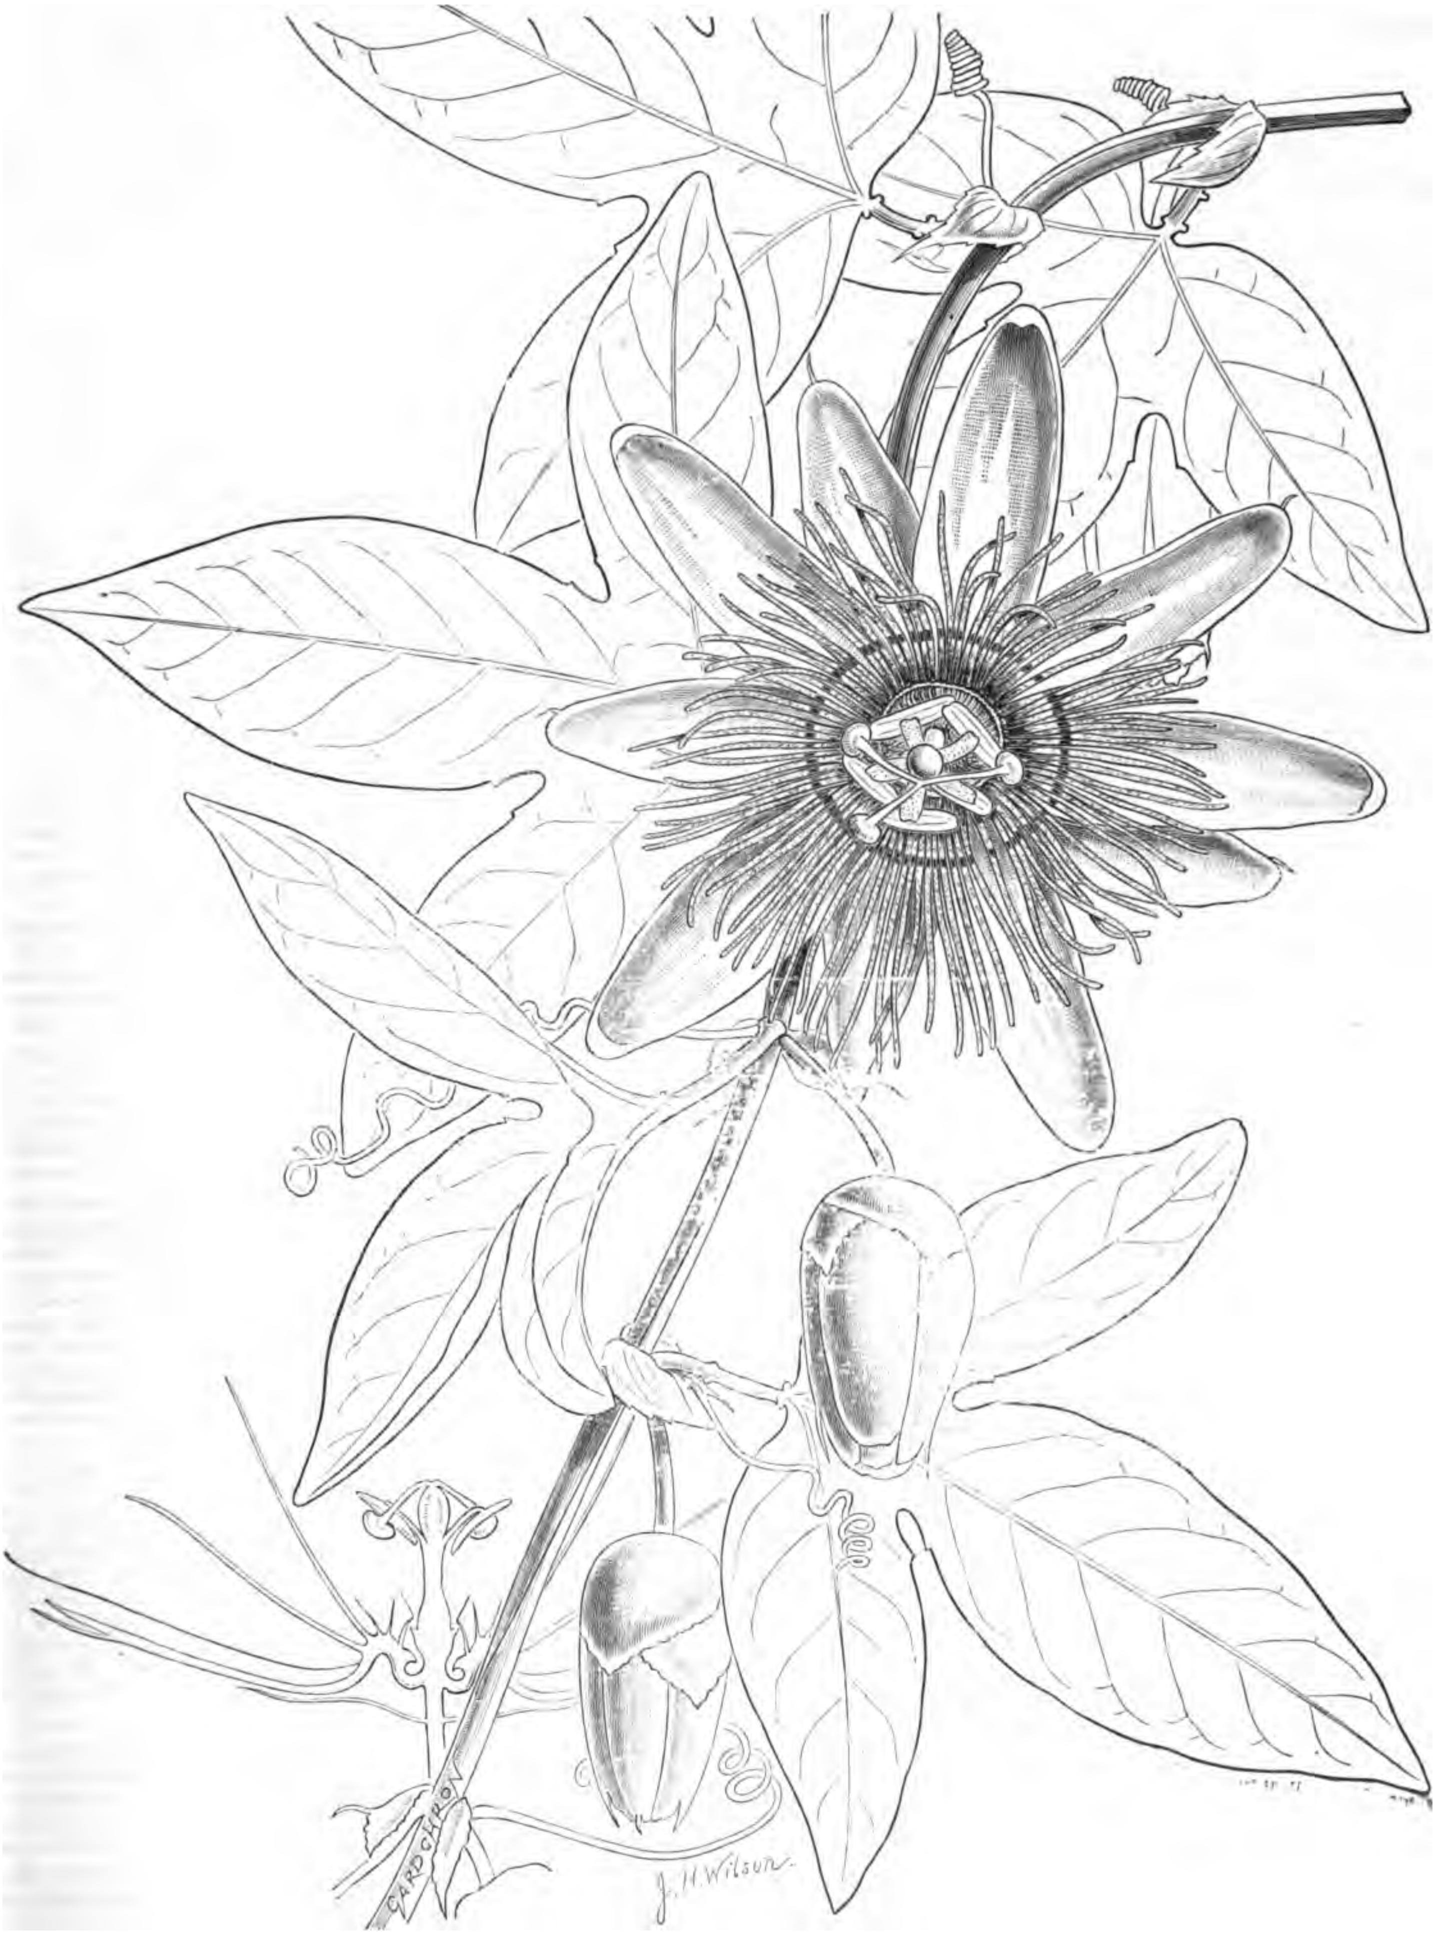

FIG. 36.—PASSIFLORA "MARGARET WILSON:" COLOUR OF PERIANTH LILAC-ROSE.

(From a drawing by the raiser, Dr. J. H. Wilson. See p. 81.)

The Linnean Society.—At the evening meeting intended to be held on Thursday, February 16, 1899, at 8 p.m., the following papers will be read:—1, "On the genus Lemnalia, Gray, with an account of the branching systems of the order Alegonacea," by Mr. Gilbert C. Bourne, F.L.S., &c. 2, "On some African Labiatæ with alternate leaves," by Mr. J. H. Burkill, F.L.S., and Mr. C. H. Wright, A.L.S., &c. 3, "Report on the Marine Mollusca, obtained during the first expedition of Prof. A. C. Haddon to the Torres Straits," by Mr. James Cosmo Melvill, M.A., F.L.S., &c., and Mr. Robert Standen.

Horticultural Exhibition at Ghent.—The programme is now arranged of the Exposition Internationale d'Horticulture de la Ligne Horticole L'Union, to be held at Mont St. Amand, Ghent, on April 30 to May 9, 1899. Many valuable prizes are offered in the various sections. A large hall is being constructed on the property of M. Alfred Van Imshoot, whose residence, greenhouses, orangery, and large garden, will all be used for purposes connected with the exhibition. *Ch. De B.*

Meeting of the Ghent Chambre Syndicale.—At a meeting of the Chambre Syndicale des Horticulteurs Belges at Ghent, on February 5, a prominent feature was a fine collection of cut-flowers of Cyclamen Papilio from M. Draps-Dom, of Laeken, near Brussels. These blooms were remarkable for variety and beautiful colouring, and were tastefully arranged with fronds of Adiantum. The spreading turbinate forms pleased me more than the wrinkled ones. M. Draps-Dom was awarded a Certificate of Merit *par acclamation*. M. Ed. Pynaert staged Adiantum Bessonianum with very wide fronds, full and healthy-looking; the plant is dwarf and ornamental. The Kentia (?) ornata differs essentially from the other species of the genus. Phœnix canariensis gracilis has narrower folioles and more elegant leaves than the type; Crinum Laurentiæ from the Congo is of dwarf habit, with many sturdy leaves, the floral racemes short and firm, the flower white and unremarkable. Anthurium Andreanum hybridum from M. C. Petrick has beautiful marbled spathes, and exceedingly ornamental leaves. Odontoglossum cariniferum has olive-brown segments, and a white lip with two violet-rose marks on the throat. O. ramosissimum bore two sturdy flower-stems with very fine flowers. These two species were from the houses of M. L. de Smet Duvivier. A hybrid Anthurium Scherzerianum raised by M. Louis de Smet has a large spathe with a broad green spot at the tip. Dracæna cannæfolia var., from the same exhibitor, is a fine plant. I would also mention a fine variegated Citrus sinensis called Gloire de Mont St. Amand. The leaves and the fruits are finely variegated; and the plant was well grown. *Ch. de B.*

Royal Gardeners' Orphan Fund. — We would remind our readers of the annual general meeting of subscribers to the above Fund, which will be held at 3 p.m on Friday next, February 17, at Anderton's Hotel, Fleet Street, E.C. Besides the usual business and election of pensioners to the Fund, a new secretary will be appointed, in succession to Mr. A. F. Barron, resigned. From nearly 300 applications for this position, the Committee, we believe, will recommend the appointment of Mr. Brian Wynne.

Chrysanthemums, etc., at Ghent.—The energy and zeal of the directors of the Royal Agricultural and Botanical Society of Ghent are things to be wondered at. We have before us the schedule of a great exhibition of Chrysanthemums which is to be held at the Casino of that city from November 12 to 14. Decorative plants, Orchids, and fruits are also to be exhibited. Foreign exhibitors are invited. M. Fierens, Coupure 135, Ghent, is the Secretary.

Stock-taking: January.—It is pleasant to find we have begun the year with a favourable commercial report; imports and exports both show increased volume, in many instances both in quantity and value; the political outlook being fairly clear at the same time, matters in the import and export line have a somewhat rosy look—if only we can steer clear of suicidal strikes. The increase in the value of imports is placed at £1,287,315—that is to say, the value for January last year was £39,929,291, against £41,216,606 for the past month. From the summary of the values we take the following brief excerpt:—

Imports.	1898.	1899.	Difference.
	£	£	£
Total value ...	39,929,291	41,216,606	+1,287,315
(A.) Articles of food and drink — duty free	13,252,926	14,211,331	+958,405
(B.) Articles of food & drink—dutiable	2,368,501	1,717,053	—651,448
Raw materials for textile manufactures	8,302,081	9,626,504	+1,324,423
Raw materials for sundry industries and manufactures	3,576,909	3,120,391	—456,518
(A.) Miscellaneous articles	1,377,214	1,170,841	—206,373
(B.) Parcel Post ...	130,881	156,372	+25,491

Wheat, as may have been inferred from our weekly averages, shows a falling off in value represented by £187,804; Barley increased by £155,153; Oats went up some £116,594. Dutiable articles fell off as recorded—Tea going down £263,836; Coffee gave way £149,573; cocoa fell off by £95,267. Hops from abroad amounted to £187,224, as compared with £242,471 in January, 1898. Seeds, Clover and Grass, show a value of £56,713, against £102,626 for the same period last year; pulp of wood, for paper-making, was valued at £132,250, against £157,058 for January, 1898; £318,949 represents the value of hewn timber introduced, as against £303,810 last year; wood and timber, hewn or split, was valued at £344,964, and last year's figures were £313,553. In chemicals, &c., £34,443 represents the decrease; oils went back £39,708. It may be noted that manufactured articles increased by £152,732; raw materials for textile manufactures gained by £1,324,423: a pleasant prospect for manufacturers. By the way, it may be noted that Australian wine prospects are looking up, and there would appear to be an early chance of a boom in Victorian viticulture—that is, if the growth of good Grapes in what are termed cool localities should prove the success anticipated. In that case great increase in the acreage devoted to Grape-growing would soon have to be reported—connoisseurs in France and Germany having favourably reported upon the qualities of the wine produced in established vineyards. From the section of the Trade Returns devoted to fruit, roots, and vegetables, we make the following extracts:—

Imports.	1898.	1899.	Difference.
Fruits, raw:—			
Apples ... ... bush.	295,551	303,058	+7,507
Grapes ... ... „	1,001	1,433	+432
Lemons ... ... „	...	...	...
Oranges ... ... „	872,849	1,244,269	+371,420
Pears ... ... „	3,060	7,332	+4,272
Plums ... ... „	3	77	+74
Unenumerated ... „	56,441	66,040	+9,599
Onions ... ... „	443,749	529,753	+86,004
Potatos ... ... cwt.	739,955	50,976	—688,979
Vegetables, raw, unenumerated ... ... value	£75,019	£109,905	+£34,886

Here are some surprising figures, the exact value of which, cultivators and salesmen alike, quite understand, as also do those who, in the depth of winter, can purchase excellent fruit at a reasonable price. As above noted, the

Exports

of British and Irish manufactures show a good front. Their total value is £20,347,234, against £19,231,404, for January, 1898, an increase of £1,115,830. The largest increase is to be found in "Ships new, not registered as British," £545,190 (this is a new item in the Trade and Navigation Returns). This is followed by £356,496, the increase in machinery and mill-work; £259,325 in raw materials; £59,205 for apparel and articles of personal use; whilst £22,963 represent the increased value of articles of food and drink exported. We may note here that there is shown a gradual improvement in the get-up of the printed Returns, making matters generally easier of comprehension by those more especially interested in it.

Botanical Magazine.—The plants figured and described in the February number are the following:—

Gentiana Burseri, Lapeyrouse, t. 7637.—This is a noble species, nearly allied to G. punctata, and having much of the appearance of G. lutea. It is a native of the Pyrenees, and of the Western Alps. The specimen figured is from the garden of the Rev. Canon Parker, of Upton Cheyney, Bristol. The roots collected by this gentleman were grown in paraffin-tubs cut in halves, and filled with leaf-mould, and the *débris* of a faggot pile. In this they thrive.

Elæagnus macrophylla, Thunberg, t. 7638.—A hardy shrub, introduced from Japan by Mr. Maries. It has broad, oblong-ovate leaves, greenish flowers, and oblong red berries, the size of a Sloe. The whole plant is densely covered with flat, star-like scales.

Dendrobium capillipes, Reichenbach, f., in *Gard. Chron.*, 1867, p. 997, and 1880, vol. i., p. 743; t. 7639.—A yellow-flowered Burmese Dendrobe, with small roundish-flat flowers, and a broad, roundish lip, with reddish lines, spreading horizontally from the base of the lip.

Ceanothus integerrimus, Hooker and Arnott, Lindley in *Gard. Chron.*, 1856, p. 36, c, ic.; t. 7640.—A native of the Sierra Nevada of California, with cordate ovate entire leaves, and many-flowered, much-branched inflorescence. It flowers annually in the arboretum at Kew.

Epilobium obcordatum, Asa Gray, t. 7641.—"As a rock-garden plant it has few rivals." It is a native of the Sierras of California, at elevations of 8000 to 11,000 feet. The flowers are of a violet-rose colour.

"The Fern Bulletin."—A quarterly journal devoted to Ferns, and published at Binghampton, New York State, by the Fern Bulletin Company, now enters on its seventh volume. It is specially devoted to hardy North American Ferns, their appearance, habits, and cultivation. The journal, we are glad to see, has been so successful that its size is to be increased. Mosses also receive attention. The editor, to whom communications should be sent, is Mr. Willard N. Clute, Botanic Garden, Bronx Park, New York City.

Grape Professor Burvenich.—The January number of the *Bulletins d'Arboriculture, &c.*, contains a coloured plate and a description of a new Grape, supposed to be an accidental seedling from the Black Hamburgh or Frankenthal. The leaves are more deeply cut than those of Black Hamburgh, and the berries are almost as large as those of Gros Colmar. It was discovered in the nurseries of MM. Gauthier Frères, at Soignies. It would, if we may judge from the illustration, make a splendid exhibition variety.

Jyree.—This is the name given to the prepared leaves of a certain Indian plant which has been for some time past recommended as a substitute for Tea. According to the *Journal of the Agricultural and Horticultural Society of India* (July to September, 1898), the real name of the plant is not yet made public. Wonderful properties are claimed for it, mostly as a curative of aches and pains as an external application; and internally as a decoction for calming the nerves, and allaying headache and neuralgia. Further, it ensures freedom from all the evils attendant on excessive tea-drinking, since it induces sleep and cures insomnia. Jyree is prepared in several ways, according to the special purpose to which it is to be applied; frequently it is used in combination with tea. If only a small part of that which is claimed for it proves to be true, and the plant can be produced in sufficient quantities, Jyree should prove a valuable acquisition both as a drug and as a beverage. In the meantime, a little scientific scepticism is prudent.

OODEYPORE.—Mr. T. H. STOREY sends us his report for the year 1897-98 on the gardens of His Highness MAHARANA FATAH SINGHJI, of Oodeypore. The gardens have been kept in good order throughout the year to the satisfaction of H.H. the MAHARANA. The report contains a list of plants suitable for hedges in that part of India, among which Inga dulcis is specially recommended. Gloriosa superba formed a splendid bed, surrounded by a protective fence of Opuntia vulgaris, the spines of which deter the deer and other animals from touching the plant. In the fruit-garden, the parrots are an ever-present nuisance, entailing the employment of watchmen night and day. The report on the menagerie and its inmates is amusing, but our limited space does not permit us to do more than mention it.

SEED CATALOGUES.—We have received the *Index seminum in horto Musei Parisiensi collectorum*, which is a list of seeds collected in the Jardin des Plantes at Paris in 1898, and available for exchange with other establishments. It is a rather formidable document of twelve or thirteen quarto pages of four columns each. It is to be wished that the modern name of the botanic garden here called "Brivatensis," had been given. We confess to ignorance as to the whereabouts of the Hortus botanicus brivatensis. Can it be Brest? From Malta also we have been furnished with the seed catalogue of the Argotti Botanical Gardens, Floriana, Malta. This is also a voluminous production, signed by Professor F. DEBONO.

NELUMBIUM.—The November number of the *Tokyo Botanical Magazine* contains amongst other articles an elaborate paper on the rate and mode of growth of the leaf and of the flower-stalks of Nelumbium. Mr. MIYAKE concludes that the different rate of growth for day and night cannot be explained by the operation of one or two factors only, but must be determined by careful observation and experiment. The conclusion of the paper will be given in another issue.

THE LANTANA PEST IN MYSORE. — To Mr. JOHN CAMERON, the Superintendent of the Mysore Government Gardens, is due the establishment of "Lantana, Limited" in Bangalore. It is incorporated under a bye-law of the Bangalore city Municipality, providing that the growth of Lantana within municipal limits shall be kept under control. Mr. CAMERON drew attention over a year ago to the extensive growth of Lantana Camara in Mysore, and observed that while the shrub served a useful purpose if kept in its proper place, it should only be admitted with much caution, and to a very limited extent where the soil is already fertile. It is a hardy plant, and its seeds are spread far and wide by birds. Like the Prickly-Pear, too, it takes a good deal to eradicate it. An attractive and protective plant, it makes a good bid for popularity; but the fiat has gone forth, and for the future its growth is to be limited in Bangalore. No doubt similar measures will probably be taken in other parts of Mysore, so that we may expect soon to see "Lantana, Limited," opening numerous branches, and throwing out "suckers and seedlings" as vigorously as the plant itself does. *Planting Opinion, cited in "Indian Gardening."*

WARNER'S KING ALIAS D. T. FISH APPLE.—We learn from the *Wiener Illustrirte Garten Zeitung* that at a meeting of the Horticultural Society of Vienna on December 18 last, the merits of this variety of Apple were discussed by several gardeners present, and Herr HUGO MÜLLER said that the tree succeeded admirably in Lower Austria, and on that account, and the fine, juicy, well-flavoured fruits its distribution should be encouraged.

ALNWICK CASTLE GARDENS.—We learn that Mr. GEO. WYTHES, the well-known able head gardener to the Duke of NORTHUMBERLAND, at Sion House, Brentford, will, in addition, take over the management of the ducal gardens at Alnwick Castle, whilst continuing to reside at Sion. The actual carrying out of the work at Alnwick will be entrusted to Mr. FOLLWELL, who has hitherto been his principal foreman at Sion. It is an onerous undertaking, and one that is, doubtless, not intended to be permanent, and we wish Mr. WYTHES every success. Mr. HARRIS, hitherto and for many years the head gardener at Alnwick, is leaving to take a business.

FIRE AT THE UNIVERSITY OF GENEVA.—The *Semaine Horticole* gives details of the terrible fire which, on the night of December 25, destroyed the buildings of the University at Geneva. When we mention that the Delessert Herbarium was burnt, we have said enough to excite the sympathies of botanists. Professor CHODAT's personal herbarium is lost, as well as the Mediterranean plants of HUBER, and various collections lent by the Museums of Brussels, Zurich, and elsewhere, for the purpose of comparison.

JUNIPERUS VIRGINIANA, "THE RED CEDAR."—There are in gardens several forms of this plant, some more beautiful than others. We should be obliged if any correspondent would inform us whether such beautiful forms as J. virginiana, Schotti, Chamberlaini, Bedfordiana, are more tender than the ordinary forms. A specimen received from Florida, through the kindness of E. B. THOMSON, Esq., approximates very closely to the form known as Schotti. Prof. SARGENT, we believe, is inclined to separate the Florida form as a distinct species.

NEW BRITISH FUNGI.—Messrs. H. T. SOPPITT and C. CROSSLAND reprint from the pages of the *Naturalist* the descriptions of a number of species found by them in West Yorkshire, together with a plate illustrative of their structure.

PROF. CARUEL.—The number for January of the *Nuovo Giornale Botanico Italiano*, contains a portrait of Prof. CARUEL, whose death on Dec. 4, 1898, we had occasion to announce. Prof. CARUEL had edited the new Italian Journal of Botany for twenty-two years, and was the first President of the Italian Botanical Society.

"ONE AND ALL GARDENING."—A copy of this useful annual for 1899 is now before us. It is edited by Mr. E. O. GREENING, and published at 3, Agar Street, Strand, W.C. The contents of the present issue include papers by the editor, by Messrs. T. W. Sanders, D. T. Fish, T. S. Cooper, R.A., H. Rider Haggard, and many other writers, including Mrs. Dr. Blackwell, Mrs. M. G. Fawcett, and Miss M. E. Braddon. Some of these articles deal with the charms and benefits to be derived from gardening, others are of a practical nature, and for the value and reliability of these the names of the authors are a sufficient guarantee. There are many illustrations, among them numerous portraits, and some pretty views of gardens.

FRUIT FROM THE CAPE.—The Union Steamship Company's vessel *Scot* has brought 361 boxes of Peaches and 59 boxes of Plums from the Cape. All arrived in excellent condition, and realised fair prices. Particular attention is drawn to the fact that some of the fruit was sold in Manchester on the day following the ship's arrival in Southampton. Sixteen boxes of Peaches and forty-four boxes of Plums were consigned to Havre for sale there.

AUSTRALIAN FRUIT.—The general manager of the Orient line of steamers—to which it would appear has now been delegated the carrying of fruit from the Australian colonies and Tasmania to this country—has informed us as to the dates of sailing of their fruit-ships during the coming season. The first ship to start is the *Cuzco*, which is to leave Sydney on February 18, and is due at Tilbury on April 1; the *Oruba* departing from the same port on March 4, and arriving on April 15; the *Ormuz*, March 18, arriving April 29; the *Omrah*, starting on April 1, and arriving May 13; the *Austral*, leaving on April 15, and arriving at Tilbury on May 29; and the last of the ships, the *Ophir*, leaving on April 29, and due here on June 12.

LINCOLN POSTAGE-STAMP CATALOGUE.—Mr. W. S. LINCOLN, of 2, Holles Street, Oxford Street, W., has just issued the twelfth edition of his stamp catalogue. The new volume is thoroughly up-to-date, is larger and fuller than its predecessors, and contains over 4000 illustrations.

DINNER-TABLE DECORATIONS AT LORD SALISBURY'S.—On Monday last the occasion of the Premier giving a dinner-party, at his London residence, to seventy-five of his adherents in the Upper House, the table was effectively decorated by Mr. NORMAN, his Lordship's head gardener, in the present fashion of employing one or very few kinds of flowers. It is a well-understood rule at dinner-parties that the plants or cut-flower devices shall not obstruct the view of the seated guests across the table, and this was strictly adhered to on the present occasion. Shallow pans or saucers, measuring 1 foot in diameter, were placed together, so as to form groups 3 feet in length, alternated with a solitary one. When filled, the width of each would be about 1 foot 8 inches. In every case sprays of Calanthe Veitchi, of a deep rose colour, formed the chief decorative material; and those being inserted in the damp sand with which the pans were filled, fell gracefully outwards. In a few instances, flower-spikes of Cœlogyne cristata, Cypripedium insigne, and Lily of the Valley were placed among and beneath the Calanthe flowers. The groundwork of the pans consisted of Adiantum Farleyense, lavishly employed, spreading over the table-cloth 6 in. beyond the pans, and effectually hiding them from sight. In the seven circular groups the leaves of Grevillea robusta were used, together with the fronds of the Adiantum; and a species of Cyperus was used at the top, together with Lily of the Valley. As a material to contrast with, and tone down the excess of pink colour, sprays of Asparagus plumosus were stuck in amongst the Calanthe blooms. The general effect was pleasing. We understood that the whole of the materials were produced at the gardens at Hatfield.

PUBLICATIONS RECEIVED.— *The Australian Fruit Garden*, by J. G. Heron. (Geo. Robertson & Co., Melbourne, Sydney, Adelaide, Brisbane, and London.) A useful handbook, forming No. 8 of an Amateur Series.—*Annual Report of the Queensland Department of Agriculture*, for the year 1897-98.—*Bulletin from the Laboratories of Natural History of the State University of Iowa*, vol. iv., No. 4, comprising papers I., on the Iowa Sedges, by R. T. Cratty; and II., Descriptions of American Uredineæ, ii., J. C. Arthur, and E. W. D. Holway.—*Bulletins* 16 *and* 18, *United States Department of Agriculture, Division of Entomology*, the Hessian Fly in the United States, by Herbert Osborne, and miscellaneous results of the work of the division.—*Boletim da Sociedade Broteriana*, xv., 1898.—*Bulletino della Società Botanica Italiana*, Dicembre, 1898.

NOTICES OF BOOKS.

CYPRIPEDIUM, SELENIPEDIUM, AND UROPEDIUM:[*] Monograph, comprising descriptions of all the Species, Varieties, and Hybrids existing at the present day. By F. Desbois.

SUCH is the title of a very voluminous work extending over 544 pages, compiled by M. F. Desbois, of Auderghem, Belgium, a gentleman well known for the interest which he has taken in the genus Cypripedium during a great number of years. It should be said at the outset that the work is essentially for gardeners, as little attempt is made to bring it into any kind of botanically classified order, the names and descriptions being generally taken as originally published, and without any attempt being made to decide as to whether they are different from previously described species or varieties of the same parentage. Thus with prolific crosses such as C. × Harrisianum, in which practically the same thing has been described under different names, no attempt is made to reduce them to synonyms or varieties, but each appears under the title given to it by its raiser or describer. That many of the hybrids of the same crosses are dissimilar there is no doubt, and in a work destined for gardeners, it may be convenient to place each under its original name, and trust to the descriptions which follow to indicate the affinities to plants bearing other names.

---

[*] *Les Cypripediums, Leur Monographie*, F. Desbois, Gand. Imprimerie : E. Meyer, Van Loo, Rue de Flandre, 66.)

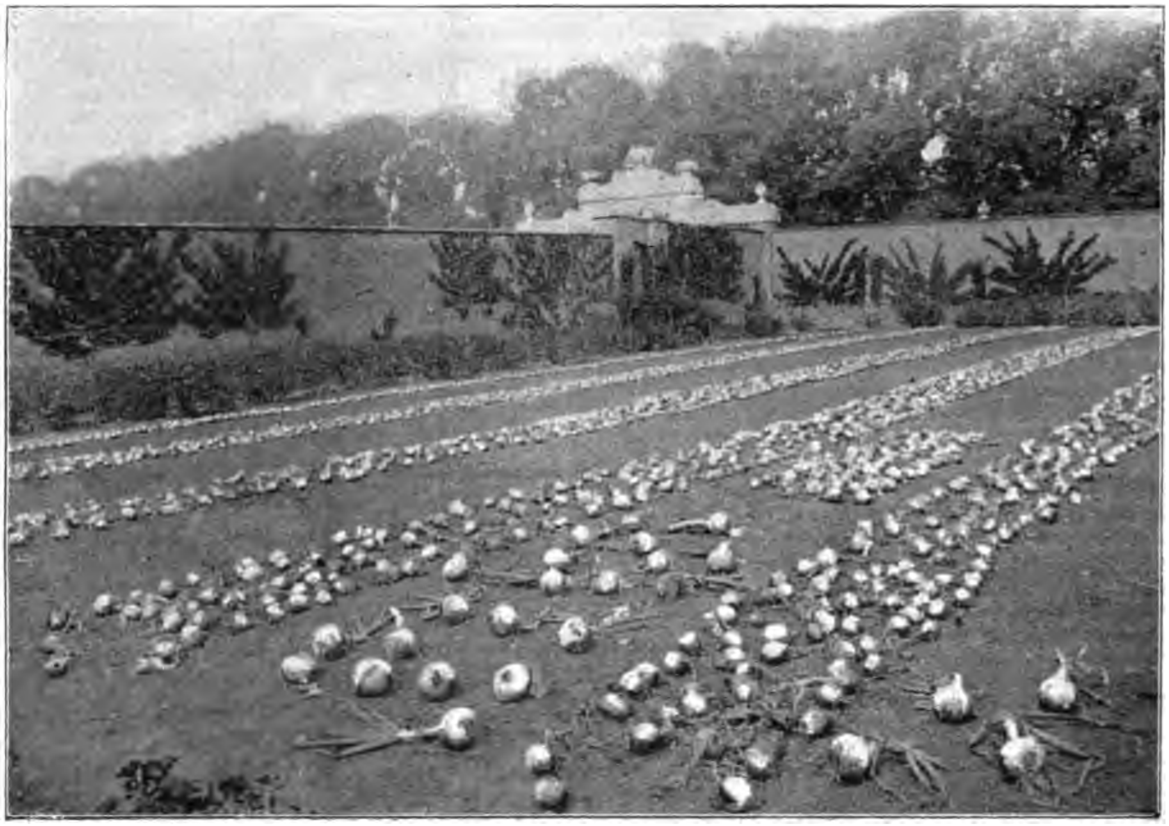

FIG. 37.—A CROP OF AUTUMN-SOWN ONIONS, EQUAL TO 12 TONS PER ACRE, GROWN IN WREST PARK GARDENS.

The old generic names Cypripedium and Selenipedium are adhered to, though why Uropedium should be introduced to carry Uropedium Lindeni, now generally admitted to be nothing but a form of Selenipedium caudatum, it is not easy to perceive, except for the purpose of carrying out the plan of the work to include all published names. In dealing with species in other parts of the work, too, there are a few contradictions. For example, on looking for C. Philippinense we failed to find it in its place, but on turning to its synonymous names, C. lævigatum and C. Roebeleni, we find them elevated to specific rank, and full descriptions given. Probably the omission of the correct specific name in its proper place is an oversight, for the author says under C. lævigatum, "Cette belle espèce est aussi connue sous le nom de C. Philippinense, qui est le premier en date et qui l'on doit préfèrer."

The work commences with an explanation of the three groups into which the author divides his subject, viz.:—1, Groupe de la region tempérée (Cypripedium Calceolus, &c.); 2, Groupe des Selenipediums; 3, Groupe orientale (C. barbatum, C. insigne, &c.), and under each group some good general remarks on culture follows. Then comes a chapter on hybrid Cypripediums, followed by an enumeration of all published species and varieties, to each of which are appended extracts from the original descriptions, with references and such remarks as suggested themselves to the author.

The work is interesting in many points, and especially in demonstrating the fact that most of the important work of importation and hybridisation has been done from the British Isles, and in indicating the great variation to be found in some of the species and hybrids. In dealing with varieties of C. insigne, more than eighty recognised and published varieties are included. What a revelation it would be if all these could be got together, and in flower at the same time! and what a slaughter there would be if all which were not furnished with well-defined fixed characters, should have to be destroyed! The work is well printed, and contains no more errors than are almost inevitable in such a book—chiefly printers'—and readers will doubtless be as glad to see it as M. Desbois must have been to see the last sheets of his proofs, which had been a source of his continual care for many years. Unlike many other similar publications, this one is brought well up to date; and it is also well illustrated.

The work will ever remain a monument of the patience, cleverness, and zeal of M. F. Desbois, and we heartily recommend it to all interested in the Cypripedium.

AUTUMN *VERSUS* SPRING-SOWN ONIONS.

THE year 1898 owing to the drought, was a very trying season, and during the summer and early autumn many of the kitchen-garden crops suffered greatly. Onions were more or less attacked by maggot and mildew. Remedies were tried, but they proved of little or no avail after the grub and mildew had once attacked the plants. The attack was worse on spring-sown Onions than on those that were sown in autumn and were transplanted to their permanent quarters during March. This was no doubt due to the latter having become better established.

The crop of spring-sown Onions, when harvested, was anything but a satisfactory one; but the crop of autumn-sown Onions did capitally, and the maggot never managed to make its appearance amongst them. I would strongly advocate the sowing of a greater proportion of the Onion crop in the autumn, as I believe they will better resist the maggot and mildew than those sown in early spring.

If it is not convenient to sow seeds during the autumn, then I would procure some shallow boxes in January, or early in February, and sow in them such varieties as Ailsa Craig, Cranston's Excelsior, &c.; raising the seedlings indoors, and when properly hardened off, transplanting them into the open ground. This method gives very satisfactory results, and the risk of the crop being attacked by maggot and mildew is reduced thereby to a minimum. [See also Mr. Woodgate's letter on p. 76 in our last issue. ED.]

The late Mr. Mackenzie, who was gardener at Rosehaugh, near Inverness, writing to the *Gardeners' Chronicle* about forty-five years ago, remarked that transplanted Onions frequently escaped the grub in gardens where the spring-sown crop is greatly injured by it, and he gives the mode by which he obtained a superior crop of sound Onions from autumn sowings. He also states that none of the plants was attacked by the maggot; whereas, the spring-sown Onions were nearly all destroyed by it in the same kind of ground, and to which the same kind of manure had been applied. I herewith send you a photograph (which we reproduce in fig. 37, p. 92) of a square of autumn-sown Onions grown in the garden here last season. After weighing the Onions and measuring the ground, we found it to represent a crop of about 12 tons per acre. *George MacKinlay, Wrest Park Gardens Ampthill.*

HOME CORRESPONDENCE.

CAPPARIS SPINOSA.—From an answer to a correspondent in the issue of the *Gardeners' Chronicle* for February 4, it appears worth while, on the matter of culture, to refer to a specimen of this plant in the Cambridge Botanic Garden, which is decidedly handsome both in flower and out of flower. It is planted on a low rockery, between some houses standing 9 feet apart, and against a greenhouse wall, where it is covered with a frame-light in the winter, chiefly to protect it from excess of moisture; some light litter is also thrown over the crown, and this is quite sufficient to protect it from any probable degree of cold. The plant is much hardier than might be supposed, though its chief requirement is sunlight and warmth during the period of growth. It will live in a pot, but its cultivation is then doomed to failure. Our specimen cannot be less than 5 feet across when fully developed in the summer. *L.*

CLEMATIS VITALBA.—It may possibly be of interest to Mr. Divers to know that the old and correct name of this beautiful climber is Traveller's Ivy. It is so called in all, or nearly all, ancient botanical works; and I was pleased to notice that this old name has been revived in one of this year's garden catalogues. When it is considered how very similar the capital 'I' is to the 'J,' and how easily a 'v' may be written as an 'o,' the corruption of 'Ivy' into 'Joy' becomes at once apparent. *J. C. B., Stamford.* [The term Traveller's Joy seems, says Mr. J. Britten, in *English Plant-Names*, to have been invented by Gerard, who speaks of its "decking and adorning waies and hedges where people trauel, and thereupon I have named it the Trauellers Joie." Gerard, 739. Has the old English Joie been corrupted into Ivy? ED.]

TIBOUCHINA (LASIANDRA) MACRANTHA IN CORNWALL.—One of the most interesting plants growing out of doors at Menabilly is Lasiandra macrantha; at the present time (Jan. 25) it is in perfect health, with fully expanded flowers or flower-buds on every growth. The foliage is looking as fresh as if it were growing under glass. Owing to want of room in the houses, I planted out last spring, from a 16-inch pot, a shabby-looking plant about 5 feet high. It was planted in the border amongst other shrubs, in the ordinary loamy soil to take its chance. Up to the present time the weather has had no injurious effect on it. On Jan. 24 occurred the most severe frost, and this was only 6°, but the winter has been remarkable for a great number of storms. Should this plant prove hardy in Cornwall, it will be a great acquisition to our flowering shrubs, the colour of the flower is such a contrast to the other winter-flowering shrubs. A few feet distant is a large Camellia, with a great number of fully expanded red flowers; also Rhododendron calophyllum, covered with its beautiful white sweet-scented blooms. Then, glancing at the thousands of Snowdrops and Narcissus to be seen, it makes one think that spring is far advanced. *W. H. Bennett.*

ARCHONTOPHŒNIX CUNNINGHAMIANA (SEAFORTHIA ELEGANS).—Amongst all the species of Palms grown in our gardens, there is none more graceful or useful than this one. It is no unusual thing to see it carrying three or four spikes of flower or fruit. A grand specimen could have been seen a short time ago in the gardens of Malvern House, Nottingham, carrying a crop of handsome red fruits. It is suitable only for lofty houses, and the plant at Malvern House is about 30 feet high, and it carried fourteen well-developed leaves. The species can be propagated from seeds, and plants thrive either planted out or in tubs and pots, if afforded good fibrous loam, leaf-mould, and sand, with good drainage, and abundance of water when growing. *G. Burrows, The Dell Gardens, King's Norton.*

SNOW AS A PROTECTION TO ROSES.—Most cultivators of the Rose like to have a covering of snow on their favourites, to mix with the February rains. Snow, if it fall to a depth of 4 to 6 inches, affords a constant and regular degree of protection against frost, such as we have in this country, protecting the plants against sudden thawing, that cripples and kills our Roses, rather than frost. It is thus that snow is like wool in retaining heat. More or less snow in the months of January and February is good and safe for our Roses. There are no devices of man so safe and cheap as snow as a protector. Fir-tree boughs, heaps of straw and tree-leaves, bracken, short litter, and, worst of all, long grass, may all be used to cover the Rose-bushes; but if these be used in excess, or not removed in good time, they bring enfeeblement or disease. With a covering of snow on their heads [which soon melts. ED.], and a mulch, and manure over the roots, Roses winter safely enough in this country; and it is safe to say that more Roses are lost by being coddled than are killed by frost. With ordinary foresight and skill in pruning and training Roses, there is little danger that the plants will be spoiled or broken down by the weight of the snow resting on them. My memory carries me back to the time when, to ease Conifers of heavy falls of snow, we used to shake the boughs with poles, carefully wrapped round with rags, to save them from injury; a necessary kind of work, but one that is never required by Roses. *D. T. F.*

THE MILD WINTER WEATHER.—When reading the paragraph headed "The effects of the mild weather," in your issue of 28th ult., the reference to Apple Deux Ans reminded me of having recently read of the same Apple in the early minutes of this Society. I quote the paragraphs containing the name, but without comment, except that the minutes were remarkably well kept, and, I have every reason to believe, they are thoroughly to be relied upon.

Extract from Minute of March 14, 1822.

"Dr. Duncan, Senr., invited the members to view upon an Apple-tree in his garden at St. Leonard's (Edinburgh), perfect specimens of last year's fruit, belonging to the variety known by the name of Pomme de deux annés."

Extract from Minute of June 13, 1822.

"Dr. Duncan, Senr., who, at a former meeting of the Society, gave an account of an Apple-tree in his garden bearing the Pomme de deux annés, presented at this meeting two Apples taken from that tree in the morning, and growing within a few inches of each other, one of these Apples being the produce of blossom of the year 1821, and the other of blossom of the present year."

—*P. Murray Thomson, Sec., Royal Caledonian Horticultural Society.*

THE WINTER ACONITE.—My thanks are due to those of your correspondents who have so kindly supplied dates of the first flowering of the Winter Aconite. Their observations may be divided into two classes, viz. (1), Those which were made either in the North of England or in Scotland; (2), Those made in localities south of the Trent. Taking first the four observers from the north, we find that their dates range between January 9 and 16, whereas only three out of the six residing south of the Trent are able to give any dates at all, the rest stating that at the times they wrote (January 13 to 18) the Winter Aconite had not yet come into flower. Indeed, Mr. Batters reports that at Gillingham, in Norfolk, even as late as January 18, he could not, after a careful search, discover "either flower or foliage." My own observations of the first flowering of the plant in question which have been made in a backward district in Hertfordshire, now extend over eleven years. The average date for this period comes out as January 22, and the range from January 7 in 1898, to February 11, in 1891—or exactly five weeks. This year the first blossom opened on January 18, which is four days in advance of the above average. So that taking mild and cold winters together, the time of flowering this year is probably by no means unusual. But when we come to consider the exceptional character of the last four months of 1898 as regards temperature, it at first sight appears surprising that the Winter Aconite should not, in most parts of the country, have made its appearance above ground at least a fortnight earlier than it did. For in none of the eleven years I have had the Winter Aconite under observation, was the ground in the same four months anything like as warm as this year. It is only when we call to mind the drought of the previous summer and early autumn, that we begin to realise what a retarding influence it must have had upon the growth of this and many other winter-flowering plants. It should also be remembered that in the southern half of England this drought was much more severely felt than in the northern counties; while in many parts of Scotland there was practically no drought at all. *E. M., Berkhamsted.*

BEGONIA GLOIRE DE LORRAINE.—In reply to Mr. Burbidge's enquiry on p. 62, it may be stated that of the large number of this useful Begonia grown here, probably not more than one plant in two hundred bears female flowers, and those only one or two upon each, a comparatively small plant now in flower carrying three. M. Lemoine, from whom I purchased it, gives B. socotrana and B. Dregei as its parents. *H. B. May, Dyson's Lane Nurseries.*

CROSSBEAKS.—I notice in the issue for the 28th ult. your remarks on these birds. At Battle, in Sussex, these birds are numerous this season, and they were noticed as soon as the Fir-cones were fully grown. Some time elapsed before I could make out what caused the Fir-cones to fall when green, but after watching for a time, I discovered the crossbeaks were the cause. I have not observed any other damage done, so the birds are not molested, which is not the case with the hawfinches, which are plentiful hereabouts. *Wm. Camm, Battle Abbey Gardens.*

THE LATE MR. JOHN LEE.—Of the memorable twenty-one who formed the Executive Committee of the International Horticultural Exhibition and Botanical Congress in 1866, sixteen have been called away by death, that number being made complete by the departure of the veteran John Lee. Of the building committee, Messrs. C. Lee, J. Gibson, J. Standish, and H. J. Veitch, only the latter is alive. The arrangement committee, who dealt with the disposition of the several subjects, Dr. Hogg, and Messrs. Gibson, Eyles, and Moore, have all passed away. Of the twenty-one who were photographed on the terrace of the Star and Garter Hotel at Richmond, only Sir Daniel Cooper, Bart. (Treasurer), Dr. M. T. Masters, and Messrs. W. Bull, Edward Easton, W. Paul, H. J. Veitch, and R. Dean (Assistant Secretary) survive. This exhibition was a great horticultural event, and allusion to the departure of anyone who took an active part in carrying out its details is justifiable. *R. D.*

ROSE QUEEN MAB. — Your correspondent, "A. P.," on p. 52, remarks that this Rose is not a good grower. With us it has been from the first an excellent grower, making strong, sturdy little bushes. Like other Roses of its class, it blooms too freely to make long or straggling shoots; but in this consists one of its great merits as a bedding Rose. We were interested to read "A. P.'s" remarks upon the variety Grand Duc Ernest Ludwig, as up to now we have not been able to meet with any one who has flowered it sufficiently in this country to pass an opinion on its merits. Has "A. P." seen it in bloom in England or elsewhere? *Apropos* of the name, the variety, we believe, was raised in Germany, and came to us as Grossherzog Ernst Ludwig; if the name is to be translated into French (for which, however, we see no necessity), should it not be Grand Duc Ernest Louis? *Wm. Paul & Son, Waltham Cross.*

THE GLASTONBURY THORN.—In the front garden of a large villa residence at Ealing, appropriately named Glastonbury House, is a good-sized specimen of the early-flowering variety of Cratægus oxyacantha, which bears the name of the Glastonbury Thorn. The tradition which sets forth its origin is well known, and is not worthy serious consideration. But the fact remains, that there is a singularly early variety of the common Hawthorn which does blossom on or near Christmas Day, or soon after this popular festival. Some have said that it is in flower thus early only in the particular locality in which it is stated to have originated, and that when removed to a different, and especially to a colder climate, it loses its precocity to a great extent. The specimen at Ealing has been planted probably twenty or more years, but it still retains its early-flowering character; and not only does it produce blossoms, but leafage also long before its relative, the common Hawthorn. Change of climate and locality, therefore, does not appear to affect this peculiarity of early flowering. *R. D.*

LAW NOTES.

JOBBING-GARDENERS' ANNUAL LICENSE.

WE briefly noticed in our last issue an important prosecution instituted by the Inland Revenue authorities at Manchester, having reference to gardeners employed by nurserymen to do work in private gardens.

We now publish an account of what has since taken place, kindly sent by Messrs. W. Clibran & Son, of Oldfield Nurseries, Altrincham :—

"We now write to give you the later information named by our Mr. Brown, in *re* The Inland Revenue Board *v.* Treeby. Mr. Hockin, Treeby's solicitor, suggested that a deputation of the trade and jobbing-gardeners should wait on Sir John W. Maclure, M.P., lay the case before him, and ask if he could assist in getting the decision set aside. Mr. Councillor Collens, Edge Lane Nursery, Stretford, therefore arranged with Sir John for an interview; and after consultation with various members of the trade, a deputation waited on him on Saturday the 4th.

Mr. COLLENS, in introducing the deputation, referred to the copy of the Act, and pointed out that the decision against Mr. Treeby, in his opinion, was a misrendering of the Act, and that it was not intended by the Legislature to inflict a hardship, such as the present case brought about on jobbing-gardeners, nurserymen, and florists, as neither master-gardeners nor nurserymen were mentioned in the Act as such. Cooks, confectioners, and waiters, were included under the head of servants liable to be taxed, but it was well known that none of these, when employed commercially, ever took out licenses. The same remark applied to park-keepers and gardeners in the employ of corporations. Licenses were never taken out for these men, yet they were as much liable under the present decision for taxation as jobbing gardeners in the employ of nurserymen or florists.

Mr. H. Watkins (of Messrs. Wm. Clibran & Son, Altrincham), on behalf of his firm, protested against the decision recently given as being contrary to the spirit of the Act. As although gardeners, and under-gardeners, among other servants, were specifically mentioned in paragraph 3, section 19, of the Act, as being liable for taxation, the meaning, it was contended, had reference to servants employed solely in a private capacity, and not to include men employed by master or jobbing gardeners, who depended upon it for part of their trade.

In further proof it was pointed out that the only tradesmen named in the Act were those using or dealing in horses. These tradesmen were specifically named, although coachman, groom, stable-boy and helper in stable are also named; and if Parliament had intended that tradesmen commercially engaged in gardening were to obtain licenses for the men they send out to take care of villa gardens, that intention would have been made clear in the Act. It is only by Sub-section 4 of Section 19 that commercial gardeners can be brought in, and this same sub-section would have covered the tradesmen with horses without special mention of them. The fact that the Act does name those commercially connected with horses and does not mention those commercially engaged with gardening is a proof that it was intended that the one class should be licensed and that the other should not.

The Act provides that livery-stable keepers must keep books of account. Had it been intended that jobbing gardeners be licensed, it would surely have provided that they, too, should keep books of account, as the number of men they employ varies so much from season to season, and in different parts of the same season.

It was mentioned that one man frequently attended fifteen or twenty places in a month, and if he was not himself licensed by his employer, it was contrary to the spirit of the Act that twenty licenses should be taken out by customers for one man's service. Parliament never intended industry to be taxed in this way, and that it would only be by applying the words of the Act in a different meaning that the trade could be so taxed. The Act had been passed thirty years, and it was the first case of its kind, thus proving that the officials of the Inland Revenue had not for that length of time construed the Act in the way the present decision placed it.

In conclusion, it was hoped that Sir John Maclure would use his utmost influence to have set aside a decision so damaging to nurserymen generally.

Sir JOHN WILLIAM MACLURE said that, personally, he had no objection to the luxury of coachman or gardener, but he looked upon them in their private capacity as luxuries, and as such he was prepared to pay for them. He quite agreed with the remarks put before him, and thought it a very unfair and improper thing to tax a working gardener who was not in a continuous appointment. He would like the deputation to appoint two of their number to meet him in London, and he would take great care that they had an interview with the most important people on the subject, as he thought they had a grave charge to bring against the permanent officials; and he would take care that the statements so put before him should be heard, and he would accompany them and see if their request could be refused, which he did not think it could be. He would put them in communication with the very best authority, and give them his heartiest support throughout in support of their cause. He would be in the House of Commons on Tuesday or Wednesday (7th and 8th inst.), and suggested that no time should be lost, as the sooner the matter was brought to a satisfactory conclusion the better. If they did not succeed, it would not be his (Sir John's) fault.

A vote of thanks was cheerfully accorded to Sir John W. Maclure for his patient hearing, and his kind promise of support.

After Sir John W. Maclure left the room the matter was talked over by those present, and it was arranged that Mr. Councillor Collens and Mr. Treeby should wait on the Hon. Baronet at the House of Commons on Tuesday, and lay the case before the Board's officials.

Notice of appeal has been given, and if Mr. Yates' decision be appealed against, the trade generally should subscribe to the cost, unless the case be taken up by the Nursery and Seed Trade Association."

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JANUARY 31.—*Present:* Dr. M. T. MASTERS (in the Chair); Mr. Veitch, Mr. Bennett-Poë, Dr. Muller, Rev. W. Wilks, Professor Farmer, Mr. Michael, Professor Balfour, Mr. A. Sutton, Rev. Professor Henslow (Hon. Secretary). Visitor, Mr. L. Sutton.

Potato-grafting.—Mr. A. Sutton read an interesting paper "On the Results of Grafting and Hybridising Potatos with Tomatos," the substance of which was given in these columns in our last issue.

Hollyhock Disease.—Leaves attacked by Puccinia malvacearum were received from Mr. E. Molyneux, a fungus which has proved fatal to these plants for many years.

Eucalyptus sp.—Dr. Masters showed a flowering specimen of E. cordatus, growing in the open in Co. Down; and of E. Globulus, grown for forty years in Leicestershire. Professor Balfour observed that on the coast of Ross-shire several plants characteristic of the Riviera thrive well, in consequence of the amelioration of the climate by the proximity of the Gulf Stream.

Cypripedium.—Dr. Masters also exhibited a blossom of a Cypripedium, in which the two normally coherent sepals were free.

Fasciated Cyclamen.—Dr. Masters exhibited specimens of this not unusual phenomenon of several flowers with leaves on the same stem.

PEOPLE'S PALACE HORTICULTURAL.

FEBRUARY 1.—The annual meeting of this Society was held on the above date, the chair being occupied by C. E. SHEA, Esq.

For a Society which has been in operation only a few years, it has made astonishing headway, and seeing that its members must of necessity be drawn from densely-populated districts, where the growth of plants can be made only under unfavourable conditions, the obvious conclusion is that it supplies a want which is gladly welcomed.

The annual report by Mr. C. E. Osborn, the Secretary, set forth that during 1898, 520 adults and children joined the Society. The monthly lectures have been well attended. Four shows were held during 1898. The grand total of entries for the four shows was 1272, in 218 classes; the prize-money paid was £100, in addition to several medals. The juvenile section (prizes are offered for children at all the exhibitions) is being reorganised and extended, and a schedule of prizes is being prepared, to be competed for by children in the elementary schools. It is proposed to supply each child with a plant suitable for cultivation in a pot, which will be previously potted, and in addition a packet of seeds will be given to each child. They will be required to pay one penny for the two, and the children will have object-lessons in potting, &c.

DEVON AND EXETER GARDENERS'.

FEBRUARY 1.—At a meeting of the Society, held on the above date, a paper upon "Liliums and Lily of the Valley" was read by Mr. James Mayne, gr. to the Hon. Mark Rolle, Bicton.

Interesting and useful remarks were made upon the cultivation of L. longiflorum and its varieties, L. auratum, L. giganteum, L. speciosum, &c. In the case of outdoor culture, Mr. Mayne reminded his hearers that Rhododendron and Azalea beds offered very suitable sites and conditions for Liliums, but if tall-growing Lilies be grown together in beds, it was necessary to screen the surface of the ground with such a plant as Mesembryanthemum cordifolium in order to prevent the sun from unduly drying the land. L. candidum must be re-planted when the flower-stem has withered if circumstances make it necessary to move the plant, as this species is more or less active throughout the year.

A south-westerly aspect is the ideal one for beds of Lily of the Valley.

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

FEBRUARY 1.—Mr. W. H. Scott read a paper on "Hardy Fruit Culture for Pleasure and Profit."

He took the instance of a person having a piece of ground for fruit culture only. Mr. Scott described how a piece of ground intended for the cultivation of fruit-trees should be planted with Apples, Pears, Plums, and Cherries, standard, pyramid, and cordon trees, and the relative advantages of each were described. Advice was given respecting Currants, Gooseberries, Raspberries, and Strawberries; as these could be planted between the rows of large trees, it was essential that choice varieties and free-croppers be chosen. The market garden method of culture was described. Many of the members took part in the subsequent discussion. At the instigation of the chairman, practice in judging plants was undertaken, and created an amount of interest amongst the members.

BRISTOL AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

FEBRUARY 2.—The fortnightly meeting of the Society was held on the above date, Mr. W. A. GARAWAY in the chair. A lecture was given by Mr. A. MOORE-SARA, of Stoke Bishop, on "Spores and Seeds, and their Germination."

In an interesting manner, he showed the origin, formation, and stages through which a Fern spore passed until fertilisation was complete, and a Fern plant eventually established. Treating of seeds, he also, in the same way, described the formation of a flower, the fertilisation of the seed, and subsequent germination, and explained the main points of difference between the germination of spores and seeds, illustrating the whole with blackboard diagrams. The lecture, though necessarily a little technical, was much appreciated, and the hope was expressed that Mr. Moore-Sara would again favour the Society with a paper.

HAMILTON HORTICULTURAL AND FORESTRY ASSOCIATION.

FEBRUARY 3.—The first lecture under the auspices of this new association was delivered on the above date in the Y.M.C.A. Institute by Mr. DEWAR, Curator of the Botanic Gardens, Glasgow. The Rev. S. M. B. PATERSON, President of the Association, occupied the chair, and there was a good attendance.

The lecturer dealt with the practical side of a gardener's life, and gave shrewd and sound advice as to the method to be employed in perfecting their art. The lecture was made bright and interesting by several biographical sketches of famous gardeners who had made their mark in different spheres of gardening work, &c.

At the close a discussion followed, in which the chairman and several members took part. Altogether, a good beginning was made, and the Association bids fair to have a long and useful career. *J. M.*

NATIONAL CHRYSANTHEMUM.

February 6.—The annual general meeting of the National Chrysanthemum Society, which took place at St. Stephen's Hall, Royal Aquarium, on the above date, was a credit to the Society.

The feeling has latterly been far too common that the fellows and members cannot meet for the discussion and transaction of business without exhibiting a spirit of division and squabbling unworthy of everyone concerned. Monday's meeting will in large measure dissipate such an idea, that perhaps in the near past has not been totally devoid of justification. There were quite sufficient items of inflammable nature upon the agenda (including various propositions for the alterations of rules) to have provoked a serious conflagration, but they did not. No more suitable gentleman than C. E. Shea, Esq., a vice-president of the Society, could possibly have fulfilled the duties of chairman, and his influence and example had untold effect upon the conduct of business.

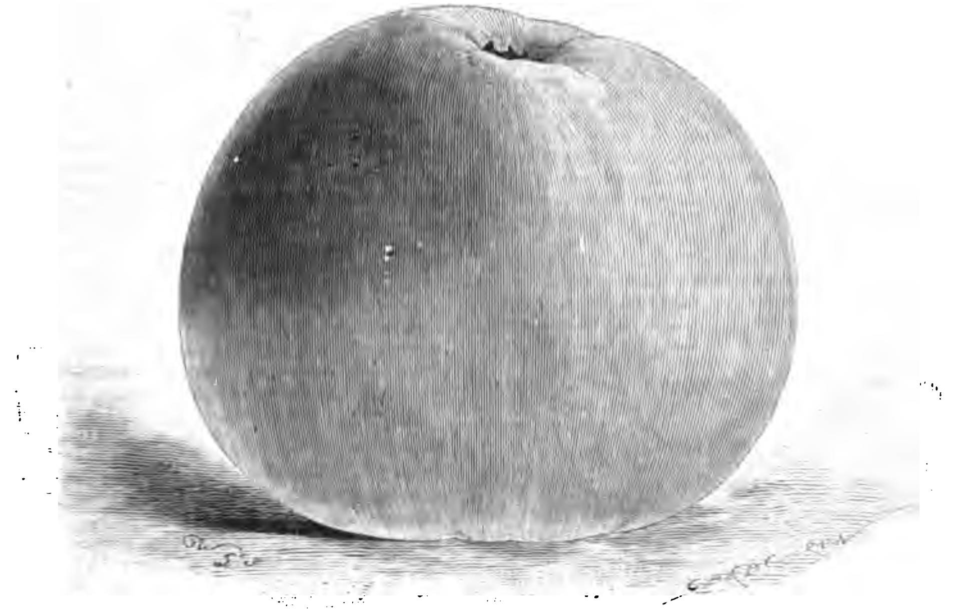

Fig. 38.—New Apple, Lady Pilkington.

Recommended an Award of Merit by the Royal Horticultural Society's Fruit and Vegetable Committee, on Jan. 31. Much resembles Dumelow's Seedling, but the flesh is softer, and more agreeable to the palate. Exhibited from the Southport and Churchtown Botanic Gardens.

REPORT OF EXECUTIVE COMMITTEE.

We had first to listen whilst the minutes of the last annual meeting were read by the Secretary, and after this to the reading of the annual report of the Executive Committee, which took a considerable time. This report has been posted to all members of the Society, and it is not necessary to reproduce the text here. The usual optimistic tone of previous reports is again apparent in that for the past year, and the committee in the first paragraph, no doubt truthfully say, "The close of the year 1898 finds the National Chrysanthemum Society still at the head of those societies having for their object the cultivation and exhibition of some particular flower." The work of the Classification Committee in regard to the classifying of doubtful incurved varieties, and to the drawing up a list of too-much-alike varieties, is described. The announcement is made that the Directors of the Royal Aquarium Company have promised to contribute an additional sum of £75 towards the prize schedule of the November show. The lighting of the building has been improved, and members of the Society will, in future, be better able to obtain refreshments at moderate charges. Then there is reference made to the report of the "Sites" sub-committee, in favour of the Crystal Palace, to the awards made to novelties, the need for a supplementary catalogue, and to the Conference that was held in October upon the "rust" fungus. The report concludes with thanks to the President, Sir Edwin Saunders, for his continued interest in the Society and gifts of prize-money, and to all other donors of special prizes

THE BALANCE-SHEET

showed that the annual subscriptions for the year had amounted to £270 15*s.* 6*d.*; Foreign members' subscriptions, £7 11*s.* 1*d.*; Royal Aquarium Company, £330; affiliated societies' medals, certificates, &c., £66 11*s.* 3*d.*; affiliated societies' fees, £62 4*s.* 6*d.*; and other smaller items, making a total receipt, including cash in hand at last audit, and the sum of £47 15*s.* 4*d.*, drawn from the reserve fund last March, of £987 10*s.* 7*d.* Expenditure included the sum of £541 5*s.* for prize-money and medals, being a few pounds more than in 1897, and the usual management items, which have been considerably curtailed.

Following the reading of the report, Mr. Shea (Chairman) made a speech, in which he said that it had been stated in the Press that the popularity of the Chrysanthemum was on the wane. As a flower for cultivation, he thought it very unlikely that this would be the case for very many years yet. That it blooms during autumn so unsparingly, and is so easy of cultivation, that it is the poor man's flower equally with the rich, places the Chrysanthemum on a throne from which it will with great difficulty be ousted. But there was the exhibition point of view. The stern evidence of figures must be given attention. The present balance-sheet showed a falling off from members' subscriptions of about £28, and a lesser sum from the fees paid by affiliated societies. Unless this downward tendency was stopped, there was no seeing its end. The management expenses have been curtailed, but there was a degree beyond which this could not be carried. Then followed a very astute plea for union among the members, and particularly that the meeting then commenced should be characterised by business-like behaviour. It had been said that, unlike other flowers, the Chrysanthemum begot in its votaries a certain degree of combativeness. Perhaps the delicious fragrance of the Rose had some effect in soothing the mind of excitable persons; but Mr. Shea thought the members had an excellent opportunity that evening to show that its meetings might be held just as quietly as those of other societies.

The adoption of the report and balance sheet was then formally proposed by Mr. Seward, and seconded by Mr. A. Outram. Mr. J. W. Moorman had some remarks to make before the motion was put to the meeting. He thought they might be proud of such a balance-sheet as was presented. A year ago the balance-sheet showed a false balance, which, however, the members decided to erase, and they then discharged their liabilities by abstracting a sum from the reserve fund. The year 1898 was, therefore, commenced without a balance at all, but he was pleased to say that they now had £18 0*s.* 11*d.* in cash at the bank, and there had been contributed in various ways during the year a sum of £20 6*s.* 1*d.* The Society had, therefore, made a profit in the year of £38 2*s.* 6*d.*, notwithstanding that they had paid more money in prizes than ever. He was now satisfied that the Society could not be rightfully charged with expensive management. Mr. Moorman then criticised various items in the assets, which were, however, satisfactorily explained subsequently by the Secretary. This veteran cultivator concluded his speech by declaring that he had been growing Chrysanthemums since 1865, and he was unaware of the least sign of diminished enthusiasm for the flower.

Speaking to a question raised by Mr. Simpson, a plea was made by Mr. Newell that the medals and certificates be permitted to affiliated societies at a less price than obtains. The Society would do well not to seek for so large a profit upon them.

The report and balance-sheet were then carried by acclamation.

Mr. Berridge next proposed a vote of thanks to the auditors, which was responded to by Mr. A. E. Stubbs.

ELECTION OF OFFICERS.

On the proposition of Mr. Bevan, seconded by Mr. H. A Needs, Sir Ed. Saunders was enthusiastically re-elected President, amidst general satisfaction that at the age of eighty-five years, Sir Edwin still maintains his interest in the flower.

The position of Treasurer, rendered vacant by the unexpected retirement of Mr. Ballantyne, was filled by the appointment of Mr. C. E. Wilkins (Swanley). This was done on the motion of Mr. J. W. Moorman, seconded by Mr. H. J. Jones.

Mr. Percy Waterer was unanimously elected to the chairmanship of the Executive Committee vacated by Mr. T. W. Sanders, Messrs. Bevan and Moorman having been nominated to the Vice-Chair, the appointment was deferred for decision by ballot. Mr. C. Harman Payne was re-elected Foreign Corresponding Secretary.

In the election of general secretary, there was another surprise for the meeting. It had been freely stated during the preceding week that there would be at least three nominations to the position. It was not so, and the present Secretary, Mr. Richard Dean, was unanimously re-elected with a considerable show of enthusiasm.

Mr. Berridge was elected auditor on the motion of Mr. Moorman, seconded by Mr. Rundel (Leicester), in the place of Mr. A. E. Stubbs who retires.

Nominations were then taken for gentlemen to serve on Executive Committee. There were, altogether, fourteen new members necessary. At a subsequent moment the following gentlemen were declared elected:—Messrs. E. Beckett, C. Gibson, H. J. Jones, A. Outram, D. B. Crane, W. Davey, Mr. Kenyon, T. W. Wilkinson (Royal Aquarium Company), J. McKerchar, C. Blick, J. W. Simmons, Alex. Wright, G. Walker, and W. A. Sturrock. The order of the names was that given in the poll by the number of votes recorded.

The nomination of Mr. T. W. Wilkinson was proposed by Mr. J. W. Moorman, who spoke with appreciation of the manner in which the Aquarium Company had now met the Society, and expressed his belief that Mr. Wilkinson would be able to render material help. The ballot in the case of the vice-chair was in favour of Mr. T. Bevan.

Upon the proposition of Mr. Moorman, seconded by Mr. D. B. Crane, it was resolved to elect Mr. T. W. Sanders a vice-president of the Society; and on the motion of Mr. Bevan, seconded by Mr. J. H. Witty, a life honorary Fellowship of the Society was conferred upon the same gentleman, in recognition of his services as chairman of the Executive Committee and in other capacities.

AMENDMENTS TO RULES.

To consummate the agitation that certain members of the trade have indulged in during last year in regard to the awarding of the Society's medals, various alterations to the rules were proposed by Mr. W. Wells. These were, in effect, to prevent the Society from giving medals to other exhibits than Chrysanthemums, and to these only when the exhibits have been the *bonâ-fide* property of the exhibitors for a period of three months.

In place of the alterations proposed by Mr. Wells, the Chairman suggested that Mr. Wells would propose a new rule embodying the restriction wished. In the end, however, neither the one nor the other was done, as Mr. Wells failed to secure any support. A technical addition to Rule III., proposed by Mr. R Dean, was by leave withdrawn.

In regard to Rule IX. Privileges: an amendment was recommended by the Executive Committee, apparently with a view to preventing delegates from affiliated societies from taking any part in the voting at the annual meetings of the mother-Society. Members of affiliated societies (especially Mr. Rundell, Leicester) were, however, on the alert, and in the end, the recommendation was not only rejected, but words were inserted in the rule positively stating the right of the delegates to attend and vote at such meetings. Securing this triumph, the next recommendation of the Committee to the effect that the delegate should be a *bonâ fide subscriber* to the society he represents was accepted joyfully.

Rule XIV. was modified in order to insert the regulation that the Schedule Revision Committee be appointed at the first meeting of the Executive Committee held after the annual general meeting.

Rule XV. will now provide that the election of judges will be effected by means of voting-papers.

Rule XVII. was made to explicitly declare that the Finance Sub-Committee shall be elected annually after the first meeting of the Executive Committee held after the annual general meeting.

This concluded the business of the meeting, save the usual votes of thanks and election of new members. There were probably about 150 members present, in spite of the very disagreeable character of the weather. St. Stephen's Hall afforded more than ample room for the company, but although certain efforts were made by the management to warm the building, the intense cold and draught was such that members could not retain their seats without the greatest discomfort, and the two heating-stoves were the centres of groups during the whole proceedings, which lasted about two-and-a-half hours.

ENQUIRY.

Maréchal Niel Rose.—1. Is there a permanent cure for canker in this variety? 2. What is the cause (probably fungus attack)? 3. Are Roses best planted below the graft, so as in time to get on to their own roots? This is a question upon which we should be obliged to our rosarian correspondents if they would favour us with their opinion.

ANSWERS TO CORRESPONDENTS.

Acalypha Sanderi (hispida): *Chas. B.* The plant will take little or no harm for ten days' sojourn in an apartment if the temperature does not fall below 50°.

A Non-fruiting Quince: *P. C. P.* Under certain unfavourable conditions of growth—as for example, under the shade of large trees, or on the north side of a wood, where, owing to the lack of sunshine, the wood would not manure, or a very wet soil where growth being late extending into autumn, the same thing might occur. Given age, say 10 to 12 years, and a sunny site, the Quince fruits satisfactorily.

Antirrhinum Seedlings: *Novice.* If the plants are not spoiling in the boxes, wait till the middle or end of the next month before planting them out of doors. If much crowded, transfer them where standing thickest to other boxes. Afford a hardy kind of treatment.

Begonia x Weltoniensis: *Novice.* The old plants will be the best to rely upon provided they have been suitably treated, that is, cut down after the stems had matured subsequent to flowering last summer and autumn, and kept dry in a temperature a little higher than that of the greenhouse. A place under the plant-stage is suitable for them. In the present month shake them out of the old soil, and re-pot them in equal parts of loam, peat, and leaf-soil, with plenty of sand, and grow them on in an intermediate house until they flower. In warm districts the plant does well out of doors till flowering time. Cuttings may be struck in March or in July, and the early-struck ones may be grown in a frame or in the open.

Books: *H. J. J.* *The Propagation and Improvement of Cultivated Plants*, by F. W. Burbidge. Published by Blackwood and Sons. A note addressed to the Secretary of the Royal Horticultural Society, 117, Victoria Street, S.W., would elicit a reply in reference to the book being in the Lindley Library.—*Young Hand.* You should obtain *Soils and their Properties*, by Dr. W. Fream, one of Bell's Agricultural Series, published by G. Bell and Sons, York Street, Covent Garden, W.C. —*A. Urbanczyk.* *The Canadian Horticulturist*, published monthly by The Ontario Fruit Growers' Association, Toronto, Ontario. *Meehans' Monthly*, published by Thos. Meehan and Sons, Germanstown, Philadelphia.—*A Foreman.* You will find Mr. Barron's *Vines and Vine Culture* a trustworthy manual; and the late Dr. R. Hogg's *Manual on Fruits* is the best we have after Dr. Bull's *Herefordshire Pomona.* We know of no special manual on Figs in the English language, and their cultivation is so simple that scarcely any is needed. Hogg's *Fruit Manual* contains a lengthy list of varieties, together with descriptions, but no cultural details. Good directions in regard to culture are given in Thomson's *Gardeners' Assistant.* Williams' *Orchid Grower's Manual* is one of the best books on the cultivation of Orchids. It can be obtained at the Victoria and Paradise Nurseries, Upper Holloway, N.—*G. F.* Try and obtain from a seller of second-hand books a copy of *Cool Orchids, and how to Grow Them*, by F. W. Burbidge. The work is out of print.

Cobœa scandens: *W. J. S.* Best raised from seeds sown on a mild hotbed in March. The plant can also be struck from cuttings of the new shoots obtained from plants started in moderate heat in February. The cuttings strike freely in a sandy soil, in bottom heat of 75° to 80°, under a bell-glass.

Correction.—In answer to "A. S. W.," p. 80 of the last issue, for Lilium lancifolium Harrisii, read L. longifolium Harrisii.

Cyclamen Flowers with More than the Usual Number of Petals: *A. H.* This is by no means uncommon, and we have seen many specimens similar to those you send. The variability to be seen in strains of Cyclamen latifolium was illustrated in these pages on several occasions last year. See *Gardeners' Chronicle*, March 5, 1898, p. 135; March 19, 1898, p. 173. Also in *Gardeners' Chronicle*, 1897, January 30, p. 70 and 71; May 15, p. 317; May 22, p. 331.

Extirpation of Water Lilies in a Lake 6 feet deep: *G. G.* If the water can be run off to a great extent, the work of tearing up the plants by the roots should not be so difficult a matter. You will require some strong drags or long toothed rakes, or even field-harrows. The work will, however, if performed in that manner, require several years to make a thorough clearance of the plants.

Fungus on Roots of Myrtle: *R. M. R.* The fungus, the mycelium of which you send, is common on decaying vegetable matter under ground, but the species cannot be determined in that stage. The state of the soil in borders under glass often engenders fungus of the nature of this one. Quicklime if used in sufficient quantity would doubtless extirpate the same, but it would destroy the plant. It was the proper course to take to dig out the entire mass of infected soil, replacing it by loamy soil ⅔, leaf soil ⅓, and sufficient sand to keep it open and aërated; see also to the drainage, that this is efficient, a great deal depending upon that. Every particle of fungus-infested matter about the roots, and decayed roots, should be removed.

Hole in Clay Soil in which a Fruit Tree is placed: *Quite an Amateur.* A 3-feet square hole, 4 feet deep, dug out in clay, is not a suitable place in which to put any fruit tree, as it will, while affording very little space, collect a great deal of surface-water, which as it could not escape through the clay, would act injuriously on the tree. The flooring of slates would hinder the roots descending into the clay, which, however, they are not likely to do. A better method of dealing with the matter would be to lay in pipe or rubble drains, 3 to 4 feet deep and 10 feet away from the trees, and lead them into a dry well or an outlet drain; then trench the soil to the depth of the tillage soil, turning up the bottom spit *in situ*, and mixing with it lime and rough rubbish, stable litter, cabbage stalks, anything in fact that will add to its porosity, and afford plant food that will be available in time to come. Having done this, wait a month before planting the trees. You may put slates, stone slabs, or a bed of concrete 3 feet from the surface, so that the tap-root does not descend further than that. In planting take out a wide hole so that the roots may be spread out at full length, and do not cover the uppermost with more than 6 inches of soil. Fresh loamy soil and a small quantity of rotten dung if the staple is poor, should be used about the roots when planting the trees.

Luculia gratissima: *W. J. S.* May be struck from cuttings of young shoots taken in June, but it is not a very satisfactory method; and layers or imported seed give the quicker results. The colour of the flowers of L. gratissima are pale rose. The plant is an evergreen. The best kind of soil is fibry loam two-thirds, peat and leaf-mould one-third, and plenty of sharp sand.

Maggots in the Shoots of Currants: *Quite an Amateur.* The insect is Ægeria tipuliformis, the larvæ of which bores the stems and shoots of the Red Currant, eating out the pith and weakening the bushes. As a remedy, cut off in spring and autumn all hollowed shoots and snags and burn them.

Names of Fruit.—*G. H.* Apple, Annie Elizabeth. —*E. D.* Cannot be recognised, so much bruised. —*G. F. Brotherston.* 1 and 3, Blenheim Orange; 2, King of the Pippins; 4, Mère de Ménage; 5, Warner's King; 6, Green Balsam; 7, Twin Cluster.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.—F. P. D.* Labels detached, but the plants are identified as follows: 1, Cymbidium giganteum, the large single flower; 2, Cymbidium sinense, two flowers on upright stalk; 3, Cattleya Trianæi, a very good variety; 4, Epidendrum aromaticum, the pair of fragrant flowers. — *T. J., Lostwithiel.* Æschynanthus speciosus.—*E. D.* 1, Maranta zebrina; 2, Eulalia japonica variegata; 3, Oncidium flexuosum; 4, Zygopetalum Mackayi; 5, Bulbophyllum Careyanum; 6, Dendrobium Pierardi, so far as we can judge without seeing flowers.—*E. S., Birmingham.* 1, Nephrolepis tuberosa; 2, Polypodium pustulatum; 3, Lygodium japonicum, a climbing Fern.—*A. F., Uckfield.* 1, Cypripedium concolor; 2, Cœlogyne lactea; 3, Dendrobium Pierardi; 4, D. primulinum.—*T. T.* Dendrobium Bancroftianum.

Orchids for Intermediate Houses: *G. T. Intermediate* Brassia Lanceana, B. Lawrenceana, B. maculata, B. verrucosa; Burlingtonias, candida, decora, fragrans, and others Cattleyas, Acklandiæ, amethystoglossa, bicolor, chocoensis, guttata, gigas, labiata, Mossiæ, Trianæi, Warneri, Wagneri, and others; Colax jugosus: Cymbidiums, eburneum, Mastersii, giganteum, and pendulum; Cypripediums, caudatum, Dominianum, Schlimi, and many more; Epidendrums, bicornutum, macrochilum, prismatocarpum, and nemorale; Lælias, cinnabarina, elegans, præstans, purpurata; Maxillarias, grandiflora, luteo-grandiflora, picta, venusta, &c.; Miltonias, Clowesii, Regnelli, and spectabile; Oncidiums, ampliatum, crispum, incurvum, Kramerianum, luridum, ornithorhynchum, papilio, sarcodes; Sophronitis cernua, grandiflora, and violacea; Trichopilias, coccinea, crispa, Galeottiana, suavis, tortilis; Zygopetalums, crinitum, Mackayi, macranthum, and rostratum. We will give you a list of cool-house species in our next issue.

Outside Plants for Cross-Breeding Purposes: *H. J. J.* There are various methods of protection from chance fertilisation, such as frames, handlights, fine muslin covering; also similar coverings to the ventilating parts of frames, &c. A flower or a number of flowers may be enclosed in a muslin bag previously to expanding.

Peach-trees and Manure: *Novice.* If the trees are in good health, and require merely a little assistance to cause the production of good wood, and increase the size of the fruits, matters which only the person on the spot can determine, you may apply lime in sufficient quantity to hide the soil—finely broken plaster will do; potash 2 to 3 oz. to the square yard, pricking this in; and finally a mulch in summer of horse-droppings and short litter 3 inches thick. If the soil be retentive, use only droppings, and prick them in; and the mulch leave on the surface if the land be light.

Richardias not Opening their Spathes: *A. K.* The plants are either checked by some cause, as loss of roots, &c., or they were too long or too severely dried off. It is a cultural matter, doubtless, which can only be settled by one having a full knowledge of the past and present treatment of the plants.

Seeds Germinating within a Gourd: *W. K.* The specimens you send are very interesting. It is not an infrequent occurrence, however, for seeds to so germinate in the case of Cucumbers, Melons, Oranges, the Papaw and other fruits. In your specimen the cotyledons were partially green, although in the absence of light. This circumstance has been explained by Prof. Church on a former occasion as probably due to some modification of the rays of light, which are capable of "greening" although their energy be altered in character. Respecting the Orchid sent, see next week's issue.

Shy Pollen-bearing Carnations: *H. J. J.* We do not suppose that you can do anything beyond exposing the pollen-bearing anthers to the light by the careful removal of adjacent petals.

Tree Fern: *E. V. G.* In the absence of any information, we can only surmise the cause of the death of the plant. It may be gas, bad drainage, improper cultivation, &c.

Use of Superphosphate of Lime in Vineries and Peach Houses: *W. G.* The chief aim being the sweetening of the soil and the rendering active the inert vegetable substances in the soil; you would find pulverised (recently slaked) lime the best to use. It can be spread half an inch thick on the surface and left there, or just turned under. It should not come at the first in direct contact with the roots. If you use bone meal at the same time it will be a wasteful proceeding. On the Peach border you might use potash at about 2 ozs. to the square yard in addition to the lime, or alone.

THE
Gardeners' Chronicle

No. 634.—*SATURDAY, FEB.* 18, 1899.

ROME.

(Concluded from p. 65.)

I HAVE sometimes had a dream of what the Colosseum might become if it were only clothed with a studied and deliberate intent. How Ramondia pyrenaica would find a dwelling-place in many a damp and dark recess, how Dianthus cæsius would cling with pleasure to the walls, how Verbascum lychnitis (which adorns Haddon Hall) would soon spread everywhere over the place; how Erinus hispanicus would be at home, how Rosa Wichuriana would like to fling itself in great lengths over the stones, how Mesembryanthemums would glisten in the sun—all these, and many more that might be named, would like to have such a chance; but the dream is one to be checked upon the instant, the Colosseum would never respond to such a covering as that. It never could have borne to be decked out in festal robes. What Dr. Arnold called "its inexplicable beauty and solemnity" would be lost, and that sweet melancholy aspect which it had in days gone by was owing in part to its left-alone condition, and and to the tangle of shrubs and plants.

There are two plants beyond all others whose comparative absence, I think, must be regretted in the Colosseum of Rome; one is the common Wallflower, which has so prettily been called "Desolation's Dower," and which used to lighten up the old crumbling walls and seem quite at home there—a ruin is ruined to my mind if Wallflowers are not growing in quantity over it, there is something quite unnatural in their absence, and their presence is an ornament for decay; and the other is the Caper-plant, which has a most extraordinary affinity for old waste places, and finds them out and seems to love buildings when all use for them has passed away. Its home used once to be amid the fallen arches and grass-grown colonnades of the neglected Colosseum, and it threw itself in great lengths from stone to stone with its pendent branches and smooth shining leaves and large white blossoms with purple stamens that waved so pleasantly in the wind. All this is for the most part over now, for though the Caper-plant still abounds in the vicinity, and roams as it likes to do in the Palace of the Cæsars on the Palatine Hill, it is under an interdict in the spot which, of all others, suited it best, and its white cascades of blossom no longer stream down in the Colosseum which it used to adorn so well, and with whose fallen state it seemed to be in closest sympathy. It is just exactly the plant which ought to be there, and which would be there beyond a doubt in great quantity but for the mischievous interference which has taken place.

I have mentioned a name above, that of Mr. Dwight Benton, about whom I venture to say more before this paper is brought to an end. The mantle of Dr. Deakin has fallen upon the shoulders of Mr. Dwight Benton in everything that appertains to the flora of the Colosseum and of the Roman ruins generally. This gentleman takes the greatest possible interest in the matter, and being both a skilled botanist and also an artist, he has qualifications for his pursuit which do not belong to everybody. He is an American, and for something like twenty-six years he has been living in Rome till lately as Consul-General de la Republic de Hawaii pour l'Italie. During all this time he has kept his eyes open for anything of botanical interest, and during the last eight of them he has had a fixed object in view in the way of working up the flora of the Roman ruins, and bringing his description up-to-date. He does not quite go upon the lines which Dr. Deakin followed, but takes a wider area, the Colosseum being embraced in it. He was very kind to me during my visit to Rome, and allowed me to handle the proof-sheets of his forthcoming book, and to talk to him about them. Not a few things of great interest I have heard from his lips. As might be supposed, after his long residence in Rome his mind is saturated with the lore and traditions of the place, and so far as plants are concerned he has spared no pains about them, always making his notes on the spot, and bringing home his specimens so that an after verification might be made. To those who have a twofold love in their hearts—the love of Rome and the love of plants as well—it may with confidence be said that Mr. Dwight Benton's guidance will be a very acceptable aid, and his book will be constantly in their hands. I said to him, "I hope it will not be a very expensive affair, and that it will not cost more than a pound." He replied that the price is not yet settled, but he did not think it would come to so high a figure as that. It goes upon the general plan in such cases as this—first comes a scientific description, and afterwards are added more general and ordinary remarks.

I will mention some two or three things about which I am indebted to him, and which I think are of interest. One of his proof-sheets ran in this way, about my favourite Caper-plant:—"This beautiful plant is found everywhere as an adornment to the relics of antiquity. Its long pendent stems hang in graceful curves from the crevices of old walls, and covered as they are with smooth, shining leaves and conspicuous flowers, form most beautiful accents and breaks in the otherwise monotonous tones of a ruin. Its flowers open only towards evening, and exhale a most delicious odour. Many attempts have been made to introduce it into cultivation, but it pines away under the fostering care of the florist, preferring its native niches in walls, where it seems to extract some unknown nutriment from the stones themselves. It thrives, however, in rocky and barren situations, specially when left to itself to spread in old Olive-orchards, &c. The species, C. spinosa proper, is rare, but the variety rupestris, is most abundant, and differs in its shorter leaf-stems, and in the absence of the curved spines at their bases." What strikes me most about this is, that it explains what I in my ignorance could never make out before. The whole plant, so far as I have had it in my hands, has always been quite smooth and spineless, and I never could see how it came to be called spinosa, except on the *lucus a non lucendo* principle, which is so utterly absurd. It now appears that I never have had anything to do with the species Capparis spinosa proper, but that only the variety rupestris is familiar to me. The other point is, that with all due deference to Mr. Dwight Benton, I do not think that Capparis spinosa var. rupestris is so intolerant of cultivation as he imagines it to be. I have had it off and on upon my rockery for many years, and I have it still, or, at any rate, I could have answered for that, towards the end of last summer, when I happened to be at home. It must be grown in full sunshine, and will pine away in the shade, and the rubble from an old wall cheats it into the belief that it belongs to some "relic of antiquity," and it is happy accordingly. But this is nothing at all. I would only say, let those who love Capparis spinosa, as I do, for many an old association's sake, not be deterred from trying it. Seek to make it think that it is in the Palace of the Cæsars, or on the Colosseum of Rome, and it will like you at once.

But another piece of information which I had from Mr. Dwight Benton is almost more interesting than the above, it is one of those very strange things which seem to defy explanation. When excavations were lately being made on the Palatine Hill, and the ground was much stirred and dug about, a large crop of a very unexpected plant made its appearance, and Nicotiana glauca, which belongs to the La Plata countries, was all over the place. Mr. Benton told me that this has been a matter of great interest to the botanists of Italy—especially to one whose name I forget, and who is a great authority, and lives at Pisa; but so far it has been a cause only for wonderment. We were talking about Cyclamens, and my instructor incidentally said there is plenty of reason why they should be called "sowbread," inelegant though the appellation may be. Cyclamens are known to be the staple food of the wild boar of Italy, &c. I only wish I had a tithe of the knowledge which Mr. Dwight Benton has both about Rome and about plants.

I cannot bring this letter to a close without expressing the fervent hope that the mischief which is being done to the Roman ruins will not go on for ever. The name of Pope Pius IX. deserves no "exornavit" after it so far as they are concerned, and his servant Rossa will long be remembered as having spoilt much of what he was so ready to touch. If only the present generation could keep their solicitude for the splendid ruins under their charge as much as possible to themselves, things would come right after a time.

The Colosseum only wants to be left alone. If Charles Dickens was right when he said that in his day it was crumbling away at the rate of one inch a year, why should it not be so? There are a good many inches and a good many years still remaining, and at that rate it would surely be better for it to be highly attractive as long as it lasts than to last to a very remote future, and to be forbidding in appearance all the way through.

Left alone the Colosseum would be certain to have its mysterious sweetness all come back to it. As it were, an invisible hand would cover up all its deformities, and drape it once again with a veil of loveliness. The Ferns and the mosses, the plants and the shrubs, would return to the spots which seem made for them, and which would receive them with the utmost alacrity. The winds would do their part in this great adornment of the place—birds may be trusted for such an office as that; and though we, of the generation to which I belong, can never hope to see the Colosseum again as I have seen it in days that have passed away, our children, if ever they come to Rome, will find that tangle of vegetation which seems to carry a message along with it to our very hearts; and they will look on one of the sweetest and most pathetic spectacles on which the human eye can rest. *Henry Ewbank.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA TRIANÆI MRS. W. H. CANNON.

It is always a pleasure to see that a variety which we have previously noticed has improved. Too often it is to be feared that an exceptionally well-grown plant, blooming under very favourable circumstances, produces a phenomenal bloom, and obtains a varietal name in consequence, and is never again seen but in the ordinary form.

Such is not the case with the two extraordinary forms of C. Trianæi named, for W. H. Cannon, Esq., Vanda Lodge, Twickenham, viz., C. Trianæi Cannoniana, a charming large flower of handsome shape, and delicate peach-blossom tint, similar to some of the forms of C. Schroderæ; and C. T. Mrs. W. H. Cannon, a flower of which is again before us. Its petals are over 3 inches in width, the whole flower of fine proportions and substance, and boldly displaying itself in the manner which lovers of perfect flowers desire. The whole flower is of a clear white, the labellum suffused with a pearl-like blush, and bearing a chrome-yellow band extending from the base to the centre, the front having a bright purple blotch, with broad white margin. It is comparable with C. T. Ernest Ashworth, and that is giving it a very high character.

CATTLEYA PERCIVALIANA.

Opinions generally differ as to the merits of most of the varieties of this species, but when an exceptionally fine form blooms, it is commonly admitted that it compares favourably with any other type of Cattleya labiata in shape and in the richness of its colour, if not in size. A bloom of an unusually fine variety is sent me by C. B. Powell, Esq., The Old Hall, Southborough, Tunbridge Wells (gr., Mr. Dupont), who remarks that in substance and colour of the sepals and petals, a bright purplish-rose, it has resemblance to the best form of Cattleya Lawrenceana. The petals and lip are broad, and finely crimped at the margin. The lip is deep orange at the base, with maroon-coloured markings. The central area is orange-tinted crimson, and shades off to light purple towards the distinct lavender-coloured crisped margin.

CYPRIPEDIUM × LEOPARDINUM (SALLIERI HYEANUM × ARGUS).

A very stately and uncommon variety under this name has been sent me by the Rev. F. Paynter, Stoke Hill, Guildford. In general appearance, and in the glossy surface of the flower, it recalls some forms of C. × vernixium; but the flower is larger and more effectively coloured. The upper sepal is of a rich yellow tint at the base; the central portion of purple, and the margin white with rosy-purple markings. The petals, which show the influence of C. Argus distinctly, are of a bright yellow colour; the upper halves and blade are tinged with reddish-purple on two-thirds of the basal portion, and also carry dark chocolate-brown spots. The lip is greenish-yellow, tinged on the face with reddish-rose. The staminode is yellow, with a green central boss. The whole flower is a curious blend of C. Argus, C. villosum, and C. insigne.

CYPRIPEDIUM (PAPHIOPEDIUM) × CALLIOPE, *new gard. hyb.*

A very striking, though not showy, hybrid, its great size, as with C. × Chas. Canham, being its chief characteristic. The upper sepal, which is abruptly folded back, is bright green, with a clear white margin, a distinct band of purple up the midrib, and some half-dozen lighter purple forked lines following the veining of the surface. The petals are yellowish-green, with a band of purple up the centre, a dark green reticulation, and pale rose tinge on the outer half. The lip is greenish-white, with a slight rose tint. In this instance, as in some others, I have noted the blackish warts so conspicuous on the upper margin of the petals of C. callosum are quite obliterated, although it was the seed-bearing parent, the margin being simply white. Lower sepal greenish-white, with darker green lines. Staminode changed from the horseshoe-shaped outline of C. callosum to a two-lobed plate, resembling a pair of elephant's ears, whitish, with pink tint, and with an indistinct green reticulation in the centre. It is a bold flower, measuring 7 inches broad, and over 5 inches in length, without spreading. Leaves, pale green, with a close dark-green reticulation.

It was raised from callosum ♀, Lathamianum ♂ (Spicerianum ♀, villosum ♂), and flowered by Walter C. Clark, Esq., Orleans House, Sefton Park, Liverpool, who considerately sent me a flower and leaf of each parent to compare with it. *James O'Brien.*

EPIDENDRUM UMBELLATUM.

A good many plants have been named Epidendrum umbellatum, and some of them have not been Epidendrums at all; but our illustration (fig. 39), taken from a plant which flowered with Messrs. Stanley-Mobbs & Ashton, of Southgate, represents the true plant, a form of which is figured in the *Botanical Magazine*, t. 2030. It is found in South and Central America, and it varies much in habit and in the size of its flowers, but in all the forms the peculiar thick green leaves and translucent pale-green flowers are constant features. This plant was recommended a Botanical Certificate at a meeting of the Royal Horticultural Society on January 31.

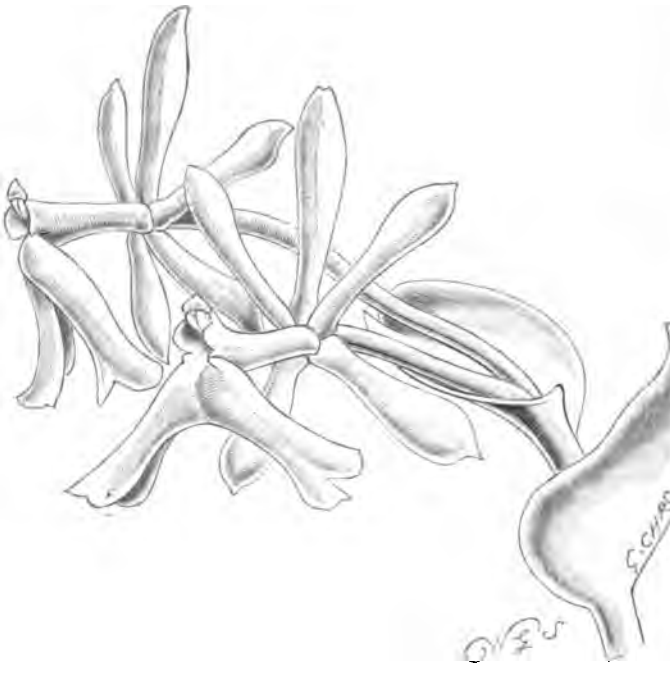

Fig. 39.—Epidendrum umbellatum.

DISEASES OF THE VINE.

(*Continued from p. 17.*)

Browning.—"Browning," or "Brunissure," is one of many names given to certain symptoms of disease common on the Vine and other plants. The disease is widespread, varied in appearance, and not easy to sum up briefly. The chief symptom is a general weakening or failure of the whole plant. The young foliage shows more or less discoloration, and tends to become dry. It may only be the leaf-margins which go in this way, or spots of varying size may appear over the whole leaf. Healthy parts frequently continue to enlarge, so that wrinkles or blisters are formed on the leaf, and offer tempting shelter to insects. In extreme cases, the leaves fall off, and the ends of young twigs wither. If the disease appears later and on mature leaves, these show discoloured spots varying from pale green to yellow, brown, reddish-brown, or purple; in other words, autumn colouring comes on prematurely. If the spots dry up, they easily drop out, leaving holes. Leaf-stalks and young wood may also become discoloured. The disease may be found in all stages. Everything indicates something wrong in the nutrition of the Vine; the result will be a loss of fruit in quantity or quality. When the plant is in this condition, various fungi will, no doubt, show themselves, and the ardent fungus-hunter is likely to indicate some of these as the cause of trouble. The appearance of the symptoms just described is said to be most common in moist weather, when mists or fogs prevail, and is most conspicuous in outdoor vineyards with a northern exposure. The disease is not favoured by weather with prevailing sunshine, and a spell of weather of this kind will probably check an attack already in progress. During a moist season the disease seems to become epidemic, and it spreads rapidly, like many fungus diseases. Heavy rains, with good weather between, are said to have no effect in assisting the damage. In regard to soils, those badly drained are most liable, and any treatment, or want of treatment, which makes a soil sodden and impervious to air, are friendly to the disease; on the other hand, all measures making towards good drainage will favour the grower. On plots near each other, with different methods of manuring, the disease is generally found worst where fresh farm-yard manure was used in quantity.

This is one of the diseases said to be caused by the action of Pseudocommis, a slime-fungus we hear much of at present. According to certain French investigators, this fungus causes diseases on innumerable plants, some of which were referred to in a note in the *Gardeners' Chronicle* on July 23, 1898, p. 69. It is described as a minute fungus, somewhat like the club-root fungus (Plasmadiophora) of Turnips, &c. We have just made a critical review of important papers on Pseudocommis, but, briefly, its importance as a parasite on the Vine or any other plant, does not yet seem well proved. It is a tempting prospect to the plant-pathologist to find a fungus, insect, or some other cause to which to refer some of the many diseases of obscure origin. This is exactly what the authors of Pseudocommis claim; to us, however, the evidence given as yet is far from convincing. The symptoms of "browning" in the Vine just described above agree with those given by a supporter of the Pseudocommis theory, but we think that growers will support our view—that the Vine will show disease in this way if the conditions of soil and climate be those indicated, without calling in the aid of any fungus. It does seem a little absurd to believe that every plant disease must be the work of a fungus, insect, or other parasite. For these reasons, we have preferred to class "browning" as a disease caused by defects in cultivation. Many experiments as to remedies have been tried under the assumption that Pseudocommis is the cause of diseases like "browning," but application of sprays or powders generally used against fungi does not seem successful. What does succeed is a clear atmosphere with moderate rains, and a treatment of the soil likely to benefit the general health of the Vines.

The dreaded Californian Vine disease in many ways resembles "browning." It seems to be confined to Grape-growing parts of western North America, and has there been the subject of much special study by qualified experts. They can trace no fungus or insect as its cause. What progress has been made in checking the disease is attained by improved cultivation of suitable varieties.

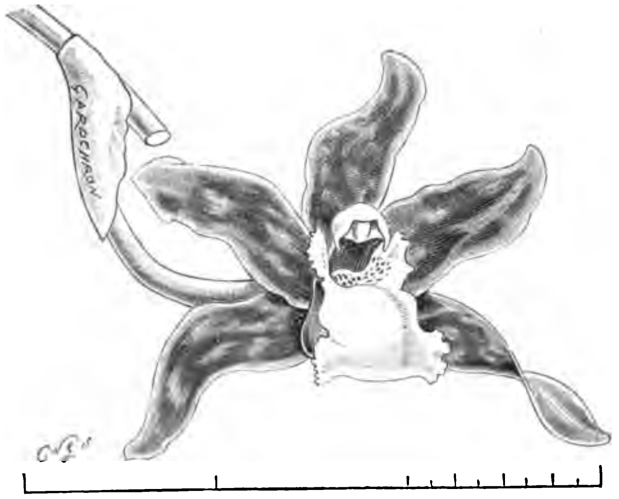

Fig. 40.—Zygobatemania mastersii.

Gumming.

This disease has its origin in the practice of pruning the Vine. When a twig is pruned off, the branch left dies back for a short distance below the cut; at the same time the vessels and other elements of the stem near the wound become stopped up by a secretion of gum, which hardens. This is a natural process, and happens after every pruning-cut on a Vine. Investigations on the cultivated and other species of Vine show that gummy substances are formed in the elements of the second year and older wood; in some cases also in the first year wood. The Vine is, then, a plant which has a tendency to form gum in its tissues. The disease of "gumming" is due to an abnormal formation of gum. The wood breaks down, and cavities are formed filled with gum, which becomes so abundant that it streams from broken places in the bark or from pruning-cuts. It may also harden inside the stem, and choke the tissues, so that no water can pass up; as a result the leaves and new wood wither, and this is accompanied by loss of the fruit-crop. Some investigators say that "gumming" is due to bacteria; others put it down to the action of Pseudocommis, the slime-fungus referred to above; others to a fungus named Coryneum. We prefer rather to take a view supported by very conclusive evidence, namely, that "gumming" is a natural tendency of the Vine, which becomes aggravated into a disease by pruning, over-cropping, and mishandling in cultivation.

In conclusion, the diseases of the Vine described in the present article cannot be traced to the direct action of any fungus or insect, although attempts have been made to do so. Nor is their cure brought about by any of the methods used against parasitic organisms. In every case the disease represents an exaggeration of some condition natural to the Vine plant. "Shanking" is an exaggerated form of the natural way in which Vines get rid of superfluous or weak fruit; "blanching" is an extreme case of paleness natural to the foliage of any plant improperly supplied with food; "browning" is an untimely appearance of autumn tints; "gumming" is an excessive formation of gummy substances found in every Vine. The disease in each case is brought about by methods of cultivation unsuited to keep up the health of the plant. The prevention and cure lies in making the cultivation more suitable. The tendency towards disease is the result of growing for a purpose—fruit production—and neglecting, forgetting, or being ignorant of details necessary to ensure the general health of the Vine. No matter how careful a grower may be of his Vines, it is easy to overlook some detail; this may pass unnoticed for years while it gathers force, ultimately to appear as a disease, probably when a cold spring, a sunless summer, or an adverse season hastens events of this kind. The fault need be no one's, and we can only blame our ignorance as to the requirements of the Vine; the lesson is to try and remedy the defects for the future. It might even be said that if we could cultivate the Vine exactly as it requires, we should probably see less of disease of any kind, including the various forms of mildew, rust, rots, and others, which are doubtless the work of fungi whose first foothold is made easy on weakly plants. The difficulty is to say exactly what is the defect in cultivation; this must be learned by experience. The records of this experience, however, should assist those in need of it. *W. G. Smith, Leeds.*

ZYGOBATEMANIA × MASTERSII.

Our illustration (fig. 40) represents a very interesting cross made by Messrs. Linden, l'Horticulture Internationale, Brussels, between Zygopetalum crinitum, fertilised with the pollen of Batemannia Colleyi. The plant and its flowers are quite intermediate between the parents, and it is altogether a remarkable hybrid. The scape bears several flowers, the sepals and petals of which are green, heavily tinged with chocolate colour, and the lip is creamy-white, with dotted lines of purple around the crest.

SEED TRADE.

Tree Seeds.—Those of the seed trade who are interested in tree seeds, and especially those of Coniferæ, may be interested to learn that in those districts from which seed of some of the species is drawn, the crops are of varying extent. Abies Douglasii is short in most districts, while A. Menziesii is an almost entire failure, but the crop of A. pectinata is good and obtainable at low prices. "It may not be generally known that the wood of Abies Douglasii is very resinous, and makes excellent firewood, even when green. In dead trees the bark and wood are often so full of resin as to burn like a torch, and from its combustibility extensive tracts of forests are burnt every year. Were it not that the vegetable tissues will burn readily, the immense mass of it that encumbers the surface of an ordinary farm on the banks of the Columbia would bid defiance to any efforts that one man could make for its removal during the time of his natural life" (*Manual of Coniferæ*). Larix leptolepis, one of Mr. J. G. Veitch's introductions from Japan, has yielded seeds freely, and prices are low. The Scotch Fir, Pinus sylvestris, has yielded seed very sparingly all over the continent; there is a brisk demand for samples, and prices are advancing. P. excelsa, the Norway Spruce, has yielded a full crop of excellent quality, which can be obtained at tempting terms. P. Larix (Larch) is a plentiful crop, satisfactory both as to quality and price. P. Strobus is also of good quality, germinating freely, and obtainable at average prices. P. austriaca, P. Laricio, P. maritima, and P. Cembra, have so far yielded, that very choice seeds can be supplied at moderate prices.

Of deciduous trees the supply of seeds of Birch and Elm is small, the unfavourable weather during spring and early summer had an injurious effect upon the trees. Of the common Oak there is ample, and there is enough of Beech mast to meet all demands, and the same can be said of the Maple, Birch, Hornbeam, Haws, Ash, Acacia, Broom, the small and large-leaved Limes, and also Furzes. *Pisum.*

NOTES FROM A SCOTTISH MANSE.

Winter for Nature, as well as for the earnest horticulturist, is a period of repose; she is resting from her energies, and increasing, by means of such temporary cessation, her latent strength. Only in rare instances do we perceive any manifestations of what may be termed vegetative activity above the surface of the ground. I have, however, already recorded in the *Gardeners' Chronicle* how the beautiful, violet hued Iris reticulata, gave me an unexpected greeting, such as only a lovely flower can give to an instinctive lover of Nature on Christmas Day. It recalled, by its beauty, the gracious benediction of the Friend of Man: "Even Solomon, in all his glory, was not arrayed like one of these." To the vision of the thoughtful, reverential nature, the splendour of monarchs must always seem garish, when compared with that of the glorious eastern and western flowers. Previously to the appearance of Iris reticulata, my winter garden was greatly gladdened by the naked-flowering Jasmine (Jasminum nudiflorum), which is always very fascinating, with its golden blossoms shining amid its glossy green branches, like a bright and steadfast hope, in the heart of adversity, of vernal beauty yet to come. Probably by reason of the absence of sunlight, most of the winter flowers are destitute of fragrance, which in other seasons would be accounted a serious limitation, but Chimonanthus fragrans, which flowers in December and January, is a striking exception to this general rule. This precious plant should always be pruned immediately after its flowering season is over; but this fact, I fear, is often forgotten by amateur horticulturists, who fail to observe that the shoots which have already blossomed abundantly are of no floral service for the following season.

One of the most graceful of all winter flowers is the Christmas Rose, Helleborus niger, which, though it does not appear to have discovered in my own garden an absolutely congenial soil, succeeds admirably at Logan House in this parish, where also the fragrant Viola odorata, which is cultivated by Mrs. McDonall, blooms profusely in late winter and early spring.

The Duchess of Sutherland makes a specialty of the Snowdrop, for whose cultivation one of her Scottish residences, Dunrobin Castle, in Sutherlandshire, has long been famous. Mr. Matthew Arnold once wrote me as follows regarding this flower:—"I do not know that I have ever mentioned the Snowdrop in my verses, but I have been planting it among my shrubberies, and admire it greatly." But as I afterwards reminded him, he had thus characterised *Iseult*, one of his finest and most delicate creations—

> "Who is this Snowdrop by the sea?"

from which it would almost appear that I knew some of his poems, and especially their charming incidental floral passages, better than himself.

Last year I had the gratification of receiving from Mr. F. W. Burbidge, the Curator of Trinity College Gardens, Dublin (who may be said to have made a special study of spring flowers), a number of fine bulbs of the gigantic Crimean Snowdrop, introduced into this country by Lord Clarinda, which I planted very carefully in a grassy plot opposite my study window, from which, when their large and lustrous, pendulous flowers appear in February (for they come somewhat late), I shall always be able to see them when I am at my work. The majority of my Snowdrops have been planted in leaf-mould, beneath the bare, overhanging branches of trees. In such positions they are in perfect correspondence with their environment, and create at this season most picturesque effects. *David R. Williamson.*

ALPINE GARDEN.

NEW AND RARE PLANTS FOR ALPINE GARDENS AND ROCKERIES.

(*Continued from p. 212, vol. xxiv.*)

Mulgedium cacaliæfolium, Boissier.—Large and good herbaceous plant, with erect stems, growing from 4 to 5 feet, bearing fine and large leaves 1 foot long and 5 inches broad, hastate or triangularly ovate; flowers numerous, deep blue, in small heads joined in large panicles. It is a very showy plant; the seeds were brought to us by the botanist Alboff, from the Caucasus. It seems to like the shade or a half-shady situation, and grows freely in ordinary soil.

Papaver radicatum, Rottboell.—A small form of P. nudicaule growing in the mountains of Scandinavia. The leaves are short and hairy, the stems short, the flowers large, and the calyx very hairy. It grows in any good soil.

Paracaryum angustifolium, Boissier.—A very good variety of Borage, newly introduced from the mountains of Asia Minor. A small and tufted plant, not exceeding a foot in height, and forming a dense bush of narrow, deep green, shining, and somewhat hairy leaves; the flowers are of the most beautiful sky-blue, disposed in corymbose racemes, and open from July to August. The plant requires sun and a dry situation, and likes the rockery, for which it might have been created.

We obtained from Dr. Duthie at Saharanpur, India, another Paracaryum, under the name Paracaryum sp. Hazara. It flowered well last summer, has broad leaves and sky-blue flowers, and seems to be near to P. inanum, although not identical with it.

Plantago uniflora, Hook.—We obtained this from seeds sent from New Zealand three years ago. It is a pretty little plant, with curious, very deeply-toothed leaves; these leaves are variegated, and marked with brown or deep purple veins; the flowers are inconspicuous and rare, but the plant is worth cultivation because of the curious and pretty foliage. It grows well in a sunny rock-pocket.

Platycodon glaucum, Siebold and Zuccharini, of Japan, is a dwarf and glaucous form of the beautiful large autumnal Bellflower, and a very welcome acquisition for the rockery.

Pulmonaria rubra, Schott.—The *Index Kewensis* considers this very showy plant as identical with P. mollis, Wolff; but I cannot admit that. The Pulmonaria rubra is different; its leaves are always destitute of the spots generally so well marked on those of P. mollis, and these leaves are thicker, shorter-stemmed, and narrower than those of the type, mollis. The flowers in P. rubra are brilliant, very showy, of the brightest red, and not turning to blue after fecundation. It is an ornamental plant for the rockery, where it succeeds in any good soil. It flowers from April to June.

Pyrethrum Starckianum, Alboff (in *Bulletin de l'herbier Boissier*, vol. ii., p. 455).—This new and interesting Composite was discovered in the Abchasian mountains in the Caucasus by my late friend, N. Alboff, in 1892, and is a valuable addition to garden plants. It is a white tomentose plant 1 foot high, bearing deeply-cut leaves, and large capsules of flowers with white ligules. It flowers well on sunny places in rockeries or the open ground. *H. Correvon, Geneva, Switzerland.*

(*To be continued*).

SOME EARLY CROCUSES.

We can hardly realise how much we should miss the Crocus, which in spring enamels our gardens with bright colour. With golden-yellow, purple, white, or striped blooms, it fills us with pleasure as we see its flowers expanded in the sunshine of a bright spring day. It cannot with any truth be said that these Dutch Crocuses are not appreciated and admired, but it can be claimed that what are known as the Crocus "species," do not receive a fair share of the attention given to the others. With these a garden may be made more attractive not only because of the greater variety, but also by reason of the succession of flowers produced by the various species. To write of these in detail would, perhaps, occupy too much space, but it may possibly be of service to speak of a very few of the Crocuses which are among the first of our flowers to bloom in the earliest days of the year according to our chronology.

Their coming is a little irregular, depending much upon the weather, not only of their season, but also to some degree upon that of the months which have just passed away. Some years they are a month or so late, but in others they favour us with their flowers a second time by coming again before December has gone.

Crocus Imperati.—Were one to be laid under the necessity of making a choice among the early-flowering Croci, it is probable that this fine species would be the first chosen. It is very hardy, although a native of Italy, and gives as little trouble as any Crocus we grow. It is beautiful also, whether closed, when its fawn-coloured segments are attractive; or open to the sun, when the rich purple of its flowers fill one with admiration. It is early, occasionally blooming with us in the North before New Year's Day, but usually in January, and further South, and in some parts of Ireland, before Christmas. There is a white variety, but this appears to be difficult to establish, and I have lost it several times. The species is rather variable in shade of colour, and it has been pointed out that there are two forms. One of these, and the prettier of the two, comes before the other, and is beautifully pencilled with black-purple on the outside. The later variety is almost self-coloured on the exterior of the outer segments, and is usually smaller. Crocus Imperati is cheap, and produces seed freely, which may be sown as soon as ripe. The seedlings do not flower for three or four years.

Crocus vitellinus.—This pretty and bright little Crocus usually comes rather earlier than C. Imperati, and gives a bright touch of gold to the spot in which it grows. The colour is a deep golden-yellow, and in the dark days of the year a good batch would be very acceptable. It is one of the species which shows its proper leaves with the flowers, a feature which, to some of us, appears to add to their beauty. The outside is sometimes feathered with bronze. The anthers are yellow or orange, and the stigmata scarlet or orange. It is common in Northern Palestine and Syria. It is quite hardy with the writer, and is a little Crocus worthy of wider cultivation.

Crocus Crewei.—The rare Crocus Crewei is closely related to C. biflorus, and it is doubtful if it would have been accorded specific rank but for its dark, almost black, anthers. It comes into bloom with me about the same time as C. vitellinus, and, although not bright like the latter in its colour, it is very pretty and refined. The whitish-buff outer segments are beautifully feathered with chocolate, and the white interior contrasts pleasingly with the deep chocolate of the anthers. This Crocus was first found by Mr. Elwes in Syria in 1874, but it has been sent from Asia Minor also. It has been figured in the *Botanical Magazine*, and fuller details regarding this and other Crocuses will be found in Mr. Maw's "Synopsis of the Genus Crocus," which appeared in the *Gardeners' Chronicle*, vol. xvi., p. 102 *et seq.*

Crocus ancyrensis.—Another bright little Crocus which comes soon after C. vitellinus is C. ancyrensis, the Angora Crocus; it is deeper in colour than C. vitellinus, and more nearly approaches a deep orange. The segments are unstriped, and a little clump of the grassy leaves and bright flowers of the Angora Crocus looks very pretty. It is said to be very plentiful in some parts of Asia Minor, but it is not nearly so commonly met with in cultivation as one would expect.

These are only a few of the considerable number of the plants of this charming genus, which present themselves to us when flowers are scarce in the garden, and when the smallest blossom is highly prized *S. Arnott, Carsethorn, by Dumfries, N.B.*

PLANT NOTES.

IPOMOPSIS ELEGANS VAR. (*Hort. Vilmorin*).

THIS pretty and useful annual affords a pleasing and attractive display when grown in groups in the flower-borders. It grows to a height of 3 feet, bearing long, more or less branching spikes of flowers, which are valuable for decorative purposes. The colour of the flowers varies, ranging from pink and salmon to creamy-white. Plants raised from seed sown in gentle heat in spring, and planted out in the month of May will flower during September and October. If desired to have the plant in flower at an earlier period, seed should be sown in August or September, and wintered in a greenhouse. Ipomopsis elegans succeeds in a warm and dryish soil. Last year I grew it well on a light gravelly soil, in spite of the drought. English seedsmen do not appear to catalogue the plant, or perhaps they include it under a different name. *James Baxter, Boldre Grange Gardens, Lymington.*

OXALIS CERNUA.

This pretty species of Wood Sorrel is a useful subject for filling up and brightening small recesses in the flower-garden or on the shady side of rockeries. It produces decumbent, fleshy stems, a foot or more long, bearing trifoliate, light green leaves, and bright yellow flowers, a little larger than those of O. floribunda, in great profusion. The plant produces small brown tubers in the axils of the leaves, which may be collected, stored in dry sand, and planted out in April of the following year, choosing a damp situation for them ; the stems are of annual duration. Although introduced about the middle of the last century, it does not appear to have been cultivated to any extent. A few years ago tubers of this plant were imported under the misnomer "Bermuda Buttercups." Although no mention is made of this species in the early floras of the Canary Isles, it now covers large tracts of wild pasturage in Grand Canary, it having been introduced there from the Cape ; and so prolific is the plant, that quite 90 per cent. of the fodder cut in winter in the damp districts consists of this species of Oxalis. It has not proved hardy in this country, 4° of frost being the limit the tubers have withstood unharmed. It may prove hardy in the extreme south-west, but is likely to become a pest wherever it is established. *G. B. M.*

MONTANOA HERACLEIFOLIA.

There are a number of ornamental plants very effective in groups, or solitary on the lawn, but which, unfortunately, have fallen more or less into neglect. To these belongs the above-named plant, a native of Mexico, which during the course of the summer reaches a height of 6 to 9 feet. This rapid growth, and the handsome and remarkable foliage, renders the plant, and similarly M. bipinnatifida, very valuable in the flower-garden. The leaves have a length of 27 inches, with a width of 18 inches. They are opposite, stalked, and double-feathered ; rough, hairy, and serrated at the edges. The plant is raised by means of cuttings, which are taken in the winter from plants started in heat. Cuttings of young wood root readily. "*Wiener Illustrirte Garten Zeitung*," *for January*.

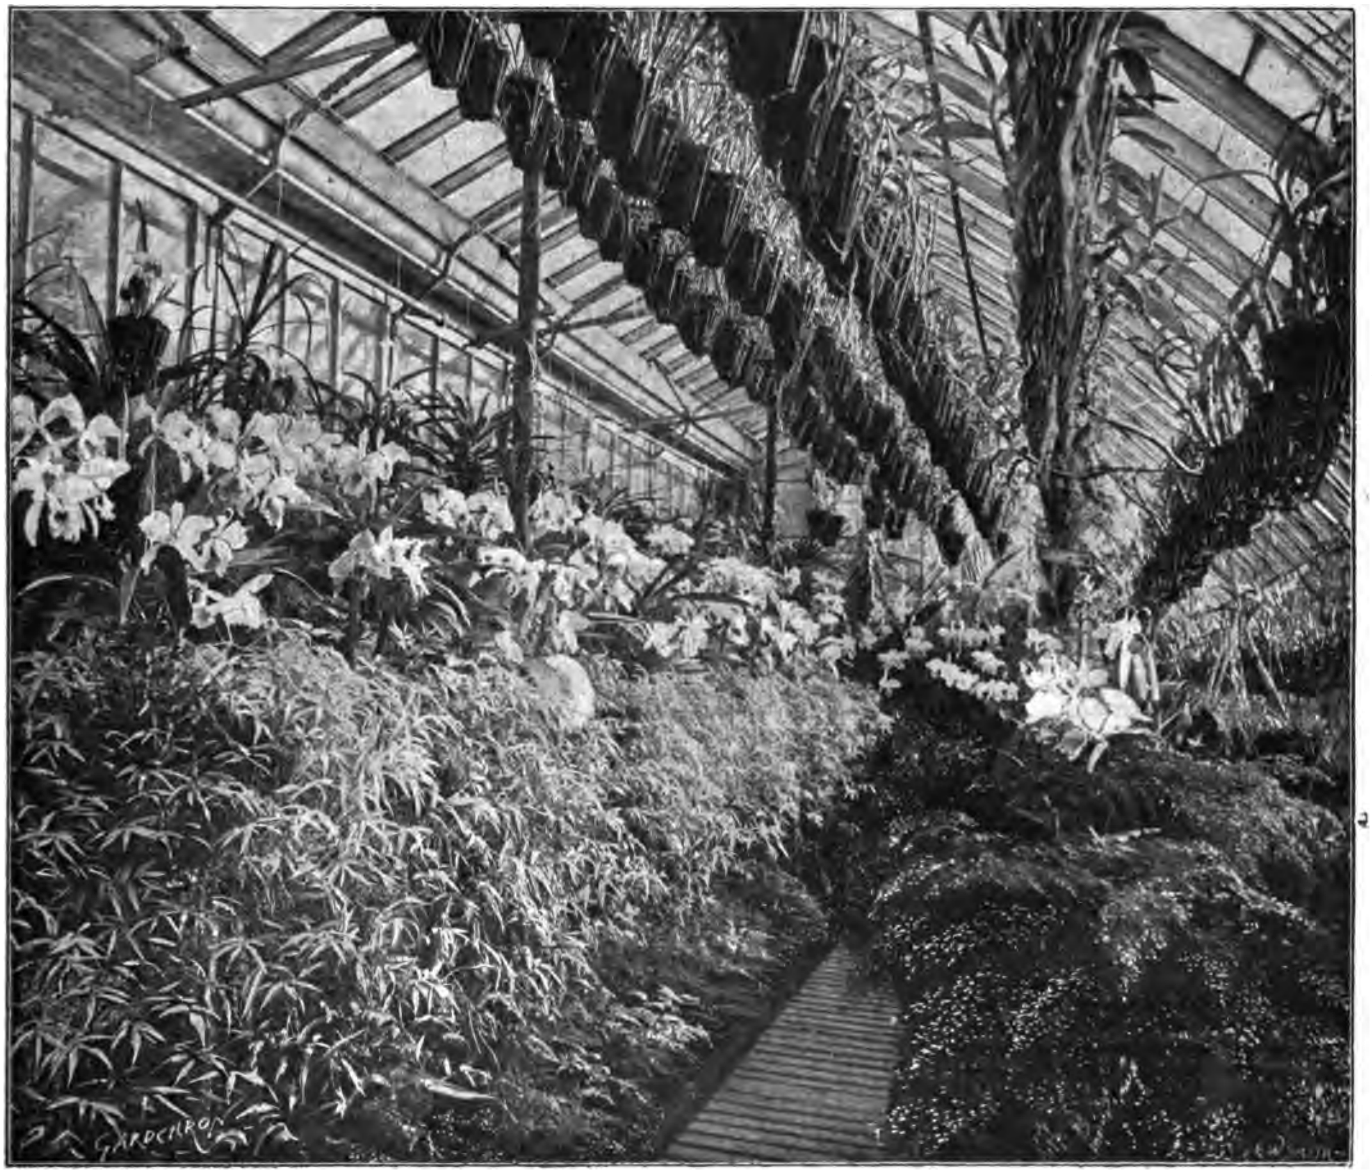

Fig. 41.—View in the Cattleya-house of Capt. G. W. Law-Schofield.

ORCHID-HOUSE AT NEW HALL HEY.

In fig. 41, we have reproduced a photograph, taken in November last, showing the interior of the Cattleya-house of Captain Law-Schofield, at Rawtenstall, near Manchester. At that date the house presented a wonderful show of flower, the principal species represented being C. labiata, C. Gaskelliana, C. × Mantini, and other Cattleyas ; also many Lælias, of which L. pumila was very fine. Among Cypripediums, the hybrids C. × Schofieldianum, C. × Lawrebel, and C. × Arthurianum were conspicuous. The collection at New Hall Hey is a very fine one, and an adjoining house was almost as gay with blooms as that photographed. At the present time the Dendrobiums are in flower, and the Orchids generally, under the cultural care of Mr. Shill, are very satisfactory.

TREES AND SHRUBS.

ELÆAGNUS.

Among the most useful of hardy evergreen shrubs are the species of Elæagnus, and the close allied genera Hippophae and Shepherdia. Not only are they hardy, but they will grow in almost any soil, and do not suffer so much from the smoke of great cities as many other plants do.

The Hippophae, or sea Buck-thorn, is common on some parts of the Kentish coast, and sometimes forms large copses, as along the Isar near Munich, and in the Rhone valley. Its silvery leaves, relieved by brown scales, are very effective, and the golden berries are very showy. Planters should remember that the plant is diœcious, that is, that the male flowers are on one plant, the female on another. We often get complaints from purchasers that their shrubs do not produce berries ; no doubt because they have purchased male plants only. As it is very difficult, if not impossible, to distinguish the male from the female plant when not in flower, nurserymen should carefully mark their plants when they have the opportunity, and thus be enabled to supply their customers with the two sexes. We do not know if anyone has ever tried to graft the male upon the female bush, but we strongly advise that the experiment should be made.

The cultivated forms of Elæagnus are mostly of Japanese origin, and those "curiosity-loving people" have sought and perpetuated many varieties which have found their way into our nurseries. Mr. Scapelhorn sends us sprays of some of the more showy varieties, from which we select the following for notice—

ELÆAGNUS REFLEXA AUREO-VARIEGATA.

A straggling shrub with axillary spines of about the same length as the leaf-stalk. The leaf-blades are about 4 inches long by 2 inches broad, oblong, pointed at both ends, wavy, coriaceous, dark green at the margins, disc heavily blotched with golden variegation, under-surface concolorous, cream-coloured, densely beset with stellate scales; nerves brown.

E. REFLEXA ARGENTEO-VARIEGATA.

Similar to the preceding in habit, but the leaves are smaller, more wavy, and the creamy-white variegation is confined to the margin, the disc being of a deep green colour.

E. HORTENSIS VAR. ANGUSTIFOLIA.

A spiny shrub, thickly clothed with silvery scales. The shortly-stalked leaves are about 1½ inch long by ½ inch in width, linear-oblong, rounded at the base, and slightly so at the tip, greenish above, silvery beneath.

One of the North American species of Elæagnus is noticeable for its fruit, which is borne on long, slender, pendulous stalks, and is eaten by those who like it. A figure of this species was given in our columns in 1873, p. 1014.

THE WEEK'S WORK.

FORESTRY.

By A. C. Forbes.

The Home Nursery.—There are few estates on which planting is more or less an annual affair which do not possess a home-nursery in some form or another. It may either take the shape of a carefully-laid-out piece of ground, provided with walks, shelter-hedges, and sheds for seeds, tools, &c., or it may simply be some out-of-the-way corner fenced round with wire-netting, and used as a depôt during the planting and subsequent filling-up of a large plantation. From the forester's point of view the former type is the most desirable, not only on account of its general utility, but also as a sort of experimental station in raising and propagating trees and shrubs, which is always interesting work to a culturist of any kind. No doubt many public nurserymen consider home-nurseries more or less detrimental to their own interests; but unless they are worked upon a large scale, we believe that they enter very little, if at all, into competition with the nursery trade generally, more especially where economy is studied; for the home nursery is not always an economic concern directly, if indirectly. It is only under very favourable circumstances that the work of sowing, bedding-out, cleaning, &c., can be done anything like so cheaply on a private estate as it is done in a public nursery; nor can that amount of attention be given to the work when it is only one of many jobs which make up the duties of an estate forester's staff. In nine cases out of ten it will be found that the bulk of the plants used in making an ordinary plantation can be purchased from a public nursery at less cost than they could be raised from seed or even seedlings in a home nursery. It is, of course, not an easy matter to estimate the cost per thousand of raising any particular kind of tree in a home nursery, and we doubt very much if the public nurseryman is in a much better position to do so either, except in a general way. All that can be done is to put the rent of the land, labour, and general expenses against the value of the stock, based upon the current market prices of the different species and sizes grown. But it is impossible to arrive at the exact percentage of profit or loss for which the stock of each species is responsible, although in a general way it will be found that those species most in demand, and on which there is the largest turnover, are the most profitable to the nurseryman who grows them on a large scale, and the least profitable to him who grows on a small scale, because the former is able to make a much larger profit at the same rate per thousand than can the latter, the cost of producing the larger number being relatively lower. The home nursery cannot, therefore, fairly compete with a public nursery, which grows a hundred plants, perhaps, to every one that is raised in the former; but over and above the fact that a business on a large scale can be carried on more economically than one on a small scale, the home nursery is usually greatly handicapped in the way of labour. Anyone acquainted with the routine of a large forest-tree nursery is familiar with the cheap and rapid method adopted in bedding out seedlings and small transplants. Chiefly done by piece-work, at so much per line or thousand, a couple of men with women or boys soon make short work of putting out forty or fifty thousand seedlings. Put a couple of ordinary estate labourers at the same work, and pay them by the day, and the number they plant in an eight-hour day can usually be counted without any great strain upon the eyes. Speaking from painful experience, we invariably find that the amount of work done in the home nursery in this direction varies inversely with the number of men employed. If a man is working alone, not more than the regulation 50 per cent. of time is wasted; but if two are together, the processes of levelling the soil, setting out the line, and opening the trench give rise to so much discussion and argument, that the extra man is rather a loss than a gain. The fact is, the average labourer rarely works hard at easy work, or work which requires dexterity and nimbleness rather than strength; and it has often struck us that the home-nursery on an estate is somehow or other associated with that class of work which can be done at any time, and which fills the gaps that occur between busy seasons. For the above reasons, we are not greatly in favour of the home-nursery growing large quantities of ordinary forest-trees, unless particular advantages or particular reasons exist for growing a particular species, large numbers of which are used on the estate. Carried out on a large scale, and by men who take an interest in and have become accustomed to the work, it may prove more profitable, as we shall hereafter endeavour to show.

(To be continued.)

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester

Early-flowering Shrubs.—The mild winter has been favourable for these on walls and in the open. One of the earliest of these is Jasminum nudiflorum, which, planted on walls having different aspects has kept up a continuous display of yellow flowers. A plant of Chimonanthus fragrans, planted against a wall with a west aspect, produces here, annually, an abundance of flowers, cream-coloured and purple, which are fragrant; Ligustrum (Lonicera ?) fragrantissimum, grown as a shrub or trained up the stem of a tree, has delicate white pendent flowers; Azara microphylla is quite hardy here, forming bushes 8 feet high and 6 feet in diameter, the inconspicuous flowers attracting attention by their sweet Vanilla-like perfume; Osmanthus ilicifolius, resembling a small Holly in growth, produces small white flowers; Andromeda floribunda is a beautiful shrub, with pretty white campanulate flowers, and requires to be grown in a peaty soil. Hamamelis arborea is a tree of low growth, and the branches are now covered with beautiful, though small, bright yellow blossoms, with deep crimson calyces; Daphne laureola has clusters of flowers of a greenish-yellow colour, in the axils of the upper leaves; D. Mezereum, with its deep red or white flowers, is effective when planted on elevated positions in the rockery; Garrya elliptica, with its long, pendulous catkins of yellowish flowers and stiff grey-green leaves, is a handsome object against a wall or as a bush or a hedge; Laurustinus stricta (fragrans) is good grown as a free standing shrub, or a plant against a wall, opening its white-waxy flowers at this season. This variety is more hardy than the common form, and the leaves are more leathery. All of these shrubs may now be planted, and the most of them will succeed on good ordinary garden soil.

Auriculas (Alpine).—Plants that were raised from seed sown last July, pricked off in boxes, and wintered in cold frames are, under the influence of the mild weather, starting into growth, and they should be placed outside, and gradually hardened off, preparatory to being planted out. See that old-established plants are made firm in the ground, and any that may be showing signs of a decaying stem, and are worth perpetuating, should have the suckers taken off and inserted in sandy soil, under a handlight, to root, which they will soon do.

Bedding Plants.—Sow seeds of such subtropical plants as Melianthus major, Albizzia lophantha (Acacia lophantha), Eucalyptus Globulus, Nicotianas colossea, atropurpurea, grandiflora, macrophylla, gigantea, and Wigandioides; Solanums robustum and Warscewiczii; Grevillea robusta, Abutilons, &c. Sow also, in mild warmth, seed of Verbena hybrida. Verbena seed is sold in packets of distinct colours, and it almost invariably comes true to tint. Plants from seed are more robust in growth, and produce more flowers than when grown from cuttings. The seed pots should be filled with light sandy soil made firm and level, and the seeds slightly covered with soil, and afforded plenty of water. Place the seed-pots in a temperature of 70°. Cuttings of Ageratum, Coleus Verschaffelti, Iresine, Heliotropes, Fuchsias, Agathæa cœlestis, and yellow and white-flowered Marguerites, should now be taken, cutting them with a sharp knife just below a joint, and inserting them in small pots filled with a mixture of sandy-loam, leaf-mould, and sand, plunging the pots to the rim in cocoa-nut fibre-refuse or fine coal-ashes, over a bottom heat of 75°, and keep close and shaded till roots form.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Peas.—As soon as the soil has got into a proper workable condition, a sowing of such second early Peas as Criterion, Dr. Maclean, Stratagem, Telephone, and others, may be made thinly, in shallow, flat drills, drawn at 6 to 8 feet apart, according to the height the variety attains. Early Potatoes may be planted between, or seed of Turnips, Lettuce, or that of any other quick-growing dwarf plants sown. There is nothing to be gained by very close cropping: afford, therefore, plenty of space to allow of each plant growing sturdily and robustly.

Broad Beans.—In the present month make a full sowing of Broad Beans, choosing the larger-podded varieties, such as Bunyard's and Veitch's Longpods, which are excellent croppers, and if Beans are liked at the best table sow seeds of Green Windsor, which has the best flavour of any. Sowings of Beans should be made on well-manured land, in either double or single rows, fully 3 feet apart, each seed-bean being put into the drills or dibbled at 6 inches apart. Mice of various species are fond of Beans, and must be trapped or hindered in some way from devouring the seed-beans. Slugs are troublesome sometimes, but a dusting of the tops with lime and soot will save the plants from their ravages. The Peas suffer from a too decided preference of the hedge-sparrow, and if no Pea-guards are available let lines of cotton be drawn tightly above the rows, at about 3 inches above the plants. As the latter grow the supporting sticks should be lifted further out of the ground, so as to keep the line of plants clear of the threads.

Shallots and Garlic.—The bulbs should be planted as soon as the land is dry enough, pressing in good-sized bulbs of the first 2 inches deep in the soil; but planting the cloves of the second, not the entire bulb, and in doing this let the top just appear above the soil. If the land be heavy and retentive, the bulbs should not be pressed in so deeply, but only deep enough to keep them from being lifted out by the action of frost, and the upward pressure of the roots. One foot of space allowed is deemed sufficient between the rows, and 8 inches from bulb to bulb; the ground for this crop should be in good heart, and be made moderately firm.

The bulbs on light land and in southern shires may be left in the ground for two years.

Herbs.—If the Thyme plants are few, seed may be sown in pans, and hastened in growth under glass, but not in a high temperature. Keep the plants sturdy, and plant them out in suitable weather, and after due hardening off. The herb border should be overhauled, and deficiencies therein made good. Keep the whole of those that are in daily use in a quarter most convenient to get at. Tarragon, Mint, &c., may be lifted, and the roots replanted in a fresh spot. Mint quickly grows into fine clumps, as also Tarragon, when young pieces are pulled up and dibbled in at 1 foot apart when the growth is under 6 inches in height.

Sweet Basil and pot *Marjoram* should be sown in pans, and placed in heat to be used in a tender state; and later a large sowing should be made for planting-out purposes. Basil being a native of the tropics requires a warm house, and to be carefully afforded water, and no crowding permitted, or wholesale damping-off will occur.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Tecoma Smithi is a very serviceable winter-flowering plant, producing trusses of orange-yellow coloured, tubular-shaped flowers at the beginning of the winter, and remaining a considerable time in bloom. Old plants which have been resting after flowering may be cut back and placed in an intermediate temperature, where they will soon make new growth, and if it is intended to increase the stock, shoots may be taken off when from 3 to 4 inches in length, and either inserted singly in thumb-pots, or eight together in a 48-sized pot, and plunged in a hot-bed or propagating-frame. When the cuttings are sufficiently rooted, pot them into small pots, affording a compost consisting of two parts loam, one part leaf-soil, and a little sand; when the roots appear at the sides of the pots, the plants may be transferred to a house where the temperature is about 55°, and when well-rooted, they may be placed in 5-inch pots, adding then a little rotten-manure to the soil. When well established in these pots, air freely, and finally stand them out-of-doors when danger of frost is past. When old plants which have been cut back, have made a couple of inches of new growth, the balls may be reduced considerably, and the plants potted into as small pots as possible, and when new roots have been made, a larger pot should be afforded.

Bouvardias which have been rested, should now be cut-back, if that has not already been done, and the plants given an intermediate temperature. When they have made an inch of new growth, turn them out of the pots, and remove the greater part of the old soil with a pointed stick, placing them in pots only sufficiently large to admit of an inch of soil being placed around the reduced balls. The easiest method of propagation is by means of root-cuttings, and to provide these, the requisite number of strong old plants should be selected. Shake the soil from the roots, and cut the strongest of these into pieces about an inch and a half in length. Fill a pan, or pots, to within an inch and a half of the rim, with sandy soil; upon this lay the root-cuttings, and cover them with half an inch of soil. Afford a watering, and place them under a bell-glass in the stove, or plunge in a hot-bed. The cuttings will soon make roots, and throw up shoots, which should be stopped above the first pair of leaves; and shortly afterwards pot them into thumbs, using a compost consisting of two parts loam and one part leaf-soil, with plenty of sand added. Afford them a moist, warm atmosphere for a time, and stop the shoots frequently, so as to produce a bushy habit, shifting them into larger pots when well rooted, and finally potting them into 5-inch or 6-inch pots, according to the strength of the plants. Towards the end of the spring they may be transferred to a cold pit, gradually increasing the amount of ventilation, and continuing the stopping of the shoots until July, by which time the plants should be well furnished. Where large quantities of cut flowers are required, old plants may be started as recommended above, and grown on until towards the end of the spring, when they may be planted out in prepared soil in a pit provided with a hot-water pipe, into which heat may be turned when necessary.

THE ORCHID HOUSES.

By W. H. Young, Orchid Grower to Sir Frederick Wigan, Bart., Clare Lawn, East Sheen.

Selenipediums and their hybrids.—The stove species, S. longifolium, Roezli, caricinum, Boissierianum, Lindleyanum, and Sargentianum may now be afforded fresh materials, viz., good turfy peat and sphagnum-moss, used in the proportion of two of the former to one of the latter. The rhizomes of the first two species have usually an upward trend, and when re-potting is not required, the new material should be packed well up to the base, so that the roots may enter it as soon as they emerge from the rhizome. Overgrown specimens should be divided into pieces of a suitable size rather than be re-planted intact in a bigger pot. Pots without perforations in the sides, except at the very bottom, should be used for this section, as they need large and frequent applications of water during the greater portion of the year, and also at this present season, that a large mass of drainage is necessary. Selenipedium caricinum, one of the parents of S. Dominianum, is like that hybrid, rather prone to damp off if water be allowed to collect in the growths, hence, care in watering becomes a necessity, more especially in the winter, when evaporation is slow. S. Schlimi, and S. caudatum, and the hybrids with an infusion of their strain, grow best in an intermediate temperature, and, like the preceding species, they should have especial care when affording water. The first-named should be undisturbed so long as it has sufficient root-room, and the drainage is in good order, affording the plants an annual top-dressing, and removing as much of the old materials as may be picked from among the roots without damaging them. A larger proportion of sphagnum-moss should be used for this species, and with an added quantity of fine crocks. When repotting becomes necessary, let the base stand well above the rim of the pot, which in this instance should consist of one of moderate depth, or a shallowish pan, having perforations at the sides. S. caudatum should not be disturbed at this date if the flower-spikes are showing, but the surface may be freshened up with the following ingredients, peat two parts, fibrous loam one part, and sphagnum-moss one part, sprinkling in some finely-broken crocks as the operation proceeds. When repotting it, more than half fill the pots with drainage, and keep the plant below the rim. Most of these are prone to attacks from insects, and means must be adopted to keep them clean and free from injury from this cause.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

Fruiting Pines.—During mild weather it is practicable to maintain a very uniform temperature, but if frost or cold searching winds prevail, it will be prudent to allow the temperature to decrease by a few degrees rather than use excessive firing to maintain a given temperature. From 70° to 75° by night, and a rise of 10° by day will be sufficient, allowing slightly higher or lower figures according to external conditions. By the increased temperatures and brighter sunshine, more frequent damping of the floors and other surfaces will be needed, and on bright days light over-head syringing may be given early in the day. Afford root-waterings as often as may be needed, and liquid manures or guano dissolved at the rate of an ounce to the gallon will be useful. Ventilate on every fitting occasion, if only for a brief period. Any plants that are throwing fruits, should be afforded a steady bottom-heat of 85°. For this purpose, tree leaves or tanner's bark may be used. The latter, if fresh, will need to be watched that excessive heat may be anticipated and prevented. A loosening of the pots will often be found sufficient to prevent injury to the roots, should the material become too hot. If it is impossible to obtain the required quantity of fermenting-materials to replenish the whole bed, the warmer end may be given this alteration, and a selection of the most forward plants be plunged therein, so as to accelerate their ripening.

Successional Plants.—Make preparations for the shifting of these into larger pots by removing under cover, and preferably in a warm place, the requisite amount of turfy-loam. This may be broken up, and an addition be made to it of bone-meal in the proportion of a 6-inch potful to each barrow-load of soil. If the turf breaks too finely, it is better to pass it through a sieve so as to remove the finer portions. To loam of a heavy nature, broken charcoal, lime-rubble, or coarse sand may be added, which will render it more easy of penetration by the roots, and less likely to retain too much water. The pots, whether for final potting or not, should be perfectly clean and dry at the time the work of potting is commenced. The exact time of potting may be decided by individual convenience, but the month of March is generally conceded to be a suitable one. This rule, however is subject to modification according to the condition of the plants themselves, and the provision made for plunging them. Before the final stage of the work of repotting and plunging is reached, the structures themselves should be put in order, by well washing the roof, and lime-washing the walls.

Suckers that are well rooted may be shifted at any time into pots of larger size, and any that are not satisfactory at the roots may be shaken out of the stale soil, and replaced in the same-sized pots in fresh compost. To poorly-rooted or weakly suckers, a little leaf-mould mixed in the potting-soil is helpful. Suckers should be removed from fruiting-plants as fast as they arrive at a suitable size. Place them in pots of small size, and afford a steady bottom-heat of 75°, and very little water until roots form freely.

THE HARDY FRUIT GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

Peach and Nectarine-trees.—The pruning and training of these trees should not be deferred much longer, as the mild weather now likely to prevail will hasten the flowering period. Assuming that the trees were loosened from the walls some time ago, in beginning the training and pruning the main branches should first be fastened in their proper position, that is radially, and then the smaller branches and shoots should be examined, and those not required removed. If the trees received attention after the fruits were gathered, and the shoots which had borne fruit were removed, the pruning to be carried out at this date will be a very small matter. The aim of the cultivator should be the retention of the finest bearing wood, therefore old growths as far as possible, having regard to covering the space, should be removed. Shoots not required to extend the tree, and all short growths growing at right angles with the wall, may be closely spurred, the resulting shoots being closely pinched during the growing season. The leading shoots should be, in all cases, laid in at their full length, it not being desirable to shorten these, for the best buds are always found towards the points, and the growth from this one always starts away in a more direct line than if shortening is practised. The crowding-in of young shoots should be resolutely avoided, the least space between them being 3 inches, and and 5 to 6 would be better. The heavy cropping of a young tree often leads to weakly growth and small fruits the next year, and in such case severer pruning and the shortening back of young weakly growths are necessary operations. Sometimes these weak shoots may be cut back almost close to the base, and long ones, with but few fruit-buds, removed altogether. If the border is become exhausted, it should be top-dressed with new loam and bone-meal, previously removing some of the surface-soil. Assuming that the trees have already been syringed with a mixture of soda and potash as previously advised, no further dressing of the branches will be required; but if they have not been so treated, let the trees be syringed with a mixture of petroleum and soap-suds, in the proportion of a wineglassful of the former to 3 gallons of the latter, keeping it well stirred during the operation. Before the training is begun, nail-holes and crevices should, if possible, be filled up with cement or mortar, the more readily to keep insect pests in check. I prefer the use of nails and shreds to that of a wired wall for out-door Peaches, but whichever is employed, the shoots require equal care. Where the former method is in use, the shreds should be cut small and neat for the young shoots, and care taken in nailing that the nails does not touch the shoots, otherwise, in swelling later, the presence of it against the rind will be sure to cause gumming, and the loss of the shoot. Equal care is required when tying to wires, and whatever material is used, it should be passed twice round the wire before tying, which will the better secure the shoot, and prevent its pressing directly on the wire. If the walls have been recently wired with new galvanised wire, it will be advisable to afford the wire a coat of oil-paint or thick lime-wash.

EDITORIAL NOTICES.

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY,	Feb. 23	Annual General Meeting of the Kew Guild, in the Garden Library, at 8 P.M.

SALES.

MONDAY,	Feb. 20	Roses, Gloxinias, Japanese and English-grown Lilies, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Feb. 21	Hardy Perennials, Asters, Carnations, Tigridias, &c., at Protheroe & Morris' Rooms. Sale of the "Willow Brook" Collection of Established Orchids, by order of D. A. Salamon, Esq., at Protheroe & Morris' Rooms.
WEDNESDAY,	Feb. 22	Japanese Lilies, Palm Seeds, Tuberoses, Continental Plants, &c., at Protheroe & Morris' Rooms.
THURSDAY,	Feb. 23	Hardy Border Plants and Bulbs, in variety, at Protheroe & Morris' Rooms.
FRIDAY,	Feb. 24	Roses, Carnations, Hardy Perennials, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period February 5–11, 1899. Height above sea-level 24 feet.

Remarks.—Rain fell on six days, Monday's being very cold, and mixed with snow and sleet; wind changing from south-east to south-west. On Friday the sun was very warm, the thermometer registering 64° in the shade.

Average Temperature for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—39°.

Actual Temperatures:—

London.—*February* 15 (12 P.M.): Max., 52°; Min., 45°.

Provinces.—*February* 15 (12 P.M.): Max., 48°, Bath; Min., 42°, Cape Clear.

The Royal Horticultural Society. The Report of the Society published in this journal on Jan. 28, p. 58, and the remarks made by Sir Trevor Lawrence, Bart., its President, at the annual general meeting held on Tuesday last, should prove of an exceedingly gratifying nature to the Fellows and friends of the Society in particular, and to horticulturists all over the country.

The meeting on Tuesday was most amicable, there being an entire absence of contentious or disputatious features, a pleasing and remarkable fact to be chronicled when account is taken of the proceedings at some general meetings in former years. We are happy in the knowledge that the Society has been skilfully piloted into a secure position, that it is in receipt of a much larger income than formerly, and that this income is being strenuously devoted to the interests of gardeners, and of gardening in its widest sense.

At a time, not so long ago, there were grave fears that the financial straits of the Society would have necessitated the curtailing or renunciation of the gardens at Chiswick. Now, however, it is pointed out that these gardens are too small for the increasing needs of the Society. In any case, the soil of the garden is greatly exhausted, so far as experimental purposes are concerned; it is, moreover, too shallow, and of so gravelly a nature, that everything suffers in seasons of drought. There are, however, twenty unexpired years of the lease, during which time the place must be retained, and the garden structures be kept in a decent state of repair. This occupancy of Chiswick for a long term of years to come need not, however, stand in the way of the Society acquiring more and better land, not far distant, for trial purposes.

From Chiswick to Westminster is but a step, and we find from the President's remarks, as we were ourselves cognisant, that the meetings, or exhibitions, as they may now be called, at the Drill Hall, in James Street, have grown, and continue to grow, in popularity with the right sort of people—those who are fond of a garden and a greenhouse, and who find their greatest pleasure and solace therein. The exhibits grow in variety, and consequently in interest, owing doubtless to the appearance of the amateur and professional gardener exhibitor in greater numbers, whilst those from the commercial gardener or nurseryman do not diminish in number or extent, although we think the latter class should be somewhat limited in the area occupied, in justice to the claims of other exhibitors.

The recent re-arrangement of the Lindley Library, and the publication of the catalogue of books and publications therein contained, received notice from the President, who laid emphasis on the feelings of gratitude evinced by the Fellows of the Society for the exertions of Dr. Maxwell T. Masters and his assistant, Mr. Hutchinson, in connection with the re-arrangement of the library and the formation of the catalogue. The library, he said, was constantly increasing, and the time had come for the appointment of a librarian, who would keep it in good order; but with regard to this and cognate matters we must refer our readers to the report itself on p. 109.

In regard to medals awarded for meritorious exhibits, it was, he said, notorious that some of these were not, now, actually given, owing to the great cost the doing of this would entail; and it is proposed to have a smaller gold medal struck, and give this absolutely to the fortunate exhibitors.

In conclusion, it may be said that the annual general meeting afforded an example of unanimity, friendliness, and general accord on the part of all present, boding well for the future of the Society.

Injury to Hyde Park and Kensington Gardens. We are informed by a correspondent resident in the neighbourhood of Hyde Park that it is proposed to cut a trench 6 feet deep by 5 feet wide through the loamy soil of Kensington Gardens and Hyde Park, from end to end, in which to lay water-mains. Our experience of cutting deep trenches through land on which trees and shrubs are growing, teaches us that disastrous consequences are certain to ensue; and in view of irreparable losses in trees, and the extreme and increasing difficulty of establishing trees and shrubs in London, immediate steps ought to be taken to prevent the perpetration of this act of Vandalism. It is quite unnecessary to carry the trench through the Park and Gardens, as for a trifling extra outlay the pipes could be laid in the high road or under the pavement. There may exist the belief that by laying them in the park the local rates will not be levied. Besides the certain injury that will occur to vegetation, there will be the nuisance from the unsightly works in progress, and practically a year's enjoyment of the park and gardens will be lost to the public. The inhabitants of the adjacent residential districts intend to memorialise the Right Hon. A. Akers Douglas, M.P., First Commissioner of Works, representing to him the injurious effects of the scheme of laying down a line of mains through the entire length of the northern side of Kensington Gardens and Hyde Park, and asking him to place his veto upon it.

Cyphomandra betacea. — Our illustration (fig. 42, on p. 105) shows a fine plant of the Tree Tomato, bearing a plentiful crop of fruits, in the temperate-house, Royal Gardens, Kew. The tree blooms at Kew during July and August, and the photograph from which our present illustration has been prepared was taken in October last. In the issue of the *Gardeners' Chronicle* for March 10, 1887, p. 383, was published a figure representing part of a shoot of this species, bearing leaves and a bunch of three fruits, together with a letter from Dr. Morris describing the plant as grown in Jamaica and other West Indian colonies. The plant is a native of Peru, where it is known by the name of Tomato de la Paz. The fruit when ripe is of a rich orange colour, and measures about 2 to 2½ inches long, and 2 inches in diameter. They may be used exactly the same as the fruits of the ordinary Tomato, and a preserve is also obtained from them. The plant is not hardy in England, but as our figure fully demonstrates, it succeeds splendidly in a house that affords little more than protection from frost. Dr. Morris says that Cyphomandra betacea flourishes best in the hilly districts of the tropics, with a mean annual temperature of 65° Fahr.

The Gardeners' Royal Benevolent Institution.—The proprietors of the *Journal of Horticulture, per* R. Milligan Hogg, Esq., have given a donation of £50 towards the sum required to complete the Victorian Era Fund. Mr. Alex. Dean has also given £5.

The Surveyors' Institution. — The next ordinary general meeting will be held on Monday, February 20, when a paper will be read by Mr. J. L. Crouch (professional associate), on "The Management and Valuation of Brickfields." The chair will be taken at 8 o'clock. It has been decided, on the invitation of the Somerset, Gloucester, and North Wilts provincial committee, to hold the next country meeting at Bristol, on April 26 and 27. The first day will be devoted to papers and discussions, with a dinner in the evening; the second day to excursions to various places of interest in Bristol and its neighbourhood. Full particulars will be issued a little later on. University degrees: members who are graduates of any of the recognised universities of the United Kingdom are requested to intimate the fact to the secretary of the Institution, in order that the same may be indicated in the next issue of the list of members.

Woodlice. — These sometimes troublesome insects can be poisoned by placing sliced Potatos puffed over with Paris Green or London Purple about the Mushroom-house, Melon-frames, and other garden structures; but let not their poisonous character be ignored, or terrible results might ensue.

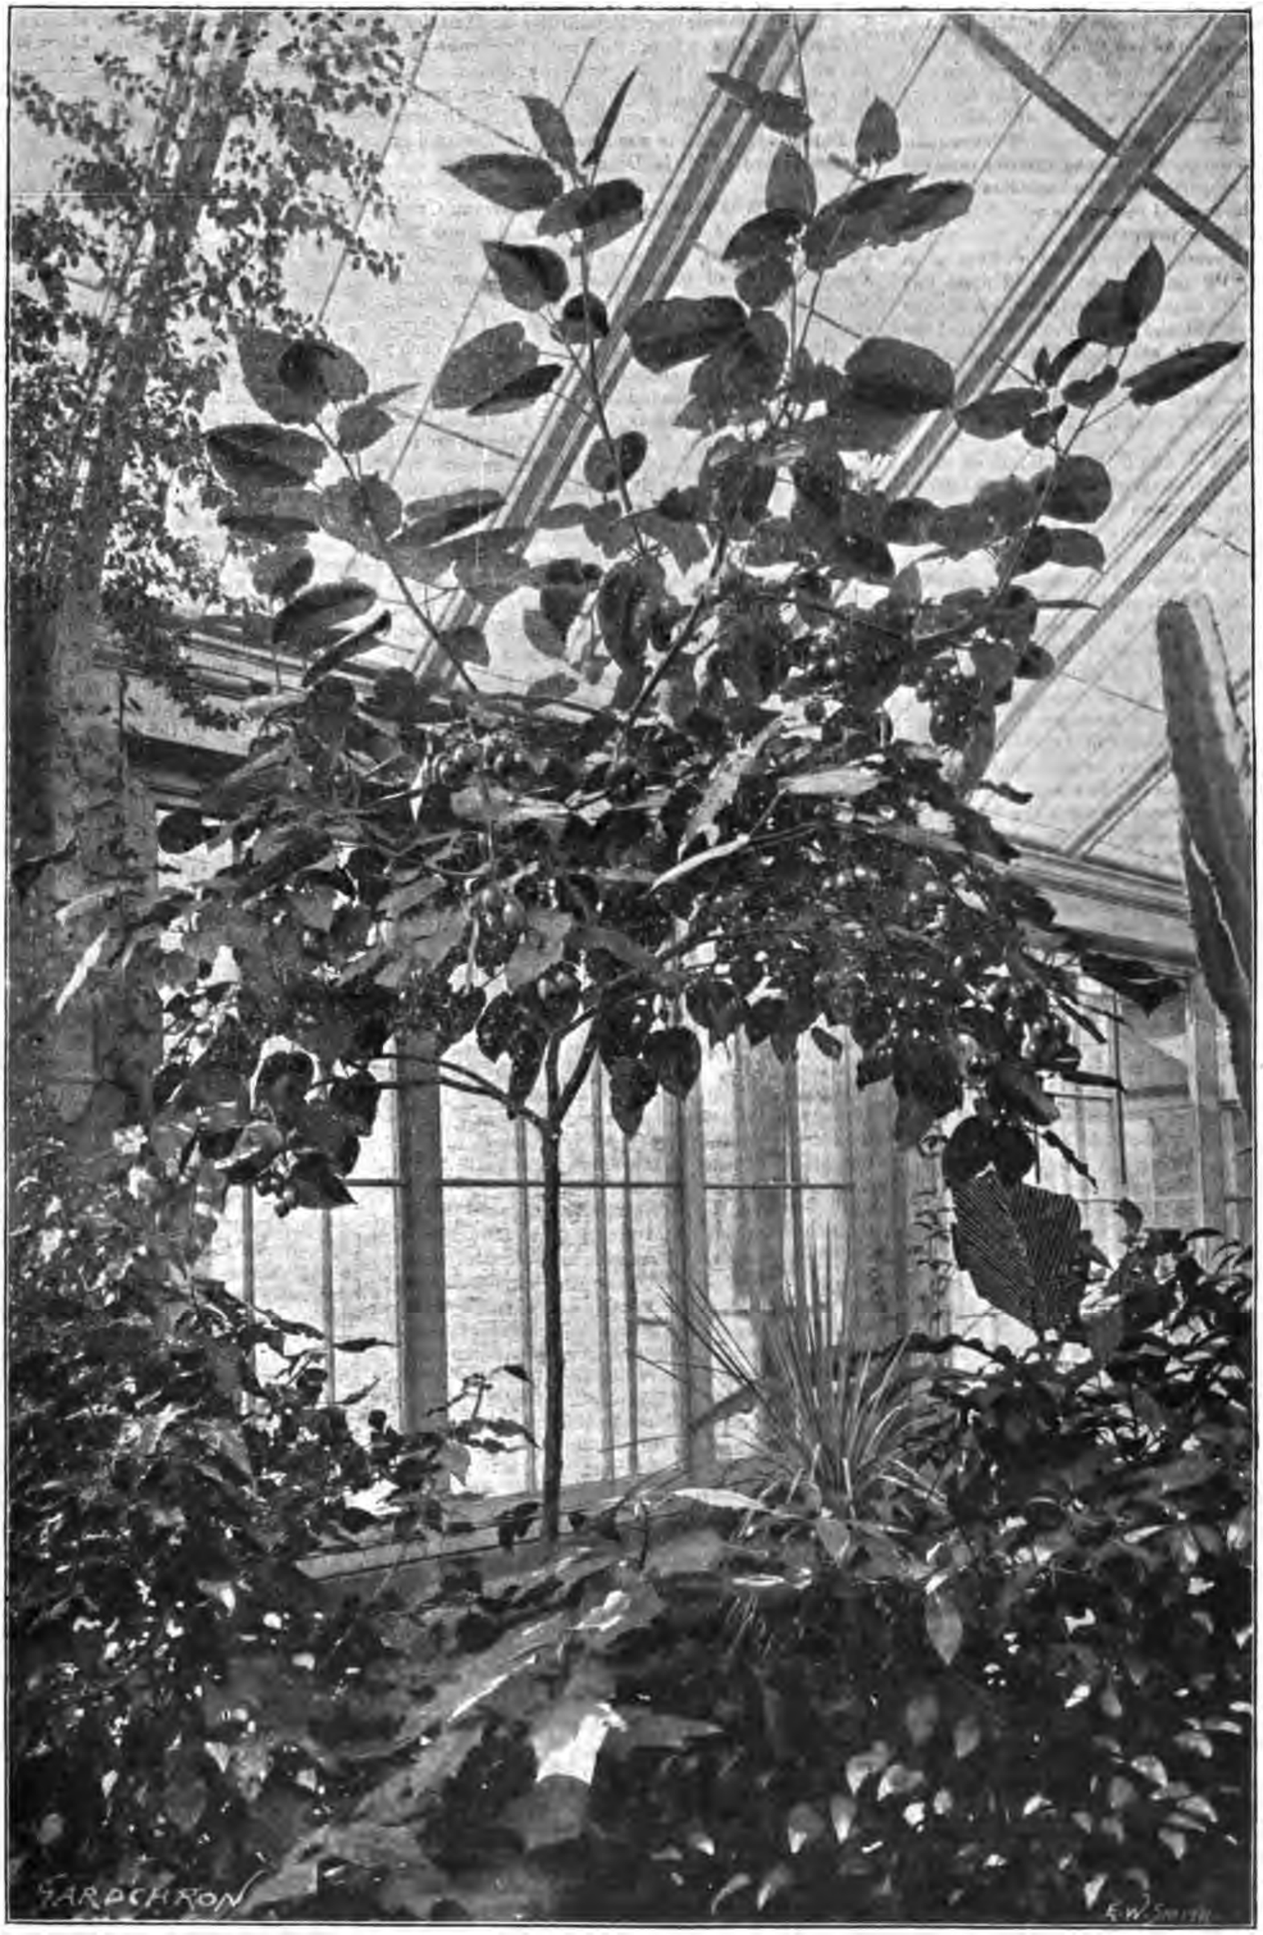

FIG. 42.—CYPHOMANDRA BETACEA IN THE TEMPERATE HOUSE, KEW. (SEE P. 104.)

TESTIMONIAL TO MR. F. LEE.—On the 13th inst. a testimonial was presented to Mr. F. LEE, who is retiring from the position of head gardener at Lynford Hall, Brandon, Norfolk, a position he has held for the past thirty years. The Lynford estate having recently been sold, and Mr. LEE being about to sever his long connection therewith, his very numerous friends in the district resolved to make this opportunity the occasion for an expression of the general respect in which Mr. LEE has been held. The presentation took the form of a silver-plated hot-water jug in the form of a watering-can, with an embossed shield upon one side engraved with a suitable inscription. A cheque for £47 accompanied the gift. From a report we have of the meeting at which the presentation was made, it is evident that the proceedings were most enthusiastic, and the expressions of respect to Mr. LEE extremely cordial.

OPEN SPACES.—Miss OCTAVIA HILL, on Wednesday, February 1, delivered an address on "Open Spaces," at the Portman Rooms. The lecturer stated that anyone who knew the life of a working man and his family in London knew how sorely a little garden was missed, and it became a necessity to provide as many small public gardens as possible near the homes of the people. These gardens, when scattered, had the advantage of opening breathing spaces for the blocks of buildings around. The usefulness of the parks and metropolitan commons was manifest, and in the management of larger open spaces on the outskirts of London a deeply-rooted desire would have to be met that portions of land should be preserved in a wild and natural state. If it was necessary to mark the boundary, let it be done with trees or hedges, not with iron fences. In 1888 a map was prepared showing the proportion of population to open spaces within a six and a four-mile radius of Charing Cross. In the western semi-circle there was one acre to every 682 of population, while on the eastern side there was only one acre to every 7,481. It was then realised that it would be hopeless to attempt to rectify this discrepancy within the four-mile radius, and attention was drawn to the importance of securing spaces within the six-mile limit. Since that time many acres had been added to the heritage of Londoners by private donors and local bodies. Still, the map showed that in the north-west quadrant there were 1,559 acres of open spaces; in the south-west 1,554; while in the north-east there were 988; and in the south-east 665. The discrepancy was large, and pointed to the necessity for some central body taking the initiative in selecting areas for purchase. Though every open space was helpful to the poor of London, the tendency was for spaces to be acquired in the richer part of the London area. Not much was now left within the six-mile radius, and, happily, improved means of locomotion had taken the population from the crowded centre. A critical time had arrived when it was incumbent upon all to unite in preserving the heritage of English citizens in commons and field-paths in all parts of the country. Indicating the various ways in which rights were filched from the public, Miss HILL pointed out the means of defence by the powers of parish, district, and county councils, and mentioned the principal agencies through which action might be taken. *Times.*

GHENT HORTICULTURAL AND BOTANICAL SOCIETY, ETC.—On the occasion of the monthly meeting of this Society in the Casino, Ghent, on Sunday, February 5, the jury awarded Certificates of Merit as follows:—To Cattleya Trianæi, shown by M. E. Coryn; to Adiantum Bessonianum, Kentia ornata, Phœnix canariensis gracilis, and Crinum Laurentio (Congo), shown by M. Ed. Pynaert; to Anthurium Andreanum hybridum, shown by M. C. Petrick; to Cattleya Trianæi splendens, shown by L. Desmet-Duvivier (unanimously); to Citrus sinensis aureo marginatis, shown by M. E. Lossy (unanimously); to Anthurium Scherzerianum hybrids, shown by M. Louis Desmet; to a collection of bunches of flowers of Cyclamen persicum var. Papilio (by acclamation), shown by M. Draps-Dom; to Kentia Buchenbergeri, shown by MM. Desmet Frères (by acclamation); to a work entitled, *Monographie sur les Cypripedium, Selenipedium, et Uropedium*, by M. F. Desbois. A Botanical Certificate was awarded to Dendrobium species shown by M. L. Desmet-Duvivier.

FRUIT FROM THE CAPE.—The *Dunvegan Castle* has brought from the Cape of Good Hope 809 boxes of Peaches, 22 boxes of Nectarines, 70 of Pears, and 68 of Plums; total, 969 boxes. The whole of the fruit arrived in excellent condition, and realised good prices. Peaches sold in shops in the City of London at 9*d.* and 10*d.* each; in the West End shops, at 1*s.* to 1*s.* 3*d.* each. There was a good demand for the Plums, and these were sold at 6*d.* to 9*d.* each. The Pears and Nectarines were in fair demand. An attempt to sell some of the best Peaches by public auction met with no success, and they were eventually sold privately in Covent Garden Market.

FLOWERS IN SEASON.—Chinese Primulas have been making a lovely show in the nurseries and private gardens since Christmas. Mr. W. Bull, New and Rare Plant Establishment, King's Road, Chelsea, has brought to our notice a number of blooms which represent fine strains in the single and semi-double-flowered sections. Of the semi-double varieties, Blushing Beauty, fulgens, and kermesina splendens, are very fine; and among the singles may be mentioned P. alba oculata lutea, marmorata kermesina, light purple, with traces of silver colour; Mavis, carmine, with wavy petals; Garnet, deep crimson flowers, of moderate size; and two varieties representing shades in the colour that among Primulas is generally termed blue. Cineraria flowers from the same establishment are types of a strain of brilliantly-flowered varieties of good form.

HEREFORDSHIRE ASSOCIATION OF FRUIT-GROWERS. — Mr. T. WHEELER MEATS, Hon. Secretary *pro tem.* of a society to be founded at Hereford under the above title, kindly furnishes particulars of the aims and objects of the same. It has long been felt that among the fruit-growers of Herefordshire there is a great need for the formation of some association which should watch their interests and provide them with an opportunity of meeting at regular intervals to discuss matters relative to fruit-growing and horticulture. The county is particularly adapted to fruit-growing, and yet the number of those who engage in it at the present time is exceedingly small in comparison with other counties; and it is thought that this method of uniting them will give a stimulus to fruit-growing, from a commercial point of view, which will be a benefit to the county. With a view to furthering this suggestion, a public meeting will be held at the Mitre Hotel, Hereford, on Wednesday, February 22, at 3 P.M., at which His Worship the Mayor of Hereford has kindly consented to preside. He will be supported by Sir JAMES RANKIN, Bart., M.P., Mr. C. W. RADCLIFFE COOKE, M.P., Mr. J. H. ARKWRIGHT, Mr. J. RILEY, Mr. H. C. BEDDOE, Mr. TICHBORNE HINCKES, and others.

PUBLICATIONS RECEIVED.—*The Agricultural Gazette of New South Wales*, December, 1898.—*Tijdschrift voor Tuinbouw.*—*Beiträge zur kenntnis der Afrikanischen Flora* (New Series), (published by Hans Schinz, Zurich).—*Orchid Review*, February, 1899. — *The Australian Agriculturist*, Sydney, January 9, 1899.—*Plantæ Europæ*, by Dr. K. Rrichter, fasc. ii., tome ii. (W. Engelmann, Leipzig).—*Banks and their Customers*, by Effingham Wilson (published by the same at 1*s.*, at the Royal Exchange, London, E.C.). A very useful little publication for the information of both large and small investors.—*Unique Journal Horticole Japonais*, communications to be addressed à la Société d'Horticulture du Japon, Shintomi-cho, Kyobashi, Tokyo.—*Le Potager d'un Curieux.* History, culture, and Uses, of 250 edible plants, by A. Paillieux and D. Bois, Librarie Agricole de la Maison Rustique, Paris.—*Dictionnaire Pratiqu- Horticulture et de Jardinage.*—*The Silva of North America*, by Chas. Sprague Sargent, vol. xii. (Houghton, Mifflin & Co., the Riverside Press, Cambridge, Mass., U.S.A.)

HOME CORRESPONDENCE.

LARGER EXHIBITS.—I think objections might be taken by others who are not actual exhibitors to the increased number constituting a dish of vegetables and fruits proposed by "A. J. L.," and his arguments show a decided absence of practical knowledge in the matter. The extension proposed by your correspondent, if carried out generally, would involve serious additional outlay in providing space in tents, &c., and staging; and many societies I know full well could tell "A. J. L." that those items of expense are already a sufficiently heavy burden on their resources. Even under existing conditions, those responsible for the arrangement of exhibits find that all available space is fully taxed. Where this is the state of matters, what wisdom is there in making further difficulties by proposing dishes where plates have previously filled the benches satisfactorily? and then, moreover, to suggest higher prizes. Your correspondent probably bolsters himself in the belief that some among the far-seeing members of the horticultural world would agree with him; but if a census of opinion were obtained from such a large body as that to which "A. J. L.'s" suggestion appeals, I am sure he would find himself among a small minority. I agree that visitors and patrons should be duly remembered, but an enhanced interest is not likely to accrue in the direction thus advanced, and surely those who contribute to the show's wealth and attractiveness are also deserving of consideration. Has not "A. J. L." seen the splendid and uniform effects in the arrangement of the Royal Horticultural Society's Annual Show of fruit at the Crystal Palace? and can he say that his proposal, if carried out, would lend additional attractiveness to that. I for one do not believe that it would, but, on the contrary, lead to much loss in effect, to say nothing of the larger amount of labour required, lower standard of quality, and fewer exhibitors. In short, the suggestion made has nothing to recommend it. *W. S.*

TREES IN SMALL GARDENS.—The case reported by you from South Australia at p. 26 is, indeed, an interesting one, and concerns the small gardens of tens of thousands of persons in this country. In how many cases have not tall-growing trees and shrubs been planted at the edges of suburban gardens, probably not more than 20 feet wide, without a thought being given to the ultimate result. In a few years, however, when these trees have reached to a height of 20 feet, the branches extending half-way over adjoining gardens, and the roots ramifying many feet from home, literally exhaust not only the owner of the trees own ground, but that of his neighbour: great harm is done, a great nuisance is created, and not less, much ill-feeling is engendered. But there is also the grave evil that such trees shut out from other gardens that which every garden occupier is fully entitled to—sunlight and air. Thus, during the summer months the trees exclude the sun, whilst the roots are preying upon the soil, and there are added the evils of drip, and the annoyance from falling leaves, creating discomfort and dirt. I have heard many complaints from unoffending occupiers of suburban gardens of such evils as these, all arising from ignorant action on the part of owners in planting most unsuitable subjects, and the not less stupid obstinacy of the occupier to refuse to abate the nuisance. Of course, with or without giving notice, the occupier aggrieved may cut back overhanging trees to his own fence-line; but what an ungainly object is thus presented! Still, there remains the exclusion of light and air, and the soil-robbery goes on all the same. A general law which prevented the planting of unduly large-growing trees and shrubs in small gardens would prove to be the best corrective of what is, much more largely than is generally known, a great evil. *A. D.*

INTRODUCTION OF THE ORANGE INTO EUROPE. — In the *Gardeners' Chronicle* of January 21, it is stated that, "According to Bretschneider, the Portuguese claim to have introduced the Sweet Orange from China into Europe before the middle of the sixteenth century." In all the accounts of Oranges I have read in my studies of the Citrus, I invariably found that "the sweet Orange" is mentioned; but I have never seen it stated which sweet Orange is meant. There are several varieties of sweet Oranges, and the sweetest I ever tasted was a small Orange grown on the borders of Nepal, north of Gorruckpore, known there under the name of Súntola, and belongs to the Súntara race. The only fault I found in this Orange was that it was too sweet. I fancy the sweet Orange to which Bretschneider refers is that known in various places of the Mediterranean by the name of "Portogallo," and in the Levant "Portugan," both which distinctly point to its origin in Europe. It is the Valencia Orange, the St. Michael's, and their varieties. All Oranges are at first sour, and, for the most part, they sweeten as they ripen. The Seville, or marmalade Orange, never sweetens. This is often called "bitter Orange," but in reality the bitterness is solely in the rind, or its essential oil, the pulp being only sour. *E. Bonavia, M.D.*

POTATO WOODSTOCK KIDNEY. — This now almost ancient Potato, for it was raised by Mr. Robert Fenn at Woodstock some twenty-six or more years ago, has had its name resuscitated through the publication of the very interesting matter furnished to the Royal Horticultural Society's Scientific Committee by Mr. Arthur W. Sutton, in detailing the results of curious grafting experiments with Potatos and Tomatos. Even if we did not know through the effects of the Potato-fungus on Tomato-plants how closely Solanum tuberosum and Lycospermum esculentum are allied, we should certainly more fully realise it when learning of the grafting experiments at Reading. But in relation to the Woodstock Kidney Potato, pollen of which was employed in connection with other cross-fertilising experiments, it was in its more youthful days one of the most free-producers of pollen and flower self-fertilisers I ever knew. I employed its pollen with scores of diverse varieties and with great success. I do not know whether it still retains that fecund character. Generally, modern Potatos produce little or no pollen; and so much are their efforts directed to the production of tubers, that they have not any left to enable pollen to be formed. Some persons regard that as being indicative of constitutional weakness. I do not. It is simply a diversion of plant-force from one direction to another, and to the grower of Potatos a far more profitable one. Reading Russet used to produce pollen and seed-berries freely, but that feature is not much seen now. Woodstock Kidney produces handsome white tubers, of distinctly superior table excellence, but the plants invariably suffered, as all first-class varieties suffer, from disease. It is odd that, whilst being so good a variety, it should be almost forgotten; its twin brother, the famous International Kidney, which gives the most beautiful of tubers in appearance, and most indifferent in flesh, is now grown in great quantities in the Channel Islands and elsewhere for the supply of the British market in the spring and summer, and which, in an unripe state, are freely consumed by the unthinking public. *A. D.*

SEEDING OF BEGONIA GLOIRE DE LORRAINE.— It may interest your numerous readers to know that in the gardens here, a small plant of the above possesses a seed-pod which I hope will prove fertile, but, like Mr. Hemsley, I fear it will not, seeing that the male blooms are devoid of pollen. May it be accounted for by the absence of sunshine to bring to pollen out in the dull winter months, or is it peculiar to the variety (a result of hybridity)? I shall retain the pod on the plant in order to ripen the seed, if any. The male blooms may, with stronger sunshine, become furnished with the pollen-grains. The plant is from a late-struck cutting. *A. S. Cole, Moncrieff Gardens, Bridge of Earn, N.B.*

—— It would be interesting to know when pistillate flowers were first observed in this plant. As far as I can gather, although it was certificated six years ago, and has been extensively cultivated each succeeding year, female flowers have not been produced till this season. In a small collection I have noticed this year, about a dozen plants produced one pistillate flower each; one plant, however, produced three, and two others produced two female flowers each, but a careful examination has failed to discover any pollen or a perfect stamen. We shall shortly see whether Mr. Hemsley's surmises are correct. with regard to the fertility of these flowers. There seems no reason why they should not produce seed. Judging from outward appearances, the stigma appears perfect, and is responsive to the application of pollen-grains; flowers pollinated one day close their petals over the stigma in twenty-four to thirty-six hours. In one case, when the pollen of a species was used, the petals closed on the third day. I have in my small collection eight of these ovaries swelling away nicely, and I hope for some good results, however small, as doubtless do many other growers. Next year should see some very interesting forms and varieties, judging from what one hears. The behaviour of these hybrid flowers under cultivation form an exceedingly interesting and fascinating study. The very much-lectured and educated young man of to-day will find scope in this study for the exercise of his powers of observation. A careful record of facts noted down at the time of observation, with the addition of all details of culture, environment, &c., will assist, perhaps, one day to eliminate the mystery of the strange behaviour of cultivated hybrid flowers. Hybrid Streptocarpi are very full of interest to the watcher; one plant with me last summer produced an erect, regular flower with equal lobes and five perfect stamens. I fertilised it, obtained seed, and have sown it. Please do not discourage me, Mr. Hemsley. *A. F.*

THE DUNS CASTLE ARAUCARIAS.—With reference to the article in the issue of 28th ult., containing a reference to the fine specimens of Araucaria at Duns Castle, I am sure it will interest many, and especially those readers who live in that locality, to learn something of the date of the planting these grand trees. Just sixty years ago, my father, then an apprentice in the gardens at Duns Castle, carried these plants in a basket from a little nursery near the lake "Hen Poo," and assisted to plant them. They were then some 18 inches high. What is now the lawn was at that date a geometrical flower-garden, laid down in box; two of these trees were planted there, and the third was placed as a centre plant in a rosary, but some years later it was moved to where it now stands. *D. Crombie, Feb.* 8.

LAW NOTES.

A LICENSE TAX ON JOBBING GARDENERS.

(*See pp.* 74 *and* 94.)

The prosecution instituted by the Inland Revenue Authorities for Manchester against Mr. Treeby, a nurseryman there, for employing a male servant as a gardener, employed in keeping gardens in order without a license, which it was alleged was necessary, has naturally created much stir in the gardening world. We therefore applied to Mr. Chas. Butcher, solicitor to the Nursery and Seed Trade Association for a statement of opinion, which he has kindly furnished, and which runs as follows :—

ASSESSED TAXES. MALE SERVANTS.

Instructions to Counsel to advise on behalf of Nurserymen.

Nurserymen enter into contracts with householders, who do not keep a gardener in their sole employ as a servant, to keep their gardens in order by the year for a fixed price, payable periodically; and for that purpose nurserymen keep a staff of men, and send one or more to the residences of householders for a certain number of days, or portion of a day, in each week, varying with the size of the garden, and the time of the year. The men so employed are engaged and paid by nurserymen, are under their entire control, and they can keep them at work on their nurseries, wholly, or in part, or send them to residences when necessary to fulfil contracts. Some men so employed give or receive a week's notice to leave; others discharge themselves, or can be discharged by nurserymen, by a day's notice, or a day's pay in lieu thereof, according to arrangement.

Although it is usual to send the same gardener from week to week to the same householder (as the latter do not like strange men), it is not compulsory to do so.

Owners of establishments engage gardeners or under-gardeners for a period subject to an agreed notice on either side to determine the same, whereas the engagements of gardeners employed by nurserymen are subject to determination as before-mentioned, and they lose time when the weather is too wet to work. It is submitted that the 32 & 33 Vict. c. 14, sec. 11, relates to persons who are engaged by and in the sole employ of householders for a fixed period, and come within the definition of a servant.

Counsel will please advise: "Whether nurserymen are required to take out licenses for men they employ as gardeners for the purposes above referred to;"

"Whether any and what proceedings should be taken to quash the conviction against Mr. Treeby."

COUNSEL'S OPINION.

"This is an important and difficult question, on which it is certainly desirable to obtain without delay an authoritative decision. It is impossible, in my opinion, to contend that male servants cannot include others than men employed by private individuals for their own luxurious convenience. Hotel and restaurant-keepers must take out licenses for waiters (*Spencer* v. *Sheerman*, 23 L.T., 873). Livery-stable keepers, it is conceded, have to take out licenses for the men they employ. I incline to think, however, that 'gardeners and under-gardeners' in sect. 19 refer to the gardeners and under-gardeners of private employers, and that there was no intention to tax the trade of a nurseryman, and that no license is necessary for the men employed by a nurseryman in his own nursery. But the question whether he employs a gardener when he contracts to keep in order a stranger's garden, is a different question. It may well be argued that he is, *pro hac vice*, a private employer, who employs a gardener. The exact facts would, in each case, have to be considered to ascertain how far 39 & 40 Vict. c. 16, s. 5, applied. On the whole, I think there is a fair chance of upsetting Mr. Yate's decision. There is no appeal to Quarter Sessions. The appeal must be by special case. *H. W. Loehnis, 7, New Court, Carey Street, W.C.*"

ELLIS *v.* THE DUKE OF BEDFORD.

This case was before the Court of Appeal on the 14th inst. It is an action brought against the Duke of Bedford on behalf of the market gardeners who use Covent Garden Market, who claim, under the Act for the Regulation of Covent Garden Market, 1828, certain preferential rights in regard to cart-stands within the area for which the tolls and charges were scheduled by the Act. In December last a preliminary point of importance arose on application by defendant, and subsequently Mr. Justice Romer decided that the six plaintiffs could not unite to join their claims in one action, nor could they as private individuals sue on behalf of a class of the public in respect of public or other statutory rights. From this decision the plaintiffs appealed on Tuesday last, and the appeal was allowed by the Court. The Master of the Rolls held the opinion that the proper course was to make the Attorney-General a defendant to represent the general public as against the preferential rights of this smaller class. The plaintiffs undertaking to do that, the appeal was allowed.

SOCIETIES.

ROYAL HORTICULTURAL.

February 14.—The fortnightly meeting of the Committees, and the annual general meeting of the Fellows of this Society, was held on the above date. The display, in the Drill Hall, James Street, Westminster, was greater in extent than has been the case for some time past, and if a proportional increase be made on succeeding occasions the meetings in March and April it will again be of the abundant and overflowing character that was the case last spring. Orchids made a very grand show, there being numerous exhibits of groups, and among these a very fair proportion of novelties. Though the Floral Committee only recommended two Awards other than Medals, there were many groups of choice spring-flowering plants for inspection. Chinese Primulas again made one of the principal features, being shown by Messrs. Jas. Veitch & Sons and Messrs. H. Cannell & Sons, and there was a fine exhibit of Cyclamens from Mr. J. May, Twickenham. Forced Tulips were shown in quantity, and the hardy-plant nurserymen brought some of the earliest flowering of the Narcissus, Iris, and other choice hardy plants, that had been brought along gradually in pots in cool frames. Messrs. W. Paul & Son, of Waltham Cross, made one of their characteristic displays of Camellias in pots, which, if this be possible, should serve to arouse a greater interest in these very free-flowering greenhouse shrubs, that at the present time are to a very large extent neglected. The Fruit and Vegetable Committee awarded a First-class Certificate to a new Apple named Sanspareil, and Awards of Merit to a variety of Rhubarb, "The Sutton," and to a patent Fruit-basket. Among several collections of Apples an exhibit from Messrs. Geo. Bunyard & Co., Maidstone, called forth the highest award the Committee can give, viz., a Gold Medal.

The annual meeting was held in the Lindley Library and Council Room, in Victoria Street, and as the subjoined report shows, was a very satisfactory event. With a favourable balance of nearly £1300, and an increase in the numbers of Fellows, as great as it is continuous, there is every cause for the satisfaction generally expressed.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Geo. Nicholson, H. B. May J. H. Fitt, R. Dean, E. Molyneux, Jas. Hudson, Geo. Gordon, Jas. Walker, J. D. Pawle, Chas. E. Pearson, Chas. Jeffries, J. W. Barr, R. W. Ker, C. R. Fielder, T. W. Sanders, E. Beckett, E. T. Cook, D. B. Crane, Herbert J. Cutbush, Chas. E. Shea, Geo. Paul, C. Blick, and E. H. Jenkins.

Mr. Chas. Turner, Royal Nurseries, Slough, showed a small group of plants in bloom of Carnation Princess May, a variety of the Souvenir de la Malmaison type, with cerise-coloured flowers.

Choice stove plants were shown in a group by Messrs F. Sander & Co., St. Albans. There was a very large plant about 4 feet high of Acalypha hispida, beside lesser-sized specimens; Dracæna Sanderiana, D. Godseffiana, Acalypha Godseffiana, and Licuala Jeanenceyi were all shown well; also a plant in flower of Hæmanthus cinnabarinus var. superba, a very showy variety of this species.

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, made a display with Adiantum tenerum Farleyense, some very nice plants of which were shown; also model plants of the popular winter-flowering Begonia Gloire de Lorraine; the latter plants, in 8-inch pots, were perfect specimens of symmetry, and a mass of rose colour (Silver Banksian Medal).

Messrs. J. Hill & Sons, Lower Edmonton, made a fine exhibit of Ferns, including a batch of plants of Asplenium Hilli, a useful decorative hybrid, obtained from A. Belangeri and A. biforme. There were some fine baskets of Davallias, especially of D. dissecta, Adiantum tenerum scutum, Gymnogramma Veitchi, Pteris internata, a dark-leaved, erect-growing form, by no means common. The fronds are very durable in a cut state (Silver-gilt Banksian Medal).

Lachenalia Nelsoni, the yellow-flowered species, was shown well by Mr. Allan, gr. to Lord Suffield, Gunton Park, Norwich, from whom was a group of nine well-flowered plants.

From Sir Trevor Lawrence's garden, Burford, were shown several varieties of Helleborus, as strongly grown, well-flowered plants in pots; and cut flowers of seedling Hellebores were contributed by Mr. J. W. Rogers, Raggles Wood, Chislehurst.

Chinese Primulas were shown in large quantity by Messrs. H. Cannell & Sons, Swanley. More than half of one of the long central tables was occupied by these. The plants were in small pots (4-inch), and consisted of varieties with more or less of the characteristics of P. pyramidalis; they were very abundantly flowered. Lady Emily Dyke was again very effective. Purple Star is a fine showy one, the colour of the flowers being bright and attractive. Harlequin has white flowers, flaked promiscuously with purple. Lady Whitehead is pure white, of very nice habit. "The Lady" has been described many times; it is pure white, except the primrose-coloured centre, and more nearly represents the type than the other varieties described, the flowers being less perfect in form, and the petioles of the leaves much longer. Princess, a white flower of good form, with yellow centre, was the most attractive variety in the group. The flower is circular, but does not open perfectly flat; the margins of the petals are much divided, and the blooms are produced in wonderful abundance. There were a few newer varieties also shown in lesser quantity that are very meritorious. Altogether, the exhibit demonstrated the beauty of this strain which has been appropriately termed "decorative," as distinguished from florists' Primulas (Silver Flora Medal).

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, contributed a magnificent group of florist's Primulas. The plants showed excellent cultivation, and the habit of them, together with the size and brilliant colour of the flowers, illustrated a very fine strain. Particularly good was Gigantic Scarlet, the flowers of which have been materially increased in size, though the colour, perhaps, is nearer to crimson than scarlet. The gigantic varieties generally, in white, pink, rose (very pretty), salmon, blue, &c., were grand; all of these colours, and other shades, were also present in the ordinary varieties, in which the flowers, though hardly so large, are produced more numerously. P. stellata and varieties between that form and the florist's strain were also included in Messrs. Veitch's exhibit, thus affording an additional indication of the appreciation now extended to this strain (Silver Banksian Medal).

Mr. John May, Gordon Nursery, St. Margaret's, Twickenham, staged a most praiseworthy group of Cyclamens, the plants being as healthy in appearance as they were well-flowered. The flowers were erect, of full size, and the colours capital (Silver-gilt Banksian Medal).

Messrs. Paul & Son, Cheshunt, showed a few plants in flower of Calceolaria Burbidgei, a rich yellow-flowered hybrid, raised by Mr. Burbidge some sixteen years ago at Trinity College Botanic Gardens, Dublin, from C. Pavoni and C. fuchsiæfolia. It will grow to about 5 feet high, and is a good pot-plant for the greenhouse. In winter, this hybrid may always be seen in flower in the greenhouse, Royal Gardens, Kew. Several new Cannas were also shown, one of them, W. Tofts, a green-leaved variety with orange-coloured flowers, being very pretty.

Messrs. Wm. Paul & Son, Nurseries, Waltham Cross, Herts, showed one of the finest lots of Camellia plants that has been observed at any meeting of the Society in recent years. The plants ran from 2½ to 4 feet in height, mostly as bushes, lightly trained, or as pyramids. The foliage was good in all cases, glistening, dark green, and abundant, and the plants were literally smothered with flowers and flower-buds. The varieties noted in the greatest numbers were C. alba plena; next to this capital white variety came C. fimbriata, the best of its class, and the plants still more profusely bloomed than the first-named. Some nice plants were shown of C. delicatissima, a finely-formed creamy-white flower; C. conspicua, mottled like C. Donckelaari, but a better bloom; C. Exquisita, an imbricated petalled flower, of a deep cerise tint. As cut blooms, arranged in boxes, we noted Princess Charlotte, white; Beauty of Waltham, blush—a beautiful flower; Eugène Massina, a deeper tint of pink, and with finely-reflexed petals; Countess of Derby, Montironi (white), Lady Hume's Blush, and a pretty seedling of light pink colour, the petals edged with a line of white; and many other pretty varieties. A Silver-gilt Flora Medal was awarded to the group.

Mr. Thos. S. Ware, Ltd., Hale Farm Nurseries, near Tottenham, made an exhibit of choice hardy plants, including varieties of Narcissus in pots, a nice lot of Leucojums; also Iris stylosa, &c. Iris persica azurea, in a pot, was very pretty.

Messrs. Wallace & Co., Kilnfield Gardens, Colchester, exhibited varieties of Iris reticulata; also I. Histrio, I. Bakeriana, I. Danfordiæ, &c., flowering in pots. Several of the newer Snowdrops were also shown, including Galanthus Ikariæ, G. Elwesii, G. Whittalli, &c.

Messrs. Barr & Son, King Street, Covent Garden, London, showed Narcissus in pots, the pretty little N. minimus being represented by a dozen or so nice specimens. Snowdrops, Irises, Hellebores, and varieties of Cyclamen Coum were all very interesting.

A variety of Codiæum (Croton), with leaves of moderate width, centre yellow coloured, with shades of bronze and purple in the margins, was exhibited by Mr. Frank Lowe, The Gardens, Eastham Park. This variety is known as Lord Hillsborough, and has some merit.

Messrs. Collins Bros., Hampton, showed a large quantity of forced Tulips in considerable variety. These were displayed as market bunches, and the flowers were strong, of good size and colour, and produced upon stout and sufficiently-long stems (Silver Banksian Medal).

The Otaheite Orange (Citrus sinensis) was very well shown in a group of abundantly-fruited plants in pots, from Messrs. B. S. Williams & Sons, Upper Holloway.

A specimen of the handsome Arum Dracunculus was shown by Sir R. Wright, Headley Park, Hants.

AWARDS.

Narcissus × *Trimon.*—A hybrid between N. triandrus var. Calathinus and N. monophyllus, raised by Prof. Michael Foster and figured in the *Gardeners' Chronicle*, February 24, 1894, p. 233. The flowers are milk-white, and in the present instance were hardly so large as some that we have seen which measured 2½ inches across. For garden purposes, it is superior to both its parents (Messrs. Barr & Sons, King Street, Covent Garden).

Hippeastrum "*Sir William.*"—A very large bright crimson-flowered variety, the flower-scape being very strong, and nearly 3 feet in height. The form of the flower was not quite equal to the florists' ideal, but it is a very effective and showy variety.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshay, J. Colman, J. Gurney Fowler, H. Little, A. Outram, H. J. Chapman, W. H. Young, H. T. Pitt, E. Ashworth, W. H. Protheroe, W. Cobb, C. Winn, J. Douglas, S. Courtauld, and E. Hill.

Probably at no former February show has there been such a fine and varied show of Orchids.

Sir Trevor Lawrence, Bart., Burford, Dorking (gr., Mr. W. H. White), the President of the Society, made a very charming display, the main features of the group being the Burford hybrid Dendrobiums and Cypripediums. Of the former were D. × Juno, of the D. × chlorostele class, but florally much superior, its brightly-coloured, well-formed flowers constituting it one of the best hybrid Dendrobiums D. × chrysodiscum and D. × melanodiscum, shown in several varieties, were also very handsome; and D. × Thalia, D. × Burfordiense, D. × Dulce, and the forms of D. × splendidissimum were also showy. Among varieties of species were D. nobile Burfordiense. Of Cypripediums, a panful of C. × Lawrebel was very beautiful; and C. × conco-Lawre, C. × hirsuto-Sallieri in several forms; C. × Leeanum Albertianum; C. × Calypso; C. × Calypso, Oakwood var.; C. Lathamianum, and distinct forms of C. villosum. Of Masdevallias a selection of nice plants was staged. Of other remarkable plants in Sir Trevor Lawrence's group were noted a splendid plant of Epidendrum Endresii, a Catasetum discolor, Odontoglossum pulchellum, O. × Andersonianum, Epidendrum paniculatum, Liparis longipes, &c. (Silver-gilt Flora Medal).

A Silver Flora Medal was awarded to Messrs. Jas. Veitch & Sons, Chelsea, for a remarkable group of hybrids and varieties. The group was brightened by a fine collection of hybrid Dendrobiums, among which were D. × Wardiano-japonicum, varieties of D. × splendidissimum grandiflorum, D. × euosmum, and the variety virginale; D. × Dominianum, D. × Dulce, D. × Cordelia, and the yellow-flowered form, flavescens. Among the species were noted a fine specimen of D. infundibulum. Of hybrid Cypripediums, C. × Enid (Spicerianum × bellatulum) is a pretty flower of middle size, ivory-white, with the greater part of the surface tinged with claret-purple. Odontoglossums were well represented. Among other noteworthy plants were the variable Epidendrum × elegantulum, a fine example of Epiphronitis × Veitchi, one of the best of the scarlet-flowered hybrids; a good plant of Cymbidium × eburneo-Lowianum, and some showy forms of Cattleya Trianæi.

J. Bradshaw, Esq., The Grange, Southgate (gr., Mr. Whiffen), received a Silver Flora Medal for a group, in which the forms of C. Trianæi were noteworthy, his C. T. regale, a very large handsome flower, good in colouring, was adjudged the best in the show; C. T. Whiffeni, of an uniform peach blossom colour; C. T. lilacinum, of a decidedly blue tint; and C. T., white variety, were also fine blooms. The group contained a number of fine forms of Odontoglossum luteo-purpureum; the delicate blush-white Lycaste Skinneri Enchantress, &c.

F. Knight, Esq., Thundersley House, Essex (gr., Mr. E. Marston), showed a group of excellent forms of Cattleya Trianæi and other Orchids (Silver Banksian Medal).

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, were awarded a Silver Banksian Medal for an effective group of Phalænopsis, principally good specimens of P. Stuartiana, P. Schilleriana, and P. Aphrodite. There were also Cypripedium insigne Millie Dow, a pretty yellow form; C. i. Ballisæ, yellow, with indistinct purplish marking on the upper sepal; C. i. Youngiana, a neat flower, and very distinct; Dendrobium Lowi, Odontoglossum crispum roseum, O. × Andersonianum, Angræcum sesquipedale, &c.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, were awarded a Silver Banksian Medal for an interesting and extensive group of plants, consisting of over twenty distinct and fine Cypripediums, three of the best being C. × Pitcherianum Williams' var.; C. × Lebaudianum, ano C. × nitens superbum. Also in the group were good examples of Phaius × Cooksoni; fine varieties of Cattleya Trianæi, that named Reginæ being very pretty; Lælio-Cattleya × intermedio-flava, Calanthe × Bella, the true Lælia anceps Williamsii, a good Cirrhopetalum picturatum, Odontoglossums, Dendrobium Wardianum, and forms of Lycaste Skinneri.

C. H. Feiling, Esq., Southgate House, Southgate (gr., Mr. Canham), staged a pretty group, remarkable for a selection of Cypripediums, the best of which were C. × C. H. Feiling, with all the rich dark colouring of C. × Harrisianum superbum on a much larger flower (Bronze Medal).

Mr. Owen Thomas, The Royal Gardens, Frogmore, showed a nearly white form of Cattleya Trianæi.

Messrs. Fisher, Son, & Sibray, Royal Nurseries, Handsworth, showed two remarkable, but not fully developed, varieties of Cypripedium insigne; C. i. Eveline being very singular, by reason of the white ground colour, stained with rose-purple on the petals, the upper sepal being similarly coloured. C. i. Handsworthiense was of the same class, but nearer to the type of the species.

Messrs. F. Sander & Co., St. Albans, showed Phaius × (Manni × tuberculosus), P. × orphanum (grandifolius × Marthæ); P. × D. S. Brown (amabile × grandifolius), and Cypripedium × Comet (Stonei × superciliare).

Herbert Harris, Esq., Bowdon Hill House, Chippenham (gr., Mr. W. J. Penton), showed Cattleya Trianæi, Bowdon House var., and Lælia anceps Schroderiana, both good.

J. T. Gabriel, Esq., Palace Road, Streatham (gr., Mr. E. Ranson), staged Cattleya Trianæi, Gabriel's variety, a fine flower of good colour.

Elijah Ashworth, Esq., Harefield Hall, Wilmslow (gr., Mr. Holbrook), showed a fine form of Cymbidium grandiflorum; also Masdevallia Schroderæ, Cypripedium × villoso-œnanthum, a handsome hybrid; and Dendrobium × Domicassio (Dominianum × Cassiope) of the form of D. × Cassiope, but larger, and with rose-tipped segments.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Odontoglossum Mrs. De B. Crawshay, a distinct form with clear yellow ground, and but sparsely spotted; Lælia anceps var. Juno, a large coloured form, and L. a. var. White Queen.

H. J. Elwes, Esq., Colesborne, Andoversford, showed a pretty rose-coloured Calanthe, between C. rosea and C. Stevensii, and forms of Bletia hyacinthina.

G. F. Moore, Esq., Chardwar, Bourton-on-the-Water, showed the fine Cypripedium × Beekemanni.

F. M. Burton, Esq., Highfield, Gainsborough, showed an orange scarlet tinted hybrid of Epidendrum × O'Brienianum.

The Rev. F. Paynter, Guildford (gr., Mr. Cook), showed flowers of Odontoglossum crispum var. Brilliant, and Dendrobium Phalænopsis hololeucum.

AWARDS.

Cattleya Trianæi "Amy Wigan," from Sir Frederick Wigan, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young). This is probably the finest colour variation of its class. The bright purplish-rose flowers had a heavy claret-purple feather on the petals, and some smaller similar markings on the sepals; the front and edges of the side lobes of the lip being of an intense claret-crimson (First-class Certificate).

Masdevallia × falcata (coccinea ♀, Veitchiana ♂), from Sir Trevor Lawrence, Bart., Burford (gr., Mr. W. H. White), a very fine hybrid with orange-coloured flowers, nearly as large as those of M. Veitchiana. A fine plant with seven blooms was shown (Award of Merit).

Phalænopsis × Mrs. James Veitch (Luddemanniana ♂, Sanderiana ♀), from Messrs. Jas. Veitch & Sons, Chelsea. This pretty new hybrid has yellow sepals, and petals spotted with cinnamon-red, the lip being white, with red-brown spots and yellow base. A very distinct flower (Award of Merit).

Cypripedium × Orion (concolor ♂, insigne ♀), from Messrs. Jas. Veitch & Sons. A charming hybrid, with yellow flowers of peculiar form, the broad petals being wavy. The greater part of the flower is sprinkled with minute red spots, most evident on the dorsal sepal, which also has purple spots on the upper third, which is white (Award of Merit).

Phaio-Calanthe × Niobe (C. × gigas ♂, Phaius grandifolius ♀), from Messrs. Jas. Veitch & Sons. A free-growing plant, of the habit of P. grandifolius. Flowers pure white, with the face of the sepals and petals and the front of the lip of a rich rose-pink colour (Award of Merit).

Lælia-Cattleya × Warnhamensis var. Hypatia (L. cinnabarina × C. Trianæi Normani), from Messrs. Charlesworth & Co., Heaton, Bradford. A marked improvement on the original type. The flowers are yellow, with claret-crimson front to the lip, which is better displayed than in others of its class.

Catasetum discolor, from Sir Trevor Lawrence, Bart. (Botanical Certificate).

Bestrepia leopardina, from R. I. Measures, Esq. (gr., Mr. H. J. Chapman) (Botanical Certificate).

Odontoglossum × Andersonianum, from Sir Trevor Lawrence, Bart. (Cultural Commendation).

Odontoglossum maculatum anceps, from Walter Coble, Esq. (Cultural Commendation).

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. Geo. Bunyard, Jos. Cheal, Jas. H. Veitch, W. Wilks, J. Basham, A. F. Barron, S. Mortimer, Alexander Dean, C. Herrin, J. W. Bates, Geo. T. Miles, Geo. Wythes, H. Balderson, F. Q. Lane, J. Smith, J. Willard, W. Poupart, and W. H. Divers.

Messrs. Geo. Bunyard & Co., Royal Nurseries, Maidstone, made an exhibit of something over sixty dishes of splendid Apples. The excellent manner in which Apples are preserved by Messrs. Bunyard & Co. until past May has been shown many times at the Temple Show. Those exhibited on Tuesday were such perfect examples, that the committee recommended an award of the Society's Gold Medal. Of the varieties, the following were conspicuous:—Allington Pippin, Bramley's Seedling, Newton Wonder, Belle de Pontoise, Cox's Orange Pippin, Lord Derby, Lane's Prince Albert, Gascoigne's Scarlet Seedling, Emperor Alexander, Calville Rouge, Wealthy, Twenty Ounce, King of Tomkin's County, Bismarck, and Golden Noble.

Another collection including Apples and a few Pears was shown by Messrs. Cheal & Sons, Lowfield Nurseries, Crawley. There were about sixty dishes, and the finest examples were those of Bismarck, Newton Wonder, Bramley's Seedling, Gospatrick, King of the Pippins, &c. (Silver Knightian Medal).

Mr. Geo. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, exhibited a well-fruited branch of Vanilla planifolia, also dried fruits of same, grown at Syon in 1898. A Silver Knightian Medal and a Cultural Commendation were awarded.

A basket of excellent Mushrooms was exhibited by Mr. J. W. Miller, gr. to Lord Foley, Ruxley Lodge, Claygate, Esher (Vote of Thanks).

AWARDS.

Apple Sanspareil.—This is a moderate-sized, conical fruit, that was a great favourite with the late Mr. Anthony Waterer, and is believed to be of continental origin. It is in season in February, March, and April, and is described as suitable for kitchen or dessert purposes. In colour it is chiefly rich yellow, marked upon one side with red. From Messrs. Geo. Bunyard & Co., Maidstone (First-class Certificate).

Rhubarb "The Sutton."—A very fine-looking red variety that evidently forces well. From Mr. Butler, gr. to the Earl of Ancaster, Normanton Gardens, Stamford (Award of Merit.)

Mallet's Patent Fruit-Basket.—This is a basket made by the Mallett Patent Basket Syndicate, 52, Union Road, Rotherhithe, London, S.E. It is made with upright laths, nearly but not quite joined together with wooden bands at top and bottom. The basket is perfectly round, will hold about 24 lb., and is recommended as being very much more durable, and also greatly smoother than the usual wicker-made bushels or sieves.

Annual General Meeting.

The Annual General Meeting of Fellows of this Society was held at the offices, 117, Victoria Street, Westminster, on the afternoon of Tuesday last, February 14. Sir Trevor Lawrence, Bart., President, occupied the chair, and among those present were Sir W. T. Thiselton Dyer, Director of Kew; Sir John T. D. Llewelyn, Bart.; and Messrs. Rev. W. Wilks (secretary), Rev. G. Engelheart, P. Crowley, H. J. Veitch, H. J. Elwes, Prof. G. Henslow, T. B. Hayward, J. T. Bennett-Poë, Jas. Hudson, R. McLachlan, C. E. Shea, Arthur Sutton, Geo. Bunyard, W. Roupell, and Geo. Paul.

The minutes of the last general meeting having been read and confirmed, a number of new Fellows were elected.

Mr. James Douglas and Mr. Alexander Dean were elected scrutineers.

Mr. George Bunyard, in proposing a hearty vote of thanks to the retiring members of the Council, took the opportunity to allude to a matter which he had had in his mind for some time past. He said the holders of the Victorian Medal for Horticulture formed a body of sixty, and he thought some arrangement might be made whereby they could meet at least once a year. In order to do that it would, of course, be necessary to have a secretary or someone who could call them together. He might also remind them that at the present moment they had no head. He ventured to suggest that the council might take the matter into their consideration.

Mr. George Paul seconded the motion, which was carried.

THE PRESIDENT'S ADDRESS.

The President then rose amid cheers, and said:—Ladies and Gentlemen: I have now the honour to propose the adoption of the report, which was circulated among the Fellows some days ago, and I have no doubt that those Fellows who are interested in the work of the Society have read it. I venture to remark that on no occasion—certainly not in recent years—has it been the good fortune of the Council to be able to send out a report which is in every respect so very satisfactory. I trust the Fellows will consider that the short history of the Society during the past year which is contained in the report is a very satisfactory one.

There are a few matters in the report to which I should like to allude. In the first place, I would refer to the publication of the catalogue of the Library. The Library, as I dare say those who have been Fellows of the Society for a good many years will remember, was purchased in 1866, out of the profit that was made by the Committee of the International Exhibition on the occasion of a great horticultural exhibition held in the grounds of South Kensington that year. The Library has been growing during the last ten years with the growth of the Society, but owing to there being no librarian, it has gradually fallen into a very confused and disordered condition. I am afraid that the catalogue, such as it was, was of such a nature as to promote that confusion. That, I am glad to say, has at last all been set right, and everything has been placed in proper order. That leads me to say how much I regret the absence to-day, through illness, of Dr. Maxwell Masters, under whose auspices the work has been carried on, and it is no exaggeration to say that a very warm feeling of gratitude should be entertained by the Fellows of this Society to Dr. Masters. I must not omit to mention the name of Mr. Hutchinson, who, under Dr. Masters, assisted in the work. All the serials—and they are numerous—have been put in proper order and made as perfect as it is possible to make them. The catalogue is complete, and the Council has decided to have all the cases closed in with glass so as to preserve the books from the dust and dirt of the London atmosphere, and the destructive effects of gas. Before leaving this subject, and so as not to go over the same matter twice, I should like to say that the clerical work of the Society has naturally greatly increased, and is now of such a nature that our very moderate staff, working most willingly and all hours, is unable to properly cope with it, and we have before us to-day a resolution proposing additional clerical assistance. The proposal has been adopted by the Council, and I think we shall be fortunate in securing the services of Mr. Hutchinson, who has been working here in the library. Of course, Mr. Hutchinson's first duty will be that of the clerical staff, and such time as he is able to spare from his clerical work he will be able to devote to supervising the library and keeping it in good condition.

The condition of the gardens at Chiswick of late years has been a source of very great anxiety to the council. As to the value of the garden at Chiswick, it is impossible to avoid seeing that the garden is, in a great measure, worn out. It is unfortunate that it should be so, but it is the case; and anybody who saw the garden during the severe drought of last year, would agree with me that the ground showed every indication of being, in a great measure, worn out. Not only that, but it is too small for the wants of the society. We want larger ground and better soil, and we want an opportunity of doing more extensive work than we are now able to do at Chiswck. At the same time, we have twenty years' lease yet to run, and so we shall not be able to quit Chiswick for some considerable time. I feel if we had a larger garden—a garden where more extensive and more valuable work could be carried on—it would be greatly to the advantage, not only of the Society, but to the numerous county councils throughout the kingdom, who are at a great loss to know where to send promising young men desiring to have a sound horticultural education. We have had an application from the County Council of one of the Home Counties, asking to be allowed to send a young man to Chiswick, and I am convinced, from what I know of the work of the various county councils throughout the land, that if a thoroughly satisfactory education in horticulture could be given at the Society's gardens, wherever they might be, and the councils would take advantage of the opportunity, it would be not only to the benefit of the Society itself, but what is of more importance, would be to the benefit of horticulture in the kingdom.

The next point to which I would like to refer is the awards which have been made during the past year for the meritorious exhibits by amateurs and the trade [this was alluded to in our excerpts from the report published in the *Gardeners' Chronicle*, January 28]. I do not think that at any period of the history of the Society have the fortnightly exhibits been as satisfactory, as valuable, as beautiful, and as interesting, as they have been during the past year. The fact that that is so, is abundantly shown by the large and highly interested body of visitors who now habitually come to the exhibitions. I was about to say, that there might be still room for some further restriction on the giving of Awards. We are all willing—perhaps I should say anxious—to receive Awards for our productions, but the merit of the Awards we receive is considerably diminished when we find that they are very largely shared by a crowd of other people. We have this year taken a step in the right direction.

During the last few years the Society has awarded Gold Medals, but the absolute Medal in the precious metal has not fallen into the hands of the recipient. That has been due to the fact that the financial position of the society did not allow it. But we have felt for some years that that was not a satisfactory state of affairs, and we have adopted a die for a new gold medal, not of large size, but the result will be that everybody who is awarded a medal will get the absolute gold medal.

The next question that is raised in the report concerned the exhibits of professional horticulturists and amateurs. [Also alluded to in our issue for Jan. 28. Ed.] I must say I find myself in agreement with my brother amateurs. Although we do not expect to rival the skill and successes of the great professional, we do our best. But it is like all the great games, whether it be golf or billiards, or goodness knows what, the professional always beats the amateur—beats him, as a rule, easily; and, therefore, there is some ground, I think, for saying, that some different standard ought to be applied to the exhibits of the amateur to what is applied to those of the professional.

Then the report refers to a conference on hybridisation [see Report, Jan. 28]. Well, ladies and gentlemen, I am very glad to say that the suggestion for such a Conference has been very warmly received in all quarters. It has been felt that in dealing with the question of hybridisation, which extends right through the realm of horticulture—whether we speak of flowers, plants, or fruit—we are dealing with a large and important, and very interesting, and I venture to say, a very intricate subject. We have received cordial assurances of co-operation, both from home and abroad, and I think there is every reason to anticipate that we may have an equally successful and interesting Conference next July.

I had occasion to write to a distinguished gardener the other day—Mr. Joseph Chamberlain—and I asked him to be kind enough, if he possibly could, to reserve July 12 for our banquet, and he was kind enough to say that if nothing prevented him, he would certainly do so. I think you will agree with me that every Fellow of the Society ought to do his utmost to make this a success. When we go abroad, we are received with the greatest possible hospitality and kindness. It is impossible to exaggerate the graceful and abundant hospitality—almost too abundant hospitality—which is shown to us, and we in this country would, I am sure, be very sorry indeed to be in any way backward in making some small return to our foreign visitors on this occasion.

Next, we come to the show in the Inner Temple. I do not think that we have ever had a finer show than we had last year, and I think it is very satisfactory that the quality and character of these shows should be maintained at the very highest point of excellence at which they have been maintained. Our space there is strictly limited, and we cannot put up any more tents. We have, therefore, to reserve the space at our disposal for the more interesting class of exhibits, by excluding those which are nothing more or less than gigantic advertisments.

I think the show at the Crystal Palace, having regard to the season, was satisfactory. Arrangements have been made for repeating it. It is gradually becoming in the autumn what the Temple Show is in the spring. It is a matter of very considerable importance to this country, where fruit growing is practised on a very large scale, that there should be something in the Metropolis to show what our growers are able to do; and there is not the smallest doubt, having regard to our climate, that the fruit-growers of this Kingdom have no reason to hide their heads. I believe they display more skill than the fruit-growers in any other country, even countries which are blessed with a more benign climate than ours; for I believe that there is no part of the world where horticulture is practised with such enthusiasm and success as it is practised in this kingdom.

With regard to the *Journal* of the Society (*vide* report, Jan. 28), arrangements have now been made to issue it quarterly, so that there will be a part issued at the commencement of every quarter, and I trust it will be possible to issue it regularly. The additional work entailed is very considerable, and I must in this connection refer to the indefatigable labours of our secretary. The *Journal* would soon come to an end were it not for two things—first, the very valuable papers that are written for it, and our fortnightly meetings; and secondly, the admirable way in which the *Journal* is edited by our secretary. No labour is too great for him—no sacrifice of time and leisure is too great for him to make, and the Society owes a deep debt of gratitude to Mr. Wilks for his work in connection with the Society generally, and the *Journal* especially. The expenses of the four numbers of the *Journal*, and posting it to the 4000 Fellows of the Society during the past year, was £1041, from which has to be deducted £460 for advertisements and sale, leaving a net cost of £581, and at that price I venture to think that every Fellow of the Society will agree that the Society is well repaid. Very important improvements have been made in the *Journal*, and a large number of woodcuts have been added; and I think we can all agree that the *Journal* is now indeed the *Journal* of the Society.

The next subject to which I should like to refer is the increase in the number of Fellows. I do not think we could have more distinct and convincing evidence of the prosperity of the Society than is shown by that increase. We made a net increase—after all deductions—of 500 members, the largest increase that has ever taken place. The additional number of Fellows already this year is also by far the largest addition that has ever come before the annual meeting. There have already joined the Society this year 167 new members, as against the largest number ever before up to the annual meeting of 116. That is the result of sticking to our business. I have always said, and I venture to repeat, because I do not think it can be repeated too often—that so long as the Society sticks to horticulture, so long will horticulture stick to it. I think it would be impossible to have a better Council than we have the good fortune to have; and no member of the Council would make a suggestion except it were for the benefit, improvement, and the progress and prosperity of horticulture.

There is not the smallest doubt that the financial position of the Society is gradually being thoroughly reinstated. We are every year adding something to our balance (*vide* Report), and that is eminently more satisfactory, if possible, than would otherwise be the case, as we are now very near the centenary of the Society.

In five years time the Society will have existed one hundred years, and the question arises in what way shall we celebrate the centenary? Some people think we should have a Horticultural hall. If that were possible, I should like these cheers accompanied by large contributions, which would certainly be very necessary. It is, perhaps, premature to say what would be the best way to celebrate the centenary of the Society; but if the Society only proceeds on its present lines up to the year 1904, it will then be in a position to undertake much more than it could profitably or wisely undertake now.

I have now only to express to the gentlemen who have served on the committees our grateful thanks to them for their labours, which have been so ungrudgingly given. Many of them travel very great distances, and I can assure them that every Fellow of the Society feels grateful to them.

I have already alluded to our Secretary, to whom we all owe so much. I think we have a good man in Mr. Wright, of Chiswick. He has done good work there, and he has thoroughly justified our selecting him to replace our old friend Mr. Barron. We owe a great deal to the whole of our staff.

I am afraid you are tired of listening to what I have had to say. It is a very great pleasure, I assure you, to be elected again and again to be President of what I may call this ancient Society. I most thoroughly appreciate the honour. My interest in horticulture has been of no recent growth. I was brought up among flowers, and although I should like to live as long as I can, I hope, when I die, it will be among flowers! The pleasure they give us is never-ending, and those who promote the culture of plants and flowers will never regret helping in the good work.

Sir Wm. Thiselton Dyer seconded the motion for the adoption of the report. He said after the very exhaustive address from the chair on the prosperous state of the society, it would only be necessary for him to make a very few remarks. Speaking as an outside spectator, he should like to say, that the work of the society was almost unique among the occupations and industries of this country. There were no pursuits, so far as he knew, in which all classes could join with equal enthusiasm, and equal pleasure, and equal profit. To the Drill Hall, which had done them such excellent service, but which he should like to see replaced by some more pleasant building, were brought the newest and choicest specimens of professional work of those who made horticulture their business. But for their shows they would have to spend many days, and make many journeys, to see as complete evidence of the progress of horticulture as they could see in that hall. No amateur hesitated to bring his work, for he was sure of just but friendly criticism. The shows at the Drill Hall illustrated to a remarkable degree what could be accomplished by co-operation. He felt peculiar satisfaction at the President's reference to the suggested Horticultural Hall—a project still deferred, but not absolutely lost sight of. He was glad to see their finances on such a sound basis, and he did not see why they should not do as the Zoological Society, the Agricultural Society, and the Surveyors' Institute, and other societies in erecting suitable edifices for themselves out of their accumulated funds. Until that time arrived they must encourage their admirable administrative body to stick to their present policy which had led to such prosperity. They must remember that they had passed through the fire a good deal, and their prosperity was the result of their tribulation. If they were to continue to do good they must have a programme—something they could keep before them as their ultimate aim, and that was the Horticultural Hall.

Mr. H. J. Elwes, F.R.S., was glad a gentleman had been appointed as librarian. He felt certain that if the Council guaranteed that the books should be well cared for, many Fellows of the Society and others would bequeath works to the Library. He offered to allow the Society to select from his books such works on horticulture as would be suitable for the library. Alluding to the Gold Medals, he thought the shepherd or the breeder should have some acknowledgment from the Council. It seemed a farce that they should all go to the exhibitor, until he did not know how many medals he had got. In conclusion, he congratulated them on the success of the Society, and said the praise was undoubtedly due to the good management.

The report was then adopted.

ELECTION OF OFFICERS.

The following were then declared duly re-elected:—President: Sir Trevor Lawrence, Bart. Treasurer: Mr. Philip Crowley. Secretary: Rev. W. Wilks, M.A. Auditors: Messrs. Harry Turner, H. B. May, and James H. Veitch.

Dr. Hugo Müller, F.R.S., Mr. Fred. G. Lloyd, and Mr. Alfred H. Pearson were elected to the Council, in the place of Sir Frederick Wigan, Bart., Rev. Geo. Engleheart, and Mr. Thomas Statter.

The President, responding to a hearty vote of thanks, said the Council had already under consideration the appointment of a sub-committee to deal with the manner in which the centenary of the Society should be celebrated. The question of granting medals to others than the exhibitors was, perhaps, more a matter between employer and employed. He had no doubt many employers would only be too pleased to hand the medals over to their men, who had really done the actual work.

The proceedings then ended.

CHESTERFIELD CHRYSANTHEMUM.

A CHAT ABOUT CHRYSANTHEMUMS.—At a recent meeting of the Chesterfield Chrysanthemum Society, Mr. NELSON, of Ashgate Lodge gardens, who introduced a "Chat" upon the cultivation of the plants, referred to certain peculiarities that he had noticed.

He asked why are some varieties so much slower as cuttings to emit roots than are others? Beauty of Castlewood, Mrs. C. H. Payne, and Col. Smith, for instance. Had the need been demonstrated for repotting the plants three times before they are put into the pots in which they are to flower? Mr. Nelson's experience was to the effect that cuttings inserted into a 3-inch pot, shifted into a 5-inch pot, and thence into the flowering pot, permitted the grower to use rougher rooting material, and was a better practice. Interesting remarks were made upon "stopping," also upon "taking" the buds; upon malformed buds, "damping" of buds, &c., and the partiality of insect pests to the flower-buds of certain varieties.

Respecting top-dressing, Mr. Nelson said, that after careful observation he had now abandoned the practice, for though roots were made subsequently in great abundance, plants that were not so top-dressed succeeded to an equal degree. Next was asked the question, Why have varieties of the Queen section been so scarce at exhibitions during the last few years? Some growers had urged that the varieties are worn out, are decrepit through age. If so, then why are not the varieties Mrs. G. Rundle and Mr. Bunn, which are older than some of the "sports" of the Queen family? It had been said that incurveds had been overfed, and one cultivator had planted his stock out in poor soil. Several years have elapsed, but that cultivator nor any other had yet exhibited blooms such as were formerly common. The difference in the keeping properties of blooms of certain varieties was remarked upon, and Mr. Nelson had found the best keeping white-flowering varieties to be Madame Carnot, Ma Perfection, Souvenir du Petite Amie, and Elsie Teichmann. Of yellow, Edith Tabor; bronze, Mrs. G. W. Palmer; crimson, Beauty of Castlewood. The two last-named varieties had been maintained fresh for a month after they had been exhibited. Mr. Nelson's last two queries were these: Why do we see some varieties in such good form during the first season, and not afterwards? How may we make our exhibitions more attractive to the general public, and of greater educational value to all?

It goes without saying, that the members present were provided with ample subjects for their subsequent discussions.

LINNEAN.

FEBRUARY 2.—Dr. A. GÜNTHER, F.R.S., President, in the Chair. Mr. Peter Chalmers Mitchell was elected a Fellow of the Society.

Mr. E. M. Holmes, F.L.S., exhibited specimens of Schimmelia oleifera, a native of Venezuela, the wood of which yields an essential oil known in commerce as "West Indian Oil of Sandal-wood." The plant, hitherto undescribed, was found to belong to a new genus of Rutaceæ, and has been named Schimmelia, after the German expert who distilled the oil, and who, with considerable difficulty, procured flowering and fruiting specimens of the plant for proper determination.

Mr. E. S. Salmon read a paper entitled "Notes on the genus Nanomitrium, Lindberg." This genus had hitherto been regarded as cleistocarpous. Examination of fresh specimens of N. tenerum showed, however, that the capsules possessed a distinct zone of specialised cells—delicate, narrow, and transversely elongated, clearly marking off the upper part of the capsule as a lid. The same structure was found in the original specimens collected by Brentel, in Mitten's Sussex specimens, and in various continental examples. The remaining four species of the genus were then examined. N. synoicum and N. Austini agreed with N. tenerum in possessing the zone of differentiated cells, and in these species, although no opened capsules were found, the author expressed the belief that a complete separation of the lid takes place in Nature. It seemed to him probable that the very thin cell-walls of the zone, which become partly disorganised, aid in effecting the dehiscence. The above-mentioned structure satisfactorily accounted for the regular dehiscence which had been observed by various authors, and figured by Sullivant.

N. æquinoctiale showed no differentiation in the cells of the capsule-wall, and was truly cleistocarpous. The inflorescence of this species proved to be polyoicous (autoicous × dioicous). In N. megalosporum, also, no differentiated cells occurred. Contrary to what had been stated by Philibert, the capsule of this species was found to possess stomata, and generally to show a structure similar to that of Ephemerum.

The author pointed out that the characters by which Nanomitrium had been separated from Ephemerum were insufficient, and considered that the former genus should be limited to N. tenerum, N. Austini, and N. synoicum, referring N. megalosporum (and perhaps also N. æquinoctiale) to Ephemerum. The essential character of the genus Nanomitrium was the presence of a zone of differentiated cells, by which a regular dehiscence is effected.

The systematic position of the two genera was next considered.

Lindberg had well placed Nanomitrium in the Funariaceæ, but considered Ephemerum to belong to the Tortulaceæ. Reasons were given for supporting Dixon's opinion that Ephemerum also belonged to the Funariaceæ.

In conclusion, the author remarked that, since his paper had been written, he had noticed that in the last part of his *Organographie der Pflanzen*, Goebel had investigated the capsule of Nanomitrium tenerum, with special reference to the development of the columella. In one of the figures given of a longitudinal section of a ripe capsule, the differentiated cells of the capsule-wall are shown, and are referred to in the explanation of the plate as the annulus. Nothing further on this point is mentioned, and the dehiscence of the capsule is not referred to.

A discussion followed, in which Dr. R. Braithwaite and Mr. E. M. Holmes took part.

Mr. F. W. Stansfield, M.B., read a paper "On the Production of Apospory by Environment in Athyrium filix-fœmina var. uncoglomeratum, an apparently barren Fern." This had been effected by cutting off parts of the immature fronds, and allowing them to expand during eighteen months in an uniformly humid atmosphere. The result was the production in the ultimate divisions of a meristematic tissue which gave rise to (1) gemmæ or bulbils, (2) prothalli, producing both apogamous buds and ordinary sexual axes of growth. One of the prothalli had been examined, and found to bear both archegonia and antheridia. On layering the primary fronds produced by apospory, it was found that these readily gave rise to fresh aposporous growths. The ease with which apospory was induced in the primary fronds, as compared with the extreme difficulty in the case of fronds from an older plant, was said to be characteristic of aposporous Ferns in general, Mr. Stansfield having observed it in every case (eight in all) in which he had raised Ferns by apospory. Assuming the truth of the "recapitulation" theory, he suggested that this fact indicated that apospory was an atavic trait in Ferns.

Mr. Stansfield's culture was exhibited, and showed the primary aposporous prothalli with fronds of the sporophyte proceeding from them, the latter being layered and having secondary aposporous prothalli, bearing root-hairs, growing from them.

In a discussion which followed, Prof. Farmer and Mr. C. T. Druery took part, the latter taking occasion to exhibit a new form of Scolopendrium vulgare, showing apospory profusely developed in the heavy fimbriated crests peculiar to that variety, and distinguishing it from Scolopendrium vulgare var. crispum Drummondiæ, also shown for comparison. A culture from said crests was also shown displaying prothall with root-hairs, archegonia, and antheridia as developed after layering. A variety indistinguishable from var. Drummondiæ was also exhibited in conjunction with, and originating from, a mass of prothalli produced from material supplied by Mr. E. J. Lowe in connection with his paper "On Discoveries resulting from the division of a prothallus of a variety of Scolopendrium vulgare" (*Linn. Soc. Jour.*, Bot xxxii. p. 529). Mr. Lang's culture yielded similar results; and Scolopendrium vulgare var. crispum Drummondiæ being an aposporous Fern, this leads to the presumption that the phenomena recorded by Mr. E. J. Lowe were mainly due to inheritance and not all induced by division, although young plants raised by the exhibitor from var. Drummondiæ did not present such extreme aposporal features as did Mr. Lowe's, which in some cases bore all the sexual features without being layered. This and the stunted nature of the young plants might perhaps be referable to the check of repeated division, but not the apospory *per se*.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

FEBRUARY 7.—The monthly meeting was held on the above date, at 5, St. Andrew Square, Edinburgh.

There was a large attendance of members, with the retiring president, Mr. Todd, in the chair. The minutes of the last meeting were taken as read and confirmed. Thirty-three new members nominated at the last meeting were admitted as members, and a large number nominated for admission next month. Mr. Todd recommended Mr. Malcolm Dunn as a life member of the Association, and made a genial speech in resigning his office of President, expressing the pain and the pleasure his two years of office had given him, which had proved years of special success. His last duty in the chair was to introduce his successor, which he did with much pleasure, Mr. C. W. Cowan, Vallyfield, Penicuick, as a gentleman, the head of a family so long distinguished in the public and commercial life of Edinburgh, as well as for the skill shown in the culture of Narcissus, alpines, and other hardy plants which had converted their home and nursery into a sort of floral paradise.

Mr. Cowan took the chair amidst great applause, confessed that he was no great speaker, but in the time of Daffodils, he would be pleased to see all the members at Vallyfield to see them for themselves. He concluded by promising to let Mr. Laird, their Secretary, know when the Daffodils were at their best, and hoped with their assistance to do his best to serve the Association. Having had the good fortune to see this rich, varied, and rare collection of Daffodils last summer, the writer can assure the visitors of a great feast of good things. Mr. Peter Loney then proceeded to give an able and informing lecture on "The Insect Pests of the Garden." He gave vivid descriptions of the structure, modes, and rapidity of reproduction, and tremendous powers of destruction of insect pests, common and destructive in gardens.

Mention was made of the Pea and Bean-beetle (weevil), the Onion-maggot, and the Beetroot-fly. Mr. Loney based his descriptions and the facts relating to the generation of insects on Miss Ormerod and other high authorities, and clearly illustrated his points through an interesting series of greatly magnified diagrams. He also suggested various remedies, and did ample justice to birds, parasitic mites, and especially lady-birds, as powerful friends to the cultivator.

Having stated that he had no certain cure for the Onion-maggot, Mr. D. T. Fish declared he had, viz., autumn or February sowing, which pushed the Onions beyond the nesting, that is, the three-bladed stage, before the advent of the fly. Onions do not suit their taste nor capacities when larger and tougher.

The late President as usual, and out of special compliment to the new President, Mr. Cowan, showed a superb stand of Daffodils firmly supported by a wire frame that holds every bloom in its place. There was also a fine bunch of the immensely popular Acacia dealbata, which seemed blanched white in the gas-light; and a very fine spray of Clematis indivisa lobata or grandiflora, the latter from Mr. SMALE, Glenburne, Oswald Road. Especially dwarf and broad Brussel Sprouts plants also excited a good deal of interest.

The meeting concluded with the usual cordial Vote of Thanks to Mr. Loney and Mr. Cowan, the new President. *D. T. F.*

NATIONAL CHRYSANTHEMUM.

FEBRUARY 13.—The Executive met at 265, Strand, on the above date.

Mr. PERCY WATERER, the newly-elected chairman, presiding; a series of resolutions were passed, among them one acknowledging the services Mr. T. W. Sanders had rendered to the Society, and it was further resolved that the large Gold Medal of the Society, together with an address engraved on vellum, should be presented to Mr. Sanders. The date of the annual outing was fixed for July, when, by kind permission of Lord Rosebery, a visit will be made to the gardens of Mentmore.

Messrs. C. Blick, R. Kenyon, and A. Wright, were elected on the Floral Committee, in the places of retiring members; and R. Kenyon and J. W. Simmons on the Classification Committee. The Schedule Revision Sub-committee, and also that for Finance, were appointed.

A report was brought up from the Schedule Revision Sub-committee, showing that the November schedule had been augmented to the amount of £55. A new class is for twelve vases of five blooms of specimen Japanese Chrysanthemums on long stems, 1st prize, £20 and a large Gold Medal, given by Mr. H. J. Jones; the society adding a 2nd prize of £15 and a small Gold Medal; a third prize of £10 and a Silver-gilt Medal; a fourth prize of £5 and a large Silver Medal; while every exhibitor not taking a prize will receive a small Silver Medal. Mr. P. WATERER, the chairman of the committee, offers a prize of Five Guineas for the best Essay on Chrysanthemum-Rust, the Essay not to exceed 2,000 words, to be type-written, and be sent in to the secretary by Oct. 1.

A few new classes have been added, and many special prizes are further offered.

The qualification to exhibit in Division A, reads:—"For those who mainly, if not entirely, personally cultivate their Chrysanthemums, and employ but one assistant regularly, and does not grow for sale. Single-handed gardeners, who grow for their employers, can also exhibit in this section; but in all cases of entry, the name and address of the employer in full must be given, and will appear first on the exhibition-card."

The definition in Division B, is in effect: "For those who employ no paid assistance in the culture of their Chrysanthemums, and are the *bonâ-fide* growers of their plants. No person who is employed in a nursery, or public or private garden, can compete in this section, and any act of selling cuttings, plants, or blooms, unless seedlings or sports, will disqualify."

BRISTOL AND DISTRICT GARDENERS'.

FEBRUARY 10.—The fortnightly meeting of this Society was held at St. John's Parish Room, Redland, on the above date, Mr. W. A. GARAWAY in the chair.

The subject for the evening was the "Culture of Hardy Fruit," a paper upon which was read by Mr. E. Poole, F.R.H.S., of Downend.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Yams from Canaries, case	7 0 —

ANSWERS TO CORRESPONDENTS.

ACHIMENES: *W. W.* Longiflora and l. alba patens and patens alba, Ambroise Verschaffelt, picta, Argus, Dazzle, Dr. Hopf, Grandis, Mauve Queen, Sir Treherne Thomas.

BOOKS: *W. H. B.* No very modern manual on the subject is in print. One of the best is *Artistic Flower Decorations*, illustrated by B. C. Saward, and published at the *Bazaar* office, price 2*s.* Enquiry at the office, 170, Strand, would elicit information concerning the little work. There are, we believe, several manuals on the subject in the German language.—*Illustrated Flora. Paul Emery.* As you do not say of what country, we cannot answer you.

BROAD BEANS: *F. K.* Sow now in late and early positions.

Calceolarias Turning Brown at the Edges of the Leaves: *Forfarshire.* This may arise from bruising, or punctures made by insects (aphis), or from excessive dryness of the air, or many other causes, which, for lack of information, we can only surmise.

Chrysanthemum "The Queen:" *X.* Your experience certainly proves the variety to be a good one for affording blooms during January.

Conservatory Heated by Gas-boiler: *W. W.* The plants die because the products of combustion, or the gas, gets into the house, or noxious fumes from another source.

Cool-house Orchids: *G. T.* Odontoglossum gloriosum, O. Pescatorei, O. triumphans, O. Servantesii, O. Rossii, O. macranthum, Oncidium macranthum, On. tigrinum, On. varicosum, Vanda Kimballiana (should be wintered in a warmer house), Masdevallia Harryana, M. Veitchi, M. ignea, Epidendrum vitellinum, Disa grandiflora, Dendrobium Jamesianum, Cypripedium insigne, C. villosum, Cœlogyne cristata, Lælia præstans, Anguloa Clowesii, Ada aurantiaca, Cattleya Gaskelliana, C. Warscewiczii (gigas), C. labiata, C. Mendeli, C. citrina, Cymbidium eburneum, Lycaste Skinneri, Thunia Marshalliana, Sobralia macrantha, Calanthe × Veitchi, and vars. of Calanthe vestita, Dendrobium nobile, D. Ainsworthi, D. aureum, D. Findlayanum, and some others. At certain seasons either of growth or rest, some of the plants named will require to be transferred to the intermediate or East Indian-houses, but most of them may be cultivated the year round in the cool-house. The list is by no means an exhaustive one, but rather a selection of species not difficult of cultivation.

Correction: Royal Horticultural Soc. lecture, see *Gardeners' Chronicle*, February 4, p. 78, for muriate of potash read 2 cwts., not 20 cwts.

Crocus: *Bradford.* The corm has seemingly failed to flower, because it had made top-growth before there was root-activity. In the case of all bulbs, efforts should be made to induce the formation of roots before any leaves are pushed forth.

Crotons: *F. K.* You will be doing rightly by cutting-back the plants severely, employing the healthy tops of branches for cuttings if you require young plants. They will readily strike in sandy soil, in strong heat, under a hand-light.

Cultivating Cucumbers and Tomatos for Sale: *G. R.* Considering that you know nothing about the culture of these plants, we consider that you are a very rash man to embark forthwith on the business of a market grower. Had you not better study the methods of cultivation at a market garden first, meanwhile reading a manual on each —there are many—and then start the business?

Flowering Season: *Veritas.* Cymbidium aloefolium flowers in September; and Trichopilia laxa in October.

Gardeners' Directory: *Leafless.* Procure the *Horticultural Directory and Year-Book*, published at *Journal of Horticulture* office, 12, Mitre Court Chambers, Fleet Street, London, E.C.; or, *The Garden Annual*, published at 37, Southampton Street, Strand, W.C. The cost of either is 1s.

Manures for Potatos in the Place of that of the Farm-yard: *A. C. C.* That from the piggeries, if partially decayed, or well-fermented dung from a dovecot; Peruvian guano, native guano, fish-manure, raw and dissolved bones, bone-meal, superphosphate of lime, or night-soil. Most of these would serve as a top-dressing, together with muriate of potash, at the rate of 2 oz. to the square yard, for the fruit-trees.

Moss on Lawn: *F. K.* See p. 80, in our issue for February 4, present year.

Mushrooms: *W. Button*, and *Geo. Farmer.* Such abnormalities are not uncommon, and we have figured in back numbers of the *Gardeners' Chronicle* specimens even more monstrous than are yours. On p. 510, April 4, 1894, you may see a Mushroom springing normally from the bed, bearing upon its apex an inverted specimen, and this again surmounted by another in correct position. In regard to the "cluster" of forty-five Mushrooms mentioned by *W. Button*, we may refer him to the *Gardeners' Chronicle*, June 18, 1898, p. 381, where was figured a cluster which included 104 Mushrooms, and weighed 5 lb. 2 oz.

Names of Fruit: *Wm. Camm.* 1, French Crab; 2, Claygate Pearmain; 3, Court of Wick; 4, Not sent; 5, Brabant Bellefleur; 6, worthless, not known. It is a pity not to send these fruits earlier in the season, when the characteristics of the varieties are more evident.—*C. Edwards.* Apple Mère de Ménage.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.* — *J. May.* Desfontainea spinosa.—*Murr.* 1, Abies orientalis; 2, Thuiopsis dolabrata; 3, Juniperus chinensis; 4, Juniperus recurva, figured in *Gard. Chron.*, April 14, 1883, p. 468; 5, Sequoia sempervirens; 6, Thuia nootkatensis alias Thuiopsis borealis.—*T. P.* 1, Lælia anceps; 2, Cymbidium Lowianum.—*H. A. B.* 1, Cryptomeria japonica; 2, Veronica species; send when in flower.—*Anxious.* Phaius grandifolius.—*J. Morris.* Cassia Chatelainiana.—*W. S. C. P.* We cannot name Violets from such specimens. You had best send them to a nurseryman who may compare them with growing plants.—*P. Penge.* 1, Asplenium bifidum; 2, Swainsonia sp.; 3, probably an Abutilon; 4, Acacia armata; 5, the grass is a species of Carex, which we are unable to name without flowers; 6, Acacia dealbata.—*Miltonia.* Your Pelargonium, for which you suggest the name of York and Lancaster, is the same as the variety cultivated by Messrs. H. Cannell & Sons, Swanley, under the name of Double New Life.—*D. McIntosh, Bray.* Pittosporum undulatum.

Narcissus for Forcing.—The following varieties of the trumpet section will be found to force well in pots:—N. telamonius plenus, Ard Righ, Golden Spur, Princess, Spurius, Horsfieldi, Sir Watkin, Henry Irving, Major, and Obvallaris. We assume you intend to procure bulbs during next autumn. No Narcissus, nor any flowering bulb, should be forced two seasons in succession, or the result will be very poor. For such purposes, always procure the very best samples possible, and when forced, they may be planted out in the grounds.

Newly-imported Burmese Orchids: *Aubipine.* Before any potting is done, hang the plants up by the heels, in a warm, very moist house, till growth of root and top begins; or place the roots in new pots, and fill up with clean crocks loosely, and wait, as by the other method. The crocks may be moistened once or twice daily as may be found necessary.

Nursery Stock (*way-going, not aged*): *Nurseryman.* You should be allowed the time customary in your district for a nurseryman to remove his stock, i.e., six months or a year after the expiration of the tenancy. If the landlord or the incoming tenant takes the stock at a valuation, that is another thing. If you took to stock, but did not pay for it, you may find it to your advantage to leave the landlord its equivalent.

Palm Seeds: *W. W.* Sow forthwith in a house, pit, or frame, having a steady heat of 65° to 80°.

Plantain and other Coarse Weeds on the Lawn: *A. H. W.* Let one person cut off the heads of leaves, and another follow him with an iron or earthenware vessel, having a high bow handle, and holding vitriol, and let him be provided with a pointed stick, wherewith to place a few drops of the vitriol on the top of each root thus exposed. The roots will die, and the bare spots may be coated with loam, and sown with the finest Grasses in April, or earlier if the weather keeps mild. These coarse weeds may be choked out of existence by encouraging the growth of the finer Grasses by means of dressings of fish manure, rotten dung, wood-ashes, and loam, but it takes some years, and the above method is very effectual as well as rapid. The man with the vitriol-pot should wear thick gloves as a safeguard.

Room Plants: *G. N.* A moderate number of scentless flowering plants in a room do not cause suffering. Strongly-scented flowers sometimes do, when in quantity, cause headache and nausea in delicate persons; as for example, Hyacinths, Narcissus, Jonquils, Crinums, Eucharis, Gardenias, Stephanotis, &c. Gardeners who work among thousands of these species of plants are not affected by them, and we doubt if others are much affected. The room must be very small and ill-ventilated where these plants cause suffering. Carbonic acid gas is given off by the leaves in small volume during the hours of darkness.

Shrubs near Dwelling-houses: *D.* There is no reason why the shrubs should not be allowed to remain in close proximity to two sides of a house, which is entirely open to the east. The house, standing on a knoll separated by dry hollows (whose sides form the shrubbery in question), from a double line of high trees 50 or 60 yards distant; and the shrubs, being below the level of the foundation, could suffer no harm, nor would the inmates. There might be offence created if much tree-foliage was permitted to rot under the bushes, but that might be averted by burning it in the middle of the spaces between them, or raking them out and carrying them to the leaf-heap. Masses of tall trees coming to within 20 yards of a dwelling are not desirable.

Soil from Brook: *Loam.* The soil you send is of such a retentive nature, that we should be disinclined to use it for the cultivation of any plant in a pot. Should you decide to make use of it in the case of Tomatos or Cucumbers in borders, you will do well to break it up as thoroughly as possible, and mix with it a good proportion of lime-rubble, burnt-ash, or other material that will be likely to render it more porous and more conducive to root-formation. You might add a little rotted manure.

Sowing Seeds of Celosia plumosa: *A. P.* Sow in the first or second week of March in well-drained pots filled with light sandy soil, in heat of 75°. Grow on the seedlings in the same degree of heat for a week or two, affording air on sunny days for a few hours, but watching the frame carefully lest injury be done by cold draughts; shade lightly, and only when the sunshine is bright. Prick off before crowding takes place, and pot off into 60's, and then in 48's. The process of hardening off must be patiently carried out, and should extend over three weeks at least. The first or second weeks in June will be sufficiently early to plant them in the beds. It is as well to have a successional sowing.

The Prevention of Stagnation of Water in a Tub containing Nymphæa Plants: *S. W.* If you could keep the water agitated by means of a little overshot paddle-wheel, which would aërate the water in the tub, as well as afford a constant intrickling supply of water, it would be as good an arrangement as any. The water might be derived from an over-head tank or barrel, or from the water mains.

Vineries: Late and Early: *E. B.* An early vinery, started about four weeks ago, should not, as early as this, be kept at 60° at night; rather, a steady maximum degree of warmth of 50° to 52° would be more suitable, and by day 60°, with air afforded in mild weather for several hours. The heat, day and night, may be increased about 1° a week. Of course, on warm days rather more than this. The fire should be banked down, or the flow in the pipes checked, if there is a difficulty in keeping a proper degree of warmth. The two Vines which have the more prominent buds, may consist of varieties that respond quicker than the other Vines in the house to the forcing process, or the house or the border is from some cause slighly warmer where they are growing. You may come upon the cause when you have been longer in charge of the vinery. Do not rely so much on the syringing of the Vines, but more on damping down. A bed of stable manure and tree-leaves is of much use in this connection, only it should not be built on the border, but on a platform raised 6 inches above it. Turn the materials once a week, and again put them compactly together. Such a heap of warm materials is useful in forcing shrubs and bulbs, rooting cuttings, or forcing Rhubarb, care being taken that the roots of the plants do not get scalded. Otherwise your methods seem all right, except in the matter of temperatures. Let the late vinery start almost without the use of artificial heat.

Vines for Sale Purposes: *A. R.* Any good manual on Vine-culture would afford the sort of information that you need. You might obtain Barron's *Vines and Vine Culture*, published at 12, Mitre Court Chambers, Fleet Street; it is one of the best.

THE
Gardeners' Chronicle
No. 635.—SATURDAY, FEB. 25, 1899.

SUBURBAN GARDENS IN 1796.

TOWARDS the latter part of the last century, an enterprising publisher conceived the idea of producing a pocket-companion to the suburbs of London; and when the idea became transformed into a reality, it met with so much success, that edition after edition was exhausted. The title of the book was *The Ambulator; or, a Pocket-companion in a Tour Round London, within a Circuit of* 25 *Miles.* The copy which recently fell into the hands of the present writer is dated 1796 (the earliest issue which we have been able to trace is dated 1774), it being the "eighth edition, augmented and improved." Not the least interesting portion of the book is the preliminary account of the metropolis, from which we learn that the population of London at that date was computed at less than 600,000. Quoting from another author, the compiler nods approval, so to speak, to the following statement:—"The country round, especially on the London-side [of the Thames] is nearly open to some distance, whence, by the action of the sun and wind on a gravelly soil, it is kept tolerably dry in all seasons, and affords no lodgment for stagnant air or water. The cleanliness of London, as well as supply of water, are greatly aided by its situation on the banks of the Thames," and so forth. It seems almost impossible to believe that London was ever anything but gloomy and grimy, and yet here we have an unimpeachable witness to the contrary. It is not, however, with London itself that we have to deal just now, but with a few of the *Ambulator's* descriptions of the suburban gardens.

The arrangement of the book is alphabetical, and the earliest reference of more immediate interest to us occurs under Barnes, which is described as a "village in Surrey." On Barnes Terrace, we are told, Lady Archer had a villa, "noted for its fine greenhouses; it is now the residence of the Marquis de Chabe, a French emigrant." To this we may add that Lady Archer's house was furnished and decorated in the Chinese style, and that her grounds were five acres in extent, and sloped down to the Thames. Our *Ambulator* further tells us that in 1653 a certain Edward Rose left £20 to the poor of Barnes "for the purchase of an acre of land, on condition that the pales should be kept up, and the Rose-trees preserved." If Mr. Rose were to come to life again, he would be very much surprised to learn that he would be unable to purchase a bit of land large enough to accommodate half-a-dozen Rose-trees at Barnes for his modest legacy of £20!

Battersea, which is also described as "a village in Surrey," is not a place one would select for its gardening possibilities, for there is no land now left on which to experiment. Battersea Park is, however, a beautiful example of what can be accomplished in crowded districts. In 1796 Battersea "has been long famous for the finest Asparagus." The public tea-gardens of Bayswater, "a small hamlet in the parish of Paddington," were "about twenty-five years ago," the gardens of the late Sir John Hill, "who here cultivated his medicinal plants, and prepared from them his tinctures, essences, &c."

Beddington, two miles west of Croydon, was famous for its "gardens with choice fruit trees," in which Sir Francis Carew, the former owner, took great delight. He "spared no expense in procuring them from foreign countries. The first Orange-trees seen in England are said to have been planted by him." These trees were planted in the open ground, and were preserved in the winter by a moveable shed. They "flourished for about a century and a half, being destroyed by the hard frost of 1739-1740." At Brompton, "a hamlet of Kensington," "Mr. William Curtis has a botanical garden, near the Queen's Elm turnpike;" and, further, we are informed that "subscribers to this garden, at one guinea per annum, are entitled to the privilege of walking in it, inspecting the plants, perusing the books in the botanical library, and examining the extensive collection of drawings in natural history," &c. A subscription of two guineas secured still further advantages; but non-subscribers were admitted on payment of half-a-crown. Curtis had removed here from Lambeth Marsh, where he had been established for many years. A botanic garden in the evil-smelling slums of what is now known as the New Cut, seems too absurd to have been a fact, even a century ago!

The park of Bush Hill, the seat of Mrs. Catherine Mellish, is said to have been originally laid out by Le Nôtre, the celebrated French gardener.

Campden House, Kensington, which in 1796 was "an eminent ladies' boarding-school," then boasted of "a remarkable Caper-tree, which has endured the open air of this climate for the greatest part of a century, and, though not within the reach of artificial heat, produces fruit every year." Campden House still exists, but the Caper-tree, whatever it may have been, has long since ceased to produce fruit.

The account of Chelsea is largely taken up with the Apothecaries' Garden and Sir Hans Sloane. "On the north side of the garden is a spacious greenhouse, 110 feet long," and on "the south side are two Cedars of Libanus, of large growth and very singular form. They were planted in 1685, being then 3 feet high; in 1793 the girth of the larger, at 3 feet from the ground, was 12 feet 11¼ inches; that of the smaller, 12 feet 9¼ inches." Assuming the date of planting to be correct, the two famous Cedars have now weathered the storms of over two hundred years. [One died several years ago, and the other is nearly dead. Ed.]

The compiler of the *Ambulator*, in his account of Clapham, another "village" in Surrey, states what appeared to him to be a very startling fact, that a certain Mr. Baldwin "sold 14 acres of land" for £5000. It would be very interesting to know how much this little plot of land is worth at the present moment.

Eltham has during the past few years been more associated in the average person's mind with the late Col. North than with royalty or horticulture. Yet here in 1796 "the handsome garden of Mr. Dorrington" contained "a greenhouse in which were formerly kept the exotics of that eminent botanist, Dr. Sherrard. The *Hortus Elthamensis* is well known to the curious in botany."

One of the most interesting entries is that which relates to Fulham, "a village of Middlesex." The writer tells us that the gardens of the Bishop's Palace were first noted in the time of Bishop Grindall, "one of the earliest encouragers of botany, and the first who imported the Tamarisk-tree into this country, about the year 1560. Bishop Compton, who was himself an excellent botanist, made them still more celebrated by the introduction of many new plants and forest-trees, particularly from North America. Of these, the following only were remaining on a survey of the garden in 1793; and these may be regarded with some veneration by the botanist, as the parent-stocks of their respective races in this kingdom." Then follows a list of the plants, with girths taken at 3 feet from the ground, and their computed height. The trees were Acer Negundo, Cupressus sempervirens, Juniperus virginiana, Juglans nigra, Pinus Pinaster, Quercus alba, Q. Suber, Q. ilex, Acer rubrum, and two "Gleditschia triacantha."

There is an exhaustive description, historical and otherwise, of the celebrated Fairlop Oak in Hainault Forest; tradition, observes Gilpin, "traces it half way up the Christian Era," but the "high winds" of February, 1820, completely destroyed this historic tree.

Hampton Court, one of the chief "lions' of the suburbs, occupies several pages, but the only paragraph which we now quote runs as follows: "The celebrated Brown had his present Majesty's permission to make whatever improvements in these gardens his fine imagination might suggest; but he declared his opinion, that they appeared to the best advantage in their present state."

Having regard to the fact that Kensington Palace is about to be thrown open to the public, it is interesting to learn that "the gardens were originally only 26 acres. Queen Anne added 30 acres, which were laid out by her gardener, Mr. Wise; but the principal addition was made by Queen Caroline, who took in near 300 acres from Hyde Park, which were laid out by Bridgman, and they have since been improved by Brown. They are 3½ miles in circumference, and have for many years past been a very fashionable promenade."

The very long and interesting account of Kew Gardens, at that time comprising about 120 acres, is not original, but is copied from a description by Sir William Chambers.

Coming to Lambeth Palace, "the gardens and park which contain," we are told, "near 13 acres, are laid out with great taste;" and further, that they contain "two remarkable Fig-trees of the White Marseilles, which bear delicious fruit. Tradition says, they were planted by Cardinal Pole. They cover a surface of 50 feet in height, and 40 feet in breadth; the circumference of the furthermost is 28 ins., of the other 21 ins." (See *Gardeners' Chronicle*, Oct. 23, 1886, p. 528.)

Of the celebrated garden of the Tradescants "there are now no traces." Peckham, a "hamlet of Camberwell," contained the seat, built in the reign of James II., by Sir Thomas Bond (and afterwards occupied by Lord Trevor), who apparently took great interest in his garden. "The kitchen-garden and the walls were planted with the choicest fruit-trees from France, and an experienced gardener was sent for from Paris to have the management of them, so that the collection of fruit-trees in this garden has been accounted one of the best in England." The house, however, was pulled down a few months after the *Ambulator* appeared, and Hill Street now covers a portion of the site.

*

Richmond, "the finest village in the British dominions," occupies a very considerable space, for its attractions in 1796, as in 1899, were extremely numerous. The royal gardens "were altered to their present form by Brown, to whose exquisite taste in the embellishment of rural scenery the didactic poet [Mason] paid this merited eulogy, while he was living to enjoy it:—

"Him, too, the living leader of thy powers,
Great Nature! him the Muse shall hail in notes
Which ante-date the praise true genius claims
From just posterity. Bards yet unborn
Shall pay to Brown that tribute, fitliest paid
In strains the beauty of his scenes inspire."

The beautiful gardens, "stored with a great many curious exotics," at Sion House, "were principally laid out" by the inevitable Brown, whose familiar appellation of "Capability" Brown, if it does not readily lend itself to poetic treatment, is a well-earned tribute to his fertility of resource.

The last entry to which attention need be called relates to Walham Green, "a village of Middlesex." Here, we are told, is "a curious garden, planted since the year 1756, by its present possessor, John Ord, Esq." "Within a short space it has produced trees which are now the finest of their respective kinds in the kingdom, particularly the Sophora japonica, planted in 1756, now 8 feet in girth, and 40 feet high; a standard Ginkgo-tree, planted in 1767, 2 feet 3 inches in girth; and an Illinois Walnut, sown in 1760, 2 feet 2 inches in girth. Among other trees, also remarkable for their growth, though not the largest of their kind, are a black Walnut-tree, sown in 1757, about 40 feet high, and 5 feet 4 inches in girth; a Cedar of Libanus, planted in 1756, 8 feet 8 inches in girth; a Willow-leaved Oak, sown in 1757, 4 feet in girth; the Rhus vernix, or varnish Sumach, 4 feet in girth; and a stone Pine of very singular growth. The girth of the last, at 1 foot from the ground, is 6 feet 4 inches, at that height it immediately begins to branch out, and spreads at least 21 feet on each side, forming a large bush of about 14 yards in diameter.

Such, then, are a few "points" relative to the suburban gardens of rather more than a century ago, very many of which have long since given way to the encroachments of bricks and mortar. That gardening was as popular in 1796 as it is in 1899 is a fact which does not require any elaborate demonstration; and that it was, in a circumscribed manner, as successful, the few foregoing extracts will, I think, amply prove. *W. Roberts.*

NEW OR NOTEWORTHY PLANTS.

MINA CORDATA.

The *Journal de la Société Nationale d'Horticulture de France* records, in the following terms, a plant exhibited by M. Marc Micheli at a recent meeting of the above Society:—"Mina cordata is a new undescribed species from Mexico. The seeds were received in April, 1898. Sown at once, they soon germinated, and the plants developed vigorously. In September they covered a wall 10 feet high. Unfortunately, owing to the late sowing, only a few inflorescences were fully expanded before the first frosts came. In the early days of October several cuttings were made in the manner described as pursued with Mina lobata in the *Revue Horticole*, 1892, p. 455. The majority of these cuttings succeeded, and are now in bloom, some in a warm, others in a temperate-house. Therefore, it is hoped that good plants will be obtained this year. Other cuttings without a heel gave less satisfactory results. Mina cordata is in growth like Mina lobata, and can be used in similar ways. It is distinguished by having entire, cordiform, not lobed leaves, and by the colour of the flowers, which show pretty magenta stripes on a paler ground."

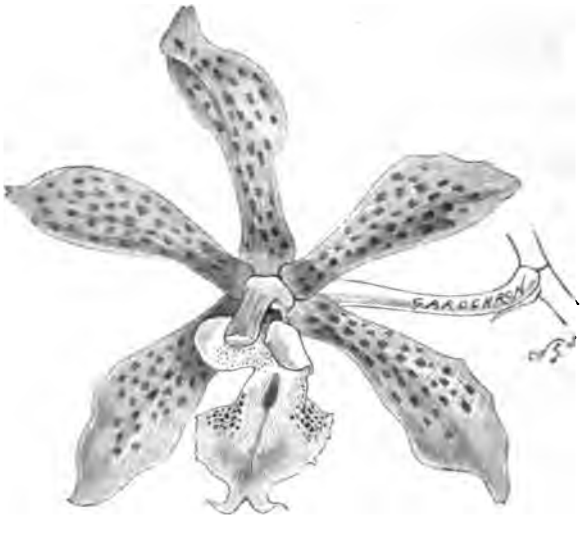

Fig. 43.—Phalænopsis × Mrs. J. H. Veitch.

PHALÆNOPSIS MRS. J. H. VEITCH.

We have in this cross betwixt P. Luddemanniana and P. Sanderiana a flower which is remarkable among Phalænopsids in shape and colouring. The sepals and petals are of a greenish-yellow tint, with brownish-crimson dots (fig. 43). The front lobe of the lip is white, and a little yellow tinge is noticeable in the throat. It received, on the occasion of its being exhibited by the raisers, Messrs. J. Veitch & Sons, on February 14 last, at the Drill Hall, James Street, an Award of Merit.

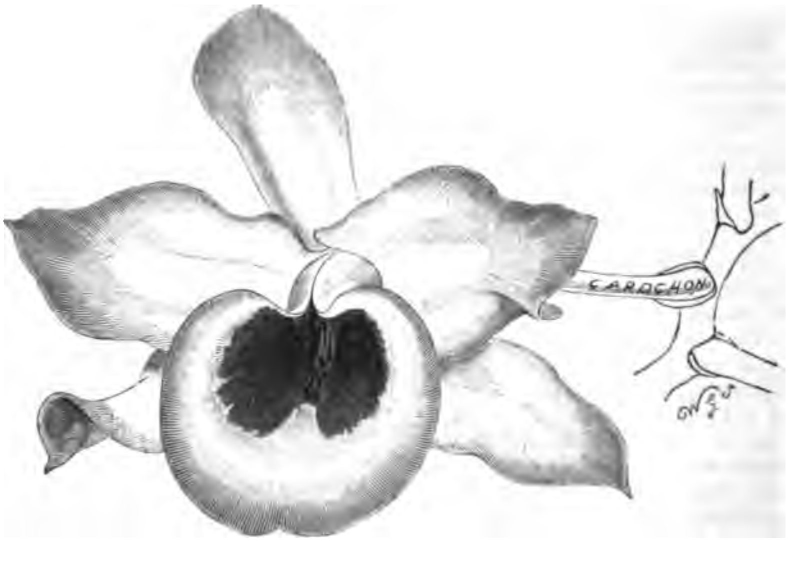

Fig. 44.—Dendrobium × Juno.

DENDROBIUM × JUNO.

A beautiful cross-bred Dendrobium was shown by Sir Trevor Lawrence, under the name given above, at the meeting of the Royal Horticultural Society on Feb. 14 of the present year (fig. 44). The parents were D. Findlayanum and D. Ainsworthi, and, as was stated in our report (*Gardeners' Chronicle*, February 18, p. 108), it belongs to D. × chlorostele group, but its bright-looking flowers are greatly superior, and their beauty is enhanced by the rich, dark purple colour of the throat, which forms a sharp contrast with the rest of the flower. It was raised, we believe, at Burford.

FERNS.

After the dull, foggy weather we have experienced during the past few months, it is interesting to note the effects produced on various classes of plants; and, although Ferns are usually associated with shade and moisture, there is perhaps no class of plants which, when kept in an active state of growth during the winter, are more benefited by the bright rays of the sun; and with regard to fog, it is curious to note, that some of those which would appear to be the most likely to suffer escape unhurt, while others of a hardier nature suffer considerably. Taking Adiantums, the beautiful

Farleyense has come through remarkably well, especially plants suspended to the roof, where they get all the light possible. They have not only retained their matured fronds well, but the new ones have developed as perfect as in summer, though, of course, they are devoid of the beautiful pink tint seen in sunny weather. A. elegans: this grows and produces perfect fronds, where the old favourite, A. cuneatum, makes only a weak attempt to grow; elegans also retains a brighter and fresher colour in the matured fronds; A. Birkenheadi is another Fern worthy of note, as resisting the baneful effects of fog. The Gymnogrammas are quite impervious to fog; this is probably owing to the fronds being covered with the powder or farina. They suffer from cold or excess of moisture; but where a good warmth is maintained, they go through the winter well.

I find it is those with a bright, smooth surface to their fronds, which suffer most. Cyrtomium falcatum, and Polystichum coriaceum, or others of similar texture, I have seen with their fronds having the appearance of having been scorched after a dense fog, while others of a more tender nature have escaped unhurt. Nephrolepis go through the bad weather well, and will continue to make good growth provided sufficient warmth can be given. Of Ferns grown for market these have come much to the front within the last three or four years. N. exaltata, that is found the most useful, and it is as a basket-plant that it is most appreciated. During the past season they were much used in London. I saw it used in several instances for hanging from balconies, and where sheltered from the wind they last a considerable time. N. philippinense is a good hardy kind, and makes a compact plant. Most of the varieties are found very useful, and when grown where they are well exposed to the light they make fronds of good substance.

Davallias of the Haresfoot type are all useful. They do not come from spores so freely as the Pterises, but with care in selecting spores good results may be obtained, and seedlings make much better plants than divisions. I have found D. fijiensis to vary much, some of the seedlings being more robust, and others dwarf and compact, with very finely-cut fronds. Dissecta, elegans, Mariesii, and others may be recommended. Of Pteris, the most useful crested variety is Wimsetti, though cretica cristata and serr. cristata compacta still remain favourites with many. Of the plain forms cretica major or Ouvrardi now holds first place; it is a splendid Fern for winter work.

Phlebodium aureum is a fine Fern for winter, and keeps the beautiful glaucous hue unless exposed to a very low temperature; but I find that after being exposed to cold the fronds go black, the damage may not be seen for some days perhaps, and though they may last for some time while kept cold, they show the effects very soon when taken into warmth again. Aspleniums of the bulbiferum type are good winter Ferns; biforme, of which there are several slight variations, is the most generally grown. *H. A.*

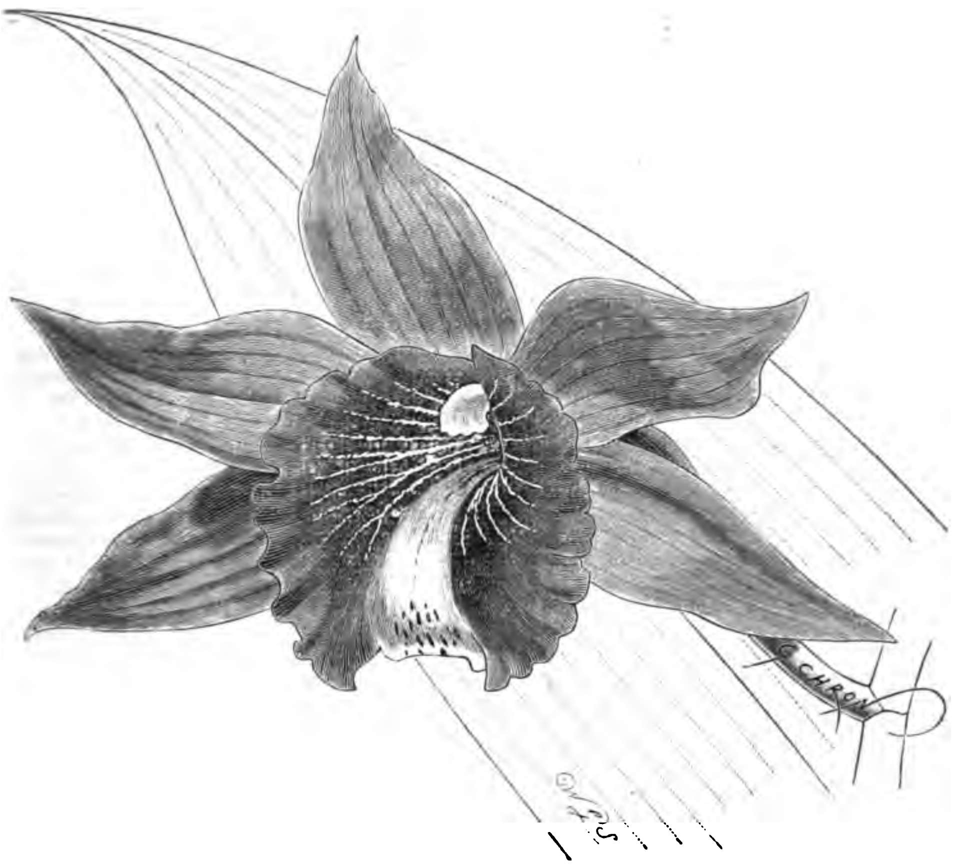

FIG. 45.—PHAIUS × : A CROSS BETWEEN P. MANNI AND P. TUBERCULOSUS.

PHAIUS ×.

When the Royal Horticultural Society met on February 14 last, Messrs. Sander & Co., St. Albans, showed a very handsome form of Phaius (fig. 45), obtained by them by crossing P. Manni with P. tuberculosus. The flower is well expanded, richly coloured, and a great addition to our winter-flowering Orchids.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM × ANDERSONIANUM, WESTONBIRT VARIETY.

Few imported Orchids vary so much as do the forms which the late Professor Reichenbach ultimately combined under O. × lanceans, a fact accounted for by their hybrid origin, and in the probability that some of them are secondary crosses, reverting in some instances towards O. gloriosum, and in others towards O. crispum. Hence it is that some of the forms in their small size, narrow segments, and other characteristics, are but little removed from O. gloriosum, and are consequently but little esteemed by orchidists; while others, in far less quantity, have the size, form, and handsome appearance of O. crispum, and, consequently, are highly prized.

A grand inflorescence of one of the largest and showiest forms I have ever seen has been forwarded me by Captain Holford, Westonbirt, Tetbury (gr., Mr. A. Chapman), where, in the time of the late Robert Stayner Holford, one of our earliest and best collections of Orchids was formed. The sepals are 3¼ inches across, and the petals which are ⅝ inch wide, 3 inches across; they are cream-white, the sepals having each a group of seven to ten red-brown spots along the middle, and the petals a similar marking of smaller spots, with the addition of three short red lines at the base. The lip is very different from that of the ordinary O. × Andersonianum in form, it being ovate and crimped at the edge, white, with one large blotch in the centre, and some red markings on each side of the upper portion, the area in front of the callus being bright yellow. The whole flower is sufficiently showy to be classed with spotted forms of O. crispum. *Jas. O'Brien.*

DENDROBIUM PIERARDI LATIFOLIUM AND D. PRIMULINUM GIGANTEUM.

I couple these two Dendrobiums together, because in many respects they are very similar, though there is sufficient diversity in the bulbs, leaves, and growth to warrant the retention of the names as they now appear. These varieties do not appear to be grown so much as used to be the case. The colours of the flowers are not so striking as those of others, some of which may be grown just as easily, but for arranging with other plants in the conservatory or show-house there are few varieties more beautiful than are these. The former can be grown with pseudo-bulbs some 3 to 4 feet long, and the latter still from 2 to 3 feet. They are best grown in baskets or on blocks; the former method is perhaps preferable, but care must be taken that the basket used be not too large. It is better to water often during the growing season than to have large quantities of mossy soil remaining wet for a lengthened period.

I know the object of most Orchid growers is to possess and continue to grow the original plant, and endeavour to increase it in bulk and general effect; but it is not always the case that increasing dimensions are correspondingly followed by greater floriferousness, or flowers of finer hue and substance. Very often a plant is retained in the original bulk, when one side will grow freely, and flowers appear numerous enough; whilst another portion is dwindling, puny, and unsatisfactory. Still, it is a large plant, and it is imagined that skill and attention are rewarded in the fact that it is kept intact and growing. Much better it would seem to be to break up the masses, and instead of seeking to have large specimens, moderately flowered, to grow medium-sized plants, full of vigorous growths, and flowering with freedom and strength.

So with these two varieties. If plants with two or three flowering bulbs, of the lengths indicated, were in baskets, and when in flower suspended among other choice plants, the effect would give satisfaction.

D. Pierardi latifolium will shortly be in flower, for if the necessary rest has been given, it will by now have been placed in the warm-house again, and numerous buds showing along a good portion of the bulbs. When in flower, endeavour to retain the blooms fresh as long as possible, for at best they will not last more than two or three weeks; and as the flowers pass away, and the growth of the new bulbs advance, seek by heat, moisture, and a fair amount of light, to obtain stout, lengthy, and plump pseudo-bulbs. Do not be afraid of keeping the plants fairly dry during the resting season, and if the leaves fall off, no harm need be feared.

D. primulinum giganteum is generally a little later in flowering than the one previously mentioned, but in all respects the cultivation needed is the same. This includes heat, moisture, and light when growing, but not direct sunshine, and occasionally syringing under stages, or watering the earth surfaces with manure-water. If at times the glass registers at shutting-up time 85°, 90° or even beyond, no harm will follow if other conditions are the proper ones. *W. Swan.*

NEW VARIETIES OF CUPRESSUS LAWSONIANA.

SINCE the introduction of Cupressus Lawsoniana from Northern California in 1853, by Murray, its usefulness in various directions has been well recognised. It is the hardiest known Cypress, even young plants of it being rarely killed in the severest winters. As a specimen tree, the size to which it will grow, coupled with its handsome appearance, are such as to commend it to the attention of every tree planter. Several beautiful specimens are to be met with in the neighbourhood of Woking, as at Byfleet, the London Necropolis Cemetery, which is largely decorated by trees of Cupressus Lawsoniana, which are of great size. Probably the largest specimens occurring in the British Isles are the two recorded at the Conifer Conference of the Royal Horticultural Society in 1892 — that growing at Dupplin, Perthshire, which in that year was 55 feet in height, with a stem-girth of 4 feet 3 inches; and another big one is to be found at Tortoisk, Argyllshire, 34 feet in height, with a stem girth of 8 feet 6 inches. The variability of this Cypress when raised from seed is very remarkable, and numerous forms are now recognised in gardens. During the past few years several which are quite distinct forms have been raised, which are likely to become valuable in gardens. Although these novelties may not be used to the same extent as the type, they will be employed sparsely in gardens. Of these varieties I may name the following: —

Triomphe de Boskoop, with foliage of a bluish shade, and of such an extent is this tint, that the variety might be fittingly named the Blue Cypress. In growth and habit it resembles the type, being as vigorous and free of growth. Owing to its remarkable colour and fast growth, it is likely to become a popular subject for garden planting. Its name indicates Dutch origin.

Var. filifera glauca is an equally valuable but very distinct variety, of robust growth and pendulous habit, resembling in this respect C. L filifera. The deep blue colour of its foliage is very decided, and the gracefulness of the thread-like branches is an additional charm. Having been introduced about two years since, only small trees are obtainable at nurseries. It originated in Messrs. K. Wezelenburg & Sons' nurseries in Holland.

Var. Wisseli, a distinct-looking form, which cannot be praised too much. Its growth is strong and compact, and the habit stoutly columnar. It has also foliage of a blue tint, but a distinct habit of growth is its chief point.

Var. erecta viridis filiformis, a form that partakes more or less of the style of C. L. erecta viridis, but differing in having thread-like growth of branches, although its colour is exactly the same, namely, light green. The growth is vigorous. *E. S., Woking.*

MARKET GARDENING IN THE CHANNEL ISLES: JERSEY.

(Continued from p. 67.)

VARIOUS NURSERIES, &c. - One day I was privileged to accompany a leading grower on a business journey; we covered a good distance, inspecting and noting the fruit as it appeared in many of the fruit-growers' gardens and farms. Upon entering the Imperial Nurseries, those that were held so long by Mr. C. B. Saunders, and yet more recently by Mr. H. Becker, we noticed many fine fruit-trees in full bearing. There were choice fruits of Louise Bonne of Jersey, Van Mons Léon le Clerc, Beurré Bachelier, very fine; Williams' Bon Chrétien, Brockworth Park, Beurré de l'Assomption, 1 lb. each; Beurré d'Amaulis. Here, too, were excellent fruits of André Despartes, a grand October Pear, of large size, excellent flavour, a heavy and certain cropper; General Todtleben, Beurré d'Anjou, very large trees, in wonderful bearing; Napoleon III., an early Pear, of large size, very free in setting, sweet and delicious in flavour; Beurré d'Arenberg, Beurré Sterckman, fine tree, with large and well shaped fruit; Jules d'Airolles, a late Pear, delicious in flavour, in many respects resembling a Marie Louise. I noticed here, under some of the trees, numerous empty flower-pots, of about 6-inch size, plunged in the ground almost the whole of their depth. On enquiry, I was informed that the manure-water is poured into these, and passes directly downwards to the roots. We then visited the Cæsarian Nurseries, where we gathered some very fine Apples and Pears; and thence to the fruit farm of Mr. De Guelle, Grouville, where there were grand Apples, some Peasgood's Nonsuch weighing 27 oz. From this garden fruits weighing no less than 34 oz. of this variety have been gathered from espalier trees. Bismarck on espaliers were very large, and of a brilliant colour; Gloria Mundi were immense fruit gathered from a wall. This is rather tender flesh, still here it is a very free bearer. Beauty of Kent, Calville rouge d'Anjou, very fine Apple; Cornish Gilliflower, fruit of unusual size; and Monstreuse Incomparable, fruit of large dimensions, weighing 24 and 26 oz. Another very fine sort was Belle de Cholet. Here we saw a very fine Plum named Jersey Lily growing on a wall. The tree was very vigorous, the fruit was yellow, with bright rosy spots, and a purplish bloom showed over all. The fruits were of large size, measuring 4 inches in length. Some of these had weighed just a quarter of a pound apiece.

In the houses was a fine lot of Tomatos, the variety grown being Chemin Rouge, of which the grower speaks very highly.

At another farm we admired the woodrous fertility of the many large pyramidal Pear-trees. The Pears were of splendid size, and as the gathering was taking place we noticed with much pleasure the care with which each was handled. Most of the trees were literally loaded with fruit; the Williams' Bon Chrétien were being despatched as quickly as possible. These fruits were splendid in size, and delicious in flavour. Doyenné du Comice had fruits exceptionally fine, since some had just been gathered weighing 27 oz. Of Beurré Bachelier fruit had been gathered weighing 40 oz. The proprietor had on a previous season exhibited twenty-five fruits of this latter variety which averaged 1½ lb. in weight. The space devoted to these fruit-trees is considerable, but one could not also held noticing the number of trees on any given spot, the healthy condition, and the heavy crop every tree was bearing. Here, too, were Apples of large size, and trees bearing heavy crops.

Many excellent things were seen on this day's journeyings that impressed me very much with the woodrous fertility of the soil, the healthy condition of the trees, the freedom from blight and scale, the large crops most of the trees were bearing, the beauty and fitness of the climatic conditions; and, perhaps more than all, the steady and persistent labour expended on all connected with fruit-culture. May the success already achieved by so many be trebled in the future.

PRIVATE GARDEN.

The Firs, Cobo.—I was privileged to visit this garden in company with Mr. Simpson, the gardener. The park and pleasure-grounds are of considerable extent, and the fine trees and clumps of Bamboos formed a picture that will not be easily effaced from my memory. It was not as single plants or solitary clusters that Bamboos came into view, but as veritable groves and plantations. Arundinaria viride-glaucescens, B. Metake, and B. Quilloi, were of unusual dimensions; in some cases many stems of 20 feet in height were noticed, and exceedingly graceful withal; and so dense and impenetrable the thickets, that in many places it was impossible to enter them. Arundinaria aurea and A. nigra were equally fine and tall, and stout in the stems.

Standing in the park, there were remarked a Japanese temple and a dwelling-house, the approach to the temple being led over flat stones laid on the grass, and then up several flights of steps, ascending to the centre of the building. The dwelling-house is an object of great interest, and affords a good idea of the ordinary Japanese country-dwelling. The park, as has been said, is extensive.

In the gardens near the owner's house were more large Bamboos, several Cordyline indivisa, Melianthus major, quite tall, and not as we in England are accustomed to see this plant; Edwardsia, Sophora japonica, with its finely-cut foliage, flowers very freely; Phormiums in variety; Chamærops, Aralias, Magnolias, as immense trees; Abutilons, Plumbago capensis, Ipomœa Learii, Lapageria rosea, and large standard Figs, everything luxuriantly growing. To have such surroundings to a large flower-garden (which itself was gay with bright and showy subjects), and to see them repeated in specimens, 8, 10, and 12 feet high, with Camellias and Azalea indica as common shrubs, and a number of plants usually considered in England as inmates of the intermediate or cool greenhouses, was a great source of delight as well as a surprise.

The kitchen-garden, of fair size, contained good crops of most sorts of vegetables, and standards and pyramids of Apples and Pears, which were splendid objects, bearing in most instances large crops of fine-looking fruit. In a low-roofed vinery black Alicante Grapes hung in splendid profusion and condition, the bunches unusually large and of symmetrical proportions, many turning the scale at 3 lb. each, with berries of an intense black. It was a pleasure to note many beds and borders filled with annuals that were bright-looking, and as a whole very effective; and being placed in the kitchen garden, they gave colour and brightness where these are usually lacking. A long bank of Hydrangea Hortensia in flower under the shade of some tall, deciduous trees, was a pretty feature. Whether it was the soil, the shade, or proximity to the sea, the flowers were of a blue tint, without, as far as could be seen, a single truss of the usual pink colour. The effect by the failing evening light haze was remarkable. *W. Swan, Exmouth.*

THE ROSARY.

PRUNING ROSES.

As the present month draws to its close, the thoughts of the Rose-grower will be fixed on the pruning of his stock of plants. Twenty years ago it was the practice to get all of the hybrid perpetuals, Bourbons, and Gallicas pruned by the end of this month, and the Teas and Noisettes a month later; but experience has shown that this is too early, if we are to avoid, as far as possible, the lamentable effects that follow hard frosts, if these fall late in the spring, which have been so common the past few years, I have no hesitation in saying that quite half of our Roses are pruned too early, even now.

Then, again, so few of our amateur friends seem to realise why we prune Roses and other flowering shrubs, and so they go on what I may, perhaps, style a rule-of-thumb system, and prune each Rose, no matter the variety or class to which it belongs, upon the same lines. Such methods cannot result in good effect, and it would be almost as well if the knife were kept from the plants entirely.

We prune Roses with the sole object of diverting the energy of the plants into the more useful wood, and it is obvious that this is not the same in all of the several classes of Roses, to say nothing of the widely differing characteristics of varieties in any given class. Let me take as an example the extremes from a few of the principal classes, in which the varieties first named are of exceptional vigour, while the second example is of very moderate growth. Hybrid perpetuals, Madame Gabrielle Luizet and Horace Vernet; Teas and Noisettes, Rêve d'Or and Ma Capucine; Bourbons, Mrs. Paul and Souvenir de la Malmaison; Polyanthas, Crimson Rambler and Perle d'Or; Hybrid Teas, Gloire Lyonnaise and Lady Mary Fitzwilliam; and many more such instances might be given.

There is only one rule that can be followed with any degree of safety: and that is, to leave as many as possible of the healthy long shoots of the previous year upon the very vigorous growers; and limit the number of buds upon those of medium or weak growth, according to the strength of the variety. In all cases, weakly and immatured wood can be removed to advantage; also any that is the least affected by frost, cutting back to a thoroughly sound eye.

A little observation will show that all of our Roses and Briars depend to a very great extent upon new growths from their base for a continuance of vigorous health. As time goes on, the uppermost shoots become exhausted, and gradually decay. Now these shoots cannot be of much use in future, and especially in the case of climbing and extremely vigorous varieties; therefore an experienced pruner will remove them as soon as deterioration is remarked, which enables the younger and more healthy growth to find space and advance. These points, and the cutting-back to well-matured eyes, are the essential matters in pruning Roses; and if they are borne in mind, and the knifeman takes counsel of common-sense, few pruners will go wrong.

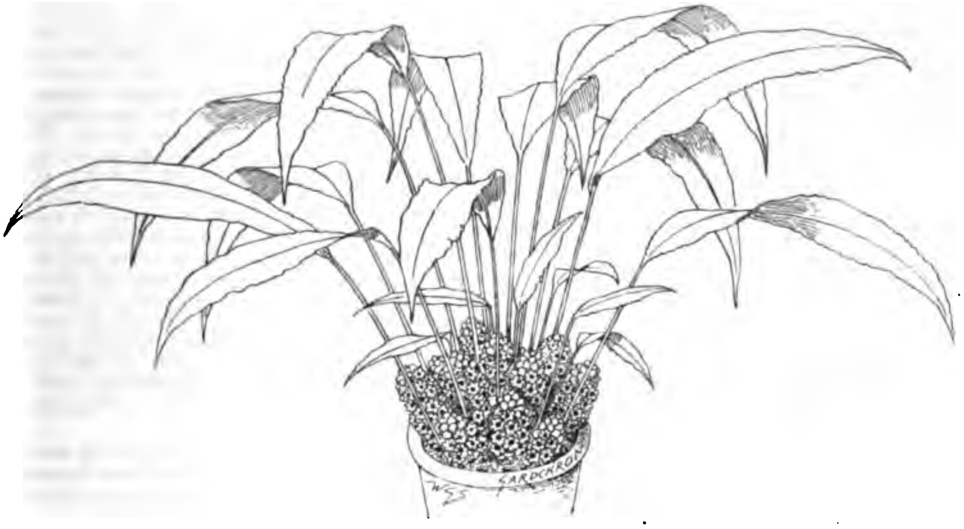

Fig. 46.—Lourya campanulata.

To give full instructions would occupy too much space, seeing that the characteristics of numerous varieties would need to be noted. He must also bear in mind that Roses are or should be grown for the embellishment of the garden, and he should leave far more of the ripe wood than if the object be the growing of a few blooms of high quality for exhibition. Among vigorous-growing Roses, few produce blooms upon their longer shoots in the current season—these come the following year; and nearly every well-matured eye will produce lateral growths, which seldom fail to carry good blossoms. *A. Piper.*

LOURYA CAMPANULATA.

This is a Cochin-China plant, described by the late Prof. Baillon.* It was exhibited at the last meeting of the Royal Hort. Soc., and as will be seen (figs. 46, 47), has much of the general appearance of an Aspidistra, but the inflorescence is more elongated. The perianth resembles that of the Lily of the Valley, but has a purple blotch at the base. The structure of the flower, as described by Baillon, is very curious, and shows that the plant must be placed among the Peliosantheæ, near to Ophiopogon. The dense raceme of flowers is followed by a cluster of bright blue berries, each oblong, ovate, about 1 inch in length, by ¾ inch in breadth. While the plant will serve the same purposes as the Aspidistra, it will be seen that the flowers, and especially the fruit, render it still more attractive.

ALPINE GARDEN.

NEW AND RARE PLANTS FOR ALPINE GARDENS AND ROCKERIES.

(Continued from p. 100.)

Ranunculus Sommieri, N. Alboff (in *Bulletin de l'herbier Boissier*, vol. i., p. 245), was found by Alboff in the mountains of Abchasia in 1892. A well-tufted plant, with rather large and heavy leaves cut into three, and large yellow (bright yellow) flowers. It requires sun and a well-dressed soil in the rockery, and flowers from May till July.

Rudbeckia maxima, Nuttall, from North America, is one of the best but rarest of herbaceous plants. The foliage is smooth, glaucous, and leathery; the flowers are very large, and of a bright yellow colour. The true R. maxima is the one most to be recommended of the herbaceous perennials; it is very hardy, but is rare in gardens. It grows over 6 feet high, and requires a good deep soil.

Rudbeckia purpurea nana.—We found, three years ago, in a bed of Rudbeckia purpurea, in our nursery, near Lancy, a very dwarf plant of this, covered with large flowers of the deepest carmine-red. The seeds of it retained the character of the variation, so that it may be considered as a variety of the type.

Salvia ringens, Sibthorp and Smith.—This is a very showy and good plant from Greece, growing in the mountains between 3500 and 4000 feet altitude. The stems exceed 2 feet in height, and bear large, ashy-grey-green three-lobate leaves, and very large, sky-blue, beautiful flowers, which are, if not so bright and showy as those of the Salvia patens, the best of all the perennial kinds. The plant is a very good and useful addition to garden plants, especially for rockeries and sunny and dry places.

Samolus repens, Persoon, from New Zealand, is a very small, low-growing plant, which has no analogy with the European kinds of Samolus. The stems are creeping, lying on the soil, and the leaves, small, of a dark and brownish-green, are generally joined in small rosettes, from which start other stems, just as in the Saxifraga sarmentosa or Androsace sarmentosa. The flowers are white, of middle-size, and very numerous. It requires a damp, but partly sunny situation in the rockery.

Sanicula marylandica, Linnæus, has a pretty foliage, and is quite different from our European species; it is worth cultivation as one of the best kinds for woods and shady places.

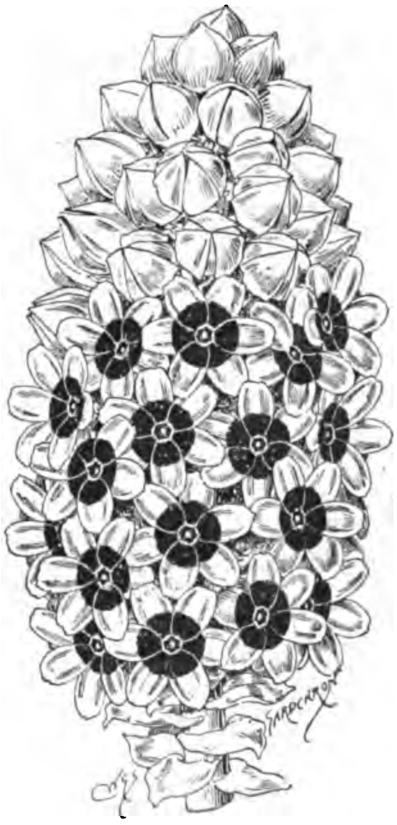

Fig. 47.—Lourya campanulata.

Showing inflorescence. (Real size.)

Saponaria glutinosa, Marschall v. Bieberstein, from Oriental and Mediterranean regions, is a plant, of which the bright carmine-red flowers form a good decoration for rockeries, where they open from July to September.

Saponaria pulvinaris, Boissier.—From the highest regions of the Anatolian mountains and Lebanon, is the Silene acaulis of that country, and at first it might be mistaken for it. Very dwarf, very cæspitose, the plant is good for the rockery; the leaves are small and numerous, joined in rosettes like those of the Saxatile alpine plants; the flowers are very shortly stalked, and the corolla is of the deepest carmine-colour. It flowers in May and June, and requires a dry and sunny situation in the crevices of the rockwork.

Saxifraga corbariensis, Timbal, from the Pyrenees (Mount Corbière, &c.), is very pretty, and quite distinct from S. geranioides, to which it is attached by some authors. The leaves are round in form, three-lobate, and the lobes have three to five very obtuse teeth. The back of the leaves is pubescent, glandular, and marked with small protuberances. The flowers are large and white. It is rather a delicate kind, and needs a sunny and dry place, and a crevice of the rockery.

---

* *Bull. Soc. Linn.*, Paris, No. 93, p. 743; Carrière in *Revue Horticole*, 1889, p. 129; and D. Bois, in *Revue Horticole*, 1894, p. 84, c. ic. col.

Saxifraga cuneata, Willdenow, was discovered by Boissier in the rocks of the mountains in Pamplona (Navarre), and on the Peña Redonda by Reuter in Old Castile. It is the most distinct and rarest of all the Saxifrages of the Dactyloides group, and is very seldom seen in gardens. I believe that the garden of M. Boissier, at Valleyres-sous-Rances, in the Canton de Vaud, is one in which it grew many years ago. M. Barbey Boissier was kind enough to give it to us, so that we could distribute it. The plant is a large and very showy one, growing in bushes, and forming tall cushions of dark-green, coriaceous, thick leaves, viscid beneath, and trilobate. The flowers are white and three-nerved, but not very numerous. It is a curious and interesting plant, which prefers to be in a crevice exposed to the sun, or grown on in an old wall. *H. Correvon, Jardin Alpin d'Acclimatation, Geneva, Switzerland.*

MARKET GARDENING.

HORSERADISH.

Good Horseradish always commands a ready and remunerative sale, the current wholesale price being from 2*s.* to 2*s.* 6*d.* per dozen sticks. At these prices, one acre of well-cultivated ground planted with Horseradish in rows 1 foot apart, and at 6 inches from plant to plant in the row, would give gross returns of £726 and £907 10*s.* respectively two years from the time of planting, thus leaving a good balance on the right side after cost of manure, double ploughing of the land, and rent of same, plants, planting, and marketing, had been deducted. A light, deep, fertile soil is suitable to the growth of Horseradish of such a description as would, if only produced in sufficient quantity to meet the demand, render foreign-grown stuff unsaleable in English markets. The ground should be double ploughed in order to loosen it to the required depth, a good coating of well-decomposed manure having been previously laid, afterwards harrowing, in order to produce a fairly level surface preparatory to planting. Stretch a line in the direction in which the rows are desired to run—say north and south—the entire length or breadth, as the case may be, of the ground to be planted, commencing at the outside as a matter of course, and with a light crowbar make holes at 6 inches asunder in the row for the reception of the individual roots. These should consist of straight, thin pieces from 9 to 12 inches long, and prior to being planted, these should be drawn through a coarse piece of cloth held in the closed hand, so as to rub off any eyes or buds, which would otherwise push into growth from the sides of the main roots, thereby detracting from the size of the latter. Place one root (small end downwards) in each of the individual holes, drawing a little soil into the holes with the hand at the same time, until the row is finished, afterwards repeating the above-mentioned operations until the planting of the piece is completed. The last week in January and during February is a good period for planting, weather permitting.

The Dutch-hoe should be run between the rows of plants a few times during the interval elapsing between March and September, stirring the soil to the depth of 1 or 2 inches, as much with a view to accelerating growth in the Horseradish as in destroying weeds. *H. W. Ward, Rayleigh, January* 21.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

Nuts.—The female flowers are now opening their blossoms, and as some of the bushes may be deficient in male catkins, a few well-loaded branches from wild or cultivated bushes, should be tied up in the bushes where pollination is likely to be deficient; the pollen from which will, on fine days, when shaken by hand or by the wind, be dispersed in clouds over the bushes. If any pruning remains to be done, it should be finished off forthwith. Young bushes should have the main-shoots shortened one-half or one-third of their length; the other pruning will consist of the removal of shoots from the centre of the bushes, and cutting back over-strong shoots in order to obtain laterals and removal of suckers.

Cordon-trained Currants and Gooseberries.—Where clean fruits of White and Red Currants, and also Gooseberries for dessert are desired, any spare spaces on walls or fences may be planted with these fruits, training them vertically with two or three branches. These fruits are very useful in providing late fruits when planted on a north aspect.

Pruning and Training Newly-Planted Trees.—The necessary pruning of trees planted in autumn or winter, should now be done. If it be left for another year, a season's growth will be lost to the formation of the head of the tree. This applies especially to standard trees of Apples and Pears, and in a lesser degree to bush or wall-trees. In the case of the former, the shoots should be cut back to a good bud pointing in the direction it is desired the growth shall take, and these will form the foundation for the future head of the tree. Where the shoots are left too long on newly-planted trees, they seldom start away with vigour, making little headway for years. Pyramid and bush-trees should have the leading growth shortened to four or five buds, or to about a third of their length where fairly strong, and the weaker side-shoots to within one bud of the previous year's growth. Espaliers or wall-trained trees of Apples or Pears should have the central leading shoot shortened to about 12 ins., or one bud above where it is desired the next tier of branches shall be placed. Other leading shoots must be shortened to three or four buds, and the remaining ones cut close to one bud. Wall-trees and others, if planted early, will have settled sufficiently in their positions to allow of nailing or tying being done, but it should be done somewhat loosely, in case any slight further depression may ensue. If a mulching of half-rotten littery manure has not already been given the trees, this should be applied.

THE ORCHID HOUSES.

By W. H. Young, Orchid Grower to Sir Frederick Wigan, Bart., Clare Lawn, East Sheen.

Cypripedium insigne.—This species having been at rest since it flowered, may now be afforded a clean or a new pot. It would serve no good purpose to enumerate varieties, as the same treatment serves for C. i. Sanderæ as for the commoner varieties, therefore C. insigne includes each and every form of this especially attractive species. The pots should be rather more than half filled with drainage, and the following ingredients as compost should be used, viz., peat two parts, fibrous loam one part, and moss one part, sprinkling in a fair amount of finely-broken crocks when re-potting. Do not put the whole of the ball in just as it comes out of the old pot, but pick out the crocks, and as much of the old soil as possible, so that the greater proportion may be fresh and new for the plant to get re-established in. C. insigne should occupy a cool, moist, and somewhat airy structure, similar in character to an Odontoglossum-house, but with a few degrees higher temperature. After being re-potted, afford water through a fine rose, and until the plant has got established apply as much as will keep the material merely moist. These remarks are equally applicable to C. villosum, C. Boxalli, C. purpuratum, C. Charlesworthi, C. Leeanum, C. Arthurianum, and many other related hybrids.

Temperature and Shade.—The increasing warmth of the sun will induce more genial, and indeed call for more genial, conditions in the warm-houses, and to this end the hygrometric state of the air should be more on a par with the temperature than heretofore, the latter being permitted to advance gently with the season. On bright days, those plants which have thin leaves will need protection from the sun by means of sheets of tissue-paper, until the proper blinds be brought into use.

The Potting of Thunias.—These plants, being in a fit condition to be re-potted, should be shaken out of the pots, and be divested of the worn-out soil and dead roots, and re-planted in a compost consisting of one part fibry loam, one part orchid peat, and a third part of sharp sand, powdery cow-dung, and sphagnum-moss, finely-broken crocks being incorporated therewith in the process of re-potting. Pots should be used large enough to accommodate one, three, or more plants, according to fancy, and these should be about half-filled with crocks. Let a stake be placed in the pots when the crocks are put in, and to this tie the bulbous-stems. A sufficient number of the old roots should be left on the pieces as will enable the potter to fix the stems in the compost, covering them and the base of the new break with the mixture, which, when finished, should be about ¼ an inch below the rim of the pot. When potted, place them altogether in a light position near the roof-glass in the east Indian-house, and syringe them in fine weather, but afford no more water for some considerable length of time. T. Bensoniæ does not show signs of activity so early as the other species, and should therefore be held over until ready for repotting.

Mossing the Aërides, Angræcums, Saccolabiums, Vandas, &c.—Some members of these genera will now require to have the decayed sphagnum-moss and drainage-material replaced with new, a beginning being made with plants whose roots are beginning to grow anew. The smaller-growing species, usually accommodated in baskets or pans, require nothing more than a few crocks as drainage, and to be surfaced with living sphagnum-moss; but the plants grown in perforated pots and other large vessels should have the sphagnum-moss and larger crocks mixed together, always placing the crocks perpendicularly, and finishing off the surface with sphagnum-moss alone for appearance sake. Aërides crassifolium, Fieldingi, crispum, odoratum, and japonicum thrive in the Cattleya-house, and A. vandarum in the cool-house. Angræcums, excepting A. falcatum, which is an intermediate house subject, require the warmth of the East Indian-house, as do also the majority of the Saccolabiums and Vandas, excepting those of the tricolor section, which require more air and less heat than is possible to give them in that house. Vanda cœrulea will not as yet require attention in the matter of surfacing or repotting, it being still at rest in a cool airy house. Those plants which rest on a large body of sphagnum-moss must be watered very cautiously for some considerable time yet, or the sphagnum-moss, and probably the roots, may decay. In all cases let the surface of the sphagnum be sprinkled sufficiently often to prevent it becoming quite dry, and on sunny days let the pots be carefully sprayed with the syringe, being careful not to allow water to accumulate in the axils of the leaves. In the case of Vandas teres, Hookeriana, and the hybrid, Miss Agnes Joachim, this precaution is unnecessary.

Epidendrum vitellinum.—Plants growing near the roof ventilators in a cool-house are now beginning to make new roots, and any that require new rooting materials should have them forthwith. The most suitable are peat and sphagnum-moss in equal proportions. The amount of water may be increased afterwards.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

The Early Peach-house.—The wholesale removal of superfluous shoots being injurious to the trees, the disbudding should receive almost daily attention, gradual removal causing no check to growth of shoots or of fruits. In young and vigorous trees excessive disbudding should be avoided, especially if the fruit-crop is a light one, it tending to over-grossness in the shoots. When disbudding is carried out leisurely it is an easy matter to study the requirements of the tree, and to select the best bearing shoots of the next year. Peach-trees, when forced at an early part of the year do not always break uniformly, especially such as are planted on back walls of lean-to houses, the lower parts of a tree being some few days in advance of the upper parts. When this occurs, disbudding is facilitated if the growths are left on the upper of the branches, instead of on both sides, always leaving a shoot to extend from the point, or immediately beyond the fruits. In a long fruiting branch, an additional one may be retained, which, if not required for fruiting, or if no space be found for it, may be kept pinched short, that is furnished with about three leaves. By so doing, the flow of sap is equalised, and the tree well furnished with foliage and shoots. The thinning of the crop of fruit must proceed along with, or follow closely upon the disbudding. The best-placed fruits should always be left for the crop, that is, those which will obtain the most sunshine, and which can develop properly without being squeezed out of shape by contact with the wire trellis, &c. Do not thin them too severely all at once, as some fruits may not be perfectly set, and they will fall. When a fruit has reached hazel-nut size, it is easy to determine which are surely set, and thinning may safely be then brought to a finish. Green-fly should be destroyed by fumigation as soon as detected on the trees. Afford tepid water in sufficient quantity to reach to the bottom of the border, when an examination shows it is needed. Old-established trees may be afforded liquid-manure, but young trees in good growth are the better if supplied with water. Ventilation should be amply yet carefully applied on bright days, a slight increase in temperature being allowed weekly. Syringing, too, may be resumed on trees that have passed out of flower, carrying it out once or twice daily in accordance with the weather.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Gloxinias.—A good batch of the tubers should now be started, choosing those which afford an indication of a renewal of growth, and leaving the dormant ones for succession, if such be required. Let the whole of the old soil be shaken from the tubers, then place them in small clean or new pots that will just hold them, covering the tubers with a compost consisting of two parts sandy loam, one part each of peat and leaf-soil, with a liberal allowance of silver-sand, and place them in a house where the temperature is kept at about 60°, affording water very sparingly until signs of active growth are apparent; otherwise rotting of the tubers may occur. When the roots have reached the sides of the pots, let the plants be transferred to the pots in which they will be flowered, which may be 5 inches to 8 inches in diameter, in accordance with the size of the tubers.

Achimenes, Tydæas, Weigelas.—A portion of the stock of each of these plants may now be started, likewise a number of summer-flowering Gesneras. The Achimenes should be turned out of the pots and pans in which they have been wintered, and the tubers laid on light soil, in well-drained pans, about an inch apart. The pans should have been filled to within an inch of the rim with loam, peat, and leaf-soil in equal proportions, and a good deal of sharp sand; and the tubers should be covered with soil to the depth of 1 inch. Place the pans in the stove, and afford water very sparingly until growth has begun; and when the shoots are 2 inches high, lift each with a little ball of soil attached, and pot them to the number of six to eight in 5-inch pots. They may go into broad, deep pans, or into wire-baskets, or earthenware hanging receptacles. Tydæas, Nægelias, and summer-flowering Gesneras may be started in the same manner, but in potting-up it will not be necessary to place many plants in a pot, three or four being sufficient in the case of the first two, whilst Gesneras are best when potted singly.

Zonal Pelargoniums.—Where fine plants are required for autumn and winter blooming, cuttings of the varieties should be inserted in well-drained 4 or 5-inch pots, filled with sandy-soil, eight to ten cuttings being placed in a pot, affording water sparingly till it is seen that the cuttings are making roots. When well rooted pot them singly in small pots.

Dracænas and Codiæums.—When these plants become "leggy," or when an increase of the stock of plants is desired, the tops of the stems and leading-shoots may be made into cuttings, inserting these in small, yet deep pots, filled with loam, peat, and sand in equal proportions, plunging the pots in a propagating-case or hotbed-frame. These plants may also be propagated by ringing, that is, taking off circles of bark 1 inch wide from the stem or shoot, about 5 inches below the top, removing all leaves standing in the way; then fasten some wood-moss round the shoot at this point, and sprinkle it daily. When roots appear through the moss the shoot is ready for removal, and it may then be potted in a light mixture of loam, peat, leaf-soil, and sand; and, if possible, the pots should be plunged in a mild hot-bed, affording water carefully, shifting the plants when well rooted into larger pots. Before full establishment in the pots has taken place, shading from strong sunshine will be required by both, but afterwards the Codiæums should be gradually accustomed to bear full sunshine, accompanied with much aërial humidity, only this sort of treatment bringing out the colours of the leaves fully.

Cannas.—The beautiful varieties of Canna indica which have been introduced of late years are excellent subjects for the greenhouse and conservatory, and if the plants are started in batches, a succession of flowers may be obtained for a considerable portion of the year. Old plants may be divided into pieces consisting of one or more crowns, and placed in pots large enough to admit of a little soil being placed around the roots. A suitable compost for this potting is loam, leaf-soil and sand. The pots may then be plunged in a mild hot-bed, or may be placed in a house where the temperature does not fall below 55°. If the potting-soil is in a sufficiently moist condition, very little water will be required at first. As soon as the roots take possession of the soil, the plants should be shifted into their flowering pots, using the same kind of soil as before, with the addition of one part decayed manure.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.

Herbaceous Borders.—The present, if not the best time to lift, part plant and replant herbaceous plants is the next best season. A border may be replanted throughout, having first lifted every plant and trenched the ground, or the work may be carried out piecemeal fashion. In the case of a partial renovation, if the border was properly drained, trenched, and manured when planted, little will be required besides lifting, parting, and selecting those portions of the plants to be removed that are found at the outsides of the clumps. When replanting anything, fresh soil or manure should be added, according to the needs of each plant. When planting it is best, I think, to arrange them in groups of three triangularly, these, when in flower, forming effective masses. A good selection of species and varieties will keep up a continuous display of flowers from early spring till late in the autumn, and any good nursery list will indicate the best to plant. Where bulbs are largely planted, the bare places left after the foliage dies down can be covered by planting in proximity such creeping plants as Tropæolums, Verbenas, Lysimachia Nummularia and others, Gazanias, &c. Spaces should be left between the clumps for such annuals as Sweet Peas, Zinnias, Scabious, Stocks, Salpiglossis, Sweet Sultan, Helichrysum, Linum, Shirley and Iceland Poppies, Clarkias, Calliopsis, Godetias, Lavatera, Marigolds, Nicotiana, Clarkias, Amaranthus, Convolvulus, Tagetes, Dahlias (single, Pompon, and Cactus), Lobelia cardinalis, Mignonette, &c.

Lawns.—All grassed areas should be swept and rolled. Banks and other parts of the garden which the drought of last season may have rendered bare, should have a top-dressing of fine sifted soil, soot, wood-ashes, and leaf-mould scattered over the surface evenly about half-an-inch in thickness, brushing the dressing into the turf with a birch-broom. All stones left on the grass by the sides of walks should be picked up or swept off previous to using the mowing-machine, and all uneven edges of verges well rolled and afterwards lined out anew and cut true. Push on with turfing work so as to complete it this month.

Cannas.—The resting roots should be cleaned, placed in trays where slight bottom-heat can be afforded them, and a top-heat of 55°; the rhizomes being covered with leaf-mould, and water afforded to settle the soil. They should not be wetted overhead till growth has begun. Those kept in pots through the winter are throwing up shoots, and these may be parted and potted; should the need be to increase them, or if larger plants are required, the soil may be shaken from the roots, the latter repotted in loam, dry cow-manure, and sand, affording the pots plenty of drainage materials. Let the pots stand on a bed of coal-ashes, and afford a day-temperature of 60°.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Potatos in Hotbeds and Pots.—As the plants approach the stage when moulding will be called for, let the soil be tested, and if found lacking in moisture afford the bed tepid clear water pretty freely, afterwards moulding up the plants with soil of the same temperature as the bed. In doing this work, let the lights remain on the frames as much as possible, or at the most removing but one of them, unless the weather is mild. Air in quantities more or less should be admitted at all times in bright fine weather, either by tilting-up the front, back, or side of the lights, according to the direction from which the wind comes. Another lot of frames may be planted, without bottom-heat this time, the variety being Ashleaf, or one of that type; and at the same time, on a warm, sheltered border, some tubers of this or other early variety may be planted.

Carrots.—On hotbeds, when the plants are large enough to be handled, thin them out to 2 inches or rather less distance apart; leaving the Early Shorthorn type somewhat thickly, and thinning again when the roots are large enough for consumption. After thinning any crop, afford the bed a gentle watering as soon as the work is finished. Let air be afforded in increasing volume as the season advances, and apply thick coverings at night, in order to prevent a check being given, removing this as soon as the sun reaches the frames.

Lettuce.—Plants raised in pans or boxes in heat should be transplanted into either frames or cutting-boxes, doing this before they get drawn, and grow them freely, but do not render the plants tender by a close and warm treatment. Plants wintered in the open or in cold frames should be thinned, transplanting the thinnings, which should be carefully lifted, on to a rather firm, rich, warm border. In the open a plot of ground should be set apart, and prepared for the summer supply, seed being sown at intervals of a fortnight in shallow drills, where the plants will remain after thinning them. Plants are less liable to suffer in dry weather if not transplanted, and the heads are larger and better. The distance apart at which to leave a crop of Cos or Cabbage varieties may be 10 to 12 inches.

Rhubarb in the open being now on the move, may be sprinkled over with a little litter or other protecting material. New beds may be prepared and planted, breaking up the old roots, and using for the purpose those pieces which have strong bud or buds. The beds should be made on deep, well-dunged soil in a spot convenient for forcing, if that method be practised.

Jerusalem Artichokes.—If these roots be not dug up, no time should be lost in lifting them. Select the largest and best-shaped tubers for consumption, putting them in a cool spot, whilst those of middling size may be put aside for planting. When the soil is sufficiently dry as to be workable, plant these sets at 2½ feet between the lines, and 1 foot apart in the rows; although these, as a rule, are lifted and planted on the same ground, and produce heavy crops for several years, a change of sets and of ground should not be overlooked.

THE APIARY.

By Expert.

Condition of Stock.—There will be opportunities during the present month for the examination of all stocks in which there is the least suspicion of scarcity of food, and after a season such as that of 1898, ordinary calculations as to the amount of stores may be readily upset. The examination need be little more than a cursory glance at the upper portion of the combs to see if there be sealed food in them, and it should, if possible, be done only on such days as the bees are flying, so that if a more thorough overhaul of any stock is found to be immediately necessary, as mischief may follow. When food is found to be short, a good-sized cake of soft candy warmed and pressed into a flattish cone shape, so as to lay on the top of frames directly over the cluster of bees, should be afforded forthwith, and the quilts made to fit comfortably down over it. My plan is to use four slips of wood, one of which we lay along each edge of the quilts, and weighted down with a piece of stone or something heavy. I usually advise no interference with bees at this season, but the present season is exceptional, and the condition of stores in every stock should be ascertained. It is well also to give an occasional look at the "packings" to see that all is dry. If any of the quilts or coverings have become wet and mouldy, clean warm ones should be substituted. I would warn anyone against stimulative feeding, for the quieter the bees remain the better. Instead of removing any of the wraps or packings considered so necessary in winter, we would rather add to them.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	Feb. 25—	Royal Botanic Society, Meeting.
TUESDAY,	Feb. 28	Royal Horticultural Society's Committees.
THURSDAY,	March 2—	Linnean Society, Meeting.

SALES.

MONDAY,	Feb. 27	Roses, Climbers, Iris, Montbretias, Gloxinias, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Feb. 28	Hardy Border Plants, Lily of the Valley, Carnations, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	Mar. 1	Japanese and English-grown Lilies, Palm Seeds, Continental Plants, Tuberoses, &c., at Protheroe & Morris' Rooms.
FRIDAY,	Mar. 3	Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period February 12-18, 1899. Height above sea-level 24 feet.

Remarks.—The first four days of the week were wet, and on Friday the wind changed to S.E., and brought fog with it. On Saturday there was also fog, which was very dense at night.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—40·6°.

ACTUAL TEMPERATURES:—

LONDON.—*February* 22 (12 P.M.): Max. 49°; Min. 37°.

PROVINCES.—*February* 22 (12 P.M.): Max. 50°, off Cape Clear; Min. 40°, Isle of Man.

The Evolution of Fruits.

THE fruits mentioned in Prof. BAILEY's last book* are the American forms of Grapes, the Mulberry, the Plums and Cherries, the Apples, the Raspberry, the Blackberry, the Persimmon, and various small fruits which we need not enumerate. The author's plan is to sketch the history of the attempts to bring the wild plants under cultivation, gradually to ameliorate the fruits, and to indicate in what direction and by what method further progress may be made. He shows how, up to the present, the development of new fruits has been more or less accidental. Growers failed in their attempts in one direction, but their experiments served to draw attention to the native species which were then taken in hand, with such success that the named varieties of Grapes grown in the States mount up to over eight hundred.

But the author's greatest satisfaction, he tells us, is in the record of the men rather than of the fruits: "The names which are generally known are those of persons who are distinguished in military operations, politics, general science, or literature; but persons who have expended equal talent and effort in other and more restricted fields of activity may have wrought as much permanent good to mankind. The agricultural and industrial status of an epoch may be of greater importance to the progress of a people than the political complexion is. It is a question if the habit of dwelling upon a few very prominent names in a few fields of human endeavour does not tend to obscure the really fundamental movements, and to distort historical perspectives. At all events, the writer is glad of the opportunity to give what prominence he may to persons who have rendered a service to the national welfare in fields which are little appreciated."

Accordingly, we find in Prof. BAILEY's book a summary history of the doings of certain pioneers, such as the DUFOURS, JOHN ADLUM, who introduced the Catawba Grape; NICHOLAS LONGWORTH, who turned it to account; EPHRAIM BULL, who originated the Concord Grape, and many others not so well known on this side of the Atlantic.

The early attempts to cultivate the European Grape failed, because, as is now known, the Vines were attacked with downy mildew (Peronospora viticola). The native Grapes are by no means immune from this pest any more than they are from the Phylloxera; but while the native species survive the onslaught, the introduced strangers fall a ready prey. These facts induced cultivators to turn to the native species, of which there are many, and to develop what may be called a national industry. Similarly, the European Gooseberry in the States succumbs to the attacks of mildew, and American pomologists therefore set to work to improve their native kinds.

The historical details given in the present volume as to this development are very interesting to the naturalist, but they will naturally not appeal so directly to the Grape-growers and pomologists on this side of the globe.

The progress made in the improvement of the Blackberry may still make us wonder that our own resources are not turned to advantage. Botanists are divided in opinion as to whether we have two or three or as many hundred varieties of Rubus, and they expend a great deal of time, and fill endless papers with descriptions which are rarely so characteristic as to be of much use to any but their authors. Consequently, wide differences of opinion exist. If all this minute critical study had been accompanied with an equally minute study of the fruit and of its potentialities, we should not have laid ourselves open to the reproach of neglecting the natural gifts of the soil. The Americans have acted very differently with their Cranberries; we could grow these also here, as well as our trans-Atlantic brethren, but for our slowness to adopt anything new.

Prof. BAILEY makes mention of several fruits not known here under their popular names. Thus the Juneberry is the fruit of the Amelanchier Botryapium; the Buffaloberry is yielded by Shepherdia argentea; the high-bush Cranberry is none other than Viburnum Opulus! the fruits of which are, so far as we know, never used here for culinary purposes; the Loganberry, supposed to be a hybrid between the Dewberry and a Raspberry; the Wineberry, Arctostaphylos alpina; Thimbleberries, Rubus species; Salalberries, Gaultheria Shallon; Salmonberries, Rubus spectabilis; Crowberries, Empetrum nigrum; Huckleberries, Vaccinium uliginosum; Bunchberries, Cornus canadensis; Molkaberries, Rubus Chamæmorus.

Curiously enough, but all of a piece with similar illustrations given in the book, the fruit of Rubus laciniatus, which is the best of our European Blackberries, has attracted no attention in the States.

In this country we tire of the endless lists of Apples and Pears, and we are not particularly thankful to those who augment the lists. We should prefer them to turn their attention towards the elimination and destruction of inferior varieties. Professor BAILEY evidently does not share this view. "In the first place we want," says he, "more varieties of every native fruit now cultivated. . . . This is because new needs are always arising, and the fruits are being grown in new regions, and new varieties are needed to adapt the species to these wants."

It is obvious that this remark applies with greater force to the enormous territorial area of the States, with their widely different conditions, than it does to us, with our restricted surface and comparatively uniform conditions. For this reason we hardly agree to the full with Professor BAILEY's remark:—

"Those persons who are looking for the coming of the perfect, all-round variety, are behind the time, and are constantly getting further behind, for it is more and more impossible to combine all the varied and contradictory specific desires of men into one plant form. There must be a best variety for every particular use and locality."

Take our Black Hamburgh Grape, or our Muscat of Alexandria, as illustrations. Newer Grapes come and go, but these remain behind as the best "all-round varieties." We have not yet improved upon these for general all-round purposes. Far be it from us to suggest that we never shall; but if we are to progress, it would seem as if we must break entirely new ground, and obtain "a greater range of variation, more divergent, and widely unlike varieties."

"The actual work of improvement," says Professor BAILEY, in concluding his volume, "will be done by a few patient souls, whose love of the work far outruns desire for applause and for pecuniary reward."

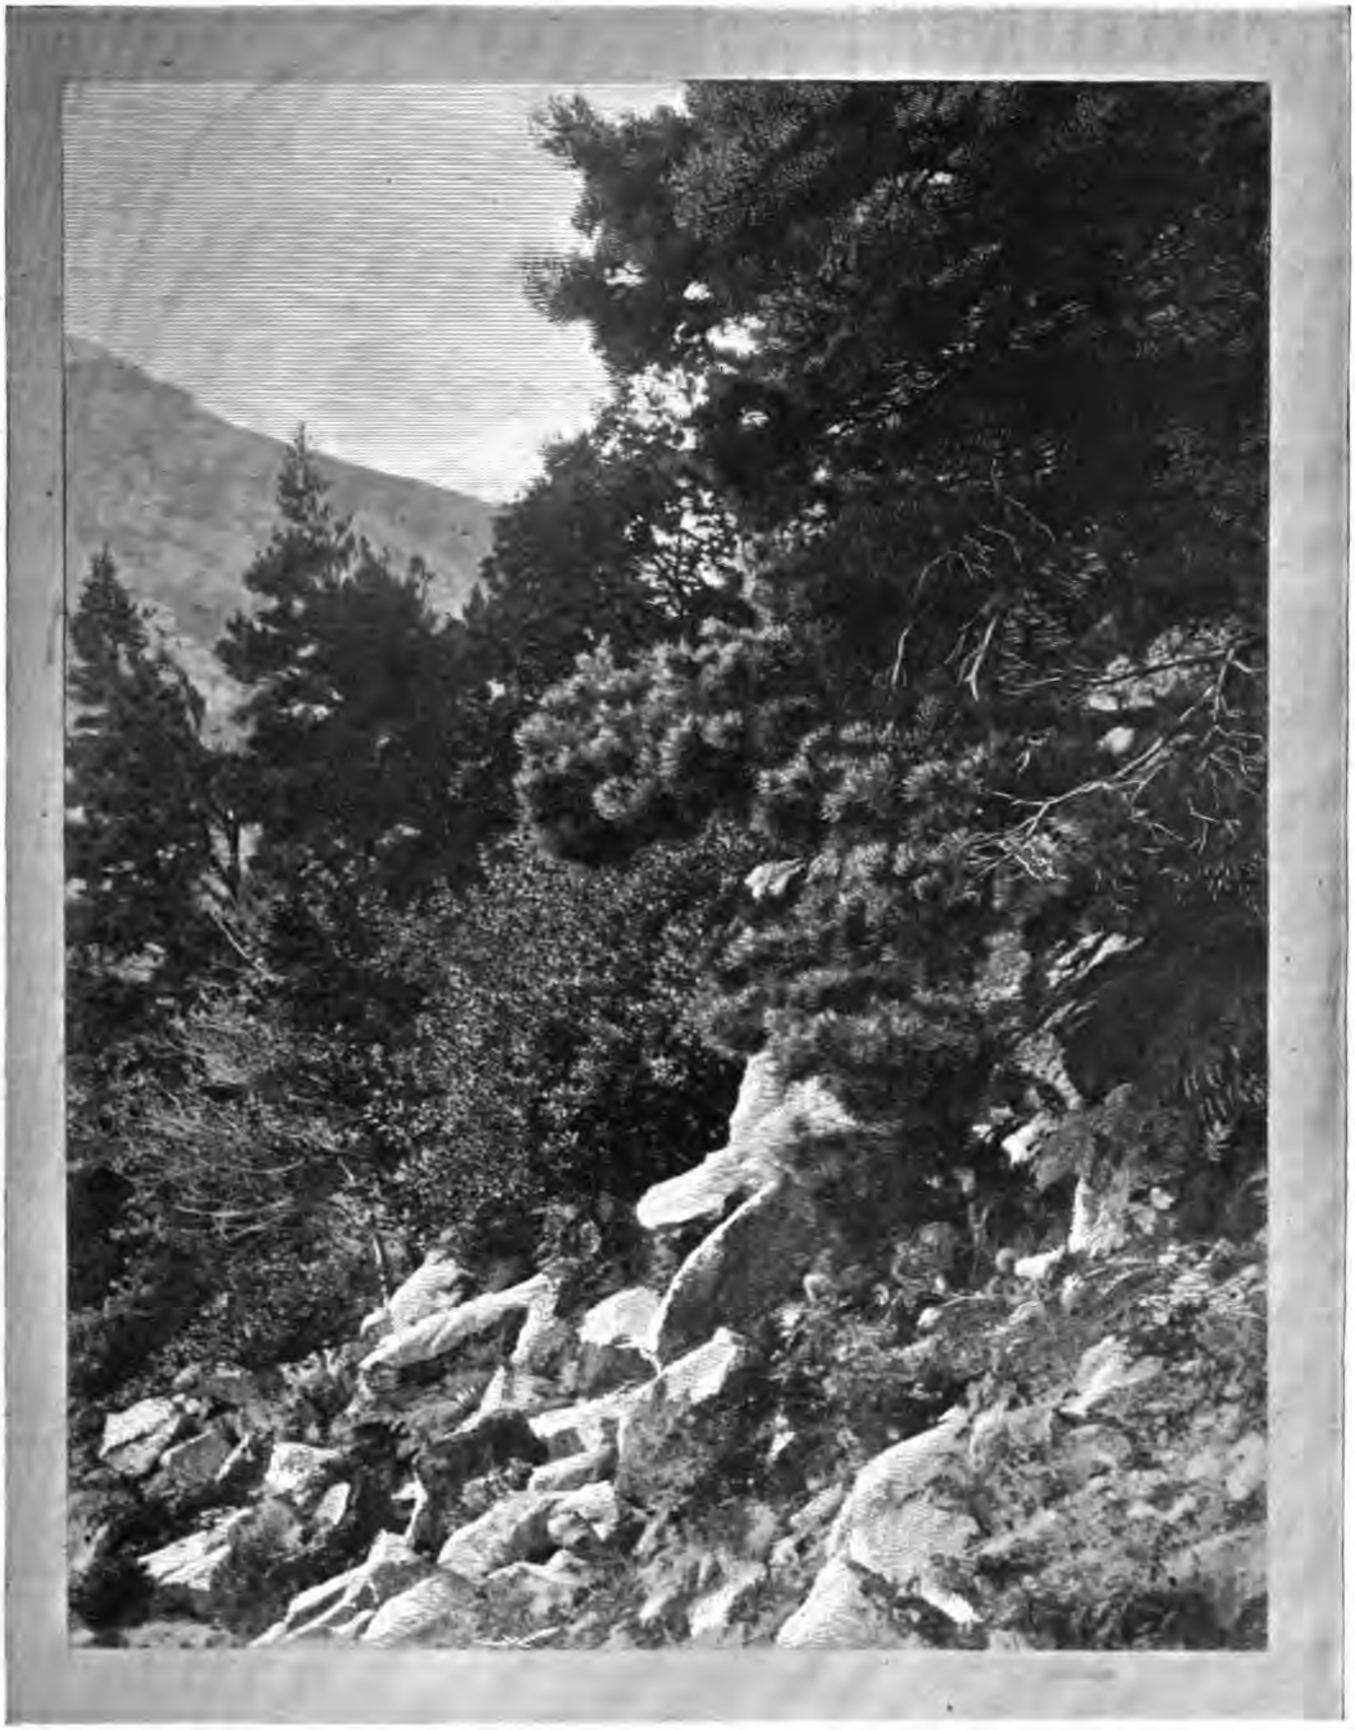
Our readers will, we trust, be able to judge from our remarks what are the general contents of the book before us, and what is the line of argument throughout.

To the naturalist and to the student of evolution the book provides a storehouse of facts, and an enunciation of principles, which are as applicable here as they are in the States; to the pomologist it furnishes an infinitude of suggestions, which he will do well to turn to practical account. The book is well illustrated, nicely got up, and provided with a good index.

---

* *The Evolution of our Native Fruits . . .*, by L. H.

SUPPLEMENT TO THE "GARDENERS' CHRONICLE," FEBRUARY 25, 1899.



A VIEW IN THE SCALP PASS, DIVIDING THE COUNTIES OF DUBLIN AND WICKLOW. (SEE P. 121.)

A View in the Scalp Pass (See Supplement).—The whole of Wicklow and the adjoining portions of Dublin County are extremely picturesque, much of the country being a succession of narrow valleys and high rocky hills of rather softened contours. Arboreal and other vegetation, thanks to the salubrious moist climate and the proximity of the sea, grows with vigour wherever the soil is of fair depth, and even on the hills, as at Powerscourt, very fine timber-trees are to be met with, especially of Beech. Our supplementary illustration affords a view, one out of many, which the tourist with an eye to pleasing combinations of rugged rock and tangled masses of wild plants, trees, and brushwood, could discover in this part of Ireland, but which are not easy of imitation in a garden unless some of the chief conditions are existent. The illustration was reproduced from a photograph taken by Miss Armstrong, of Monkstown, Dublin.

Royal Horticultural Society.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, February 28, in the Drill Hall, James Street, Westminster, from 1 to 4 p.m. At 3 o'clock a lecture on "The Colours of Insects; their Meaning and Use" (illustrated by lime-light), will be given by Mr. H. L. T. Blake.

The Sherwood Cup, 1899.—It having been represented to the Council of the Royal Horticultural Society that the terms in which the Sherwood Cup is offered for competition on p. 52 of the Society's Arrangements, 1899, are not sufficiently definite, the following additional regulations are made:—

1. No exhibitor may stage more than 100 dishes in all.
2. The 100 (or less) dishes may be divided between the two meetings in any proportion the exhibitor pleases.
3. Special regard will be given to quality and to variety.
4. As with all other exhibits for prizes, all the exhibits must have been actually grown by the exhibitor in his own or his employer's garden. W. Wilks, Secretary.

By order of Council, Feb. 14, 1899.

Royal Gardeners' Orphan Fund.—A concert, under the auspices of the Chislehurst Gardeners' Mutual Improvement Association, was held in the Village Hall, on the 14th inst., in aid of the above charity. The concert was very successful, as, after paying the expenses, the committee are enabled to hand over a sum of £17 10s. to the Fund.

Proposed Laying of Water-mains in Hyde Park.—Many of our readers will be glad to know that the First Commissioner of Works has refused permission to the water company to construct a main under Kensington Gardens or the Hyde Park. The matter was, as our readers may be aware, made public in our issue for Saturday last, attention being called to the evils that were sure to result from the carrying out of the project.

Horticultural Club.—The twenty fourth annual dinner of the Club took place on Tuesday, the 14th inst., at the Hotel Windsor, Victoria Street, Westminster. It was in every respect a most successful one; for the first time in its history ladies were invited, and formed about one-third of those present. The chair was occupied by Sir J. D. T. Llewelyn, Bart., M.P., chairman of the Club, who, after proposing the usual loyal toasts in happy and appreciative terms, proposed the "Prosperity of the Club." He rejoiced greatly at the step forward which had been made, and he assured the ladies that their presence was much appreciated. The toast was responded to by the Secretary, who gave an encouraging account of the financial condition of the Club, and of the harmony and good feeling that existed amongst the members. Mr. Geo. Bunyard had most kindly arranged for a selection of vocal and instrumental music to be given during the evening. Mr. Harry J. Veitch placed a beautiful stand of flowers of greenhouse hybrid Rhododendrons in front of the chairman; and a sumptuous dessert, consisting of Pine-apples, Grapes, Californian Easter Beurré Pears, Peaches (from the Cape of Good Hope), Bananas, &c., was placed upon the table, owing to the kindness of Messrs. Assbee, George Monro, Peter Kay, and M. J. Garcia. The evening was a most agreeable one, and the hope was generally expressed that it would not be very long before the ladies were again invited.

The Fire at the University of Geneva.—It is a matter of satisfaction to us to be able to announce that the statement published at p. 91, was, in some important particulars, incorrect. It was based, as was stated at the time, upon one previously made public in the *Semaine Horticole*. The Delessert Herbarium is fortunately intact. It is the property of the town, not of the University, is under the direction of M. Briquet, and is contained in a building more than 500 yds. distant from the University where the fire occurred. The fire broke out in the left wing of the University, and destroyed an apartment in which were some collections, diagrams, &c., relating to the Alpine Flora belonging to Prof. Chodat. Some loan collections from foreign herbaria were likewise destroyed, as well as some physical instruments that had belonged to De Saussure. We are deeply indebted to several Geneva correspondents for pointing out this error to us. Had one of them only prevented its commission by communicating trustworthy intelligence, it would have been better still.

National Chrysanthemum Society.—Several of your readers, writes Mr. George Gordon, Kew, have written to me with reference to the new regulations of the National Chrysanthemum Society relating to amateur exhibitors, which you published in your issue of the 18th inst., under the impression that I am a member of the executive. As I have but little spare time for correspondence, I shall be greatly obliged by your allowing me to state that I occupy no official position whatever in connection with the Society.

Ruinous Railway Rates.—In connection with the proposed amalgamation of the South-Eastern and the London, Chatham, & Dover Railways, there is considerable correspondence in the daily press. Mr. A. Ayers, nurseryman, of Swanley, stated in the *Daily Mail* for Monday last, that he had just received a small case of bulbs from Haarlem, Holland. The carriage from that place to London was 2s. 1d. The London, Chatham, & Dover Railway conveyed the case from London to Farningham Road station, and their charge was 6s. The fruit growers of Kent should look to it, that in any proposed alteration in the railway services through the county, their interests be not more prejudiced than at present.

Dendrobium nobile.—The suitability of many Orchids for cultivation in large towns is again shown by a photograph from Mr. R. Robertson, gardener to H. F. Smith, Esq., in the Regent's Park district. It has been grown from a very small piece, and last year flowered for the first time. It is now a strong specimen, bearing 184 fine blooms.

Report of the Michigan Board of Agriculture.—We have received a volume containing the thirty-sixth annual report of the secretary of the State Board of Agriculture of Michigan, and the tenth annual report of the Experiment Station from July 1, 1896, to June 30, 1897. We note, as forming *Bulletin*, No. 139, Veterinary Department, of special interest, a paper by Mr. C. E. Marshall on "Bacteria," what they are, what they do, and how they are cultivated. This is of considerable value, giving, as it does, in a comparatively small space, a clear and comprehensive account of an important subject, the literature of which is not only very voluminous, but not easily accessible. The paper is accompanied by a glossary and numerous illustrations, and explains some of the bacteriological phenomena of daily life (the tainting of meat, rising of yeast, and so on), thus bringing the subject within the comprehension of the ordinary reader, who is still apt to consider bacteria as in themselves rare and isolated diseases, rather than inevitable factors in every-day life. The volume contains various other papers on agricultural subjects.

The "Shading" Season.—At no distant date the need for shading material will again be felt by Orchid cultivators, choice fruit growers, and gardeners generally. The reminder, issued by Messrs. Wood & Son, is in the form of a book that encloses samples of a wonderful variety of materials for the temporary shading of plants and houses, and also for protecting choice specimens from the attack of wasps, &c. The particular material recommended for the latter purpose is known as the "Hexagon" shading, and that for shading Orchid-houses, &c., as "Rot-proof Scrim," which has been chemically treated to make it unusually durable. Another specialty, and a good material for general purposes is "A. White." All of these and others are obtainable in almost any degree of strength.

Triple-spathed Arum.—We very frequently receive specimens of Richardia africana with a double spathe. Triple spathes are less frequent. For a drawing and a photograph of such a one we are indebted to Mr. Dinwoodie, of the Buckland Gardens, Bwlch, Breconshire. Mr. Dinwoodie is endeavouring to perpetuate the peculiarity.

Fruit from the Cape.—The *Norman*, one of the Union line of steamers, has arrived from the Cape with 610 boxes of Peaches, 202 boxes of Pears, 105 boxes of Plums, and 54 boxes of Nectarines. The whole arrived in excellent condition, and the merchants have expressed great approval of the manner in which the Company has carried the fruit—the cool-chamber arrangements appearing to be perfect, and it is hoped that the shortly expected consignment of Grapes will turn out as well. For the large freestone Peaches good prices were obtained, and were sold in the West End shops at 1s. to 1s. 6d. each. Clingstone fruit did not make so good a market, selling at prices ranging upwards from 4d. each. Plums, Nectarines, and Pears, met a sale at our last reported prices. By the way, it was to be noted that the matters of picking and packing had been properly attended to, the initial steps certainly adding largely to the final excellent result.

The Nutritive Value of Mushrooms.—The chemical composition and nutritive value of Mushrooms and fungi have been recently discussed by L. B. Mendel, in the *American Journal of Physiology*, vide *American Gardening*, January 21. About a dozen species were examined, and in most cases it was found that water amounted to 70 to 94 per cent. Agaricus campestris, the common meadow Mushroom, is practically nine-tenths water; and the Morel Morchella esculenta, has about the same amount. The digestible protein in all the specimens was found to be comparatively small, so that taking this fact and the great quantity of water, the Mushrooms themselves appear to have but little food-value—in fact, about as much as Carrots, Cabbage, and similar vegetables. On this side of the Atlantic we have been taught the contrary, and some of our English fungi have been favourably contrasted with beef-steak.

Seasoning Wood by Electricity.—A model plant for seasoning wood by means of electricity is now in operation at Messrs. Johnson and Phillips's electrical works near Charlton Junction, the system used being the Nodon-Bretonneau. The timber to be seasoned is placed in a large tank and immersed, all but an inch or two, in a solution containing

10 per cent. of borax, 5 of rosin, and ¾ of carbonate of soda. The lead plate upon which it rests is connected to the positive pole of a dynamo, and the negative pole being attached to a similar plate arranged on its upper surface so as to give good electrical contact, the circuit is completed through the wood. Under the influence of the current the sap appears to rise to the surface of the bath, while the aseptic borax and rosin solution takes its place in the pores of the wood. This part of the process requires from five to eight hours for its completion, and then the wood is removed and dried either by artificial or natural means. In the latter case a fortnight's exposure in summer weather is said to render it as well seasoned as storage in the usual way for five years. The current employed has a potential of 110 volts, the consumption of energy being about one kilowatt per hour for each cubic mètre of timber, and the greener the wood the better, because its electrical resistance is less. The liquid in the bath is kept at a temperature of from 90° to 100° F. *Times.*

PROSPECTS OF THE WHEAT CROP IN UNITED STATES.—The daily reports concerning atmospheric conditions in America must have prepared the reader for any kind of adversity in either the animal or vegetable kingdom—that concerning the latter only finds record here; and by a report received on Tuesday from New York we learn that great damage to crops is perceptible. The great Wheat-fields of the west and north-west have especially suffered from frost, and the crops are estimated to have been so much affected, that their value is calculated to have been decreased from 10 to 50 per cent. The reports from Southern States are varied in character, but they indicate disaster to varying extents, according to conditions of vegetation. At one southern station 72° was recorded before the storm-clouds gathered; on Monday last, the record was 6° above zero !

THE VEITCH MEMORIAL FUND.—At a meeting of the trustees held on the 17th inst., it was resolved to place a Medal and prize of £5 at the disposal of the Trowbridge Horticultural Society; and a Medal and prize of £5 at the disposal of the Borough of Hanley Floricultural Fête, to be competed for at their respective forthcoming annual shows. It was also resolved to place the sum of £20 at the disposal of the Lindley Library trustees.

SOCIETY FOR THE PROTECTION OF BIRDS.—We have received notice that the annual general meeting of the above society will take place on Tuesday, February 28, 1899, at the Westminster Palace Hotel, Victoria Street, London, S.W. The chair will be taken at 3 P.M. by Sir EDWARD GREY, Bart., M.P. The president is her Grace the Duchess of PORTLAND; Mrs. L. LEMON is hon. sec.; and the society's offices are at 3, Hanover Square, London, W.

FLOWER IN SEASON.—We have received a bouquet of deliciously scented Freesias from Mr. GEO. CARPENTER, West Hall Gardens, Byfleet. Being the product from two 6-inch pots, they are exceedingly good, and represent as successful cultivation as is possible. Foliage and flowers alike are strong to a degree.

PRESENTATION. — Mr. G. HARRIS, who is vacating the charge of the gardens at Alnwick Castle, and will become County Council instructor in horticulture for the counties of Northumberland, Cumberland, and Durham, was on Saturday, 18th, presented with a handsome barometer, furnished with a suitable inscription, the presentation being made by Mr. J. STEWART, principal foreman in the gardens at Alnwick Castle, as a token of the esteem in which he was held by the men employed in the gardens.

PUBLICATIONS RECEIVED.—*Report on the Calne Agricultural Demonstrations*, Wilts County Council: Agricultural Committee, Section I., Quemerford Station; Section II., Lickhill Station.—*Le Potager d'un Curieux*, par MM.] A. Paillieux & D. Bois (Paris), third edition.—*Boletim da Sociedade Broteriana*, xv., including supploments relating to the Flora of Portugal and the Botanic Garden of the University of Coimbra for the year 1897-98.—*Jevremovac Jardin Botanique du Royaume de Serbie à Belgrade*, ix. Année. — *Wood and Garden*, by Gertrude Jekyll (Longmans).

PLANT PORTRAITS.

CATTLEYA TRIANÆI var. HOFGÄRTNER WUNDEL, *Garten Flora*, t. 1458, a very highly-coloured form, the front lobe of the lip in particular being of a rich, rosy purple.

CYCNOCHES CHLOROCHILON, *Revue de l'Horticulture Belge*, February.

CYPELLA HERBERTI, *Garden*, January 14.

HERBERTIA PULCHELLA, *Garden*, January 14.

PHACELIA CAMPANULARIA, *Garden*, January 21.

PHYGELIUS CAPENSIS, *Revue de l'Horticulture Belge*, February.

PRUNUS MYROBALANA ROSEO-PLENA, *Bull. Soc. Tosc. d'Orticult.*, t. ix., 1898.

ROSE ANTOINE RIVOIRE, *Garden*, January 28; a hybrid Tea, raised between Lady Mary Fitzwilliam and Dr. Grill.

SCILLA CAMPANULATA, white and rose-coloured varieties, *Moniteur de l'Horticulture*, January 10.

NOTICES OF BOOKS.

DIE BÄUME UND STRÄUCHER DES WALDES, Von Gustav Hempel and Karl Wilhelm: II. Abtheilung, Die Laubholzer; Holzel, Vienna.

This is a treatise devoted to European forest trees and shrubs. It contains full descriptions in German of the several trees, their structure, geographical uses, &c. It is copiously illustrated with woodcuts, and has thirty-six quarto coloured plates, illustrative of catkin-bearing trees. Even to those who do not read German, this work will be found very useful by reason of the excellent illustrations.

THE GOOSEBERRY GROWERS' REGISTER.

(Bingley: Edward Fould.)

This is a little book which growers of Gooseberries for exhibition must needs have. It is one that statisticians and physiologists will find serviceable none the less so that the facts recorded are set down without the least bias towards this or that theory, and, indeed, so far as we can judge without any knowledge of the grave questions relating to origin, development, or evolution on which these pages are capable of throwing light. It is, in fact, a record of Gooseberry-shows held at various taverns, principally in the north of England, and the only question entertained is as to the number of "dwts." and "grs." that particular berries weigh. This retention of pennyweights and grains is itself a curious circumstance, convenient for Gooseberry-growers in general, but rather troublesome to foreigners and others who desire to get information out of the records.

The Gooseberries are classified into red, yellow, green, and white varieties. Size, or rather weight, is in general the only criterion considered, though, in one case, we do find the not wholly unimportant quality of flavour taken into consideration. Thus, at the "Green Man" inn, Harborne, Leveller, Dan's Mistake, Blucher, and Transparent are noted as having been exhibited, and, presumably, premiated for flavour. In some cases we find that the competition is open to all "honest" growers ! We hope that this qualification applies to all growers of this useful fruit. Among the heaviest berries during the last eighty-nine years are London, a berry of which in 1852 weighed 37 dwts. 7 grains, the heaviest berry yet recorded. Numerous entries show that this variety has yielded berries of 30 dwts. and upwards on several occasions, but it has never exceeded the weight recorded in 1852. We do not understand whether the tables given on p. 78 apply to one year, 1898, or to an average of many years, but it is evident that Blücher (red), Diadem (green), Leveller (yellow), Surprise (green), Transparent (white), are among the heaviest. The weights of the winning sorts have varied from a minimum of 18 dwts. 22 grains in the case of Sportsman in 1809, to a maximum of 37 dwts. 7 grains in the case of London in 1852.

A poetical (?) effusion appended to the volume tells us that—

> "This London of renown was that famous Huntsman's son
> Who was raised in a Cheshire village, near the Maypole in Acton;
> While in bloom he was but small, yet still so fast he grew
> That everyone admired him, for his equals are but few."

The epic goes on to describe the consternation of "Lion" at the success of London, his defiance, the challenge, the intervention of other combatants; but the opinion is that—

> "The Bobby is the favourite, both in village and in town."

though, so far as we can make out, Bobby has never weighed more than 34 dwts. 20 grains.

A little more care in editing future editions will be desirable, and the importance of the statistical details is such that we trust the *Gooseberry Growers' Register* may have a long and successful career.

APPLE SMART'S PRINCE ARTHUR.

ON the occasion of the meeting of the Royal Horticultural Society's committees on Tuesday, January 31 last, W. Roupell, Esq., Streatham, exhibited this remarkable-looking variety (fig. 49). It is an excellent winter culinary fruit, which remains in good condition under proper treatment till March. The skin is orange-coloured, with broken streaks of crimson, and some amount of green. The eye is rather open, with erect convergent segments set in an angular depression; the stalk is short, inserted to its full length in a cavity. The flesh is tinged with yellow, firm, juicy, and of good flavour. It is a variety much grown about Maidstone.

HOME CORRESPONDENCE.

BLOOM AT ARD CAIRN, CORK.—The following Daffodils were, on February 19, in full bloom out-of-doors. The weather is charming, warm as in April, and insect life abounds. The Daffodils Androcles, Cervantesii, Countess of Annesley, Claddagh (a seedling from N. maximus), Golden Spur, Henry Irving, Ard-Righ, King Umberto, Tuscan Bonnet, Butter-cup, Princeps, Saragossa, North Star, Early Bird, Maximus longevirens, Minimus minor, Cyclamineus, and Telamonius plenus. Many of the white Trumpets are in bud; Polyantha varieties, six or seven, including Soleil d'Or and Gloriosa. Of Anemones, there are St. Brigid, fulgens, and Beauty of Cannes. The Lenten Roses are very beautiful; Prunus Pissardi, as great trees, white as if covered with snow-flakes; Pyrus japonica, Azara microphylla, Snowdrops of all sorts, Glory of the Snow; and sheets of yellow colour from the Crocuses. The perfume from the Azara microphylla is as penetrating as that of Vanilla. Tulips, of which a large collection of late varieties has been formed, are breaking through the soil, and look vigorous and full of promise. *B. H.*

CHRYSANTHEMUM PRINCESS BLANCHE.—The beautiful white flowers of this valuable decorative variety may be had in good condition until the middle of February. The plant is naturally dwarf, and has a bushy habit, rarely exceeding 2 feet in height. I enclose several flowers for your inspection. *H. K., Faringdon, Feb.* 21.

BEGONIA × MOONLIGHT, AND OTHERS. — I should much like to find B. Moonlight, which was grown so successfully at Chiswick some years ago. The variety was raised by the late Col. Clarke, who gave us some other good hybrids, including Weltoniensis. It is about thirty years ago that I first knew this, and grew it successfully in Sussex, and at that time it was thought as much of as Gloire de Lorraine is at present. From my earliest associations with plant-growing, Begonias were always great favourites; and under the instructions of the late Mr. G. Parsons I commenced to hybridise them.

my first attempt being with B. insignis and B. boliviensis. The result was a good batch of plants, which showed distinctly that a cross had been effected; but unfortunately, the stock at the nursery was sold off, and the best varieties were lost. B. insignis is by no means to be despised. At one time I had a house full at Chiswick, loaded with bloom; they were in 8-inch pots, and were much admired. The remarkable strides made in the improvement of the tuberous-rooted Begonias has somewhat overshadowed the older winter-flowering species; yet they are well worthy of attention, and if I had the opportunity, I should prefer to work on these rather than on any other class of plants. At Chiswick, I was fairly successful, both in culture and hybridisation; but those which received First-class Certificates in 1880 have long been surpassed, though I believe the one named after myself would find favour even now. It was of hybrid origin, had medium-sized, pink flowers, and small foliage—quite distinct from the ordinary type of the tuberous Begonia seen at the present time. *A. Hemsley, Edmonton.*

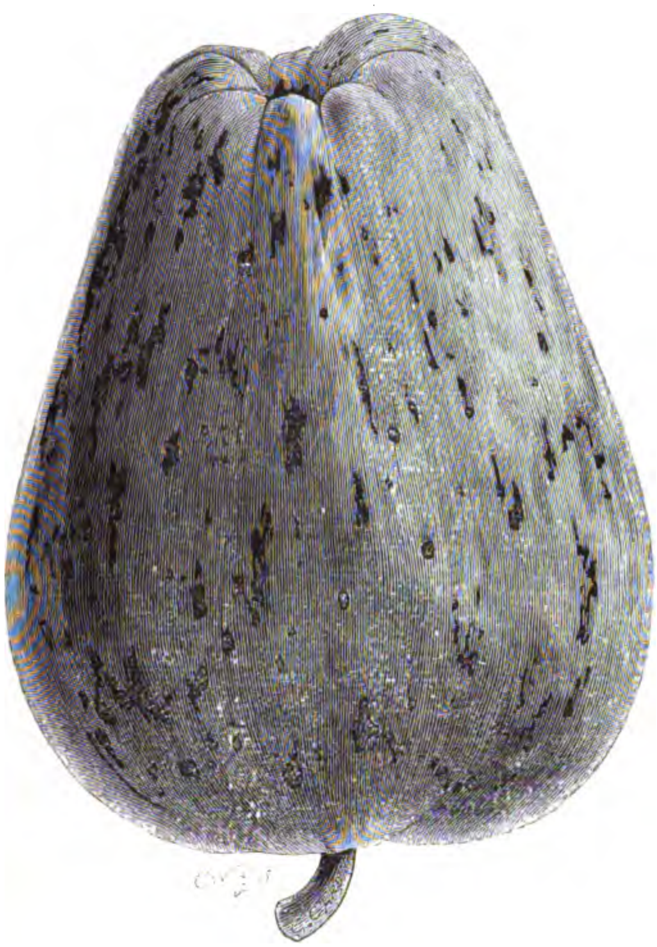


Fig. 49.—Apple, Smart's Prince Arthur. (See p. 122.)

(Shown by Mr. Roupell at the Meeting of the Royal Horticultural Society, January 31, 1899.)

PYCNOSTACHYS URTICIFOLIA.—Observing on p. 82 ("Kew Notes"), of a recent issue, the mention of this plant, it may be interesting to know that plants of Pycnostachys have recently flowered here. Our plants have been fairly successfully grown in pots. I have no doubt but that the plants are better adapted for planting-out, and should be employed for that purpose. They seem to have a tendency to become too tall and loose for pot-work. It is certainly a subject well worthy of general cultivation, and should have an excellent future when once introduced into our gardens. I am informed by Mr. J. Hughes that these plants were obtained from seed brought to Wentworth by the Hon. H. Fitzwilliam from Africa, the precise locality and date I am not able to state. *P. Bolt, Wentworth Gardens.*

WHAT CONSTITUTES ODONTOGLOSSUM WILCKEANUM?—In an article under the above title in your issue of February 11, p. 82, Mr. Crawshay introduces some remarks respecting myself, which to say the least, are in bad taste, without having the merit of being strictly true. He carefully quotes certain remarks of mine respecting the identity of the so-called Odontoglossum crispum Golden Queen, and states, "He now tardily admits, though in a manner as if he had never doubted the facts, which have been stated by the writer (Mr. C.) both in and out of print for years past, and strongly contested by Mr. Rolfe . . . . it has taken him nearly two years to advance," &c. Had not Mr. Crawshay quoted the actual page, I should have thought he had overlooked my remark—"it is quite possible that it is a form of the variable O. × Wilckeanum, in which the shape of O. crispum is nearly reproduced. Other instances could be adduced among hybrids." This quite disposes of this part of his remarks. And with respect to the so-called O. crispum flaveolum, which called forth Mr. Crawshay's remarks, he may refer to 1893, and he will find me saying: "O. crispum flaveolum . . . This is very near O. × Wilckeanum elegans and O. × W. sulphureum, having longish segments of primrose colour, with a few spots on the sepals only, and the characteristic crest" (*Orch. Rev.*, i., p. 204). On the very next page Mr. Crawshay may find my summary of the characters of O. × Wilckeanum (it had taken me over four pages to discuss the various so-called species referred to it), as follows—"Considering the present hybrid as a whole, it is remarkable what a wide range of variation it presents. Just as in the case of O. × glorioso-crispum, there appears to be almost every possible combination of the characters of the two parent species. The robust habit, branched inflorescence, and more elongated segments of O. luteo-purpureum may be combined with the white ground of O. crispum, and with the heavy spotting of the former, or almost without spots, as in so many forms of the latter. O the compact habit of O. crispum may be coupled with the yellow colour and brown blotches of the other parent; while all kinds of intermediate forms occur, both in shape and colour. It is now quite certain that this hybrid is more polymorphic and polychromic than is generally supposed." These remarks were not passed upon anything that Mr. Crawshay had said, and will enable anyone to judge of the accuracy or otherwise of the picture which he draws of Mr. Rolfe strongly contesting something which he has stated in and out of print for years past. Mr. Crawshay in 1897 described "true O. crispum" as "spotless," and remarked "as soon as the yellow usurps more than the disc of the lip, and as soon as spots and marks appear, then I consider that there is evidence of hybridity. No one can tell the myriads of cross-fertilisations that have taken place. This has been proceeding till one can fancy there is not a true crispum left." My reply to this was:—"Here I cannot agree with Mr. Crawshay, for there are both yellow and spotted forms in which I cannot detect the slightest deviation from the typical O. crispum in its essential characters, and especially in the details of the crest." The point may be debateable, but I think Mr. Crawshay lays too much stress on hybridisation, and not enough on variation pure and simple. Your readers can now judge whether Mr. Crawshay was justified in his remarks about naming plants, that "if the botanist or expert does in this way, we are wise in doing all we can to correctly name them without their aid," which, after all that I have done to clear up the origin of these plants, and taken in connection with some of his other observations, I consider to be both personal and offensive. I am quite as anxious as Mr. Crawshay to see these plants extricated from the confusion into which they have fallen, but have no desire to dogmatise on the matter. A few well-chosen experiments would probably throw some light on the question whether secondary hybrids do occur in this group, and Mr. Crawshay, who has the plants, might very well try the effect of crossing O. × Wilckeanum back on to one or the other of its parents, or of crossing it with O. × Andersonianum or O. × Coradinei, and let us know the result. *R. A. Rolfe.*

TRAVELLER'S IVY.—"J. C. B." says that Clematis vitalba is so called in all, or nearly all, ancient botanical works. Will he kindly mention *one*? *James Britten.*

WELL-CULTIVATED CALANTHES.—I enclose a photograph of our annual group of Calanthes. They are mostly C. Veitchi, but include a few plants of C. vestita rubro-oculata and C. v. lutea. The individual spikes of C. Veitchi are good, the best having reached a height of 4 feet 6 inches, with from thirty-seven to forty-two expanded blooms on each at one time, and with several buds to open. Taking the whole collection, the average number of expanded blooms would be about thirty-three. I find the strongest bulbs do not produce the finest blooms, either in colour or size. The plants of C. vestita rubro oculata and v. lutea have been strong in proportion, and make a fine contrast amongst the carmine colour of C. Veitchi. This district has been particularly free from fogs this winter, and the Calanthes have been in bloom from the middle of October to the third week in January. *James Machar, Gr., Branwoods, Great Baddow, Chelmsford.* [The photograph represents very successfully-cultivated plants, and well illustrates the decorative value of these charming winter-flowering Orchids. Ed.]

MISLETO AND PHORMIUM TENAX.—At Bishop's Teignton recently, I noticed in a garden some large bunches of Misleto, green and vigorous, on several Apple-trees; and immediately beneath one of the trees a fine plant of Phormium tenax, which was not afforded any protection in the winter. The longest leaves were about 5 feet, and the plant was as vigorous-looking as possible. *W. S.*

EULALIA JAPONICA VARIEGATA, ETC.—A fine specimen of this interesting plant may be seen at the Moor Gardens, Bishop's Teignton. It is growing alone on the lawn, near to beds of shrubs. The plant is just 12 feet through, and almost circular in outline. There were many plumes still upon it, one of which I forward. I saw it during the present month, and the flowers and leaves had turned yellowish-brown. Even then it was conspicuous among other occupants of the beds and borders.

A very large specimen of Chimonanthus fragrans was full of flower, the individual blooms were small, but the number of them and their fragrance was very grateful. *W. Swan.*

CLEANSING TOMATO SEEDS.—I have read with interest the several notes upon this subject, and would explain my own method. I first cut the fruit in half, and with the haft of a budding-knife scoop out the seeds and pulp into a pan. The following day I obtain a very fine-meshed sieve, and sift some silver-sand, so that it will pass through it readily. I then put the seeds and pulp into the sieve, and cover it with sand, afterwards gently working the seeds and sand together with the hands. The sieve is next immersed in a pan or tub of water, and the contents are stirred well. The sand sinks, leaving the seed partially cleaned. This process is repeated two or three times, and then with a tub of fresh water the cleaning operation can be finished by stirring the seeds under water. As they settle on the bottom, gradually draw the sieve aside, and the skins which surround the seeds while in the pulp, and all immatured seeds, will pass out. This can be repeated. Then tilt the sieve slightly in the open air, and when partially dried, spread out the seeds on trays to finish off. I have had good crops of Tomatos from seeds thus cleaned, even after keeping them for several years. I enclose a sample of seed washed last July, on which I should like your opinion. *H. Southcott, 2, Cleveland Road, Chichester.* [The seeds are very fresh-looking, and thoroughly clean. Ed.]

CONTINUOUS FLOWERING OF PANCRATIUMS.—On Feburary 5 of last year you published my letter on above, p. 91, wherein I stated that I had cut Pancratium-blooms on 366 consecutive days, from February 1, 1897, to February 1, 1898, inclusive. This morning, February 1, they have again completed another 365 days, without a break of a single day, making in all 731 consecutive days, and they are throwing up fresh spikes rapidly. I have only about 100 large pots with several bulbs in each. *Henry Porter, Barkfield Nursery, Freshfield, Liverpool.*

FILMY FERNS IN A COOL FRAME.—At the Moor Gardens, near Bishop's Teignton, I was recently shown a capital lot of these Ferns in an ordinary unheated brick frame. The back wall of the pit was about 3 feet high, the lights having the usual slope. The interior had been deepened rather more than would be necessary for ordinary plants; there were specimens of Todea superba, with a score or more fronds on each plant, many of which would measure fully 18 inches across. These plants were in splendid condition, with no sign of thrip or other insect pests. Trichomanes radicans was equally vigorous. These plants, I was informed, had been grown under these conditions for a number of years, and since it has been proved again and again that fire-heat is detrimental to the culture of many of the filmies, it would seem far wiser to grow them under conditions where moisture prevails naturally, rather than in cases or parts of greenhouses and intermediate-houses where constant syringing becomes necessary. I remember some years ago, when visiting Messrs. Birkenhead's nursery, at Sale, having seen a sunken pit, in which a quantity of Todeas were growing. There, also, no artificial heat was used, and during the winter a few mats was all the covering given. So well had these Todeas grown, and distributed spores, that the interior walls was covered with young plants of one or two years growth. Many Todeas and other filmy Ferns are crippled, and some lost altogether, through being subjected to too warm a temperature. *W. Swan, Exmouth.*

AMERICAN NOTES.

CHICORY GROWING.

The cultivation of Chicory in America is not exactly a new industry nor a new idea, but the home production still falls considerably short of the demand. Mr. M. G. Kains, of the Department of Agriculture, says that the imports of dried roots in 1891 was 1,867,577 lb., and that it increased to 16,930,162 lb. in 1897. There was at the same time a considerable falling off in the imports of prepared Chicory, showing that manufacturers have got in the way of preparing the material here. Mr. Kains asserts, after investigation of the Chicory-growing business in America, that we can grow quite as good an article here as in any other land, and he thinks we ought to do it.

Mr. Burbank's "New Creations."

Mr. Luther Burbank, of Santa Rosa, California, comes near to being the best-known horticulturist in America. His fame rests chiefly on the production of new varieties of fruits and flowers. He is a skillful hybridiser, lives in an exceptionally favourable climate, and does work on an incredibly large scale. His announcement for 1899 has just been issued, under the taking title of *New Creations*.

Hybrid Plums.

The most prominence is given this year, as it has been sometimes before, to new varieties of Plums. The "leader" is a hybrid bearing the name of Climax. It is derived from Botan (Prunus triflora) fecundated with pollen of the Simon Plum (Prunus Simoni). The fruits which I have examined are very large, strongly heart-shaped, dark red, firm-fleshed, free-stone, and of the finest quality. Other hybrid or cross-bred Plums announced are Sultan (probably a mixture of Prunus triflora and P. Simoni), Bartlett (same specific parentage), and Shiro (said to be a hybrid combining Prunus cerasifera, P. triflora, and P. augustifolia). These are all very interesting. It now remains for time to test their value. Mr. Burbank is not the only man in this country who is working upon the hybridisation of Plums. There are several others, among whom may be specially mentioned Messrs. T. V. Munson, Texas; J. S. Breece, North Carolina; F. T. Ramsey, Texas; Theo. Williams, Nebraska; C. E. Pennock, Colorado; and G. L. Taber, Florida. So many varieties of hybrid, or supposed hybrid origin, have lately been introduced to the horticultural public that I have undertaken a special study of them under the direction of the Vermont Experiment Station. I find from forty to fifty named varieties now known and cultivated to some degree, mostly experimentally. Some of them seem to be of considerable promise. The introduction of these hybrids marks an important epoch in our pomology, for up to the present time most of our cultivated sorts have been pure-bred seedlings of the several species grown in this country.

The Simon Plum.

The Simon Plum, Prunus Simoni, has been the object of a good deal of comment in this country, largely of an adverse nature. The quality is very inferior, at least, in most cases, and the trees are seldom very productive. Still, the fruit has such a fine appearance that it sells readily from the fruit-stands to a certain class of customers, such as eat Ben Davis Apples and Kieffer Pears. It has been grown commercially to some extent in California, and I have heard reports of its profitable cultivation in the Eastern States. The most singular and promising fact I have met in connection with this Plum, however, is its apparent success as a stock for hybridising. A large number of Mr. Burbank's best hybrids are strongly marked with Simon Plum characters, and yet such varieties are almost uniformly of the highest quality. The astringent and mawkish flavour of the Simon Plum seems to disappear entirely in crossing, and to leave the fine solid flesh and brilliant colour to co-operate with better flavours from other parents.

Gossip.

The American Pomological Society expects to hold its biennial meeting this fall in Philadelphia. Professor Bailey has just issued a new book. It is a text-book of general agriculture for use in schools. Professor Goff has published a second edition of his attractive little work on *Principles of Plant Culture*. At the time of writing, the winter meetings of the various state and provincial horticultural societies are in full swing. Taking them altogether, the one most notable feature about them is the decline in the excitement over the San José scale. *American Gardening*, of New York, which has recently changed management, has also changed dress and style somewhat with the beginning of the year, and is offered at a slightly increased price. There is practically no longer a "visible supply" of Apples in this country; and the fruit is a rarity even on the best furnished tables. *F. A. Waugh.*

THE DUTHIE PARK, ABERDEEN, AND THE LATE SHOW THEREIN.

I had the pleasure of spending a week in the "granite" city and neighbourhood at the time of the Aberdeen Horticultural Society's annual show in August last. I arrived on the show-ground about 10 P.M. the night preceding the show, and there saw a "woondrous sight." A long avenue adjoining the tents was blocked with vehicles of all sorts, from a garden wheelbarrow to a railway dray. On each there was the usual exhibitor's paraphernalia, and clustering over the top of all were the exhibitors and their assistants; these assistants being sons or daughters, wives or sweethearts, or some "chum" come to lend a hand. It was evidently the time chosen by the amateurs for staging their stuff. By amateurs, in Scotland, we do not mean the nobility who keep half-a-dozen or more professional gardeners. These Aberdeen amateurs are mostly tradesmen, may be granite-masons, or paper-makers, who do their nine hours' work every day, and their gardening after 6 o'clock. Hence, many of them on the night before the show would rush home, swallow a cup of tea and a bit of bread-and-butter, and get into the garden to cut or lift their flowers or vegetables, and afterwards proceed to the show-ground.

It was an inspiration to move along and watch the eager faces and the busy hands at work. In one corner, a man was endeavouring to select the best half-a-dozen French Marigold blooms, by the aid of the light of a halfpenny candle held at his side by a boy. On the grass close by, the finishing touches were being given to a collection of vegetables by two men on their knees in a devotional attitude. A lady was underneath a lamp putting some annuals into position which had got awry through the jolting of her conveyance. A friend of my own started off to find a fountain, which he was told was "ower there," guiding his steps by the light of a borrowed carriage lamp; he stumbled headlong, lamp, watering-can, and self, right into a flower-bed, and after that decided to give up hunting for water till daylight. This almost equals my own experience at Arbroath station on the journey north. I left Glasgow about 4 o'clock in the afternoon, and was due at Aberdeen, *viâ* the Forth Bridge, about 9. Having had only a very light lunch in Glasgow before starting, I hoped to refresh myself at Dundee; but there we only stopped a minute or two. At Arbroath I determined to do something, and so jumped out of the train and asked a porter where the refreshment-bar was. "Along there," was the laconic answer. I went along, and could find none. As I jumped into the carriage I saw the same porter again, and said to him, "There's no refreshment place along there." "There's a water-tap," said he! The Aberdeen show was duly reported in your columns at the time, and it is therefore not of it I intend to write, but of the fine park in which it was held.

The Duthie Park, the gift of the late Miss Duthie, extends to 44 acres, and is under the able management of Mr. Peter Harper. The situation of the park is in every way a beautiful one, and it is boldly and effectively laid out. Here Nature supplies mountains for a background, and rivers and woodlands for a middle distance, and Mr. Harper fills in the foreground—with what? Largely with hardy annuals, and it was their beauty and appropriateness that caused me to make the few notes which I am now extending. In a park of such extent as this there are many bold clumps of trees, and many beds of shrubs. Round the outside of many of the latter, about 18 inches back from the grass-hedging, Mr. Harper has planted Arabis alpina, Erica carnea, Alyssum saxatile, and alpine Auriculas, which form beautiful edgings in spring. The space between these plants and the grass is carefully cultivated and manured in the autumn and again in the spring, and it is here the fine effects are obtained with many of our common varieties of hardy annuals. At the time of my visit the most beautiful were the following: Godetias Lady Satin, Rose, Gloriosa, and Duchess of Albany; Jacoba, a very fine dwarf strain, with double flowers of a rich crimson colour; Eucharidium grandiflorum and Linum grandiflorum were two other striking crimsons. Among white-coloured flowers were the well-known Alyssum maritimum, Candytuft, and Matricaria inodora, fl.-pl., the latter being kept by cuttings every year. Brachycome iberidifolia, or the Swan River Daisy, was very-well grown and particularly charming; although it ranged in colour, white predominated. Viscaria oculata formed very brilliant hues in the sun, and that lovely annual Linaria reticulata aureo-purpurea seemed quite at home, forming thick lines of its brown flowers tipped with gold. Others used with capital effect were, Convolvulus minor, blue; Lupinus nanus, a most serviceable annual which keeps a long time in good order; Omphalodes linifolia (Venus navel-wort); Nemophila insignis, Venidium calendulaceum (like a Calendula or pot-Marigold); Calliopsis Drummondi, Saponarias, and Eschscholzias. The latter were very well grown, and embraced all the newest shades of orange, salmon, salmon-pink, rose, and carmine. I must not forget that pretty little compact blue annual Kalfussia amelloides. Gazanias and a capital strain of Lobelia (Duthie Park blue), are propagated by cuttings and used in association with Pelargoniums in the beds near the entrance-gates. Dahlias are also largely grown, all the newest and best varieties of the Cactus class being much in evidence; but it was of the humble annuals, and the effective use made of them by Mr. Harper, that I took up my pen to write, and I have done so at a time when the experience at Duthie Park may be suggestive to others arranging for summer effects. I have already stated that Mr. Harper thoroughly cultivates his narrow borders in autumn and spring. He is never in a hurry to sow, and I think this is important. He waits until the end of April, or even until early May, and until the soil is, through weather conditions, in first-class sowing order. The plants are moderately thinned when in a small state, before they have time to get drawn up into a spindly condition. *William Cuthbertson, Rothesay.*

LAW NOTES.

MESSRS. R. H. BATH v. W. F. GILLETT.

At the last sitting of the Wisbech County Court, before His Honour Judge Willis, Messrs. R. H. Bath, Ltd., The Floral Farms, Wisbech, sued W. F. Gillett, of Conway Road, Cardiff, architect, under a default summons for £3, in respect of goods supplied. Mr. Leak, on behalf of the plaintiffs, said he did not think it was any use asking for an order for payment forthwith; the claim was for plants supplied for defendant's garden. The defendant was an architect, and they found that the furniture was in his wife's name.

His Honour remarked that might be so, and added, that a great service was rendered to the public by Messrs. Bath, who, in reply to advertisements, sent out goods that people might rely upon. No person like the defendant, however, should order those things without having the means to send the money direct. Eventually judgment was entered for the plaintiffs for the amount claimed, to be paid at the rate of £1 per month.

The Licensing of Gardeners.

A large meeting of nurserymen and florists was held on Thursday evening, February 16, at the seed warehouse of Messrs. Wm. Clibran & Son, Manchester, to receive a report from Mr. E. Collens, concerning his recent visit to London with Mr. Treeby, as reported in our issue of February 18.

Sir John Maclure, M.P., personally conducted the deputation to the Treasury Office, Whitehall, and they were introduced to the private secretary to the First Lord of the Treasury (the Right Hon. A. J. Balfour), by whom they were very kindly received, and the object of their visit was fully explained by Sir John.

Mr. Collens explained the position taken up by the trade as to the injustice of the case. The absurdity of the judgment was pointed out, and Mr. Collens' impression from the questions asked, and the way the answers were received, was that he (the secretary) was surprised at the judgment Mr. Yates had given.

The Secretary asked Mr. Collens to leave his notes; and a promise was given that the papers should be carefully perused, and that he would communicate with the deputation through Sir John Maclure.

The manner in which the deputation was received was gratifying, and the members came away satisfied that justice would be done to their case.

Mr. Collens then reported that he had had an interview the same day with Mr. Butcher, solicitor to the Nursery and Seed Trade Association, who stated that the association was anxious to take the matter up in London, and a special appeal case might be taken out and fought through the courts there.

Mr. Collens thought it would be advisable to leave the case in the hands of Mr. Butcher, and it was for the meeting to decide whether it should be proceeded with in Manchester as previously arranged, or whether it should be transferred to London.

After considerable discussion, in which Messrs. Yates, Hooley, Birkenhead, Watkins, Plant, and Brownhill joined, the following resolution, as proposed by Mr. Birkenhead, and seconded by Mr. Hooley, was carried unanimously:—

"That this meeting is of opinion that it would be better to wait the decision from the Treasury Office before proceeding any further in the matter; but in the event of the answer not being favourable, that the whole affair should be transferred to the hands of the Nursery and Seed Trade Association to proceed further with."

Mr. Birkenhead proposed, and Mr. C. Noyes seconded, that a very hearty vote of thanks be accorded to Messrs. Collens & Treeby for the very efficient way they had conducted the proceedings in London, and to Mr. Watkins for his services; also to Mr. Clibran for his valuable help, and for the use of the room for their meeting. This was carried unanimously.

Lord Bath and the Licensing of Gardeners.

In reference to the taxation of gardeners, we may recall the fact that the Marquis of Bath was summoned recently at Warminster for employing male servants without taking out licenses. The case for the Inland Revenue authorities was that fifty men were employed in the gardens and grounds at Longleat, and that twelve claimed to be under-gardeners were not licensed. The figures were admitted, and it was contended that twenty of the men were employed and received pay as ordinary labourers, and that licenses were not required. The Bench took this view and dismissed the summons, and allowed three guineas solicitor's fees.

Notice of appeal was given on behalf of the Inland Revenue. A similar decision was given a few weeks previously, and it was repeated in order to afford an opportunity for an appeal. *Devizes and Wiltshire Gazette.*

Obituary.

George Smith, Vice-Regal Gardens, Dublin.—It is with deep regret that we learn of the death of this veteran and much-respected member of the horticultural craft. Mr. Smith died on February 19 at his residence at the Vice-Regal Gardens, deeply mourned by his family, and regretted by his numerous friends. An impressive funeral service was held in Rutland Square Presbyterian Church on Wednesday morning at 9 o'clock, after which the funeral took place at Mount Jerome Cemetery.

Mr. Smith was seventy-three years of age, and of Scottish extraction, and had been in charge of the Vice-Regal Gardens in the Phœnix Park for about forty years, during which time it was celebrated for its good and artistic management. In the early days of flower gardening the bedding out at these gardens was perhaps the earliest and best in Ireland. The vineries are extensive, and contain one or two remarkable Vines, grown on the extension principle.

Formerly under the control of the Lord Lieutenant for the time being, the gardens have of recent years been under Mr. Smith's more immediate care. Standing as they do close beside the Vice-Regal Lodge, and in the centre of the noble Phœnix Park (with its groves of native Hawthorn, and splendid groups of Elm-trees planted by the Earl of Chesterfield), these gardens are very beautiful, and contain a very healthy and interesting collection of memorial trees, most of them planted by H.M. the Queen, the late Prince Consort, and their children.

It is not too much to say that while under the earlier management of Mr. Smith, under Vice-Regal auspices, these celebrated gardens have been of immense value as an efficient working school of gardening. Not only were they an excellent example to the country at large—the best of object-lessons—but from their precincts good and capable men were engaged for other gardens throughout Ireland. Mr. Smith leaves a widow, also a son and a daughter, to whom we tender our most respectful sympathy in their sad loss.

Rev. A. Headley.—We regret to see the death announced, in the *Journal of Horticulture*, of the Rev. A. Headley, on February 15. The deceased clergyman was a frequent contributor to the pages of the *Journal*, and the originator of the phrase "Our Journal," as applied to it.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

February 14.—*Present:* Mr. McLachlan, in the chair; Mr. Hudson, Rev. W. Wilks, Mr. Michael, and Rev. G. Henslow, Hon. Sec.

Diseased Apple-twigs.—These were received last December from Rev. A. Foster-Melliar. Prof. W. E. Smith, after a prolonged and difficult investigation, has pronounced the disease to be due to bacteria, and forwarded the following interesting report:—"The portions of branches of Apple sent show a disease with the following characters. The wood is sound, except where in contact with the bark; the bark is completely disorganised, with the exception of the hard fibres and the dry outer corky layer. Investigations for signs of fungi or insects made on arrival of the material (December 10) gave no result. Portions were placed in a moist chamber and examined during January. The bark became soft and spongy, no fungus-growth appeared, but bacteria were found in numbers. Amongst other bacterial forms, a bacillus was common which agreed with that figured by Duggar (*Cornell University Bulletin*, 145, 1898). Other symptoms, as far as presented by the material sent, agreed with American descriptions of the bacterial disease "fire-blight." We have, however, no record of the tree having blackened twigs or leaves during last summer—an important symptom of this disease. "Fire-blight" was proved, chiefly by the work of Burrill, in 1880, to be due to the action of bacteria. A good general account, based on further research, is given by Waite (*Year Book of the U.S. America Department of Agriculture*, 1895). The disease appears in America on Pear and Quince oftener than on Apple, and is also known on allied species. It attacks chiefly vigorous well-fed trees with much soft young wood, similar, in fact, to this Apple-tree as described by your correspondent. A warm moist season or situation favours the disease; dry weather checks it, and during winter it makes little progress. The remedy is to prune off thoroughly all parts which show discoloured or destroyed bark, and to carefully burn them. Pruning is best done in autumn or spring. The cuts must be made well below diseased parts, and large wounds should be painted with tar. If the pruning be severe, it may induce a large growth of young wood next season; this must be carefully watched, as it is an excellent starting-point for a reappearance of the disease. The bacteria are propagated by insects, which visit a gummy fluid containing bacteria, which is given out from diseased parts of the bark. Then they visit a similar fluid exuded from the bark where exposed by cutting, boring insects, or other agents, and they infect this with bacteria. A similar fluid in the flowers also tempts insects there, and the bacteria thus introduced destroy the fruit crop." A unanimous vote of thanks was given to Professor Smith for his valuable report.

Lourya campanulata.—Mr. Jas. Hudson exhibited a specimen of this uncommon plant in blossom, of which figures will be found on p. 117.

Pear-tree with Caterpillar.—Mr. McLachlan showed a twig with the interior eaten away by the caterpillar of the wood leopard moth, Zeuzera Æsculi. It was received from Mr. N. Nutter, of Leigham Cottage, St. Julien, Old Streatham. The best remedies for this and boring-beetles is to run a stout wire up the gallery and pierce the grubs. Petroleum, or spirits of turpentine, poured down the hole would also probably be effective in destroying them.

Richardia, two-spathed.—Rev. H. F. Goffe, Thoresway, Caistor, forwarded a specimen in which the uppermost leaf had assumed the form of an additional spathe—a not uncommon phenomenon. It was hoped that experiments would be made to fix this peculiarity if possible.

Cedar with aërial roots.—The following communication was received from Mr. J. W. Odell, The Grove, Stanmore, together with photographs of the tree described, and a large mass of aërial roots:—"During the recent heavy gales considerable damage was done to one of the large Cedars of Lebanon in Mrs. Brightwen's grounds here; a huge branch was torn from the parent trunk, and revealed a very curious growth of aërial roots. I forward to you with this letter photographs showing the broken branch in two positions, and also a part of the very large growth of adventitious roots. You will observe on photograph (marked *A*) a large scar, corresponding in size and shape to the base of the branch on photograph marked *B*. The roots sent were growing from the edges of the contiguous portions of the trunk and broken branch, and grew downwards from this position towards the base of the tree, but had only penetrated so far as is indicated by a small branch at the base of the scar (seen on both photographs). Both on the branch and on the scar left on the trunk the wood is very much splintered, and the roots were found not only in a large mass as sent, but also growing in between the splintered portions of the wood. The appearance of the fracture indicates, I think, some previous injury (perhaps by lightning), and as a consequence some moisture may have penetrated into the union between the trunk and the branch. I have once or twice before seen similar roots in broken pollarded Willows, but have never observed the formation of such adventitious roots in a Conifer, and thought perhaps it would have some little interest for your committee of the R.H.S."

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT.

February 4.—The monthly meeting was held at Newport on the above date, Dr. J. Groves presiding over a good attendance.

Mr. George Bennett, florist, Ryde, gave an interesting lecture on the "Cultivation of Potatos," several of his remarks leading to considerable discussion, as they were quite contrary to the general practice of Potato-growers. Mr. Bennett recommended the planting of sets without shoots or spears, and to be put at a depth of about 9 inches, to render it unnecessary to earth them up. Amongst the varieties for general cultivation he recommended Up-to-Date, White Beauty of Hebron, and Suttons' Satisfaction.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

February 9.—On the occasion of meeting held at the Coal Exchange, Manchester, on the above date, there were present, Messrs. G. Shorland Ball (in the chair), Thomas Statter, J. Leemann, H. Greenwood, J. Cypher, R. Johnson, and Thomas Mills (Hon. Sec.).

Thomas Statter, Esq., Stand Hall (gr., Mr. Johnson), showed Cypripedium insigne Luciani, receiving a First-class Certificate; C. Wiertzianum (Rothschildianum × Laurenceanum), First-class Certificate; and Dendrobium Whitefieldi (Leechianum × albiflorum), an Award of Merit. G. W. Law-Schofield, Esq., New Hall Hey (gr., Mr. Shill), showed Dendrobium Ainsworthianum (First-class Certificate); also a yellow form of Cypripedium insigne. John Leemann, Esq., Heaton Mersey (gr., Mr. Edge), showed Cattleya Trianæi, West Bank House var. (Award of Merit); C. T. Chevalieriana (Award of Merit); Lælio-Cattleya Gottoiana (Award of Merit); Cyp. nitens superbum; Cyp. Creon; Dendrobium Wardianum candidum (Award of Merit); Maxillaria Lindeniæ (Award of Merit); and Cattleya chocoensis alba (Award of Merit). This exhibitor received also a Silver-gilt Medal for a miscellaneous group.

H. Greenwood, Esq., Haslingden (gr., Mr. Gill), showed Dendrobium Cybele roseum (Award of Merit); D. nobile Murrhinianum (Award of Merit), and a group of Dendrobiums for which he received a Vote of Thanks. Mrs. Briggs, Bury, Accrington (gr., Mr. Wilkinson), showed Cyp. Beckmanni (First-class Certificate); Cyp. insigne, Harefield Hall var (First-class Certificate); Odontoglossum hybrid (First-class Certificate); and O. crispum (Award of Merit). O. O. Wrigley, Esq., Bury (gr., Mr. Rogers), showed Cyp. Lathamianum aureum giganteum (Award of Merit); C. L. inversum (Award of Merit); and Dendrobium atroviolaceum.

A. Warburton, Esq., Haslingden (gr., Mr. Lofthouse), showed Odontoglossum crispum Jeanette (First-class Certificate), Cattleya Trianæi Imperator (Award of Merit), and Cypripedium Prewetti.

W. Duckworth, Esq., Shaw Hall, Flixton (gr., Mr. Tindale), showed Dendrobium Schneiderianum. C. J. Crosfield, Esq., Sefton Park, Liverpool, showed Cattleya Trianæi Jean Ritchie and Odontoglossum crispum Crosfieldianum.

Mr. James Cypher, nurseryman, Cheltenham, showed Lælia anceps Schroderiana (First-class Certificate); also a miscellaneous group, for which he was awarded a Silver Medal.

Mr. John Robson, Altrincham, showed Dendrobium Dominianum (Cultural Certificate). Messrs. Stanley-Mobbs & Ashton, Southgate, showed Cypripedium Spicero-Chamberlainianum.

RENFREWSHIRE GARDENERS' MUTUAL IMPROVEMENT.

February 10.—A meeting of the Renfrewshire Gardeners' Mutual Improvement Society was held on this date; Mr. Robert Macfee presided, and there was a good attendance.

Mr. John Ferrier, foreman in the gardens, Craigends, read a paper on the "Vine," giving an account in a clear and practical manner of the methods required in successful culture.

Mr. Dewar, Curator, Botanic Gardens, Glasgow, read a paper on "Rambles in Switzerland." Mr. Dewar was on a botanical expedition in Switzerland, and his description of the flora of the Alps was of great interest.

Thereafter, Mr. John Stewart, gardener, Cartvale, showed, by the aid of lantern-slides, a large number of pictures of Swiss scenery, which were much appreciated.

READING & DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

February 13.—An interesting lecture on "Destructive and Injurious Sawflies" was given on the above date before the members of this association, by Mr. P. H. Foulkes, B.Sc. Edin., of the Reading College.

In introducing the subject, the lecturer said that sawflies belonged to the order Hymenoptera, which included all those insects which had wings of a membranous character, and that this particular order was also divided into various classes. The flies touched upon were the Apple sawfly, Gooseberry and Currant sawfly, Cherry and Pear sawfly, and the Turnip sawfly. Their time of appearing, method of attack, the best means to take for their prevention or destruction, and the various stages of growth, were fully dealt with, the latter more particularly so by the aid of several illustrations shown by limelight.

SHERBORNE GARDENERS' MUTUAL IMPROVEMENT.

At a meeting recently held, an address was given by Mr. Crook, gardener of Forde Abbey, on "Profitable Fruit-culture."

After asserting that the demand for good fruit was increasing, and that fruit cultivation, if properly carried out, was a paying business, he maintained that Cox's Orange Pippin, the qualities of which it took the English thirty years to recognise, had been pronounced by expert judges to be the best Apple of the day, and a man who understood his business would not sell it for less than 2*s.* per dozen. The West of England was one of the best parts of this country to grow fruit; but what did they find in their orchards? Miserable crabs. If they planted Apples like the Cox's Orange Pippin, they would make money instead of sending it out to America, Tasmania, and California. He had seen Blenheim Orange in Yeovil Market for which 3*d.* per lb. was asked, and they would be astonished at the figure that worked out per bushel. He had gathered 110 lb. off a Lane's Prince Albert, which was only 7 feet high, and 7 feet in diameter; and another tree, Seaton House, which was introduced from Scotland, and bears early, would pay to grow.

WARGRAVE AND DISTRICT GARDENERS'.

February 15.—At the fortnightly meeting held on the above date, Mr. T. Haskett, gr. to J. W. Rhodes, Esq., Hennerton, read a paper on "Kitchen Gardening," describing what a kitchen-garden should be, and the great amount of forethought necessary to keep a garden as it ought to be kept.

The soil and situation best suited for such a garden were dwelt upon, and the proper methods of digging, trenching, and ridging explained.

DUMFRIESSHIRE AND GALLOWAY HORTICULTURAL.

February 18.—A special meeting of the committee was held on the above date. The prize schedule for the forthcoming show was finally revised, and the show will be held in the Drill Hall, Dumfries, on Wednesday, September 6.

After some discussion as to the desirability of inaugurating a course of lectures on some of the more popular flowers in their season, it was agreed to give a lecture on "Daffodils" in April.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS.'

February 20.—The monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on the above date, the President, W. F. G. Spranger, Esq., C.C., presiding over a good attendance of members.

The lecture was under the auspices of the Technical Education Committee, Southampton County Council, and was given by Mr. E. T. Mellor, B.Sc., London Lecturer in Biology at the Hartley College, Southampton.

"The Influence of Light on Plants," was the subject of the lecture, which was amply illustrated by means of lantern slides and experiments. A few questions were put to the lecturer and answered, and at the close a vote of thanks was heartily accorded to Mr. Mellor for his most interesting lecture. There was a nice display of spring-blooming plants, contributed by the members; and Mr. Curtis, gr. to the President, was awarded 1st prize for three sorts of forced vegetables. During the month there was also an excursion of a large number of the members to chemical works of Messrs. Spooner & Bailey, Eling, near Southampton, by special invitation from the firm. Mr. E. Bailey courteously showed the party over the works, explaining in all its details the manufacture of chemical manures.

ROYAL GARDENERS' ORPHAN FUND.

The Annual Meeting.

February 17.—The annual meeting of the supporters of this excellent institution was held on the above date at Anderton's Hotel, Fleet Street, London, E.C. Among the company present, which was larger than usual, were noticed Messrs. W. Marshall, H. J. Veitch, Dr. M. T. Masters, W. Roupell, Geo. Gordon, J. Assbee, A. W. G. Weeks, W. Poupart, H. B. May, H. J. Jones, C. E. Osman, J. Smith, P. Rudolph Barr, A. Outram, A. F. Barron, R. Dean, B. Wynne, A. Dean, W. H. Divers, &c.

The minutes of the last meeting having been read by Mr. B. Wynne, and adopted by those present, the Chairman (W. Marshall, Esq.) moved the adoption of the Committee's Report, which ran as follows:—

Report and Statement of Accounts for the Year ending December 31, 1898.

At the close of the eleventh year since the institution of the Fund, your committee are enabled to announce that it is gratifying to find that there is an increase in the annual subscriptions, though the committee are compelled to admit that they have not hitherto received that measure of support from the gardeners of the kingdom that they hoped for in the early days of the Fund. The financial support received has largely been derived from sources, the existence of which was scarcely contemplated at the outset, such as receipts from the sale of flowers at horticultural exhibitions, the opening of gardens and plant-houses to the public, concerts, &c. Gardeners' societies in particular have given a generous measure of support which materially assisted the Committee in administering relief to the fatherless when it was most urgently needed. In view of the number of applicants for the benefits of the Fund, your Committee do most earnestly appeal for the sympathy and support of the entire gardening community, and especially to that section of it for whose orphan children the assistance afforded by the Fund is solely intended.

There are now sixty-eight children receiving the benefits of the Fund, in addition to those to be elected this day. Most gratifying assurances are constantly being received from the mothers of orphan children, to the effect that the assistance rendered during the time the child was on the Fund, proved of unspeakable advantage to many a struggling widow; and not less satisfactory has been the testimony borne to the timely and valuable aid rendered to some orphans in giving them a start in life after they had ceased to be chargeable to the Fund.

The total number of children who have been placed on the Fund since its foundation is 103, and the total amount paid to the orphans is £6836 15*s.* Special grants in aid have been made this year to the amount of £18 5*s.*

The annual festival took place at the Hôtel Métropole in April last, and the committee were fortunate in securing the valued services of Charles E. Keyser, Esq., Aldermaston Court, Reading, High Sheriff of Berkshire, as their chairman, whose forcible appeal in aid of the Fund assisted in realising the sum of £557 11*s.*

Your committee have great pleasure in placing on record their high sense of the important services rendered to the Fund by the treasurer, N. N. Sherwood, Esq., whose generous support of the charitable institutions connected with horticulture is so keenly appreciated by the whole gardening community; and they give hearty thanks to their auditors, Messrs. Martin Rowan and P. Rudolph Barr, for bestowing so much attention in auditing the accounts. Mr. Barr is the retiring auditor, and is nominated by your committee for re-election.

By the death of Baron Ferdinand de Rothschild, the fund loses one of its vice-presidents, and a generous supporter for several years past. The committee recommend that C. E. Keyser, Esq., be this day elected a vice-president to fill the vacancy.

It is with great regret that your Committee have to announce the retirement of Mr. A. F. Barron from the post of secretary to the Fund through failing health. As one of the chief promoters of the Fund, and its secretary since its establishment, Mr. Barron has done much to further its interests, and merits the best thanks of all interested in gardeners and gardening; and in consenting to be nominated for election as a member of the Executive Committee, Mr. Barron proves his devotion to the Fund, and his ready willingness to continue to afford assistance in carrying on the good work. The committee unanimously express their sympathy with Mr. Barron, and their best wishes for his improved health and well-being.

Mr. G. W. Cummins has resigned his seat on the committee, and Mr. T. Peed, Roupell Park Nurseries, S.E., has been elected to succeed him. The members of committee who retire by rotation are Messrs. Cuthbert, Laing, Lyne, Nicholson, Osman, Poupart, Smith, and Walker. These, with the exception of Messrs. Nicholson, Smith and Laing, being eligible, offer themselves for re-election. The committee nominate Messrs. A. F. Barron, Chiswick; J. Cheal, Crawley; and W. Howe, Park Hill Gardens, Streatham, for election this day.

The committee, having advertised for a secretary, have considered the numerous applications, and recommend Mr. Brian Wynne for election at a salary of £100 per annum.

CASH STATEMENT FOR THE YEAR ENDING DECEMBER 31, 1898.

Having inspected the securities and examined the books and vouchers supplied to us, we hereby certify the above account to be correct. (Signed) P. Rudolph Barr } Auditors.
M. Rowan }

Dated January 21, 1899.

There was general satisfaction with the nature of the above report, and after the chairman's proposition had been seconded by Mr. A. W. G. Weeks, the report and cash statement were accepted without discussion.

Election of Officers.

Proceeding to the election of officers, Mr. R. Dean moved a vote of thanks to Mr. N. N. Sherwood for his services as Treasurer to the Fund, and at the same time moved Mr. Sherwood's re-election, which, after being seconded by Mr. Osman, was carried with enthusiasm.

Mr. P. Rudolph Barr was then re-elected joint-auditor on the proposition of Mr. H. B. May, seconded by Mr. A. Outram. The re-arrangement of the committee, as proposed in the above report, was also duly effected, and no counter-propositions were made.

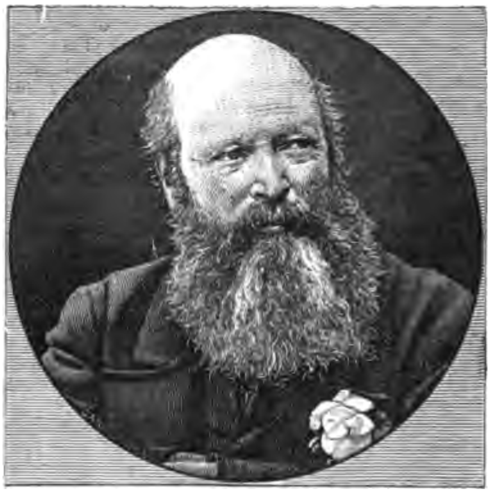
Proceeding to the election of secretary, the chairman announced that the committee had received 291 replies to their advertisements for a secretary in the room of Mr. Barron. A sub-committee had been appointed, who after several sittings had eventually selected six candidates. These were each balloted for by the whole of the committee, and the result was in favour of Mr. Brian Wynne. The Chairman had, therefore, to propose the election of that gentleman by the meeting. He said they all knew how Mr. Wynne had lent a helping hand to Mr. Barron for some years past, and there was no one better suited for the position. The proposition was seconded by Mr. R. Dean, and passed unanimously without further discussion. Mr. Wynne then thanked the meeting for its confidence, and pledged himself to further the interests of the Fund to his utmost ability.

Mr. H. J. Veitch next proposed a resolution thanking Mr. A. F. Barron for his labours on behalf of the Fund since its inception eleven years ago, which for some years was done without pecuniary reward. Also that there be presented to Mr. Barron an illuminated address upon vellum. It was with the deepest regret that Mr. Veitch moved such a resolution, knowing the circumstances of Mr. Barron's health that have led up to his retirement. We can only hope, said Mr. Veitch, "that with the relaxation of duties it may please God to spare him for many years to come."

Dr. Maxwell T. Masters, who seconded the motion, said, the meeting was in perfect unison with the sentiments expressed by Mr. Veitch. They were all deeply grateful to Mr. Barron. The chairman added that everyone knew what a great deal Mr. Barron has done from pure love for the gardening fraternity. Mr. Barron thanked the meeting in tones scarcely audible for their kind words, and said that it gave him much pain to relinquish his duties. He hoped, however, to be of further service to the Fund as a member of the Committee.

Alteration of Rules.

Rule V.—Upon the recommendation of the Committee, it was decided in Rule V., line 4, after the word "purpose," to omit the words "All donations and legacies," and to insert the following:—"All receipts, except legacies and donations specially given as such for investment, shall be considered as subscriptions, and be available for current expenditure. All legacies and special donations."



MR. W. MARSHALL,
Chairman of the Committee of the Royal Gardeners Orphan Fund.

Rule XI.—Line 5, after the word "require," the following addition was made:—"Not more than two children of the same family can be in receipt of the benefits of the Fund at the same time." The chairman explained the circumstances that had led the Committee to propose this alteration, and letters were read from Mr. J. B. Stevenson and Mr. J. Miles, honorary local secretaries at Bournemouth and Southampton respectively, in which they advocated even a more stringent regulation than that proposed.

Mr. A. Dean suggested that at a future time it would be expedient to insist that there must be four children under twelve years of age in a family before two of its members could be upon the fund at the same time. The alteration as proposed by the committee was carried unanimously.

Election of Candidates to the Fund.

The chairman stated that of the nineteen candidates for benefit from the fund the committee recommended that nine be elected. Two of the nineteen had left this country, and were therefore not eligible—these were James Seegar and Eugenia Seegar. Anyone present who had voted for either of these children could transfer them.

The scrutinising committee subsequently reported that the following nine children were elected:—

Alice Gilhorne Seaton	375 Votes.
Muriel Gutteridge	373 ,,
Daisy Agnes Spong	282 ,,
G. H. Donaldson	256 ,,
Jas. Henry Tanton	250 ,,
Helen Macdonald Milne	217 ,,
Isabella Emma French	205 ,,
Vanda Mary Bartlett	200 ,,
Harry John Mason	195 ,,

In regard to one of the unsuccessful candidates, Arthur George Wood, a second scrutiny was asked for, and it was found that the votes recorded for him were 190.

At six o'clock in the evening, a friendly dinner of the members of the committee and friends was held, under the presidency of Mr. W. J. Nutting.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.: 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending February 18, is furnished from the Meteorological Office:—

"The *weather* was again very mild, unsettled, and rainy generally. Thunder-storms were experienced at some of the Irish and English stations between the 12th and 14th. Some improvement took place over the greater part of England during the latter part of the week, and fog became general over England on the 18th.

"The *temperature* was above the mean, the excess ranging from 2° in Ireland, to as much as 6° in 'England, S.,' and 7° in 'England, E.' The highest of the maxima were recorded on the 17th, when they ranged from 63° in 'England, S.W.' (at Llandovery), and from 58° in the 'Channel Islands' and 'England, E.,' to 51° in 'England, N.E.,' and to 50° in 'Scotland, W.' The lowest of the minima were registered on the 16th, and ranged from 27° in 'England, N.E.,' and from 29° in 'Ireland, S.' to 36° in 'England, S.,' and 37° in the 'Channel Islands.'

"The *rainfall* was rather less than the mean in 'England, N.E.,' and just equal to it in 'Scotland, W.,' 'Ireland, N.,' and the 'Channel Islands.' In all other districts there was some excess, the fall in the 'Midland Counties' and in 'England, S.W.' being nearly double the normal value.

"The *bright sunshine* was in excess in most parts of the kingdom, but somewhat deficient in 'Scotland, N. and E.,' and 'England, S.W.' The percentage of the possible duration ranged from 37 in 'England, E.,' 34 in 'Ireland, S.,' and 33 in 'England, S.,' to 22 in 'Scotland, E.,' and 10 in 'Scotland, N.'"

Answers to Correspondents

Begonia: *S. P.* The rust is due to the attacks of a mite (Sarsonymus); parasitic fungi follow. Burn any hopelessly-affected plants, and fumigate the rest mildly once a week; or dip the plants in weak Tobacco-water.

Books: *Woodman.* *A Manual of Forestry*, by W. Schlich, published by Messrs. Bradbury, Agnew & Co., Ltd., 8, 9, 10, Bouverie Street, Fleet Street, E.C.

Cattleya: *X. Y.* Judging from the poorly developed flower sent, it is C. Trianæi, pale form.

Cyclamen Flowers of two colours on one plant: *James McCulloch.* It is no uncommon occurrence for these plants to "sport."

Ericas: *J. T.* Erica hyemalis is not included in *Index Kewensis*, being a hybrid. The proper spelling of the name of the other variety mentioned is E. Wilmorei.

Failure of Bulbs of Tulips and Hyacinths: *W. B.* The Tulips sent are not of flowering age; and the Hyacinth was forced before its roots had made much progress, hence the abortive flower-shaft.

Fungus on Lucerne: *H. B.* The fungus is Pseudopeziza medicoginis, Sacc., a well-known parasite on Lucerne. As spraying is practically out of the question, the best course to follow is to cut diseased patches as soon as possible, so as to prevent the extension of the fungus by means of spores. Strewing the ground with straw or other litter, and firing, helps to arrest the disease, by destroying infected leaves that have fallen to the ground. *G. M.*

Leaf-bud and Fruit-bud: *F. A. B.* The buds are readily distinguished, a fruit-bud being larger, thicker, and more abruptly pointed than a leaf, or, in gardeners' parlance, a "wood-bud." Some varieties of Pears, of which Marie Louise and Jargonelle are examples, produce their finest flower-buds at the tips of spurs of 6 to 8 inches in length, and this fact should not be lost sight of by the pruner. In order to prevent a tree of these or similar varieties getting inordinately furnished with these long fruiting-spurs, spurs in three different stages should be encouraged: that is, spurs hard cut back, spurs singled out from the best-placed of the shoots the result of this hard pruning; and, finally, the fruit-bearing spurs. These may be obtained in pretty regular rotation on every branch. As the lowermost branches of a Pear tree seldom fruit so abundantly as the upper ones if pruned like them, the fruiting spurs should be allowed to grow long, and they may even be nailed to the wall between the branches, if space permits; or they may hang outwards from it to the extent of 1 foot.

Manuring Vine Borders: *E. B.* Cow-dung is of very little value as a manure for Vines; oxen-dung from the feeding shed is far superior, but it should not be applied before it has partially decayed. Do not apply it if the soil is heavy, nor plaster it over the border, as doing this would hermetically close the soil against the entry of air and roots need air. Better employ manure water during growth alternately with clean water. Some of the patent artificial vine-borders are good stimulants to apply before affording water.

Melons and Cucumbers in a Stove: *E. B.* The treatment required by Melon and Cucumber plants is scarcely required by the inmates of the ordinary stove, and either the stove-plants or the fruits must suffer. How, for example, could you afford the necessary dry air that a ripening Melon requires if its flavour is to be passable, or the suitable sort of ventilation? The conditions usually obtaining in a fruiting Pine-stove, a tropical aquarium, or Palm-house, would suit the Cucumber better, but Melons grow best by themselves, as they need special treatment.

Myrtle Losing its Leaves: *C. J. P.* The leaf sent shows that the plant has been greatly infested by white thrips, a common pest on the Myrtle in dry greenhouses. The plant should be taken from the wall and well cleaned with petroleum emulsion or Gishurst compound-soap, applied according to the printed directions on the box. Except during winter a Myrtle should be well syringed, twice or thrice a week, and whilst growing actively twice daily, which will do much towards keeping it free from thrips and red spider.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*T. T. W.* 1, Daphniphyllum glaucescens; 2, Daphne Mezereum; 3, Elæagnus pungens variegata; 4, not recognised, perhaps a Lonicera; 5, Quercus cuspidata; 6, Leycesteria formosa.—*Alpha.* Bletia hyacinthina.—*P., Penge.* These Adiantums have so varied by garden forms, that it is not easy to determine exactly what they are. Yours seem to be:—1 and 3, Adiantum decorum; 2, Adiantum cuneatum variety; 3, Adiantum Williamsii; 5, Adiantum cuneatum. The dead piece of Orchid is probably Oncidium flexuosum.—*M. R. M., Neath.* A very fine variety of Cattleya Trianæi.—*C. K.* 1 and 2, varieties of typical Cœlogyne cristata; 3, C. cristata alba (hololeuca); 4, C. cristata Lemoniana.—*Artus.* 1, Pinus excelsa; 2, Juniperus communis; 3, Phyllirea media; 4, Prunus lusitanica; 5, Jasminum nudiflorum; 6, Cotoneaster Simonsii.

Narcissus: *R. C. H.* It is not an uncommon occurrence.

Nespula: *W. K.* Loquat Eriobotrya may be intended. The Japanese Medlar is called by the French, Neflier du Japon. In the event of your plant being either of these, ordinary cool greenhouse treatment is all it wants.

Peach Fruits Splitting: *Nireus.* An abundance of water suddenly saturating the soil may, as you suggest, be the cause of the splitting of Peach fruits when approaching ripeness. If the trees be fed with stimulating manures at the time, or the atmosphere charged with excessive moisture, these circumstances would aggravate the malady. An article upon the subject was published in the *Gardeners' Chronicle*, September 10, 1898, p. 198.

Plants and Gas used with Incandescent Burner: *G. W.* The amount of gas issuing from the vent, being less than with the ordinary one, the injury to plants exposed to the fumes would be correspondingly less.

Potatos for Planting: *Old Subscriber.* Abundance, Chiswick Favourite, Early Regent, Magnum Bonum (late), Schoolmaster, Snowdrop (late), The Gentleman. The above are good croppers, of handsome shape, and fine quality. Improved Ashleaf is the finest early variety, but it crops only moderately.

Potato Grub: *Old Subscriber.* Liming will be found the best remedy. Gas-lime might be used in small quantity this season, and in greater quantity in early autumn, for the following spring planting. Quick-lime only should be used at the rate of 40 to 50 bushels per acre.

Primula sinensis with Foliaceous Flower: *C. R. S.* Such specimens are interesting, because they prove what botanists always insist upon, that the organs of a flower are modifications only of leaves. Hence, occasionally, and for reasons we cannot explain, the one is substituted for the other. The specimen sent is not a "novelty of merit," but a "monstrosity," or an instance of irregularity in the growth of a particular plant.

Purple Crocus: *X.* Omitted last week. No. 1, Crocus Imperati.

Scorzonère, of the French: *J. A. G.* This is our Scorzonera, an edible root cultivated similarly to the Carrot. The seed may be sown in March in drills 10 to 12 inches apart, and the plants thinned early to a distance of 4 to 5 inches apart. The ground should be hoed occasionally. If the spring be dry, the seed may be afforded water a few times. It is a hardy plant, and need not be lifted in the autumn unless the ground is required for something else.

Spanroofed-house: *Alpha.* Your data are insufficient, as you should have given the height of the side walls to enable us to calculate the cubic contents.

Strawberry Field: *Strawberry.* You should obtain the services of a horticultural valuer to inspect the field, and then fix the prospective value of the next crop.

Strawberry Forcing-houses, &c.: *C. D.* Very early forcing is perhaps best carried out in lean-to houses, but later fruits are just as well brought on in low span-pits, fitting these up with central staging, and ample means of ventilation. Such a house may be sunk in the soil 2 or more feet, and thus economise fuel, or at least avoid the use of strong heat. It should run north to south. The plants should be grown in flower-pots, 5 inches wide for the earliest batches, and 6 to 7 inches for later ones.

Trichopilia: *Veritas.* T. Galeottiana flowers in August; T. coccinea (marginata), in May and June; and T. Warneri (probably T. Wageneri of Reichenbach is meant which differs scarcely at all from T. fragrans), flowers in the winter season.

Vines in Flower: *E. B.* The Vines may be accommodated with temperatures by day with fire-heat alone, that is, on cloudy or cold days, of 65° to 68°; but with sunshine and but little artificial heat, 70° would not be too high, air being afforded, for without air admitted to the vinery, the setting of the flowers will not be satisfactory. The temperature in the afternoon may range at closing time from 65° to 70°; at 6 P.M., 60°; and at 6 A.M., 55° to 56°. There must be little fluctuation of temperature allowed at this critical period. We cannot say if high temperatures have caused injury, only a person on the spot would be enabled to decide that point. The Muscat Vine in the vinery, if not at the warmest end, may fail to set satisfactorily. You should have covered the outside border a month or two ago with stable-dung and tree-leaves, over which shutters, tarpaulin, frame-lights, should have been placed to ward off the wet and retain heat in the materials. If this bed be made 2 feet thick, it is not likely to cause harm. It is not yet too late to be of use. If you have none of the above things, cover it with straw-thatch, and lay some long poles across the thatch to keep it in position. The bed may need a partial renewal with warmed materials once or twice before the increasing sunheat calls for its renewal. Do not remove it all at once.

Wireworm: *W. B.* Very difficult to eradicate; quicklime dressings, and quicklime dug and trenched into the soil does good. Fallowing after dressing the land with soot and salt, or gas-lime laid on an inch thick, are beneficial. After all, deep cultivation, that is, burying the top spit where the creatures abound three spits deep, will work wonders in freeing the land if persisted in once in three years. They must have access to the air; therefore, shallow soils, which do not admit of deep digging, are usually the worst infested. In gardens where the wireworm is a plague, it is advisable to sow seeds of the Lettuce—a plant it is very partial to—alongside, but a foot or more distant from lines of Carrots, Parsley, Cabbage, Cauliflower, &c.

BUD VARIATIONS.

WE find in the *National Nurseryman*, published at Rochester, New York, the following remarks on sports and bud variations which are of special interest to fruit-growers, and which we therefore take the liberty to transcribe :—

"An instructive paper on the application of plant breeding through bud selection, to the improvement of varieties, was read by G. H. Powell, horticulturist, of the Delaware Experiment Station, at the tenth annual meeting of the Peninsula Horticultural Society at Milford, Del. In the course of his paper he said :--

Every bud on a tree produces an offspring which can be distinguished from every other offspring, just as every seedling. The distinction between a seedling variety and the fruits produced on a single tree lies only in the degree of difference between them. The reason for this is, that no two trees or no two buds on a tree exist in exactly the same conditions of life. The tree should be considered not as a single individual, but as a collection of individuals, with the bud as the unit. Among the many individuals, or buds, on the tree, there is the most intense struggle for existence. Some buds receive more light, more air, more room in which to grow and expand, and more plant food, and from these unequal conditions there result strong branches, weak branches, long branches, short branches, and dead branches. In fact, no two branches are ever alike, because no two are placed in exactly the same conditions.

In the same way, no two fruits are ever produced exactly alike, because the buds from which they come and the conditions in which they develop are always slightly different. So it happens that in an Elberta Peach-tree the fruits will be large or small, roundish or pointed, highly coloured or pale, or some other peculiarity distinguishes one Peach from every other Peach.

This variation existing in the buds of a tree is one of the most important principles underlying all vegetable life, and is particularly important in horticultural operations, because the variations which are manifest in the buds of a plant are transmitted through propagation.

The practical fruit-grower knows that some trees never bear, that some trees occasionally bear, and that some trees always bear. Further, if he were to examine the branches of a single tree through a series of years, he would find the same phenomenon pertaining to individual branches.

I have in mind a Currant plantation which contains some 10,000 bushes of Fay's Prolific, which came directly or indirectly through cuttings from twenty-five Fays, purchased at 1 dol. each some ten or twelve years ago. The original bushes were uniform in size, and heavy bearers. As the Fay Currant was one of the best varieties extant twelve years ago, and the plants were scarce, the cheapest way to secure a plantation was to take cuttings from a few bushes. In the haste for a large number of plants, the new wood was cut from these bushes every fall. When more bushes were established, they were divided into cuttings as fast as new wood was made. Little attention was paid to the bearing capacity of the bushes in the second generation, from which the cuttings were taken, because the original twenty-five were exceptionally heavy bearers. The result at the present time is 12,000 Fays, some of which are tremendous bearers, others light bears, while still others produce no fruit at all.

The question arises, how could this condition have happened if there is not the widest variation in bearing tendencies in the buds of the Fay Currant?. It may be answered, that the soil in which the plants grew was the immediate cause of these wide variations in the Fay plantation. But this is not true, as the soil is uniform and in a high state of culture, and the Fay is an uncertain bearer everywhere. The explanation, it seems to me, is not difficult to understand. When the Fay was first introduced, every Currant-grower wanted Fays, and it was necessary for the propagators to use all the available wood produced, without reference to the bearing-habit or constitution of the bushes from which the wood was taken. Now, if a hundred cuttings are taken from a bush that seldom bears, we have simply started 100 new bushes with a similar tendency; and if 100 are taken from a bush that always bears, the bearing-habit is likely to be transmitted to the new bushes.

If the differences in the buds of a tree can be propagated by grafting or budding, or by other means, then here is a principle on which to begin the systematic improvement of existing varieties. The propagator has only to form a clear idea of the type of Baldwin or Spy Apples he desires, and then to select through each generation buds from branches which bear Baldwins or Spys approaching his ideal. There are numerous examples of bud variations in the various strains of Baldwins, Greenings, or Crawfords. These strains are simply bud variations induced by climate or other causes. In Virginia the Albemarle or Newtown Pippin differs from the New York Newtown. In Oregon the Apple has slight ridges around the stem, and the fruit is oblong in form; while in New South Wales, the ridges are so pronounced that the Apple is called the Five Crowned Pippin.

Horticulture in its variety making and improving is not founded on any law which assures improvement in the organic world. Nature builds up her types gradually, but all the more surely, by the selection in each generation of variations which give the survivors some slight advantage over the individuals already existing. This process has been called by DARWIN, 'Natural Selection;' by SPENCER, 'The Survival of the Fittest;' and recently by Prof. BAILEY, 'The Survival of the Unlike,' all of which are synonymous expressions.

Yet we are constantly endeavouring to build up horticulture in the very way that Nature condemns, namely, through the promiscuous production of new forms or new seedlings. A seedling variety is discovered, not produced. It is not founded on a law of organic progress. A bushel of seed is sown, but the sower can only hope for something good to turn up. He never knows that an improved variety will appear, nor has he reason to expect it, because the operation rests on the element of chance, not on the laws of plant evolution.

I do not wish to condemn the production of seedlings from judicious crosses of selected parents, because in that process are included the intelligence of the operator and a knowledge of the laws of plant-crossing; but I do want to emphasise the fact that horticulture is old enough now to rest on definite laws of its own, and that those laws should act in conformity with the principles underlying the evolution of the vegetable kingdom.

It seems strange that the slight differences which appear in the buds of a tree should not have formed the basis for the systematic improvement of orchard varieties.

Horticulturists have never made a systematic attempt to improve a variety after it once appears, or even to maintain its standard of excellence, for improvement has ever been looked for through new varieties. The present system of propagating fruits in the nursery or on the farm, as followed by most fruit-growers, tends to deteriorate a variety. Buds are selected from bearing trees or non-bearing trees, or from nursery trees. The effect in every case is to transmit the tendency already existing in the bud to the new tree, and as a result there are orchards scattered all over the country in which are many trees, that, even with the highest culture, will not pay the interest on the land they occupy. Nine orchards in every ten have been propagated with no more care in selecting the buds from which the trees came than was exercised in the propagation of the Fay's plantation already mentioned. On a large fruit farm with which I have been connected, this principle is considered so important that every young orchard is top-worked with buds from trees which have shown a bearing habit for years."

SNOWDROPS.

THESE favourite flowers of the earliest period of the year have come with their wonted freedom of bloom; they are ever attractive, whether grown in the grass, where they look their best, or in the border or rock-garden. They have a copious literature nowadays, and were one to begin with quotations from the poets, it would be difficult to make a selection. One is not at this time disposed to treat of these chaste flowers from other than a gardening point of view, and without reference to their place in literature. I have recently spoken of the autumnal varieties of Galanthus nivalis, so that these do not require to be mentioned further at present.

The varieties of Galanthus Elwesii are very handsome, and it says much for the peculiarities of places that some find this fine Snowdrop do very indifferently in their gardens. G. Elwesii varies very much in its different habitats, and some collected plants are inferior in size to the ordinary Galanthus nivalis; while others, again, are greatly superior. The writer has previously spoken of Mr. Whittall's new Giant variety, and he can only add to what has already appeared by saying that it far surpasses in vigour anything of its kind. In growing it, it will be found that a rather strong soil, not too dry, will give finer results. The writer does not find G. Elwesii any more subject to the destructive fungus, which works such havoc among collections of Snowdrops, than any other species, so that he hopes to be able to grow this giant variety for long.

The Cassaba variety, which is one of great beauty, has, however, nearly all disappeared; and G. E. unguiculatus has also suffered considerably—while other and weaker-looking stocks have been unaffected. I think the varieties of G. caucasicus, including G. Alleni, are particularly subject to the attack of this mildew. So far as I know, we have no remedy for this scourge of the Snowdrop, and one is grieved to see it make its appearance year after year. I understand that gardens in low-lying situations are more subject to it than others in a more elevated and airy position.

Another Snowdrop, which is well worthy of extended growth, is G. plicatus; but this has, unfortunately, a bad habit of dying off without apparent cause. One does not usually see in this species the presence of the mildew which attacks the others, but it is not very satisfactory otherwise. The Straffan variety, which is the one mentioned by the Rev. David R. Williamson in the *Gardeners' Chronicle* of February 18, is more robust than the type.

Some fine Snowdrops raised between G. plicatus and G. nivalis are in cultivation. Among these I should place a handsome Snowdrop named G. plicatus Fraseri; this is a good grower, with large flowers, and with partially plicate foliage. I have several other Snowdrops between G. plicatus and G. nivalis. Some of these were raised by the late Mr. Wm. Thomson, of High Blantyre, Lanarkshire, and among his are a few of remarkable beauty.

The Rev. C. Wolley-Dod speaks highly of Galanthus Imperati, the fine Italian Snowdrop, which is, however, not so free from fungus with me as it is at Edge Hall. The finest form of this Snowdrop is that known as Atkinsii, which has, at times, the defect of showing an additional segment, which gives the flower a peculiar appearance when fully open. There is something quaint and peculiar-looking in Galanthus Scharloki, with its divided spathe and green-tipped flowers. Among other rare bulbs I have had from Mr. Allen are some seedlings from Scharloki, all giving flowers bearing some resemblance to those of the type, but differing also to some extent.

Galanthus byzantinus, apparently a natural hybrid between G. plicatus and G. Elwesii, is variable in flower and leaf; the flowers generally resemble Elwesii, but the leaves are more or less plicate. This Snowdrop has no more immunity from the fungus than any other I have.

Galanthus ikariæ is a very ornamental Snowdrop, with its broad arching, bright-green leaves, and its white flowers. When the latter first appear, the leaves have not attained their full length, and it is only afterwards that this Snowdrop shows its full character and beauty. It may well be placed among those of the highest rank; it is better and hardier than what is usually known as G. latifolius.

Some of Mr. James Allen's seedling Snowdrops are very beautiful. One understands a good many of them to be from G. nivalis, but in a number there is probably a strain of some of the other species. Among these seedlings, I think none can surpass Magnet, whose large flowers hanging lightly from their long pedicel look remarkably graceful and pretty. Valentine is another pretty flower; and Aurora, besides being early, is of good form and habit. Those of us who have raised Snowdrops from seed can alone realise how small is the proportion of flowers equal to those named.

The yellow-marked Snowdrops are few in number, scarce, and, unfortunately, not too robust. Both of the known single varieties, G. lutescens and G. flavescens, were found by that indefatigable grower, Mr. W. B. Boyd, in Northumberland gardens; the latter is the more robust and brighter of the two. Last year I had flowers sent me of a double yellow variety, which was growing in a garden in Cheshire; the ovary and markings, as in the cases of G. lutescens and G. flavescens, were yellow. I had afterwards, through the kindness of the owner of the garden, some bulbs sent me, but they are not yet open, and from their appearance I have some doubt whether they may not have returned to the normal green of the markings.

One has by no means exhausted the subject, but possibly it may be well to conclude with a reference to the double varieties. A noteworthy addition to these has been Mr. Allen's Charmer, a large flower, very double, and with fine outer segments; this is quite distinct from the ordinary double form. Another seedling with double flowers has not yet bloomed here, but it will, one hopes, give us its flowers in a few days. These varieties of the Snowdrop do much to enhance our garden pleasures, and show us how the simplest flower may be altered by patience, skill, and care. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

A PRUNING COMPETITION.

The competition took place on February 16, at Woodsfield Farm in a 10-acre orchard of flourishing young standard Apple and Pear-trees, about ten years planted, and as this special farm had been in hand some years, the trees were in fair condition.

Two classes were arranged, class A being for farm hands only; class B open to all; prizes of 20s., 10s., and 5s. being offered in each class; the conditions being:—"To the person who shall prune with knife, saw, chisel, or other suitable tool, in not more than three hours, four young trees, in the best manner. Time also to be considered." Unsuccessful competitors to receive 1s. each.

The trees were previously selected, as nearly equal in size as possible, by an appointed steward—two Apple and two Pear-trees for each competitor, with numbered cards attached, in consecutive order, corresponding numbered cards being prepared and kept for balloting purposes.

Sixteen competitors answered to the roll-call. The ballot took place, each competitor drawing a card, which identified his lot of trees. At a given signal, each pruner commenced his task, and as soon as he had finished his work, he returned his identification card to the steward, who registered the time received, the card being ultimately handed over to the judges for point value. The judges carefully watched the pruners at work, summing up at the finish. Various styles of pruning were adopted, and the primitive chisel was in evidence in one case.

The judges appointed were Messrs. Coleman of Eastnor, and Ward of Stoke Edith; the former, through indisposition, being unable to attend, Mr. Mullins, of Eastnor, was substituted. The work of many was of superior character, and no little difficulty was found in making the awards, and extra prizes had to be granted in both classes. Some of the competitors were in too great hurry to finish, and did not take sufficient pains for neat, skilful work; others, again, failed to smooth the saw cuts. One gratifying feature was that nearly all the prizes were taken by comparatively young men—those who had closely followed up the instructions given at the Club's demonstrations and lectures.

The event created considerable interest throughout the radius of the organisation, and a goodly number of anxious spectators watched the proceedings throughout, and waited to hear the results.

James Lea took 1st in class A; 2nd, A. H. Chew. J. Bosworth took 1st in class B; 2nd, H. H. Peel. After so successful an experiment, doubtless the competition will be repeated and extended in future.

It should be mentioned that the Club awards prizes for the best-cultivated gardens, also for allotments, hedging, ploughing, mowing, reaping, rick-building, Hop-pole pitching, and stringing, sheep-management, long-service, and other rural pursuits; besides which, an annual show of agricultural and horticultural productions is held, and 10,000 persons attended last year's show. *W. Crump, Madresfield Court.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA TRIANÆI WEST BANK HOUSE VARIETY.

So remarkable is this brightly-coloured variety that the suggestion has been made independently by several orchidists who have seen it that it is a natural hybrid between C. Trianæi and C. Warscewiczii, and the striking resemblance which it bears to some of the forms of C. × Hardyana gives reasonable excuse for the suggestion, though combination in wild specimens is not generally supposed to be possible. Nevertheless, the flower kindly sent by the owner of the plant, J. Leemann, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge), bears a considerable resemblance to the garden hybrid Cattleya × Ballantiniana (Trianæi × Warscewiczii) described by Professor Reichenbach in the *Gardeners' Chronicle*, March 2, 1889, especially in the peculiar form of the lip, its wavy margin, and the rich colour of the whole flower. The sepals, petals, side-lobes, and margin of the lip are bright purplish-rose, the disc orange coloured, and the front-lobe of that dark velvet-like ruby-crimson seen in Cattleya × Hardyana, to which the whole flower bears a resemblance.

Lælio-Cattleya × Gottoiana.

Occasionally a plant of this pretty natural hybrid is imported with Lælia tenebrosa and Cattleya labiata, between which it is doubtless a natural hybrid. No two of the plants imported have borne flowers alike, and even in their form there is variation. A flower of a very finely-coloured variety of it, in shape approaching closely a good form of Lælia tenebrosa, is sent by J. Leemann, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge). The sepals and petals are rose coloured, with a yellowish tinge in the lighter parts, the lip bright, light purple, with dark crimson veining, extending from the base, the portion in front of the column bearing on each side an oval blotch of primrose-yellow.

Odontoglossum Sanderianum.

This pretty species was described by Reichenbach who asserted that it was related to O. nevadense, but our later experience of the plant in gardens shows that it is a singular compound of O. constrictum and O. gloriosum, approaching the former species in some characteristics of its flowers, and the latter in their larger size and the more erect growth of the inflorescence. A pretty example of the flower has been sent to me by Mr. Garnett, gr. to R. G. Fletcher, Esq., Mount Harry, Withdean, Brighton. These flowers measure 2½ inches at their widest part; the ground colour is pale yellow, with showy red-brown markings, and the lip is white, with one purple blotch in the front of the callus. *J. O'B.*

ORCHIDS AT GLEBELANDS, SOUTH WOODFORD.

The fine collection of Orchids formed by J. Gurney Fowler, Esq., shows remarkable progress. Two new Orchid-houses, beside a large orchard-house, are in course of construction. The varieties of Lælia anceps have grown well, and bloomed profusely, some of them, such as L. a. Stella, L. a. Sanderiana, L. a. Schroderiana, &c., are still in bloom. Cattleya citrina thrives in the same house with these, and many of the old plants are well set with flower-buds. In the same house are two fine specimens of Dendrobium Wardianum, covered with blossoms. A number of large specimens of varieties of Cœlogyne cristata, and forms of Lælia albida are flowering finely.

In an adjoining span-roofed warm-house are grown the choicest of the Cypripediums, several strong plants of C. Lawrencianum Hyeanum, C. callosum Sanderæ, and many rare hybrids, named and unnamed, were remarked. In bloom are the fine C. × Miss Louisa Fowler (Chamberlainianum × insigne var.), recently shown by Mr. J. Gurney Fowler, which is the most handsome of the C. Chamberlainianum crosses; C. × Chamberlaino-Leeanum, pretty, but not so showy as the former; C. × Chapmani, a fine C. Rothschildianum with two flower-spikes, C. × Lathamianum, C. × Godseffianum, C. × A. R. Smith, C. × Lord Derby, some pretty plants of C. bellatulum, C. concolor, and others of the class, all of which do well here. The collection of Selenipediums was remarked growing strongly, and sending up numerous flower-spikes.

A number of varieties of Cypripedium insigne, of which there is a good collection, were noted in an intermediate-house; C. i. Sanderæ, which is growing strongly, is one that is much prized. In the same house a collection of Cymbidiums is grown, and one very vigorous plant of the finest form of C. Tracyanum; strong specimens of C. Lowianum, promising well for bloom, and the first of the C. grandiflorum, furnished with a strong flower-spike, the flowers of which have not expanded, as is usual with it when flowering in the winter, were remarked.

The range of span-roofed houses contains a collection of hybrid Lælias and Lælio-Cattleyas, some of which have not yet flowered. The Veitchian hybrids of Lælia Perrini, whose beautiful flowers appear in the winter, are favourites, as are also Cattleya × Mantini nobilior, C. × Miranda, Lælio-Cattleya × Nysa and its varieties; C. × Lady Rothschild, and other crosses of C. aurea. Of C.

aurea itself there are some nice healthy specimens, as likewise of other species, the floral display being chiefly due to forms of C. Trianæi, one specimen of which, about 4 feet across, is bearing a large quantity of flowers. Some excellent C. Percivaliana, and a few others were in flower.

In the adjoining division a magnificent plant of Vanda Sanderiana stands on the middle stage, which was once shown with the unequalled number of twelve flower-spikes, bearing altogether 137 flowers. The plant was not allowed to carry flower last year, and this year it shows great vigour. Near it a noble specimen of Arachnanthe (Vanda) Lowi, in splendid condition, was noticed; and on the side-stage is a small collection of species of Phalænopsis, all of which have been reared from small imported plants. They have steadily increased in strength. Recently they were removed from a small house, in which they had long been grown, and for some time Mr. Davis, the gardener at Glebelands, was anxious about them; but they are now safely over the dangerous period. The same remark applies to a number of Miltonia Roezli, which were removed at the same time, which are now in splendid condition, and showing finely for flower. Other notable plants in quantity consist of Lælia harpophylla, which thrives at Glebelands; some vigorous Miltonia vexillaria, and a fine collection of Odontoglossums, which are housed very commodiously.

It may be said here that Mr. J. Gurney Fowler, besides an enthusiastic Orchid amateur, is much interested in Roses and fruit-growing, both indoors and out; and in these and other matters, his gardener is very successful.

MUSHROOMS SPOILED BY MOULD.

THAT nameless pest to cultivated Mushrooms, referred to by Mr. Page, and described at some length by Dr. M. C. Cooke, on p. 61 of the *Gardeners' Chronicle* of January 28, has been familiar to the cultivators of the Mushroom in Britain for many years. It has played havoc with many promising crops, particularly in confined places, where the air remains stagnant and at an even temperature for weeks, or months on end, such as in underground cellars, and badly-constructed Mushroom-houses, as well as in caves and tunnels, in which the atmosphere is seldom moved by a current of fresh air. In places like these, where the air is practically stagnant, and maintained in the close muggy condition, which is popularly supposed to be the best for the culture of the Mushroom, if the mouldy pest once gets a settlement it rapidly multiplies, and the atmosphere becomes so contaminated with its spores, germs, filaments, or whatever term they may be known by, that it requires the adoption of extreme measures to clear the place of its malignant influence, and sweeten the air so that Mushrooms may again thrive in it.

It is true, that Mushrooms can be grown to perfection for a time in a close and slightly moist atmosphere, in places almost hermetically sealed from the fresh air of open day; but sooner or later some fungoid disease, or pest, breaks out, ruins the crop, and causes no end of trouble and expense before Mushrooms can be again grown in such air-contaminated places. The doors by which they are entered are often the only means of ventilation, and they are invariably kept closely shut when the person in charge is not passing in or out, until the atmosphere becomes as foul, if not so evil-smelling, as that of the notorious "Black Hole of Calcutta!" The natural earth-heat is generally sufficient to maintain those places at a temperature suitable for the growth of Mushrooms, and no artificial heat is applied to raise the temperature and at the same time cause a movement in the air, nor is a ventilator opened to allow the foul air to escape, and fresh, clean air, to enter. Such are the places in which the mould-pest is found doing its work with deadly effect.

In properly constructed Mushroom-houses, efficiently heated and ventilated, so that fresh air can be regularly admitted, low down and close to the heating-apparatus, without causing cold draughts, and the vitiated atmosphere allowed to escape, through ventilators near the roof, the pest will seldom, if ever, appear. Should it, however, put in an unwelcome appearance, it can be exterminated by clearing out all the materials of the Mushroom-beds, and thoroughly cleaning the house by the usual means, to destroy any germs that may be lurking about. A strong, dry heat, should then be raised by the heating-apparatus, to cause a free circulation of air in the house, which will be effectually purified thereby in a few days. With clean, fresh materials, that have been carefully prepared and kept from being contaminated by the mouldy old beds, new beds may be made up immediately, which will produce vigorous crops free from disease, and remain clean and productive for the natural term of their existence.

In the meadows where the Mushroom grows naturally in the open air, the mould is very rarely met with, or it may generally be traced to cultivated Mushrooms in the near neighbourhood. Its appearance on the open-air beds is mainly due to the same vitiating causes as those which induce it in close cellars and other confined spaces. The straw litter, mats, and other materials used for covering the beds, maintain the air on their surface in a stagnant condition, and if the mould-pest or its germs are about, they soon find their way to the delicate Mushrooms just bursting through the soil, insert their threads in them, and the fungus-infested Mushroom quickly becomes a rotten mass. For a while, many of the Mushrooms may escape attack, and grow to a full size, perfectly clean and wholesome; but eventually, as the materials of the bed become exhausted and the crop weakened, every Mushroom will be cut off with the disease. The remedy in this case is to thoroughly char or burn the mould-infested materials to get rid of the germs, and move the site of the open-air bed to a clean spot, as far from the old one as may be practicable and convenient.

A notable instance of the virulence of the disease, when once it has got firmly established in a medium suitable for its development, has been in evidence for the past few years in the extensive Mushroom-growing establishment in Edinburgh, where its ravages have caused much loss to the enterprising managers, and the pest has till now completely baffled every practicable means to extirpate it. In the disused Scotland Street tunnel of the North British Railway, running northward from the Waverley station at a considerable depth below the streets of the new town, the proprietors have carried on the culture of the Mushroom for more than a dozen of years with great success. Marvellous crops of the finest Mushrooms were gathered and marketed from the beds in the tunnel, until the mould-pest made its appearance within the last few years; and although the Mushrooms are produced as abundantly as ever, they are soon attacked by the fell disease, and utterly ruined for any useful purpose.

On the occasion of a recent visit, it was saddening to see the wreck the disease was making of the splendid crops of Mushrooms coming on in succession along the whole length of the tunnel. Entering from the north, or Scotland Street end, a line of railway runs up the left side, and the Mushroom-beds occupy the largest half of the breadth of the tunnel on the right. They are formed across the space, with a foot clear between them for working, and of a uniform size and shape, about 3 feet wide at the base, and 1 foot 6 inches wide at the top, and about 2 feet 3 inches high. They are made of well-prepared droppings, collected from cavalry and livery stables, with the long litter shaken out of them. The droppings, when ready, are firmly packed inside a wooden frame of the shape of the bed, but without top or bottom—a speedy method of making-up the beds, and the sloping sides allow the frame to be easily lifted off when the job is finished. When the beds arrive at the proper temperature they are spawned, and then covered with about an inch of fresh earth in a moist, but not wet, state, and beaten smooth and firm, in the usual manner, with the back of a spade. They are then covered over with a few inches in depth of the long stable litter shaken out of the horse-droppings, which remains upon the bed until the first of the crop is ready to gather. In the close, moist atmosphere and even temperature of the tunnel the beds keep their moisture for a long time, and seldom require to be watered. They begin to bear in from four to six weeks, and when they escape the mouldy disease, they go on for months producing heavy crops of Mushrooms, noted in the market for their thickness of flesh and high quality. When the mould-pest is about, it begins its ravages within a week or two, and spreading rapidly over the crop, it soon renders the Mushrooms utterly worthless.

The beds in bearing were seen literally white with Mushrooms, although the sound crop is gathered every day for market; and even where the crop was attacked by the mould, and converted into a morbid mass of diseased and rotten Mushrooms, a few vigorous stragglers were pushing their heads through the diseased and decaying mass, and developing into fine specimens, perfectly sound, and free from all signs of the disease—a notable instance of "the survival of the fittest!" The proprietors have tried hard by every available means to eradicate the pest, cleaning and whitewashing, at much cost, the whole tunnel (about 1200 yards long, 8 yards wide, and 6 yards high, substantially built of brick and dressed ashlar), but with no permanent or satisfactory result.

Sulphur fumes and flowers-of-sulphur, which are generally fatal to fungoid organisms, were employed, and other so-called "remedies" were applied to the droppings, soil, surface of the beds, and the air, floor, and walls of the tunnel, but all were of little service in lessening the attacks of the pest. It might be weakened for a short time, but it has always broken out again as virulently as ever, as soon as the air in the tunnel assumed its normal stagnant condition. The tunnel is on an incline of about one in seventy-five, but the only ventilation is at the ends, which makes the process of clearing out the vitiated air all the more difficult. The proprietors have, therefore, now resolved to clear out everything from the tunnel, and to thoroughly clean it, and allow it to lie fallow, to purify the air, for a couple of seasons, in the hope that they may be able at the end of the period to again secure fine crops of sound Mushrooms.

In the meantime, they have acquired the use of the tunnel through Dundee Law, formerly used by the Dundee and Newtyle Railway, in which to carry on their business; and it is proving as great a success for the purpose as the Edinburgh tunnel was before the appearance of the disease in it. The result of the extreme measures adopted by the Messrs. Paton to clear the Edinburgh tunnel of the fungoid infection will be watched with deep interest by all concerned in the culture of the Mushroom. What are our cryptogamists doing, who have so long neglected to solve the life-history of this inveterate foe to the Mushroom? Shall we have to go to German scientists for its history and name? *D. M., February* 8. [When the Mushroom-growers can afford to adopt the methods advised by the cryptogamists, and dispense with the foul materials they at present employ, then they will be able to grow Mushrooms without admixture of other fungi. ED.]

CONTINENTAL NOVELTIES.

MESSRS. HERB & WULLE, of Naples, offer a series of new hybrid Centaureas, under the name of Centaurea imperialis (Hort. Herb.). C. imperialis is stated to be a cross between the violet C. moschata and the white C. Margaritæ. The plants are alleged to attain a height of 5 feet, and to produce sweet-scented flowers of varying shades of colour. These last in a cut state for ten days, so that the plants are very serviceable for decorative purposes. The same firm also announces the issue of Tomato Wonder of Italy, which produces dense clusters of oblong cylindric fruits of a red colour.

Messrs. V. **Lemoine et fils**, Nancy, offer various novelties among Abutilons, Fuchsias, zonal Pelargoniums, Pentstemons, Petunias, and Verbenas. They also describe a form of Glyceria spectabilis, with pale yellow stripes to the leaves.

Pear Frau Louise Goethe.

A new variety, raised from a pip of Bergamotte d'Esperen, in the Horticultural School of Geisenheim in 1882, and fruited at that establishment in 1889 for the first time. It is described as being an excellent winter Pear, keeping good till March. The tree is fertile, and bears Bergamotte-shaped fruits 3¾ inches high, and 3¼ inches in lateral diameter. The rind is thick, coarse, dark green, and covered with fine warts, becoming a clouded yellow when ripe, with russetty patches. The flesh is clouded yellow, sometimes salmon-coloured, juicy, sweet aromatic, with an aroma reminiscent of the Orange. Figured in the *Bericht der Geisenheimer Lehranstalt* for 1897-98.

Pear Doyenné à Cinq Pans.

Raised by M. Herault, and described in the *Pomologie Française* as a cross between Duchess of Bordeaux and Winter Doyenné, effected in 1879. The tree is of regular growth, vigorous, and very fertile; the fruit 2¾ inches high and broad, smooth, yellow rind, spotted and flecked with fawn. It is ripe in October and November. The flesh is fine, melting, juicy, sweet, with an aroma of Pelargoniums. "*Wiener Illustrirte Garten Zeitung*," *for January*, 1899.

SPONTANEOUS HYBRIDS.

In the flower-garden at Edge Hall weeding is performed with great discrimination, and a large proportion of self-sown seedlings is allowed to grow to maturity. As a consequence of this many spontaneous hybrids have sprung up in the course of years, about which it is proposed to give some particulars. By hybrids, I mean plants produced by the crossing of distinct species; but in adopting this definition, I must observe that there are some cases where plants considered only varieties of the same species refuse to cross, and other cases where species, reputed to be distinct, are so closely allied that the result of their crossing can hardly be called a hybrid.

It has sometimes been suggested that new species owe their origin to hybrids; but careful observations have not been recorded sufficiently long to confirm or to refute this theory. It must be assumed, however, that to make a species, a plant must be able to reproduce itself constant to the parents from seed; and I have never yet found a true hybrid capable of doing this. Many hybrids are entirely barren, others are sparingly fertile; but then the progeny of these from seed is never constant; they often revert to one or other parent in two or three generations, causing the suspicion that seed when produced by a hybrid is the result of fertilisation by one of the parents. In other cases the seed of hybrids produces an ever-varying race; but none of these varieties have ever proved capable of being fixed so as to reproduce a constant race—at least, I have never seen one so capable, or received authentic information of one. It is true that I have found some closely-allied species having distinct and perhaps distant geographical areas, which, when cultivated together, seem to coalesce from seed into one, varying in its characters between the two, and retaining its fertility without definitely reverting to either. I may mention as instances Scilla nutans and S. hispanica, Papaver orientale and P. bracteatum, Inula Hookeri and I. glandulosa, Chrysanthemum maximum and C. pallens, and several Campanulas of the rotundifolia group. But the differences between these crossed varieties are not greater than are frequently found within the limits of a species. It seems to me far more in accordance with observed facts to believe with Darwin that a species gradually changes in long periods by natural selection of the fittest individuals within itself than to refer the origin of new species to the hybridisation of dissimilar plants.

It may be asked, when I describe hybrids, how do I know that they are hybrids, and not varieties, owing their abnormal characters to cultivation? I reply that in many cases these characters are distinctly intermediate; in others, where I have no doubt whatever about the seed-parent, the pollen-parent declares itself by being almost exactly reproduced in the hybrid, so that it could not be recognised as a hybrid by casual observation. In other cases, where the seed-parent is certain, the pollen-parent is uncertain, because there may be more than one likely to have produced the result.

It may be stated, as a general rule, that hybrids follow the duration of life of the shorter-lived parent; annuals or biennials crossed with perennials being annual or biennial; but I shall notice instances which seem to be exceptions.

As for the duration of the stock of a hybrid, I have not attended long enough to the subject to say much from personal experience. I believe the date at which the well-known hybrid Lily called L. testaceum was raised, is recorded. Some hybrids show greater vigour of constitution than either of their parents, whilst others are decidedly delicate, and difficult to keep. As regards bulbs, the tendency of Narcissus to form hybrids is well-known, and I shall speak of their inconstancy from seed later. Though thousands of seedling Crocus come in my garden, I have never seen a suspicion of a hybrid. Mr. G. Maw, in his monograph, remarks upon this characteristic. I may say the same of Colchicum, some of which grow and mature from seed here freely. Other plants which flower simultaneously side by side, yet seem always to come true from seed saved at Edge, are all Anemones, as A. alpina, and A. sulphurea (though thought to be only varieties), A. blanda and A. nemorosa, A. hortensis and A. coronaria; and so with some other genera. Most of the hybrids I shall mention have appeared spontaneously in Edge garden; but there are others which I have cultivated for long, concerning which I shall have something to say, especially in the genus Campanula.

In speaking of the reasons against supposing hybrids to have been the origin of new species, I have not discussed the case of a fertile hybrid taken from its surroundings and isolated. I have never heard of such a case producing seed which was true to the parent. At the same time, I have known many instances in which wild varieties of a colour different from the type have produced, when isolated, many generations of seed constant without a reversion to the typical colour. I have myself had a wilderness full of white Malva moschata (perennial), white Verbascum Blattaria (biennial), and white Geranium Robertianum, for twenty years, though it might have been thought that the innate tendency to assume the typical colour would sometimes have prevailed. *C. W. Dod.*

(To be continued).

EARLY SWEET PEAS.

In this district in Scotland, it is impossible to bloom Sweet Peas earlier than July; and in a late season I have known it to be August before the plants were in full bloom. By sowing seeds in pots during January, however, and encouraging germination by a little warmth, I have known flowers to be produced in May. I prepare about 300 pots, the seeds being sown singly in the case of new varieties, and the older sorts in triplets in 3-inch pots. Where mice abound, it is necessary to cover the pots with squares of glass until the seedlings are well up, when the plants are removed to a cooler house. I have occasionally repotted some into 6-inch, and again into 9-inch pots, and these produce much stronger plants, and they are a little earlier than those that are not re-potted. It is a commendable practice to pursue where single plants are set out in borders, and in small gardens where there is but little space, these single plants, one or two of each variety, produce an enormous quantity of flowers of the finest quality.

The greater number of our plants are grown at 9 inches to 1 foot apart in lines. They not only bloom early, but by constant cutting they continue in flower until cut down by frost. When the earlier buds appear, the tip of the leading shoot is removed, and a still earlier and finer bloom thus induced. When the top of the sticks by which they are supported has been reached, the tips of the shoots are again removed, and the rule is aways to check upward growth. A large southern grower who cultivates Peas under glass, told me he thought of giving up their cultivation solely on account of their rampant habit, and when I mentioned close pinching as a remedy, it was received as quite a new idea.

The varieties of Sweet Peas in cultivation are now very numerous, but I have had opportunities of testing all the English varieties at present in cultivation, and of the American sorts; though I have not grown them all, I have been able to inspect every variety up to last year. For my own part, I consider American introductions a long way in the rear of the best of Mr. Eckford's varieties, and so leave them out. I still admire a few of the older varieties, which for cutting are unsurpassed. Of such I may mention Princess Beatrice, Primrose, Orange Prince, Lady Beaconsfield, and Countess of Radnor, each of which, though small in size of bloom, are yet so beautifully coloured that they are indispensable. The later large or giant-flowered varieties, when well cultivated, with their long flower-stalks and greater number of flowers to a stalk, will, however, most generally command attention. A selection, comprising those with bright colours and others of distinct shades, will embrace Lady Mary Currie, strong habit and very bright flower, orange-pink in shade; Chancellor, somewhat lighter in colour, and quite distinct; Duke of Sutherland, a very telling indigo-blue, shaded; Prince of Wales, brighter than Her Majesty, but not displacing the latter; Lady Nina Balfour, a peculiar grey-mauve, very beautiful; Lady Grisel Hamilton, by far the finest of the light blue varieties. The seeds of the variety last-named unfortunately belong to the type of Countess of Radnor, and being difficult to ripen, the seedlings come up sparingly. I am not quite sure whether this variety is in commerce. Salopian and Mars supersede all other red and crimson varieties. The former is, I think, the better variety. Queen Victoria, creamy, sometimes inclining to yellow, is vigorous, and possesses a very large bloom and long stalks; Crown Jewels is of the same type, but suffused with salmon; Prima Donna is in pink shades, perhaps the most lovely; Royal Rose is a deeper tint of pink, but not so attractive. In Captivation we have one of the most beautiful of the dark-coloured varieties. It is impossible to describe the metallic lustre of the rosy-purple flowers. It is also one of the wrinkled-seed type, and difficult to increase and even to cultivate. Stanley is unsurpassed in the dark maroon shade of colour which it possesses. Among white varieties, Emily Henderson is a favourite flower, the tint of green for which it is remarkable being so pretty. Of the newer whites, Blanche Burpee is now well known for its good qualities, but Saidee Burpee is even better, the petals being more stout, and the white more pronounced. Duchess of Sutherland is so nearly white that it may be here recommended for the pearly gloss of its petals; it is a very lovely flower. I will add to those already named, Captain of the Blues; and though many fine varieties are left out of the above list, it includes a very excellent selection. *R. P. Brotherston, Dumfries.*

ADIANTUM FARLEYENSE VAR. ALCICORNE.

OF the numerous hybrid varieties of Maiderhair Ferns there are few more interesting than the above, of which we give an illustration (fig. 51), from fronds received from Mr. H. B. May, who exhibited it at a recent meeting of the Royal Horticultural Society. Mr. May has grown it for a number of years. We are unable to give its actual origin, but it appears to have been introduced upwards of fourteen years ago, and was first distributed by Messrs. R. Smith & Co., of Worcester. It would be interesting to know how it first originated. There is little doubt but that it is closely allied to Farleyense, differing only in having the pinnules cut down into unequal narrow segments, and like the type it does not produce fertile fronds. Apart from its distinct characteristics, it is worthy to be included in all collections on account of being the only known variation of the most beautiful Adiantum in cultivation.

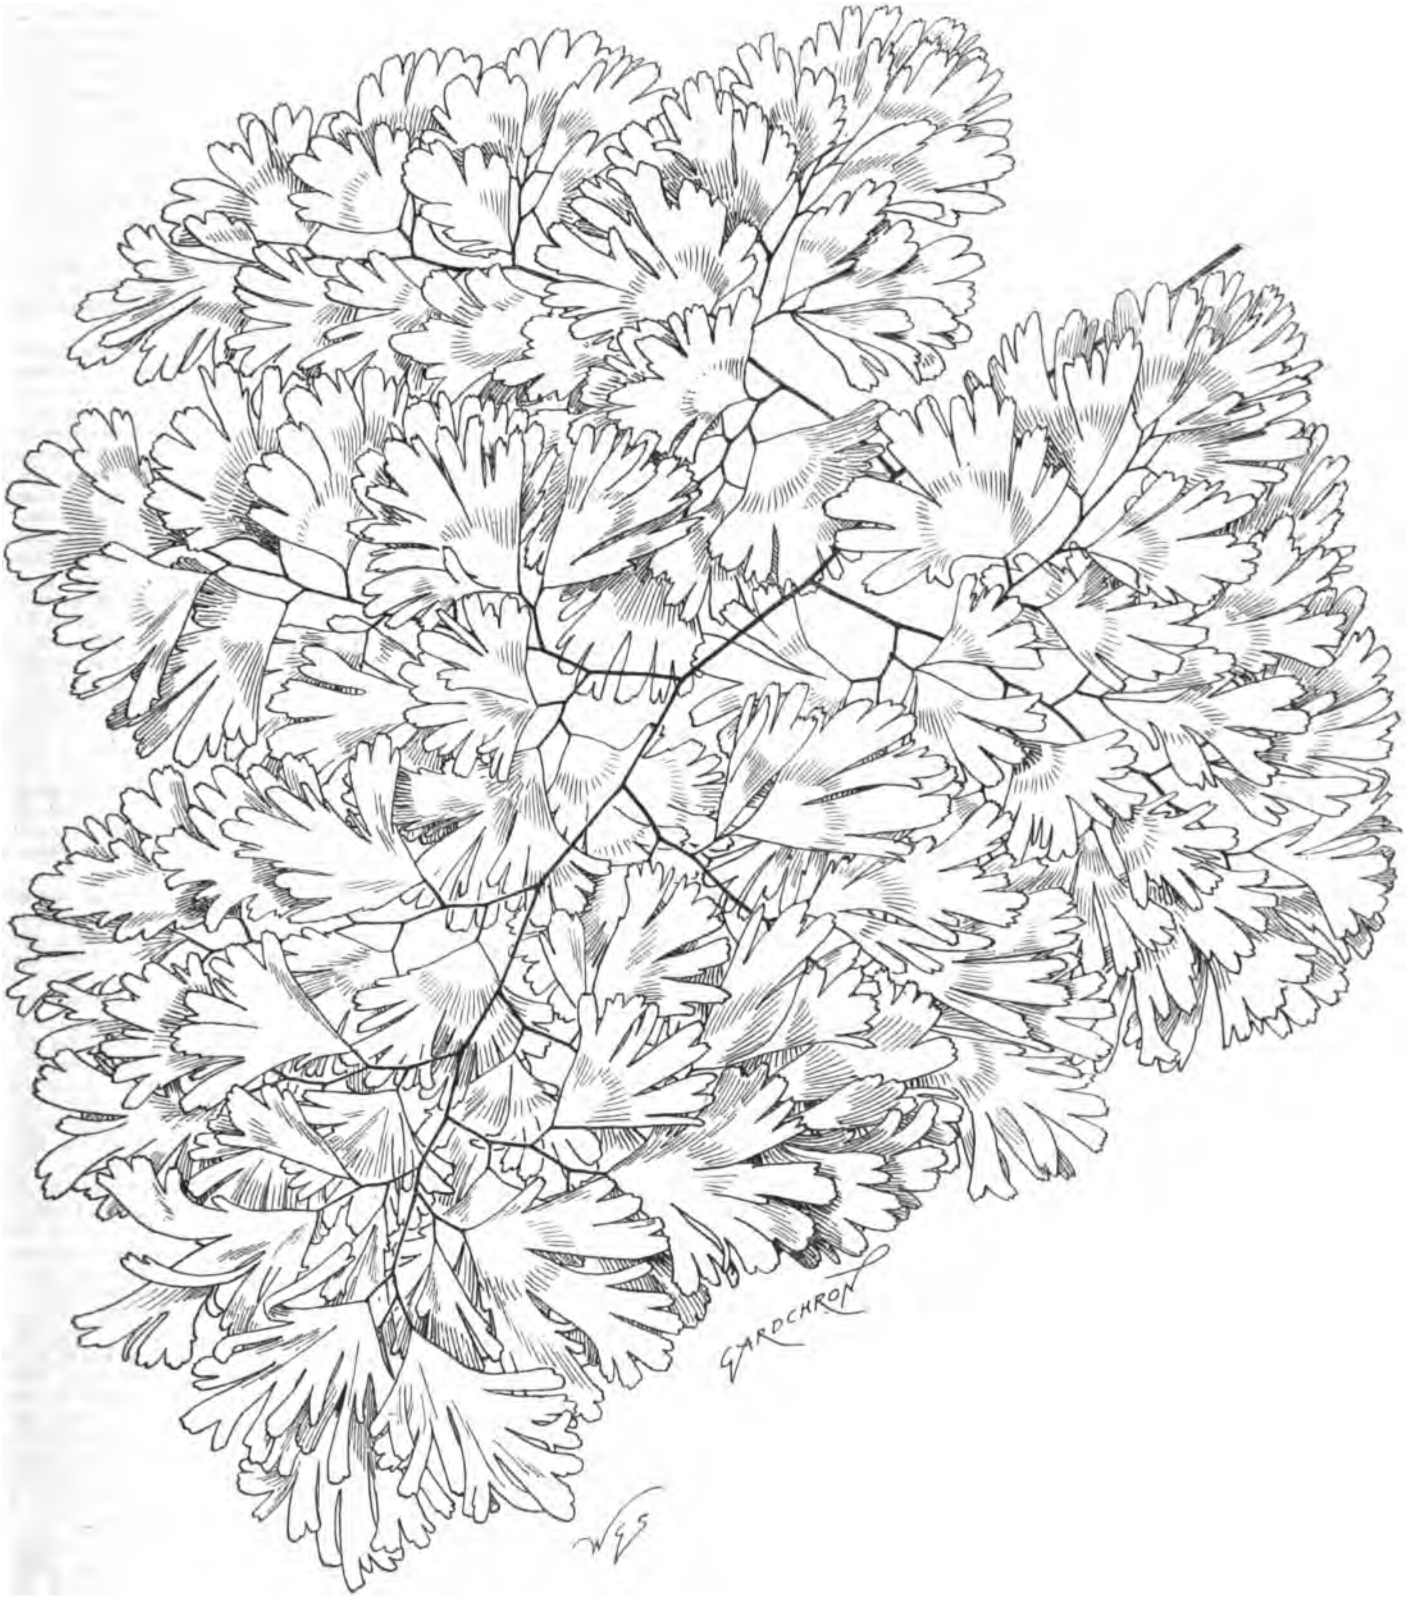

FIG. 51.—ADIANTUM FARLEYENSE VAR. ALCICORNE.

PLANT PORTRAITS.

CHINESE PRIMROSES, fringed-petalled varieties *Revue Horticole*, February 16.

CRINUM FIMBRIATUM.—Perianth with narrow white segments, deeply striped and suffused with rose; *Garden*, February 11.

FUCHSIA CORYMBIFLORA; *Garden*, February 4.

LOBELIA RIVOIREI ×, a rosy-lilac-flowered variety, the descendant of L. Geraidi, itself a cross between L. cardinalis and L. syphilitica. Of the numerous hybrids raised from this same original source, some are hardy in the severe climate of Lyons, others are more tender (see *Gardeners' Chronicle*, vol. xxiv., p. 233, fig. 64); *Revue Horticole*, February 1.

PASSIFLORA INCARNATA, *Meehans' Monthly*, February.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Onions.—The main Onion crop should be sown whenever the land is in a workable condition. The ground for this crop should, whenever possible, be manured and dug in the early winter, and if this was done, let the surface be lightly dug over early in the morning; when dry enough, tread upon or roll, and afford a heavy dressing of fresh soot, raking it in at once. The drills may be drawn at 1 foot or less apart, and half-an-inch deep. If charred soil or garden rubbish, or wood-ash, are available, the seed-drills, after the seed is sown, may be partly filled with one or the other. In view of depredations by sparrows and chaffinches, let the seed be damped, and then shaken up with powdered red-lead. Although the Onion does best in a firm soil, some consideration must be given to the nature of the soil, not trampling it more than can be helped, or endeavour to give it a very smooth surface if it be adhesive, as it will be sure to crack under sunshine, and render a very early use of the hoe necessary. If the land is infested with the Onion-maggot, the seed should be sown in boxes, and the young plants transplanted; this method being the best preventive.

Parsnips.—Let the ground for this crop be selected for its great depth and mellowness, and let it be stirred about with digging-forks, and when fairly dry make the surface level and smooth preparatory to sowing the seed. The crop may be grown in beds 4 to 6 feet wide, with alleys running between, or the alleys may be discarded. The seeds should be sown in drills less than 1 inch deep and 16 inches apart, the seed being dropped in twos or threes at 8 to 12 inches apart in the rows according to the variety, and fill in the drills lightly, making all smooth and neat. If extra large roots are required, and soil is not all that one could wish, make holes with a large dibber; fill these with a mixture of rich soil, and press a few seeds into this, and cover. The soil that is put into the holes should be made quite firm.

Celery.—For a very early supply, a pinch of seed may now be sown in seed-pans, standing these in mild heat. The main sowing should not be made before the end of the present month. Sandringham White, Major Clark's, Sulham Prize, and Standard Bearer are good varieties for present sowing. Let the soil in the pans be moderately rich, and the seed sown thinly on it, covering but lightly with soil.

Brussels Sprouts.—A small sowing may be made for furnishing plants for an early supply. A variety that is productive of small solid sprouts is preferable. The seed should be sown and placed in warmth of 50° to 60° to germinate, and when that stage is reached, the seed-pans, without the least delay, should be placed close to the glass, and kept there for a week, and be then placed in a similar position in a slightly less warm-house or pit, pricking off the seedlings into boxes when two pairs of true leaves are developed. They should be grown cool in the later stages, and duly hardened off before being set out.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

Pruning.—Where there are many shrubs in great variety, it is necessary to commence the pruning of these forthwith, and in order to do this satisfactorily, each clump should be taken in turn, and the pruning finished so far as it may be at this season. Evergreens such as Portugal and common Laurels, Yew, Aucuba, Box, Phyllirea, Berberis Aquifolium, and other strong growing species, require when of large size to be cut back more or less annually, otherwise, they soon grow too big, and encroach on weaker shrubs adjacent, or assuming the appearance of a hedge. The system I have adopted here for years is to go round each shrub carefully at this season, and cut back, not too closely, but sufficiently to keep each in symmetrical form, and not to destroy the character of the plant. Treated in this manner, shrubs get the full benefit of sunlight, and the shortening of the branches prevents injury by heavy snowfalls. Berberis stenophylla, B. Darwini, B. dulcis, and B. empetrifolia, do not require to be pruned much, if at all, the strong shoots arching over, and other shoots grow out of them, and thus graceful bushes are formed without any trouble. Flowering shrubs such as Ribes, Spiræas, Philadelphus, Weigela, Hydrangea, Hypericums, and shrubby Honeysuckles (Lonicera), are the better for being pruned just before they go out of flower, or soon after flowering. In regard to Laburnum (Cytisus), Lilac, Gueldres Rose, Cerasus, and Prunus, the young flowering shoots die back after blooming, and fresh flower-buds form or flower-shoots start from the base of the old. Prunus Pissardi and the golden leaved Elders (Sambucus) make stronger growths, and leaves of a finer colour when annually cut back, leaving about 6 inches of the previously-made wood. These plants should be left for a few weeks longer, so that frosts may not injure the pushing buds.

Re-planting.—Advantage may still be taken of open weather to remove or transplant Rhododendrons, Ghent Azaleas, and Azalea mollis, trenching the ground, and adding fresh peat if necessary. If the plants have grown very luxuriantly, let one-fourth part of sandy loam be used. On planting remove all growths protruding from the stock. Should lime be present in the adjacent soil, the peat-beds should be raised above the general level, so as to prevent water impregnated with lime draining into the bed so as to damage the plants. Plants dug up and awaiting re-planting should be well protected from the air. A mulch of decayed cow-manure will be beneficial. Kalmia latifolia, Pernettyas, Ledums, Menziesia, and Polygala purpurea are evergreen shrubs succeeding well in peat-beds, and looking well when mixed with the deciduous Azaleas. Lichen growing upon Azaleas, &c., will, if let alone, kill the branches, and eventually the entire plant. Where very abundant, an endeavour should be made, by scraping and brushing, to get rid of it, finally washing the branches with a weak solution of soft-soap, petroleum, and water. Other species that will grow in soil containing lime may be cleansed by white-washing the stems and branches.

Roses.—The hardier climbing varieties may have the old wood removed, and the young wood laid in, pretty nearly at full length, and securely fastened to the wall or fence. The yellow and white Banksian Roses should not be pruned till flowering is finished, when they should be pruned back hard in order to obtain strong flowering growths for the next year.

Liliums.—Bulbs of L. auratum and its variety, L. a. platyphyllum, may be planted; also the varieties of L. lancifolium, L. longiflorum, L. speciosum, L. tigrinum, and L. superbiens. When not planted apart, it is a good practice to plant between Rhododendron and Azalea bushes. Some bulbs planted in the month of February some years ago throw up strong flower-spikes annually; these on arriving were placed in small trays, and covered with leaf-mould, and when rooted they were planted in the beds, with some pieces of rough turfy loam mixed with the peat, and some silver-sand under each.

Bedding-plants.—Pot up singly into 60-size pots, autumn-struck cuttings of Golden tricolor, Silver tricolor, and Golden Bronze Pelargoniums, using ordinary soil, and place them on a shelf near the glass, slightly syringe between pots to encourage root-action, they will then keep the colour in the leaves, and make bushy plants by the end of May. The best of the Golden tricolors are Mrs. Henry Cox, Masterpiece, Mrs. Turner, and Lady Cullum. Silver tricolors, Mrs. Laing, Eva Fish, and Silver Wings. Golden bronze, Maréchal MacMahon, Zulu, and Bronze Queen. These are excellent varieties for bedding, standing well the full rays of the sun, and make compact borders to beds.

Pelargoniums.—The hardier green and silver-variegated leaved varieties may soon be placed in cold frames to harden off, the gardener being guided in the matter by the state of the weather. These plants should then be shaken out of the boxes, the roots bound in moss, and be planted in rows in the same frames. This is a much less laborious method than growing them in pots, much labour in watering being saved, and the plants are as good as those at planting time. In preparing the frames, a bed 4 inches deep of not too rich a soil, should be placed upon a layer of coal-ashes. The second week in March is a good time for planting them.

Bulb-beds.—In times of frost the birds scratch for food amongst the bulbs, and break off the points, but if small shoots of Berberis Aquifolium be stuck in among the bulbs, so as not injure them, and round the sides of the beds, a stop will be put to the mischief.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to the DOWAGER LADY HOWARD DE WALDEN, St. James's House, Malvern.

Anthuriums.—These plants should now be repotted, turning them out of their pots, and carefully removing as much as possible of the old material with a pointed stick, and not injuring the roots in doing this. The compost—which should be warmed before using—may consist of two parts good fibry-peat broken into small lumps, one part sphagnum-moss, one part loam, and sufficient broken charcoal and sand to make and keep the compost porous. The pots should be clean or new, and thoroughly drained. Let the plants be kept rather high in the pots, and work the compost firmly in among the roots, rounding it off several inches above the rim of the pot in order to encourage the growth of roots from the stem. Place them in a moist position in the stove, affording copious supplies of water during actual growth.

Caladiums and Alocasias.—These Aroids, which should have been kept dry during the winter, may now be started. Shake the old soil from the tubers, placing these in small pots in a compost consisting of equal parts of peat, leaf-soil, and fibry-loam, with a good sprinkle of coarse sand. A little sphagnum-moss and broken charcoal, or brick-rubble, may be added to the soil used for Alocasias. After potting the tubers, place them in a moist house where a minimum temperature of 60° is maintained, and afford sparingly of water till growth has begun. When roots have been made in quantity, repot into larger pots, this time adding one part rotten-manure to the compost previously used. Pots 6 inches in diameter will be sufficiently large for ordinary decorative purposes, but, if large specimens are required, the plants should be afforded a subsequent shift into 8 or 10-inch pots, according to the strength of the plants. C. argyrites and other small-foliaged varieties, should be grown only in small pots. Propagation is effected by dividing the tubers, each division having a bud, and these pieces should be placed in small pots. It is best to divide the tubers and lay them on a dry shelf in the stove for a week before they are potted, in order to allow the cut surfaces to dry.

Tuberous Begonias.—A portion of the stock may now be potted. If the tubers have not already been turned out of the pots in which they were grown last season, that should now be done, shaking all the old soil away from them. Place them in small pots, which should only be sufficiently large enough to admit of a little soil being placed around the tuber. Afford a compost consisting of two parts sandy loam, and one part leaf-soil, together with a liberal allowance of sharp sand. In potting, keep the top of the tuber somewhat above the surface. Place the potted tubers in a temperature of 50°, syringing among the pots, and on fine days lightly sprinkling the soil with the syringe, which will provide sufficient moisture until growth commences, when the plants may be gradually afforded more and more water. Ventilate freely, and shade from bright sun, and as soon as the plants are well-rooted, shift them into larger pots, this time just covering the tubers with soil. A safe method of starting the earliest batch is to lay the tubers bottom upwards in a shallow box upon a layer of leaf-soil or cocoanut-fibre, sprinkling a little of the same material among them, and dew them over once a day with the syringe. They should be examined at frequent intervals, and any that have commenced to grow, place with the crown upwards, and when a sufficient number have started they may be potted up. When started in this way a very small percentage of losses will occur, as the water is unable to rest in the hollows of the crowns.

Chrysanthemums which are well rooted in small pots, should be transferred to 48's. The soil for this potting should not be too rich, and good turfy loam, leaf-soil, and sand, will be a suitable compost for the present. If the loam be heavy or stiff, endeavour to render it porous by adding plenty of coarse grit, such as river-sand, road-grit, or brick-rubble; but, if on the other hand the loam is very light or sandy, add no sand to the compost. After potting, place the plants in a cold pit or frame, and shade lightly for a few days if signs of flagging should appear. Water carefully, and air freely by tilting the lights, and when the plants are established in the pots, remove the lights during the day upon every favourable opportunity.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

Early Vinery.—The change from dull rainy weather to bright sunshine, and a clearer atmosphere, has been helpful to Vines that were started early. An increase of temperature, which is easily maintained in bright weather, should be supported at night by fire-heat, to draw out the bunches to their full length. During the flowering period keep the atmosphere in the forenoon as buoyant as possible, to assist the setting of the berries. Later in the day and at night the usual atmospheric moisture should be provided, by damping down of floor and border surfaces, but discontinue syringing the Vines themselves. Beyond shaking the rods at midday, no other attention is required in the setting of early Hamburghs, &c. The necessary tying down of the laterals must be governed by the distance of the trellis from the glass. At a proper distance no tying would be needed until the bunches are set, but precaution should be taken that the shoots are kept clear of the glass, otherwise they will suffer from cold. A selection of the best-placed laterals will have been made, and these stopped at from one to three leaves beyond the bunches, according to the space furnished by the trellis and comparative closeness of the rods. Sub-laterals as they advance should be kept to one leaf, so that the primary leaves get every advantage from light and air. The work of stopping the laterals is best done by degrees, and without any binding rule as to certain days, as early Vines do not always break uniformly. Once they have been stopped, a day should be set apart in every week for the further stopping of sub-laterals, and for tying down shoots. Where the hot-water pipes are situated near the Vines, and not raised much above the soil, water will be needed around the pipes more frequently than in other parts of the border, and so soon as the bunches are set, a general watering should be given with diluted liquid-manure.

Second Early Vines will now be in an active state of growth, requiring almost daily attention to the work of disbudding. The weakest and ill-placed ones should be at once rubbed out, the remainder carefully selected, so as to get a uniformity of bunches. Laterals without a fruit bunch may be stopped early, giving others the benefit of the additional space thus provided. By damping of the floors with liquid-manure in the evening, the Vines will derive much benefit from the ammonia-charged atmosphere. While the foliage is tender it is safer to employ only clear water during the day, or, at any rate, while there is bright sunshine, the latter sometimes causing a scorching of the foliage when atmospheric ammonia is given off in an appreciable volume.

Planting Vines.—Dormant canes can now be planted in borders made entirely inside or outdoors. In the latter case, the rod has to pass through an aperture in the front wall or woodwork, and only in a dormant state can this be done with safety. Well protected with leaves and strawy litter, no danger from cold or frost need occur after planting. In neither case should water be required, the soil affording sufficient moisture for present requirements. Generally, the more satisfactory course is to shake out or disentangle the principal roots, to enable them to be spread out evenly in the border, and if they are covered with a little fine soil, specially prepared, they will be stimulated to an early and healthy growth. No shortening of the canes should be done at this date, or bleeding will be at once set up, which will subsequently be difficult to suppress. The removal of the buds from the extremity down to the point where they would otherwise be pruned, would be better practice. This will vary according to the strength of the cane and the position occupied. When planted indoors, the front of the roof-trellis is sometimes selected as the point at which to stop the rod, and in such a case, all buds from the ground upwards to this point should be retained, and pinched later at a length of two or three leaves. If the Vine be planted in an outdoor border, disbud to a point nearest the opening, or one conveniently placed for the easy training of the prospective shoot.

The Strawberry.—Those plants which are in flower should have the flowers pollinated with care every day about noon, till it is seen that a number sufficient for a crop is set. At such times ventilation should be given, in order to render the atmosphere of the forcing-house buoyant and somewhat dry. A feather, camel's-hair pencil, &c., may be used to carry the pollen to the stigmas. Plants which have set a crop, may, after a time be afforded stronger plant-food than water, such as much-diluted guano-water. Before and after setting, the foliage needs to be syringed twice daily, or red-spider will soon appear on the leaves. Continue to place plants in heat according to the demand, remembering that a fewer number of plants will suffice than earlier in the year.

THE HARDY FRUIT GARDEN.

By C. Herrin, Gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead.

Protecting Peach and Apricot Bloom.—Although I am of the opinion that the blossoms of Peaches and others are often unnecessarily covered, and very frequently much sooner than is advisable, yet it is well to have some means of protection ready to hand for placing over the trees in case of a sudden change from mild weather to severe frosts. If the covering used be fixed, do not place it over the trees before the first blossoms are partially open. Gardens lying in valleys or near water suffer considerable disadvantage at this season, as frost will affect the fruit-blossoms so much quicker than in gardens in a high and drier position. Each season during the past ten the Peach crop here has been a full one, and during several seasons no protection whatever has been afforded. The only covering ever given has been garden-netting in three or four thicknesses, and subsequent to the blossoms commencing to open. This was kept in position with poles standing out about 3 feet from the base of the wall, and let into the border a few inches, being fixed to the coping above on which the netting was suspended. If a more elaborate system of protection be contemplated, the best material for the purpose that I have seen is that sold by the trade as No. 5 shading. Where this is used, a ready means of removing it daily from the trees must be constructed: such as small iron rods fixed under the coping, and on stout posts about 3 feet high, and as much from the base of the wall. The material should be fitted with ordinary brass curtain rings top and bottom, these to run on the rods fixed parallel with the wall. Thus, each tree would have two such curtains, that, when drawn, would meet in the centre, a string tied to the top inside ring serves for drawing the curtains to and fro, and keeps them in position by tying together when drawn. In making these curtains, the depth should be only just sufficient for the rings to meet the rods and allow of running easily, otherwise if made too full, in windy weather they would blow against the trees. These coverings will last for many years if stored away in a dry place when not in use. The trees should be left fully exposed both night and day in mild weather.

The Fig-tree.—The Fig-trees have not stood in need of much protection from frost the present winter, and after this date it is not likely that we shall experience frost sufficiently severe to injure trees on walls if now exposed, especially if the walls have a good wide coping. In any case, where the trees are thatched with straw, some or all of this should now be removed, if the latter, a lighter one of fish netting, three or four times thick, may be hung over the trees after pruning. The latter operation should now be carried out. The pruning consists of the removal of all old spurred-in branches, and those which have borne fruit. The bare spaces, the result of this operation, should be covered with young shoots of the previous season, which should be laid in at their full length, the points of these shoots bearing the most fruit. A space of 6 to 9 inches should be allowed between the young shoots, otherwise the fruits of the young wood have little chance of maturing perfectly, especially if the summer be a cool one. The present season is suitable for the planting or transplanting of the Fig. As a rule of general observance, a south wall, or the corner where a west wall connects with it, should be selected for planting Fig-trees. A wide, deep, or rich border is unnecessary for the Fig, in fact, should be avoided, the rank growth induced by much nutriment leading to unfruitfulness in the plant. Where the natural soil is heavy and devoid of lime in any form, a narrow border, 18 inches deep, with something at the bottom and sides to confine the roots should be provided, the staple of the border being dug out, and loam two parts, mortar-rubble and broken bricks one part each substituted, the whole being mixed together and thrown into the hole, and rammed or trodden till it is firm. The drainage of the border should be as good as possible. A border, having an area of 1½ yard square will afford ample space for a good-sized tree. Although brick walls will confine the roots for a time, these will eventually get through or beneath the brickwork, which will entail a cutting back of the roots in order to check inordinate top-growth. The roots of a Fig-tree turned out of a pot, should be uncoiled and laid out in the border, and the soil made quite firm about them; and if the border be a new one, the plant should be planted rather high, so as to allow for the settlement of the soil. Good Figs to plant out of doors are White Marseilles and Brown Turkey; but if only variety be desired, choose the latter.

THE ORCHID HOUSES.

By W. H. Young, Orchid Grower to Sir Frederick Wigan, Bart., Clare Lawn, East Sheen.

Miltonia vexillaria.—There are but few species of Orchids which give such a wealth of bloom for the size of the plant as Miltonias, and when the situation is suitable, few are grown with less trouble. M. vexillaria, in its native habitat, is subjected to severe drought at times, so that the bulbs shrivel excessively; but the wet season restores them to a plump condition, and apparently they are not any the worse for the drought. It is not usual to subject plants under cultivation to such conditions, still, very little water is needed to keep them in good condition from October to the present. The plants are now forming pseudobulbs, flower-spikes, and roots, and call for different treatment. Excepting when the pots are too small for the plants, or *vice versâ*, Miltonia vexillaria should seldom be re-potted, a yearly renewal of the surface materials meeting their requirements, and being a surface-rooting plant, the pots should be almost filled with crocks, the plant being placed on the top, and sphagnum-moss and peat worked in among the roots, leaving the central mass slightly elevated above the rim. The moss and peat may be about equal in quantity. Such species as M. v. rubella, Klabockorum, Leopoldi, and superba, which are natives of mountains, will not be so forward in growth as the first-named, and surfacing and potting may be postponed, but in other respects the treatment should be identical, keeping them in a house having a temperature between 55° and 58°, affording air freely when weather permits, moisture in the air and at the root being maintained in excess of that which has been afforded during the winter months. Fumigate lightly once in three weeks in order to kill thrips, and remove dust from the leaves with a sponge.

Pescatorea, Bollea, &c. — Botanically speaking, these are still classed as Zygopetalums, but from a cultural standpoint, they have little in common with the old members of that genus. The essential points in their cultivation are dense shade, much moisture, a fair amount of heat, solar or other, and to be afforded fresh air. Success can usually be obtained by growing them with the warm-house Cypripediums, placing them in the shadiest part of the house. Baskets or perforated pans are more suitable than pots in which to grow them, and these should be filled to three-fourths of their depth with crocks, peat, and sphagnum-moss, the latter preponderating, being the chief rooting materials. Newly-poted plants should be sparingly afforded water until re-established, when more may be applied. With advance of the season overhead spraying will be of benefit to the plants, and help also to keep them free from red-spider, and occasionally the leaves should be sponged with a mild solution of soft-soap.

Spathoglottis aurea and Kimballiana may now be re-potted if necessary, using much drainage both under and among the roots. Over the crocks lay sphagnum-moss, and finish off with a mixture of peat one-third, loam, sphagnum-moss, sand, and small crocks. When finished, the mass should be a little lower than the rim, much water being required by the plants during the summer. The pots should stand on moisture-holding material, such as fine coal-ashes in a light part of the stove, and water be applied sparingly for some weeks. S. Vieillardi thrives under similar conditions, but being a more vigorous grower, more loam may be introduced into the compost, and more root-space given. The dwarf cool-growing S. Fortunei is deciduous, and seldom needs re-potting, the removal of loose stuff on the surface, and replacing it with a mixture of loam, leaf-mould, and sand sufficing. Just enough water to prevent excessive dryness till the plicate leaves have made headway should be afforded.

APPOINTMENTS FOR MARCH.

THURSDAY,	Mar. 2	Linnean Society, Meeting.
TUESDAY,	Mar. 7	Scottish Horticultural Association, Meeting.
SATURDAY,	Mar. 11	Royal Botanic Society, Meeting.
MONDAY,	Mar. 13	Annual Meeting of the United Horticultural Benefit and Provident Society.
TUESDAY,	Mar. 14	Royal Horticultural Society, Meeting. National Rose Society, Committee Meeting. Royal Horticultural Society of Ireland, Meeting.
THURSDAY,	Mar. 16	Linnean Society, Meeting.
TUESDAY,	Mar. 21	Truro Show of Daffodils (2 days): Deputation from the Royal Horticultural Society.
WEDNESDAY,	Mar. 22	Show of Torquay Gardeners' Association
SATURDAY,	Mar. 25	Royal Botanic Society, Meeting.
TUESDAY,	Mar. 28	Royal Horticultural Society, Committees.

SALES FOR THE ENSUING WEEK.

MONDAY,	Mar. 6	Roses, Carnations, Anemones, Spiræas, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Mar. 7	Hardy Border Plants, Gloxinias, Pæonies, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	Mar. 8	Japanese Lilies, Palm Seeds, Continental Plants, &c., at Protheroe & Morris' Rooms.
THURSDAY,	Mar. 9	Hardy Perennials, Gloxinias, Hollyhocks, &c., at Protheroe & Morris' Rooms.
FRIDAY,	Mar. 10	Climbers, Dahlias, Roses, Hardy Perennials, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period February 19–25, 1899. Height above sea-level 24 feet.

Remarks.—No rain has fallen since the 15th; the temperature has been steadily going down, and the wind has varied between N.E. and S.E. Fog has been prevalent, being very dense on the 24th and 25th.

Average Temperature for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41·6°.

Actual Temperatures:—

London.—*March* 1 (12 P.M.): Max. 55°; Min. 28°.

Provinces.—*March* 1 (12 P.M.): Max. 49°, Cromer; Min. 43°, York.

Shrubs on Lawns.

From a variety of causes it may frequently occur that the shrubs, deciduous and evergreen, afford little satisfaction, making poor growth, the branches dying at the tips, and with but few flowers in season. These lawn shrubs may consist of Deutzias, Spiræas, Coronilla Emerus, Jasminum fruticans, Philadelphus microphyllus, and **Lemoine**'s hybrids of Philadelphus, the new varieties of Lilac; Vitex, Sophora pendula, Stuartia, Magnolia Soulangeana, M. Lenné, M. stellata, Desfontainea spinosa, Aralia spinosa, Styrax obassia, a very free-flowering Japanese shrub; Indigofera decora and I. Gerardiana, Cornus Kousa, C. florida rubra, Chimonanthus fragrans, Daphne Mezereum, Desmodium, Eleagnus argenteus, Eucryphia pinnatifolia, Exochorda, Forsythia suspensa, and others; Hibiscus syriacus, Hydrangeas, Pæonia moutan, and Arundo Donax.

The present season affords the gardener the opportunity of improving the health of the plants by transplanting them bodily, digging out the bad soil wholly or in part, and replacing it with suitable fresh soil, or mixing a considerable portion of the latter with the staple, and increasing the root area by several feet.

In all cases where the health of the plants has suffered, an endeavour should be made to lift the root-mass fairly intact, and to lay the roots extending beyond the outside of the mass at varying levels, stretching them out at their full length, and embedding them in the soil firmly. If a plant's roots are found to be dead for some distance from the tips, these should be cut back to sound tissue, the cuts being made from the under-side in all cases, so as to induce ready callusing, and eventually the formation of roots.

It will considerably hasten the production of new roots in such cases if a large quantity of sharp sand be thrown in around the root-masses, and water plentifully afforded during the progress of the replanting operations. Those plants which possess small roots are benefited by having sandy-peat, leaf-soil, and sand, mixed with pasture-loam, used in the replanting; but this is a matter about which we will not dogmatise, seeing how greatly natural soils vary, and that particular ingredient which is called for in one, may not be at all needed in another.

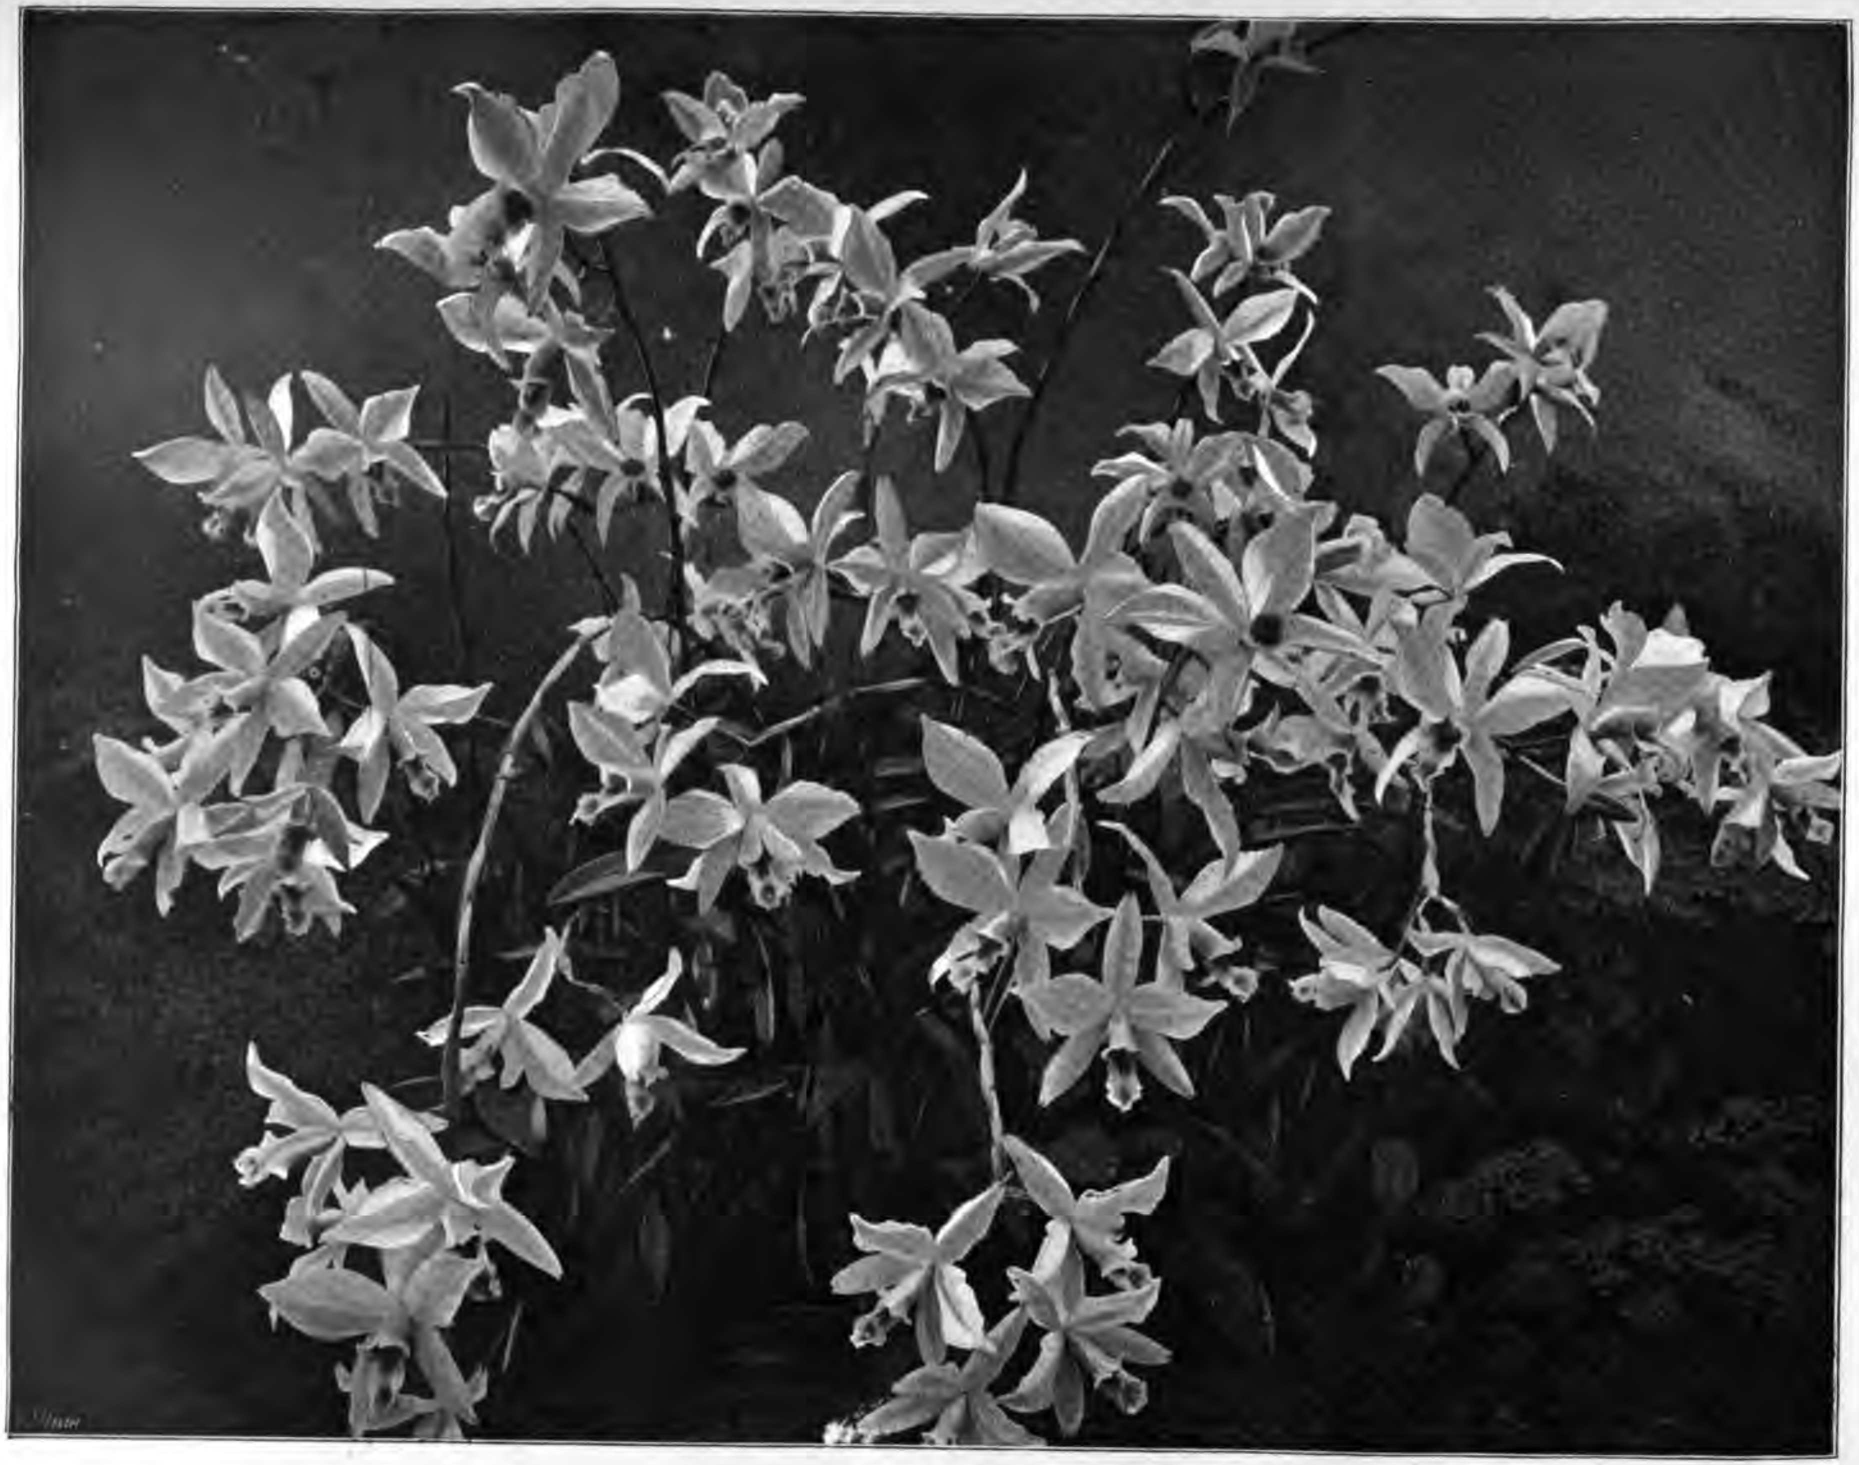
A matter often totally neglected by amateurs, and by many gardeners, is the pruning of flowering deciduous shrubs, and the removal of weak, flowerless, and useless shoots, which, being left untouched, hinder the proper ripening of the best shoots, and rob them of nutriment to their detriment.

In the case of shrubs which flower on the new growth, pruning may be carried out in the autumn and early winter severely in the case of young plants growing into form; and moderately in the case of those that have attained a desirable size, but in every case the relatively weak shoots should be removed. On the other hand, the species which flower on one-year-old shoots and spurs should be pruned towards the end of the season of flowering, not, however, waiting till it is quite past, as to do this would shorten the all-too-brief season of growth. Only in the case of young plants in course of formation should there be a cutting-back of the main shoots or branches, but the more mature plants should be allowed to assume their natural shapes, which is always more satisfactory than any endeavour to control growth would make them. This will be readily acknowledged by anyone who has compared for example a Deutzia which has not had its main shoots shortened, with one that has been clipped all over, as is sometimes done. The fact is, a good shrub-pruner must not alone possess a sharp knife, but brains as well; and he must have a thorough knowledge of the mode of growth and of flowering of all the subjects upon which he is required to operate. This, of course, bars most garden labourers and gardener apprentices. This reminds us that gardeners who know their work, and who desire their young people to acquire knowledge, should always let them accompany the person entrusted with the work. If this were more commonly done, and shrub-pruning systematically and annually carried out, garden shrubs would afford more gratification than is commonly the case. Unfortunately, shrubs in gardens, being employed as wind-breaks, fences, or screens to objectionable features about a place, come in for little if any attention, except it be of the wrong sort—as, for instance, pruning with the shears on one pattern, or the deep digging of the land beneath, with the idea, one would imagine, that the more surface-roots are destroyed in the process the better for the shrubs. We see examples of this absurd practice in some of the public gardens and parks in London, one of the worst being those of the Thames Embankment.

We will, in conclusion, touch upon the important matter of surface feeding after a shrub has become established. From the position of a shrub on a lawn, it is not desirable to place nasty-smelling manurial mulches on the soil around shrubs, neither to fork such aids to growth into the soil, so that the gardener has to fall back upon the use of bone-meal, guano, potash, nitrate of soda, lime and manure-water, all of which can be afforded readily if a circular space, 2 to 3 feet in diameter, round the stem, be left clear of grass.

Failing this free space, or in cases where the roots extend far away from the stem, the manurial agents must be applied to the turf, with naturally a resulting strong growth of the grasses. One or two copious applications of manure-water should be made in the winter months, and several during the period of growth, say in June and July, not later. In light soils particular attention should be paid to affording water in the summer, more especially to shrubs not many years planted, failure to do this usually resulting in impaired growth. Shrubs of long standing seldom suffer much before the end of the summer, and rarely so much as to flag; so that unless water and the labour to supply it are available, they may be left to chance. The recent rainfall has been general and heavy over the whole country, but that, notwithstanding the lack of moisture in the soil at the end of the year having been extreme, the rainfall, heavy as it has been, will not have replaced that which was lost by evaporation during the drought; and gardeners will probably find their bigger shrubs, and even trees, exhibiting signs of suffering before the autumn.

Lælia anceps var. Sanderiana at Highbury, Birmingham.—The Supplement to our present issue shows a very freely-flowered plant of this pretty variety of L. anceps, which recently bloomed in the Orchid-houses of the Right Hon. Joseph Chamberlain, M.P. In *Gardeners' Chronicle* for February 26, 1887, p. 281, was given an illustration of the variety, showing a bloom of its natural size. Though not perhaps so handsome as L. a. Dawsoni, that of Sanderiana very closely resembles that lovely Orchid, the crimson upon the labellum being but a little lighter in tint, and the form of the flower less perfect. There are numerous forms of Lælia anceps now in common cultivation, and all of them are very lovely, the species itself being one of the best known and most commonly cultivated



A Plant of Lælia anceps var. Sanderiana in the Gardens of the Rt. Hon. Joseph Chamberlain, Highbury, Birmingham.

of Orchids. Such a specimen as shown in our illustration is a testimony to the success with which Mr. Chamberlain's Orchid grower has cultivated the collection at Highbury.

LINNEAN SOCIETY.—February 16: Dr. A. Günther, F.R.S., President, in the chair. Mr. Clement Reid, F.L.S., exhibited some fruits of Najas minor, Allioni, and of Najas graminea, Delile, found during a further examination of the interglacial deposits at West Wittering, in Sussex. Najas minor is distributed throughout Europe, except in the north, and in Britain; Najas graminea is found in the Tropics of the Old World, as well as in the Mediterranean region. In Britain, where it has been accidentally introduced, it has been found in a canal which receives waste hot water from a factory. Dr. A. B. Rendle, F.L.S., exhibited specimens of a fresh-water Alga (Pithophora) new to Britain, and described its structure; additional remarks being made by Messrs. A. W. Bennett and Clement Reid. Messrs. I. H. Burkill, F.L.S., and C. H. Wright, A.L.S., read a paper "On some African Labiatæ with alternate Leaves," a peculiarity which had been recently used by M. Hua to characterise a new genus, Icomum. To this genus three new species were now added. Its affinity was said to be with Æolanthus, in which certain irregularities in the arrangement of the bracts of the inflorescence and flowers might be observed. The types of the new species described were stated to be in the herbarium at Kew Gardens.

THE PARIS EXHIBITION.—In connection with the horticultural section of the Exposition Universelle to be held in Paris in 1900, the committee, under the presidency of M. Charles Baltet, have decided to arrange an Arboricultural and Pomological Conference, under the following conditions:—

I. The Conference will be held concurrently with the great fruit show, probably about September 25, 1900.

II. Preliminary papers will be accepted dealing with the undermentioned subjects included in the programme of the Conference:—

1. Fruit Farms; Cultural and Economic Principles; Choice of Suitable Varieties, and their use.
2. Fruit-planting by roadsides.
3. Harvesting and preservation of Fruit; Packing Fruit.
4. Cider trees and fruits; their cultivation and uses.
5. Atmospheric agencies; their influence on forced Fruit-trees and Vines.
6. Vegetable Physiology as regards fructification; Practice of Grafting and Pruning.
7. Tariffs and conditions of transport for Trees and Fruits.
8. Insects; diseases; remedies.
9. Manures and fertilisers.
10. Concerning the propagation of varieties of Fruit for Colonial cultivation.
11. Tuition in Fruit-culture; Garden-schools; Public instruction; Congresses, &c.

The Bureau, with M. Charles Baltet as president, will arrange all details connected with the organisation of the Arboricultural and Pomological Conference.

OPEN SPACES AND PARLIAMENT.—It is but a week or two since, at a conference between central and local authorities, it was agreed to leave the supervision of metropolitan "open spaces" to the sanitary officials—this in order to ensure efficient supervision and to allay friction. On the face of it this appears to be the proper course, yet but a few days elapsed before a Bill was introduced into the House of Commons, once more altering and proposing to alter the arrangements arrived at. The new "Municipal Bill" proposes to hand over the many open spaces to the care of what we may term here "Borough Parliaments," each with a mayor, aldermen, and common council. Perhaps the open spaces may find this to their advantage—perhaps the result may be to the contrary; at any rate, the matter is well worthy the attention of all concerned: this means all lovers of pure air, contact with plants and flowers, and healthy exercise for youngsters in the metropolis. Let our parliamentary representatives make a special note of this matter when the bill in question gets into committee.

HAMPSTEAD HEATH PROTECTION.—Mr. E. Brodie Hoare, M.P., presided, on February 22, at the second annual general meeting of this Society, which was held in the lecture-room of the Subscription Library, Stanfield House, Hampstead. The Society was established in 1897, to take steps for the preservation of Hampstead Heath in its wild and natural state, so far as is consistent with its full enjoyment by the public. The annual report and balance-sheet showed that, in co-operation with the London County Council, the Society had already been the means of doing some useful work. The chairman, in addressing the meeting, said that the Society had no desire to act in antagonism to the London County Council, but to co-operate with them in preserving the natural beauties of Hampstead Heath, and he believed that feeling was reciprocated by many members of the County Council. The report was unanimously adopted, and various speakers insisted on the importance of preserving Hampstead Heath as a piece of natural open country, and of not treating it like a London park.

RUBBER-PLANTS.—Economically and commercially, great interest now centres in the cultivation in suitable localities of plants yielding caoutchouc. The demand is already very large, and it is likely to increase rather than diminish; hence, it is very important that our colonies should be supplied with the means of cultivating the rubber-plants on a large scale. Messrs. J. B. Williams & Brothers, of Verjancoda, Ceylon, send us circulars relating to the cultivation of Castilloa elastica, the most valuable Central American rubber-tree, and Hevea brasiliensis, which furnishes the Para rubber.

HYBRIDISATION.—Mr. R. A. Rolfe, of Kew, who is preparing a paper for the Hybridisation Conference, entitled "Hybridisation viewed from the standpoint of systematic botany," would be much obliged for any information respecting the reproduction of any supposed natural hybrids by artificial means, either among Orchids or other plants.

THE COAL-SMOKE ABATEMENT SOCIETY.—Sir Wm. Richmond took the chair at a committee meeting of this society, held last week at 6, Onslow Gardens. Several letters were read from members who were unable to attend. The Duke of Westminster in expressing a wish that a younger man than himself might accept the presidency, showed his practical sympathy by subscribing £100. The chairman, in referring to the rapid increase in the membership, felt it was largely due to the action of the committee in fixing the minimum annual subscription at a nominal amount, thus obtaining the wide support of the public. When the inhabitants of this great metropolis thought of the benefit to health and the saving to the pocket secured by a cleaner and purer London, they would be quick to give their substantial assistance to the movement. The hon. secretary, Mr. Owen B. Thomas, of 59, Chancery Lane, will be pleased to answer any enquiries.

KEW GARDENERS: PAST AND PRESENT.—The annual meeting of the Kew Guild, an institution that was established in 1893, as a means of bringing into closer association with each other the past and present graduates of the Royal Gardens, was held on the 23rd ult. The proceedings took place in the new room, known as the student's library, which is capable of seating upwards of seventy persons, and is in every respect a convenient and comfortable apartment. In the much regretted absence of the president (Mr. Geo. Nicholson), the chair was filled by Mr. Jno. Weathers. The report for the year was received with considerable satisfaction, and the management of the affairs of the Guild, including the *Guild Journal*, which is issued annually, and edited by Mr. Watson, was warmly praised. There are now seventy-one life members of the Guild, and the committee's appeal for others to compound their subscriptions by a payment of £1 is one that should meet with general acceptance. Mr. R. A. Rolfe was elected to represent the herbarium upon the committee, and when the young men at present employed at Kew had chosen one of their number to represent them in place of a retiring member, the rest of the committee were re-elected *en bloc*. It may interest many members in the colonies to know that a portrait of Mr. W. Botting Hemsley, F.R.S., will form the frontispiece to the next *Journal*, to be issued in May. A resolution was passed offering the congratulations of the Guild to the director of the Royal Gardens, Sir W. T. Thiselton Dyer, K.C.M.G., &c., upon the honour recently conferred on him by Her Majesty. Several minor alterations were made in the rules for the purpose of fixing the annual meeting for the last Thursday in February of each year. Any reader who has been employed at Kew, but who does not receive the *Guild Journal*, is invited to write to Mr. Watson, the hon. secretary.

FRUIT CULTIVATION BY FARMERS.—At the Farmers' Club, Salisbury Square, Fleet Street, E.C., on Monday, February 27, Mr. Spencer Pickering, F.R.S., gave a paper on this subject which attracted a large gathering of members. All the principal points in relation to fruit growing on Farms were dealt with generally, and especial stress was laid upon the fact that more attention was needed than had hitherto been accorded from an agriculturist's point of view. Examples of the gross neglect so apparent in many districts were described, and the remedies indicated. The extension of fruit culture by an arrangement between landlord and tenant was advocated, and the method which found favour with the lecturer was one by which the landlord provided the trees, and the tenant incurred the expenses of preparation, planting, and culture. A system of compensation was also recommended; the actual amount payable to an out-going tenant being determined by valuation. A vote of thanks to the lecturer concluded the proceedings after some discussion had taken place on the various aspects of the subject.

ORCHARDS.—A practical paper was contributed by Mr. R. L. Castle, Manager of the Woburn Experimental Fruit Farm to the Bedfordshire Chamber of Agriculture, on Saturday, February 25, in which the subjects of planting, managing, and restoring orchards, were dealt with exhaustively. There was a large attendance of members, and an interesting discussion followed, during which, both the difficulties and the advantages of fruit growing were fully brought out. Mr. Crick, a fruit grower of Ampthill, endorsed the whole of the statements made in the paper, which he described as thoroughly practical, and useful in every respect. He further stated, that after forty years' experience he was preparing to make a considerable extension of the area of land he devoted to fruit, and he thought that was the best proof of his opinion in the matter. A hearty vote of thanks was accorded to Mr. Castle at the conclusion of the proceedings.

MISS HELEN THORNYCROFT'S EXHIBITION.—Miss Helen Thornycroft, sister of Hamo Thornycroft, R.A., sculptor, has now on view at her studio, 2A, Melbury Road, some beautiful flower pictures, and paths and corners of old-fashioned gardens, the latter mostly taken from cottage gardens in Monmouthshire and Herefordshire, where the soil must be exceptionally good, and the care and attention of the gardener unremitting. Miss THORNYCROFT'S flower pieces are well known; and in looking round her gallery one is especially struck by the purity and brilliancy of her colouring, and the accurate drawing of the flowers so gracefully arranged. There are two beautiful Orchid groups, and a very free and natural arrangement of Fritillarias. Besides the flower subjects alluded to, Miss THORNYCROFT is showing sketches of Scotland, Monmouthshire, and the Italian and Austrian Tyrol, the former so blue and tender in colour, and Dolomite country so still and cold. The exhibition will remain open till March 25 inclusive.

FLOWERING OF AMHERSTIA NOBILIS.—Knowing that you are always interested in anything special or rare, writes Mr. JEFFREY, of Harewood House Gardens, Leeds, under date of February 28, I am writing to let you know that one of our plants of Amherstia nobilis is showing two racemes of flowers. The plant is between 6 and 7 feet high, and was brought from Trinidad by Lord HAREWOOD five years ago. Judging by the progress it is making, the blooms should be open in about four weeks.

WILTS COUNTY COUNCIL. — The following summary of the chief results obtained for the last four years in the Experimental Stations near Calne has been published in the annual report:—

POTATOS.—1. Good crops of Potatos may be grown at a profit for four years (probably more) on the same land with artificials alone as a manure, provided these contain nitrogen, phosphorus, and potash in suitable form and proportion. 2. The omission of any one of the ingredients (nitrogen, phosphorus, or potash) reduces both the crop and the profit on the manure employed. 3. Of the three above-mentioned ingredients, the omission of potash causes the least loss, and that of nitrogen the greatest 4. The application of 8½ cwt. per acre of artificial manure containing equal weights of nitrate of soda, mineral superphosphate (26 to 27 sol. phos.), and kainit, is more remunerative than one consisting of either 4½ cwt. or 12¾ cwt. of a similar mixture. 5. Sixteen tons per acre of stable-dung, at 5s. per ton, produces a bigger crop and more profit than 8½ cwt. per acre of the artificials referred to above. 6. The maximum crop and profit were obtained with stable-dung, 8 tons per acre, supplemented by nitrate of soda, 3 cwt. per acre, or an equivalent of ammonium sulphate. 7. During an average season but very little may be gained by spraying early varieties with Bouillie Bordelaise if planted in good time; but the spraying of late varieties may at least be regarded as a cheap form of insurance against loss of crop from the Potato disease. 8. Equal weights of whole and cut seed yield very nearly the same weight of crop. 9. The plucking of flowers from the Potato plant, to prevent loss by formation of seed, is not remunerative. The yield from heavy land, especially in dry seasons, is greater than that from light land. 10. The best distances for planting appears to be eight rows to the perch, and 14 inches between the sets in the rows for late varieties, and ten rows to the perch and 12 inches between the sets in the rows for early varieties.

ROTATION CROPS (ON HEAVY LAND).—1. Good crops of Mangels, Barley, Beans, and Oats may be profitably grown in rotation without farmyard-manure, provided suitable artificials be employed. 2. Of the above crops, Mangels give the best and Beans the least return for artificial manuring. 3. The best financial results have been obtained so far by manuring as follows:—Mangels: nitrate of soda 4½ cwt., salt 3 cwt., and superphosphate 1 cwt. Barley: nitrate of soda 1½ cwt., and basic slag 4 cwt. Beans: no manure, but seeds treated with nitragin. Oats: nitrate of soda 1½ cwt., and basic slag 4 cwt. per acre. *C. H. Corbett, Secretary.*

EXPERIMENTAL GARDEN, DROITWICH.—The third annual report is before us, giving details of the various fruit trees and garden crops raised during the year 1898. Cox's Orange Pippin, Bismarck, Gladstone, Potts' Seedling, Stirling Castle, Cellini, Keswick Codlin, Lord Grosvenor, Winter Hawthornden, and Worcester Pearmain were among the best Apples grown. The best Plums were the Czar, Pershore, Mallard, and Bittern. Of Red Currants, La Fertile, Victoria, and Knight's Early are the most vigorous growing varieties. Among Gooseberries, Rough Green, Whinham's Industry, Keepsake, Rough Red, and Scotch Red are the strongest growers. The favourite Raspberries are Prince of Wales, Red Perpetual, Superlative, and Surprise d'Automne. The best four Strawberries were Royal Sovereign, Monarch, the Countess, and Sir Joseph Paxton. Similar details are given with relation to kitchen garden crops. Our space will not allow us to cite more freely, but we advise those interested to become possessors of this useful little treatise, which is issued by Mr. UDALE for the Worcestershire County Council, and which may be had from Messrs. MARK & MOODY, Stourbridge.

"ILLUSTRATIONS DE FLORE DU CONGO."—Under this title, MM. DE WILDEMAN & DURAND are issuing a series of quarto lithographic plates devoted to the illustration of the new plants discovered in the Congo State. Some 2[illegible]0 specimens are already preserved in the National Herbarium at Brussels, of which no fewer than 500 are considered to be new to science. Living plants will also be collected and remitted to M. LINDEN for purposes of cultivation. We presume also that the Botanic Gardens of Belgium will profit by these importations. The illustrations before us are principally of botanical interest only. They are excellent representations of the respective plants, and are furnished with detailed analyses, without which such plates are of little value. Vernonia hamata is remarkable for the inner scales of the pappus, which are strongly hooked at the apex. The collaboration of monographers of particular families is ensured.

THE CRYSTAL PALACE. — Exhibitors know full well that there is no place near London anything like so well suited for their purposes as "the Palace." They will, therefore, be interested in knowing that the prospects of the Company are decidedly improving. The financial condition is sounder, the train service is to be improved, and altogether the outlook is much more favourable than it has been of late years.

THE SURVEYORS' INSTITUTION. — The next ordinary general meeting will be held on Monday, March 6, 1899, when a paper will be read by Mr. F. J. SMITH (Fellow), entitled "The Working of the Light Railways Act, 1896." The chair will be taken at 8 o'clock. Country meeting at Bristol:—It has been decided, on the invitation of the Somerset, Gloucester, and North Wilts Provincial Committee, to hold the next country meeting at Bristol, on April 26 and 27. The first day will be devoted to papers and discussions, with a dinner in the evening; the second day to excursions to various places of interest in Bristol and its neighbourhood. Full particulars will be issued a little later on.

A NEW WATER-LILY.—Under the name of Nymphæa fennica, Mr. A. J. MELD, in the *Acta Societatis pro fauna et flora Fennica*, xiv. (1897), April 3, describes and figures a new small-flowered white Water-Lily. The leaves and flowers are small; the petiole has only two large central air-canals, instead of four, as in N. candida and N. alba. The base of the flower, and its relative size in regard to the sepals, are very characteristic looked at from beneath, is four-sided, and separates the species from N. candida and N. alba. The white petals, ten to fifteen in number, are narrowly lanceolate and concave, so that the entire corolla is cup-shaped. The stigmas are five- to nine-parted, with yellow, often violet-tipped, lobes, so that they form a central star, whose rays are deep violet-coloured. The species occurs chiefly in middle and East Finland, mostly in small forest-pools.

THE CEDAR AVENUE AT DROPMORE.

FEW persons who have visited Dropmore, that paradise of Conifers, failed to view the remarkable Cedar avenue. It is not a conspicuous feature, leads to nowhere in particular, and is situated some hundred yards distant from, and about parallel to, the road which traverses the grounds. The finest specimens of Cedrus Deodara now extant at Dropmore were planted by Frost in 1834, which was soon after his appointment as gardener; but this avenue of Lebanon Cedars was probably planted ten or fifteen years later. The trees were planted in avenue form, we believe, in reality to get rid of them, so many Cedars having been dotted about the grounds as to be suggestive somewhat of monotony. But although it owes its origin to an accidental abundance of young plants, the avenue forms at this day a pleasing and unusual feature of tree-planting in this country. The photograph from which our illustration (fig. 52) was prepared was taken by Mr. James, of Farnham Royal.

HOME CORRESPONDENCE.

FULHAM PALACE GARDENS.—I notice in the *Gardeners' Chronicle* of last week's issue, a reference to the above gardens in the olden time. Having had the pleasure of a ramble round the grounds and gardens of this interesting old palace, one day last summer, I had many ancient specimens pointed out to me by Mr. Turner, the present head gardener. Two mentioned in last week's article are still there, viz., Gleditschia triacantha, and Juglans nigra. Beautiful specimens of evergreen Oaks are prominent on the lawns; also noteworthy specimens of Fagus asplenifolia, Taxodium distichum, Cedrus libani, and Betula incisa; a magnificent example of the Eastern Plane-tree, Platanus orientalis, stands in the centre of a broad walk, leading to the drawbridge. On the palace walls are the old Sweet Bays and Myrtles, growing to a height of from 16 to 20 feet. The grounds, gardens, and palace are surrounded by a moat, which is still kept filled with water, as in ancient days. It is pleasing to add that Bishop Creighton and his lady take a great delight in their gardens, which Mr. Turner keeps in admirable order. *T. H. Bolton.*

DUTHIE PARK, ABERDEEN.—I can fully endorse the remarks of Mr. William Cuthbertson (p. 124) on the beautiful Duthie Park, also the compliment he pays to the able superintendent. I enclose a cutting from the *Aberdeen Evening Express*, which shows the desire of the town council to render the park still more attractive and interesting to the public. *G. W. Cummins, Balmedie Gardens.* [The cutting shows an extensive, pleasing, cruciform glasshouse, with a central dome, high sides, and a lantern roof, the building standing on a slightly elevated platform, approached by flights of steps, and a sloping path. ED.]

EUCALYPTUS GLOBULUS IN SCOTLAND.—Having read several letters in the *Gardeners' Chronicle* about these trees, my experience in the open here may be of interest. Some fifteen years ago a plant of Eucalyptus Globulus was put out against a south wall of this house. The plant has thriven since, and now covers the entire wall, the top of the tree having been cut off many years ago to encourage the branches to spread. In 1894 this plant flowered freely. I gathered the seed in 1896, and sowed it in February, 1897. Almost every seed came up, and these are now splendid young plants, all of which I intend planting out when two years old. In the autumn of 1897 I planted in the woods two young E. Globulus, about 7 feet high, both these have grown rapidly, one making a growth of 9 feet 4 inches during the past summer. This plant is growing in a very wet peaty soil; the measurement was taken on September 30, and is accurate. Seventeen degrees of frost was registered here in November last, but neither plant was in the least affected. *Logan, Mull of Galloway, N.B.*

STRAWBERRY NOBLE AND ROYAL SOVEREIGN.—There appears no reliable time to reckon on the ripening of forced Strawberries. Last year my Nobles and Royal Sovereigns were both ripe in February, within two days of each other. This year, although both were housed the same day, and in the same house, Royal Sovereign was ripe on February 16, but the Nobles will not be ripe for some days. This will bring them nearly three weeks later than Royal Sovereign. *Edward Bennett, Farnborough, Hants.*

PRUNUS PISSARDI IN LATE WINTER.—There is sharp frost outside, and a dense fog, though not sufficient to hide from view the fact that the trees immediately contiguous have their branches wreathed with rime; but inside, in my cold glass-house, this Japanese Plum is laden with blossom. The plant is in the form of a low standard, occupying a 12-inch pot; it has a head some 5 feet through, and every branch and twig is laden with white blossom from the centre to the extremest points. The mass of snowy blossom is singularly profuse; and I need scarcely add the specimen is greatly admired. As I am compelled through exigencies of space to keep the plant reduced in size, as soon as the blooming time is over I prune back quite hard, leaving a mere skeleton, but shoots are speedily thrown out, and by mid-summer there is a dense head of reddish claret-foliage, and the shoots bearing this produce the bloom of the spring. The plant, with its bright foliage, forms an ornament in my forecourt garden all the winter. If gardeners only realised what a charming object this plant can be made to be, they would grow it largely in pots for cold house and conservatory decoration at this season of the year. I think it is better adapted for a cold house than a warm one, because I think that the warmth would provoke growth; while, in a cold house, without the stimulus of artificial heats, there are only a few leaves to be seen at the points of the shoots. I have shown that this Prunus is amenable to rough treatment; a plant will also do well in a pot for years, provided some fertiliser be used during the season. I have employed ichthemic guano with excellent effects, placing a thin layer upon the surface once a week, and watering it in. In summer, owing to the plant being in a pot filled with roots, the pot is kept standing in a pan of water. There are few subjects so easily managed, which are so useful as Prunus Pissardi; heaping up its flowers in happy plenteousness in spring, and then putting on a brilliant robe of leafage in summer and autumn, which it retains until they drop. *R. D.*

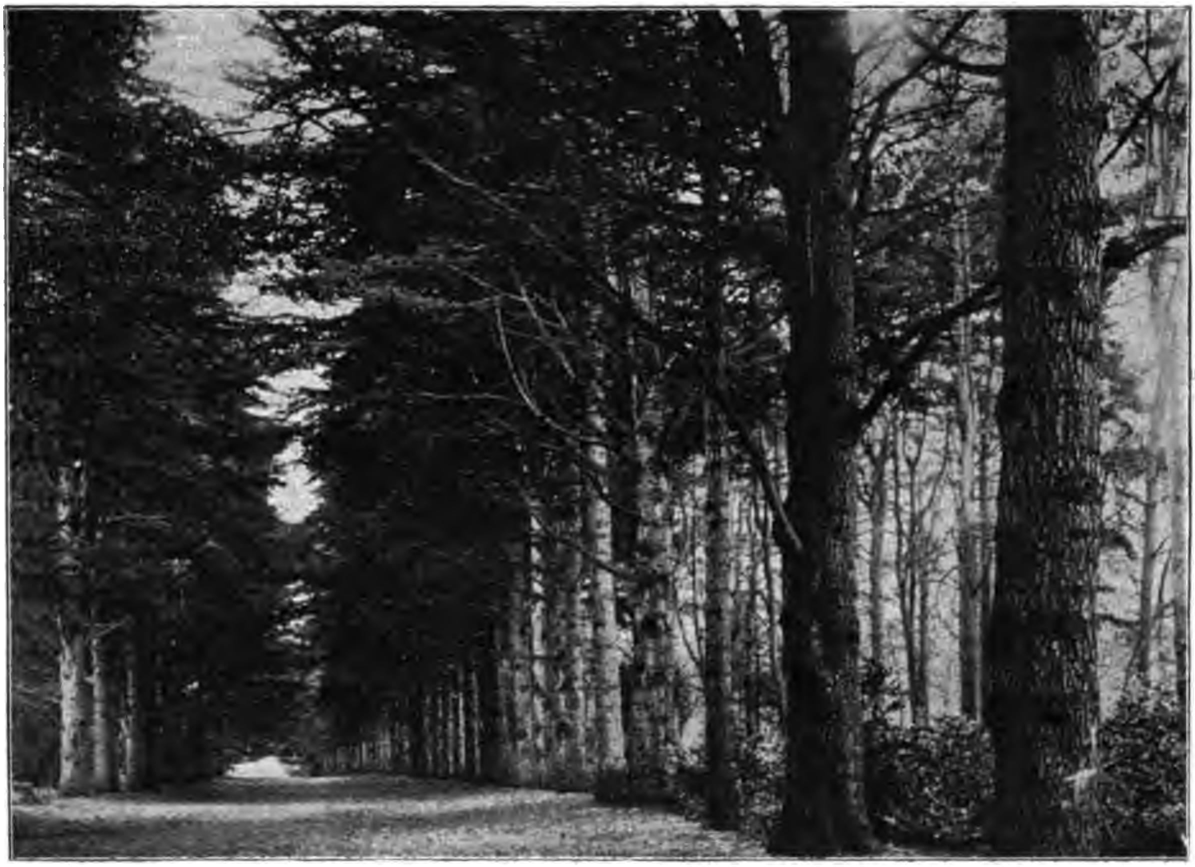


FIG. 52.—THE AVENUE OF CEDARS OF LEBANON AT DROPMORE. (SEE P. 138.)

FROST AND FOG.—It is a common saying in Hampshire, "So many fogs in March; so many frosts in May." I have known old gardeners and husbandmen who held to this belief with all the fervour of devotees; but I could never get from any one of them the reason of the connection between the two. This belief (for it amounts to a belief) is probably based upon some observation made in times past, which may possess an amount of credence it is scarcely wise to scoff at. It is doubtless a remnant of the old weather lore, which abounds in country places, and which is handed down from parent to child as of undoubted credibility. Can anyone throw light upon the *rationale* of this country expression. *R. D.*

BEGONIA GLOIRE DE LORRAINE.—I have about forty plants of this fine variety, which were raised from cuttings struck early in May, 1898, in strong bottom heat. When the cuttings were well-furnished with roots, they were removed to a house having an intermediate temperature. After a few re-pottings they flowered in small 32's in September, and they are still flowering profusely. I know of no flowering plant for which so many uses can be found, and I have had plants which have flowered beautifully for six weeks in succession. With regard to female flowers, I had six plants which exhibited from ten to thirty female flowers each, the seeds of which I carefully harvested, and I have now as much seed as one could place on a sixpence. I am about to sow this seed in the hope that it will have germinating power. *Jas. Moir.*

PHORMIUM TENAX.—In your issue of February 25 a correspondent makes mention of seeing a fine plant of Phormium tenax growing in a garden at Bishops Teignton, in Devonshire, without winter protection. It may be interesting to him to know that there are at present in the nurseries of Messrs. Alex. Dickson & Sons, of Newtownards, co. Down, a large number of splendid specimens of both this and the variegated variety, which have stood out for many years, without the slightest protection, and have now attained large proportions. *W. F. Gunn.*

THE VISCUM ALBUM.—I have from time to time made a few remarks on the above parasite, and find from long observation that many varieties differ in habit very greatly—that there are some that are very compact in growth, with very small foliage, and others much coarser and longer in growth, and with very thick leaves, having the fasciated form, variegated, and double parasitic forms. The remark I am about to make is, that two kinds may be produced from the same seed, one part of the plant differing from another part. I have two specimens showing this peculiarity, and feel quite sure myself it is correct (but what science may say remains to be stated), as very frequently a berry produces two shoots, and attaches itself to the tree, showing a proof of the correctness of the assertion. The old berries that are left on the plant sprout in themselves after attaining a certain age, that is, being fully ripe. There are often some berries left on the plant till the next crop, which doubtless would grow if put carefully and securely on the rind, but not having tried them I cannot say; but I fully believe it would succeed, as the berry, if good, will sprout on anything, on even a cannon-ball, stone, or on a dry fence, but lacking the nutriment required it dies. Doubtless, some of the more learned in such matters, and possessing more botanical knowledge, will give their views (should they think the remarks made worth their notice), and their experience with this parasite. The specimens alluded to are from nine to twelve years old, so that my observation of them is not very limited. *Justus Corderoy.*

FILMY FERNS IN A COOL FRAME.—I read Mr. Swan's remarks about the cultivation of filmy Ferns with interest. We know that the plants dislike heat, and are most at home in shady, cool pits, or glass-cases, if severe frosts are guarded against. In the gardens at The Hendre we have, as has been remarked in the pages of this journal, a glass-case of this kind on the north side of a high building, in which Todeas, Hymenophyllum, &c., thrive admirably. My object in writing is to point out that although filmies are able to withstand some degree of cold without injury, as I have proved several times in the last twenty years, yet there is a certain limit, and beyond which some species are injured. In February, 1895, we had unusually severe frosts, and when, on one occasion, 32° were registered, the Fern-case, although being well protected with mats and litter, the plants, on being examined, were found to be thickly coated with hoar-frost. The coverings, however, were kept on the case till the frost had quite disappeared, hoping that all would be well with the plants. This was not so, however, for plants of Todea pellucida were killed, and a fine specimen of Todea superba lost all of its fronds, as well as the undeveloped ones, none forming in 1895. In the spring of 1896, a whorl, however, appeared, and the plant now has upwards of thirty fronds, but they are not as large as those it possessed at the time of the frost. Todea plumosa, Trichomanes radicans, T. dissectum, and T. dilatatum withstood 32° of frost without any apparent ill-effects, and likewise Hymenophyllum tunbridgense and H. Wilsoni, as they might be expected so to do. *Thos. Coomber.*

FRUIT REGISTER.

NOTES ON SOME LATE WINTER PEARS.

AFTER Winter Nelis, a delicious Pear which is in season in December, and whose fruits come finest on wall trees, Passe Crassane is one of our most valuable Pears, keeping late and becoming fit for table use in January, and lasting for about five weeks. The tree must be trained on a south or west wall, and in a hot season it will reach perfection. Ne Plus Meuris is a trusty variety, which is fit for dessert as late as March; if it have faults these are smallness, and sometimes grittiness, but good cultivation results usually in a fair size and excellent flavour. The tree bears well in most soils.

Glou Morceau is as good a variety almost as the last, and is one of the largest of the late keepers. It is improved in flavour by keeping, and generally, if it be left on the tree till November, with suitable treatment in hastening or retarding ripening, Glou Morceau has a season of two months. The fruit when well exposed to the sun is always of a fine yellow tinge. It is buttery juicy, but sometimes gritty at the core. Josephine de Malines and Bergamotte d'Esperen are our latest dessert varieties, and to have them in good condition they should not be gathered, or, at the least, not all of them, before November, or shrivelling will occur, and flavour will be lacking. I have kept these two varieties till the month of May in passable condition.

It need scarcely be said that these late varieties should be handled and stored with the utmost care, wood-wool or other soft material being laid in the gathering baskets and on the fruit-room shelves. The Pear-room should be dry and airy, and the fruit laid in a single layer, covering them with paper. When Pears are sent to table each variety should be labelled neatly, so that the employers may know what the variety is. *W. A. Cook, Compton Bassett Gardens, Calne.*

FLORISTS' FLOWERS.

SINGLE-FLOWERED CHRYSANTHEMUMS.

To provide flowers for exhibition in a cut state, disbudding is necessary, in order to increase the size of the blooms; but as decorative subjects, I am not in favour of cultivating single flowers on what is known as the large-bloom system. For purposes of decoration, either as plants in pots or as cut flowers, the plants should be permitted to produce long sprays, branching freely in a natural manner. Many varieties belonging to this section are sweetly perfumed; that known as Mrs. Langtry is especially so, and a freely-flowered plant is sufficient to perfume a whole house.

February is a good time to insert strong, healthy cuttings, and two may be put into each 2½-inch pot, using sandy soil. Place them in a cool-house, and when the plants are 4 inches high, pinch the tops from the shoots, in order to induce the plants to make lateral branches. Re-pot the plants before they become in the least root-bound, and seek to keep the growth as stocky as possible. Pots 8 and 10 inches in diameter are sufficiently large. Indeed, the latter size would afford room enough for three plants. To obtain plants of various sizes, some of the plants may be again "pinched" when they have made 5 inches of additional growth. Subsequently, as the plants grow and make natural breaks, the number of shoots to each will be considerably increased. Beyond loosely tying the branches to a few stakes in each pot, no interference with the growth will be necessary. The plants will then form as many buds as possible, and subsequently produce charming sprays of blooms 2 feet long. The varieties are now numerous, and it is not wise to grow any but the best.

The following are a good selection:—Miss Mary Anderson, white shaded rose; Miss Annie Holden, a creamy-buff sport from the above; Fairfield Beauty, rich velvety-crimson in colour, and of exquisite form; Annie Heard, pure white, of medium size; Admiral Sir T. Symonds, blooms deep yellow, extra large; Mrs. A. E. Stubbs, pure white; Purity, also white, very free; Souvenir de Londres, crimson; Oceana, silvery blush; Jane, an old favourite, pure white; Earlswood Beauty, primrose; Mrs. C. H. Seeley, white, extra fine; Millie Agate, blush; Springfield Beauty, maroon; Earlswood Glory, white with green disc; Golden Star, rich yellow, shaded bronze; Florence, blush-pink; Mrs. Langtry, pale-pink, fragrant; and Miss Rose, pink, very free. *E. M.*

FOREIGN CORRESPONDENCE.

SPECIES OF SELAGINELLA WORTHY OF CULTIVATION.

In the number of the *Gardeners' Chronicle* for December 17 last, Mr. G. B. Mallet describes some species of Selaginella, and touches upon their cultivation. I should be glad to add a few remarks. Among the species of larger growth the following are as beautiful and worthy of cultivation as those named by Mr. Mallet, viz., S. atroviridis, Spring, is an oriental species, with a sub-erect and decompound dark green fronds (if the term frond may be adopted for the branches of Selaginellas). The fronds become a half to 1 foot long. It is a plant of easy cultivation, and has a good effect when grown in large pans. S. atroviridis seldom produces spikes. This species belongs to the same group as the well-known S. Martensii. S. Breynii, Spring, may be regarded as the most beautiful species of the uncinate or plumose group. Its stems are entirely trailing, and bears sub-erect, pinnate, branched fronds; the lateral leaves are of a bright golden lustre, that renders the plant very effective, and the better if several plants are planted together into one large pan.

S. flagellifera, of which Mr. J. G. Baker, in his excellent monograph of the Selaginellas, in the handbook of *Fern Allies*, says is a form of plumosa, introduced from Fiji. We find it sometimes cultivated in English ferneries—for instance, in the far-famed fernery of Messrs. Birkenhead, at Sale, near Manchester. We also received most of the following described species from Messrs. Birkenhead. S. flagellifera is valuable for the same purposes as plumosa.

S. tassellata, Hort. Bull, is one of the most interesting species we know of. The lateral fronds are large, and much dilated on the upper side at the base; the bracts of the spikes are extremely long and ciliate. We cannot explain the meaning of the specific name "tassellata." It is a very distinct and ornamental stove Selaginella.

S. umbrosa somewhat resembles caulescens. It is a very pretty upright-growing variety, of straggling habit. The fresh green colour of its fronds makes a charming contrast with its bright red stems. Selaginella erythropus grows quickly in a temperate greenhouse.

S. Victoriæ, Moore, is, I think, the most valuable species next to grandis and Wallichi. Its sub-erect, sarmentose stems become 3 to 4 feet long, and produce large fronds with long caudate pinnæ. The upper-side fronds are of a dark-green colour, that may have given occasion to the synonym "atroviridis," Spring. With respect to its cultural requirements, these are attended to by Mr. Mallet in the above-mentioned article. A species quite different from all other cultivated Selaginellas is S. oregana (Eaton). In its habit it is more like a Lycopodium than a Selaginella. Its thin stems are pendent, and grow 6 feet in length; its fronds are uniform, and for that reason it is included in the rupestris group. S. oregana is worthy of cultivation, and its trailing habit makes it suitable for baskets and hanging vases. It also has a very good effect in masses.

Of small-growing, moss-like species, I only name S. Poulteri; the others are known well enough, except, perhaps, the two varieties of Kraussiana, viz., Stansfieldi and Browni; these are nice varieties, suitable for covering a rockwork fernery. In German gardens S. Kraussiana is mostly called denticulata. This is quite wrong; denticulata is a Mediterranean species, totally different in habit from S. Kraussiana. *C. K. Schneider, Darmstadt.*

NURSERY NOTES.

CARNATIONS AT EXMOUTH.

THE winter-blooming varieties of Carnations may be easily grown if the necessary convenience for their cultivation is available. It is best to cultivate them in considerable quantity, and devote a good portion of a house, or, better still, the whole of it, to the accommodation of the plants. The exact attention and treatment they require can then be given them, without reference to the needs of other plants. Satisfactory results may then be confidently anticipated.

I had lately the pleasure to see the collection of Mr. W. J. Godfrey, at the Claremont Nursery, Exmouth, and was surprised to find so fine a display of bloom there. The vigour of these plants and their free-blooming qualities enable me to recommend the varieties as most desirable ones to acquire. They have been raised by Mr. Godfrey. Among the white-flowering sorts Pearl Beauty is prominent; it has large and full flowers, of fine form, and pure white in colour, they were also sweetly scented. Lady Doreen Long is one of the most handsome varieties ever introduced. The colour is clear yellow, with a slight pencilling of carmine-pink, very large, of rare substance, and a very strong grower. Mrs. Richard Ley is rich salmon-pink, with smooth and even petals. Miss Nita Bloxsome is in colour similar to Madame Thérèse Franco, but is more robust and free flowering, and the blooms are smoother. Many growers are discarding Madame Th. Franco for Miss Nita Bloxsome. Miss Adam-Hogg is of most desirable form; the blooms are similar to those of Miss Joliffe, but are larger, the colour is bright glowing salmon, quite distinct, and very fragrant. The plant is a dwarf and robust grower. Lady Gertrude Rolle reminds one of the border variety Duchess of Fife in colour, but is of a richer and more solid rose-pink. In habit the plant is dwarf, robust, and very free; it is one of the very best of its colour. Nellie Stevens is in colour similar to the blush Malmaison, perfect in form; the petals are of good size and substance, and the flower charming. Exmouth Gem has blooms of large size, of pale salmon-pink colour; Mrs. Herbert Stewart is a very handsome flower, measuring nearly 3 inches across, and is one of the most striking. The colour is rich rosy carmine, and is distinct and attractive. Exmouth Scarlet is a decided improvement on Winter Cheer, the colour being brighter, and the plants have more of the tree habit with them. Mr. Godfrey is now working up a stock of this variety as rapidly as possible. All other varieties, too, are being increased in large quantities. There are thousands of plants that were struck in heat last November that are now potted into thumbs and large 3-inch pots. In the propagating-pits there are even greater quantities now making roots. The healthy condition of the plants was very observable, and no disease was seen. Batches of the dwarf, yet free-flowering Godfrey Richardia, are full of spathes, though everyday quantities of blooms are cut from them. *W. Swan.*

Primulas at Farnham Royal.

How pleasant is it to look over a fine collection of Chinese Primroses under the bright light of a high country district! Messrs. James & Sons, whose houses are on high ground, enjoy pure air and freedom from smoke, do not grow plants strong or very large; every one of the many hundreds here are in 48's, the object being, of course, to promote good bloom-production on compact form and foliage, and thus facilitate fertilisation and seed production. For the Primula naturally flowers in the winter, and because of the absence of insects—and a desirable absence too for the grower—artificial fertilisation has to be performed, the whole of the plants being gone over repeatedly whilst in bloom. The plants are for this purpose placed in blocks of strains and colours, and whether few or many, almost every one in its place seems to be the duplicate of the other. Some sparing varieties produce but little seed, due doubtless to the long continuance of in-breeding; but that fact may help to induce breeders or raisers not to be too continuous in such matters, lest they defeat their object eventually by producing strains that are absolutely barren. With these tender plants we are dependent entirely on seed for propagation, hence the importance of securing good seed producers, as well as fine flowers. No doubt the moderate culture, pure air, and light, found at Farnham Royal, conduce in a high degree to success in this matter. The new stellata or pyramidal forms, seeds most freely, and presents a good seed parent for crossing with large-flowered varieties. Still, it would be a misfortune were that pretty plant to suffer in form if inter-crossing destroyed its free blooming pyramidal habit, and reduced it to the level of the ordinary florists' strains. The varieties here largely comprise the finest of the Reading stocks, and amongst them are some superbly deep rich coloured forms, such as Crimson King, deepest of all, the flowers of fine form, rich crimson, having a clear lemon eye, round which runs a belt of maroon; this is new, and wonderfully true to character. Next comes a brilliant fiery red or scarlet that is a long way superior to its progenitor, Chiswick Red. How a mass of this glowed in the sunlight as with fire, and was wonderfully effective! Giant Terra-cotta, really a rich carmine, is superb and does not discolour; and Giant Purple has splendid flowers of a rich magenta hue, and is quite a gem of its shade. The blue strain is here in strong evidence, quite a rich and striking lavender-blue; and one of the loveliest is Giant Pink, a delightful, soft, rosy-pink colour that commands warm admiration. Giant Royal White, on dark palmate leafage, is the finest and purest of all the section; it seems impossible to excel this for size, or in purity. There are many others of the single forms grown, but all cannot be indicated. Doubles are fine, especially the rich blood-red, salmon or pink, and the whites are both dark and light green leafage. The former seems to have the finest and purest flowers, but all the stocks of the many strains are of the very best, and in bulk make a beautiful show. *D.*

SCOTLAND.

A WINTER GARDEN FOR ABERDEEN.

At the meeting of the Aberdeen Town Council on Monday, the 16th ult., the Convener of the Links and Parks Committee moved the adoption of a report by the City Architect with regard to the proposed winter garden in the Duthie Public Park. The building is to be 108 feet long, 36 feet wide, with two side-wings of 30 feet in length, by 36 feet wide, with a circular dome in the centre. Arrangements will be made to allow of the different parts of the building being heated to different temperatures. The total cost is £1550.

Natural History and Antiquarian Society of Aberdeen.

Thanks to the energetic and indefatigable efforts of Dr. James W. H. Trail, Professor of Botany in Aberdeen University, and a few other local gentlemen, a new era, from which the happiest results are anticipated, will be inaugurated for this Society on Friday evening, 24th inst. In anticipation of Friday's meeting, 117 ladies and gentlemen have been added to the membership of the Society. Of this number some two-thirds reside in and about Aberdeen, the other third being resident in, or connected with the surrounding counties. At the meeting on the 24th inst., a short address was given by Professor Trail, on the work and place in Aberdeen of the Society, and there was an exhibition of objects of interest in the botanical rooms of Marischal College, where the Society intend holding their meetings. The office-bearers of the Society are as follows: President, Professor Trail; Vice-presidents, Mr. William Ferguson, LL.D., of Kinmundy; and Mr. George Sim, naturalist, Aberdeen. Members of executive: Dr. Alexander Brown, Mr. W. Forest, Mr. Alexander Mackie, and Dr. W. H. Williamson.

LAW NOTES.

FRAUD ON CHARD NURSERYMEN.

At Birmingham Quarter Sessions, on Monday, before Mr. T. S. Soden, Deputy-Recorder, John Sexton, 40, salesman, was charged with obtaining, by false pretences, from Messrs. Jarman & Co., nurserymen, of Chard, forty-eight Apple-trees, and seventy-two Rose-trees, value £7, with intent to defraud. Mr. Stubbins prosecuted, and Mr. McCardie (instructed by Mr. Coode) defended.

The first witness called for the prosecution was Mr. H. Seagon, who stated that he was the representative of Messrs. Jarman at their stand at the cattle show, Bingley Hall, Birmingham. While there, either on November 29 or 30, the prisoner gave him an order for four dozen Apple-trees, £5, and six dozen Roses, £2; at the same time handing him a memorandum form which stated that the prisoner was a grocer and provision merchant at 10, Edward Street, Redditch, with warehouse at Unicorn Hill. On these representations Mr. Seagon accepted the order, and the goods were despatched from Chard on December 20, packed in one crate, one basket, and one bundle. The witness further identified a memorandum form on which the prisoner had written to Messrs. Jarman on December 29 for seven dozen dwarf Roses under the name of "J. W. Johnson, grocer and provision merchant, 2, Gough Road, Sparkbrook, Birmingham." Messrs. Jarman's suspicions, however, being aroused, these trees were not sent.

Various witnesses were called to prove that the prisoner neither carried on a business of grocer or provision merchant at the addresses given, or possessed any trade stock whatever.

The prisoner stated that the Rose-trees were ordered by him for a Mrs. Johnson, but Mrs. Johnson's "garden" consisted of a bricked yard at the back of the house of about 14 by 10 feet.

Mr. McCardie contended that prisoner made *bonâ fide* purchases, but was merely unable to pay.

Two goods porters were called to prove that the prisoner re-consigned the trees from Redditch Street to Messrs. Parker, Kirkam & Parker, Auctioneers, 35, Temple Street, Birmingham.

Mr. Parker, auctioneer, stated that the prisoner wrote him, saying that he had some trees for sale, and asked him to include them in his sale of the following day or so, but the trees arrived too late, and were consequently held over till January 5. In the interval prisoner came to Mr. Parker and asked for an advance on the trees, which was refused. A day or so afterwards Mr. Parker had some of the trees unpacked, and found on them labels bearing Messrs. Jarman's name, and being somewhat suspicious, he communicated with Messrs. Jarman, with the result that the latter firm placed the matter in the hands of the police. The trees, having been out of the ground so long, were dried up, shrivelled, and fetched only £2 3s.

The jury found the prisoner guilty on both counts, and the Deputy-Recorder sentenced him to six months' imprisonment, with hard labour.

Obituary.

Rev. Canon Du Port.—Another of the older generation of British mycologists has passed away in the person of the Rev. Canon Du Port, who died at Denver Rectory, in the county of Norfolk, on February 21, 1899. James Mourant Du Port, the son of James Du Port, Assistant Treasurer of the States of Guernsey, was born at St. Peters Port on April 14, 1832. He was educated at Elizabeth College, from whence he obtained a scholarship at Caius College, Cambridge. He took his B.A. in 1855, being tenth wrangler, and subsequently became Dean of his College. He was Hebrew lecturer from 1855 to 1862. In the latter year he was appointed to the vicarage at Mattishall, where he remained till 1884, when he became rector of Denver. In 1881 he was made Honorary Canon of Norwich, and in 1890 Rural Dean. Throughout his life he was keenly interested in natural science. For a long series of years he conducted meteorological observations both at Mattishall and Denver. His greatest pleasure, however, was in the study of botany. Not only did he possess a sound practical knowledge of the phanerogams of his own country, but also the floras of France and Switzerland, as well as that of Egypt received his attention. He was best known, however, as a fungologist, and for many years was a regular attendant at the fungus forays of the Woolhope Club, of which field club he was an honorary member. His knowledge of Latin was greatly appreciated by his fellow-members, and it was always at their service, for he spared no trouble in unravelling the intricacies of the descriptions of the "Hymenomycetes" and "Monographia." Always ready to help, his genial manner and kindheartedness made him a universal favourite amongst the Woolhopians. For many years he was a member of the Société Mycologique de France, and attended several of the forays, notably in 1887, 1891, and 1896, where his knowledge of the French language stood him in good stead. Mainly interested in the Hymenomycetes, there was nothing in the shape of a fungus which came amiss to him. One of the species found by him at Mattishall, Russula Du Porti, was named after him. It is figured in *Cooke's Illustrations*, pt. 1042. He contributed the following papers, "On some species of Tricholoma not easily distinguished" (*Woolhope Trans.*, 1883); "On the colours of the fungi as indicated by the Latin words used by Fries" (*Ib.*, p. 113); "The unexpected appearance of two species of fungi in a field quite recently under cultivation" (*Ib.*, 1890, p. 122); "On the fungoid diseases of cereals" (*Norfolk and Norwich Trans.*, 1880, p. 194); "On some of the rarer fungi found near Mattishall in 1880" (*Ib.*, p. 200); "On a remarkable appearance of fungi" (*Ib.*, 1893, p. 558). *C. B. P.*

MAJOR H. L. BARTON, D.L., J.P.—With deep regret we have to record the death of Major Barton, of Straffan House, co. Kildare, on the 23rd ult. He was laid to rest in the family grave at Straffan Church on Tuesday, the 28th ult., and by his express wish the coffin was conveyed thither borne on one of the carts from the home farm at Irishtown. This vehicle was painted black, and draped very tastefully, and the coffin upon it was covered with fresh foliage and flowers, in the shape of wreaths and tokens from friends. Major Barton was 75 years of age, having been born at Bordeaux in 1823, but he had lived on his Straffan estate for many years, and thoroughly enjoyed and liberally supported both farm and garden. His celebrated breed of Shorthorns, was well known throughout the British Isles. Although a very enthusiastic sportsman, the garden under the more immediate care of the Hon. Mrs. Barton, was also a never-failing source of pleasure and interest to him. The Dog-wood, and the Cardinal Osiers are very bright and cheerful beside the river at Straffan just now, and the Snowdrops also under the great Lime-trees on the lawn. Deceased's widow, the Hon. Anna Barton, was a sister of the late and of the present Lord Clarina, and is widely known for her appreciation of horticulture.

SOCIETIES.

ROYAL HORTICULTURAL.

February 28.—Tuesday last was preceded by so cold a night, that the display made at the usual fortnightly meeting was less in extent than the preceding one. Visitors were numerous, and not a few of them stated that their thermometers had registered as much as 15° of frost; consequently, it was not surprising that exhibitors, especially those who would have brought the warmer-growing Orchids, were not prepared to incur the risk that would have attended the bringing of their plants in quantity to Westminster. Nevertheless, there was a moderate show of Orchids, and the Orchid Committee recommended the awards of two First-class Certificates and five Awards of Merit. The Floral Committee recommended the award of a First-class Certificate to a pure white, double-flowered variety of Prunus persica, and Awards of Merit to Rhododendrons × Hercules and Exquisite, each of them valuable varieties of the hybrids obtained from R. javanicum There were groups of Cyclamens, Cinerarias, Narcissus, and other hardy plants and flowers.

The exhibits before the Fruit and Vegetable Committee were of little interest.

In the afternoon an interesting lecture upon the "Colours of Insects" was given by Mr. Blake, and the subject was freely illustrated with lantern views.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. Geo. Paul, R. Dean, Wm. Howe, Jas. Hudson, J. F. McLeod, J. Jennings, Chas. T. Druery, C. J. Salter, Thos. Peed, H. Selfe-Leonard, W. Bain, J. D. Pawle, C. R. Fielder, Jas. Walker, Chas. E. Shea, E. T. Cook, Herbert J. Cutbush, Harry Turner, John Fraser, E. H. Jenkins, and J. W. Barr.

Messrs. W. Paul & Son, Waltham Cross Nurseries, Herts, showed some prettily-flowered plants in pots of Prunus, P. triloba, P. Myrobalana rosea plena, &c. P. triloba is a very double pink-coloured flower upon shoots with partially developed leaves, and suitable for cutting. Several varieties of the Peach with pink and deep rose-coloured flowers were attractive, as also was the double Almond. Pyrus Malus floribunda is an effective flowering shrub, by reason of its excessive freedom in producing bloom. Forsythia suspensa, one of the prettiest of the Forsythias, was also shown. The group was faced by plants of variegated Privet and Euonymus (Silver-gilt Banksian Medal).

Mr. F. Miller, 110, Fulham Road, South Kensington, London, made a fine show with Cinerarias, exhibiting dwarf freely-flowered plants of brilliant colours. These were interspersed with Ferns; and there were cut Narcissus blooms, Freesias, various floral designs, and wreaths (Silver Banksian Medal).

Messrs. Sander & Co., St. Albans, exhibited Acalypha hispida (Sanderi) as a standard, with a clear stem of about 2½ feet, afterwards several branches, all of which were well flowered.

A fine display of Cyclamens was made by the St. George's Nursery Company, Hanwell, London, W. This group of about six score plants represented a strain remarkable for the size of its flowers, and for the decided colours they present. The extra-large size or giant strain that is not at present associated with the best of form, may be capable of improvement in the latter respect. The fimbriated strain was also represented, but the value of the exhibit consisted most in the florist's normal varieties (Silver-gilt Banksian Medal).

From Purnell Purnell, Esq., Woodlands, Streatham Hill, S.W., was shown a very large group of Narcissus in pots, and a smaller one of Cinerarias. A most commendable amateur's exhibit, that was recommended a Silver Flora Medal.

Mr. Thos. S. Ware, Ltd., Hale Farm Nurseries, Tottenham, showed a group of Narcissus in pots; some of the more popular varieties were represented by strongly-grown plants, and we also noticed in this exhibit a plant in flower of Orchis fusca, a purple-flowered species with large and broad green leaves; varieties of Cyclamen Atkinsii, bluish-flowered Primulas, the very dwarf-growing Gaultheria procumbens, &c. (Vote of Thanks).

Messrs. Barr & Sons, 12, King Street, Covent Garden, London, had a similar exhibit, but included, in addition, plants of Lachenalias, Chinese Primulas, Cinerarias, &c. The curious Iris tuberosa, with purple and green flowers, was represented by cut blooms, and the earliest of the Anemones and Chionodoxas were shown in pots (Vote of Thanks).

Messrs. Paul & Son, The Old Nurseries, Cheshunt, showed forced plants of Lilac alba grandiflora, also plants of Helleborus caucasicus punctatus, and a number of varieties; and H. orientalis, Saxifraga lutea purpurea, S. Boydi alba, Megasea Stracheyi, &c., and two beautiful blooms of L'Innocence H. T. Rose.

From Mr. Jno. Russell, Richmond Nurseries, Surrey, was exhibited a group of plants of a fine white-flowering variety of Viburnum Tinus (Laurustinus). The plants were dwarf standards and bushes, and all of them were full of bloom; Skimmia Fortunei, well berried; and Hedera arborea fructu-luteo, a large-leaved Ivy, with yellow berries, were likewise included in the group.

Messrs. Robt. Veitch & Son, Exeter, exhibited blooms of Primula floribunda var. Isabella, with larger and paler blooms than the type, being cream-coloured instead of yellow.

Some splendidly cultivated Violets of the varieties Marie Louise and Neapolitan were shown by Lady Margaret Boscawen, Tregye, Perranwell, Cornwall, for which a Cultural Commendation was awarded.

Beautiful sprays of Asparagus Sprengeri, with white and red berries, were shown by Mr. J. Hudson, gr. to Leopold de Rothschild, Esq., Gunnersbury House, Acton (Cultural Commendation). Mr Hudson also exhibited a fine variety of Clivea named "Vivia."

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, exhibited a small group of plants in pots of a most decorative variety of the Peach named Prunus Persica magnifica. The flowers are very large, and in colour deep red. Messrs. Veitch also showed a plant in flower of Hippeastrum procerum, a Crinum-like plant with lilac-coloured flowers. It is a native of South Brazil.

AWARDS.

Prunus Persica vulgaris alba flore-pleno.—This is a beautiful white-flowered Peach, with large-sized double blooms. The plant exhibited by Messrs. W. Paul & Son, Waltham Cross, was dwarf and very freely flowered, being a most decorative object (First-class Certificate).

Rhododendron × Hercules.—A greenhouse Rhododendron of the R. jasminiflorum × javanicum group of hybrids. In colour the flowers are a shade of apricot-yellow, but the stamens and anthers being red, afford a pleasing contrast. Each flower is from 2½ to 2¾ inches across, and most of them possess six or seven petals in place of the usual number, five. A plant of considerable size was exhibited, and bearing several large trusses of flowers, afforded ample proof of the decorative qualities of this variety (Award of Merit). From Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea.

Rhododendron × Exquisite.—This is a hybrid, we are informed, from the two species R. javanicum and R. Teysmanni from Sumatra. The flowers of this hybrid are a little less in size than those of R. × Hercules, and the colour is a shade of bright yellow, approaching golden. The anthers have a considerable effect, being purple. It is a valuable addition to these beautiful Rhododendrons that Messrs. Jas. Veitch & Sons, and their Mr. Heal, have originated (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Hon. Sec.), De B. Crawshay, T. B. Haywood, W. Thompson, H. T. Pitt, A. Outram, J. Douglas, E. Hill, H. J. Chapman, H. Little, H. Williams, H. Ballantine, F. J. Thorne, Norman C. Cookson, and Major Mason.

A dull, foggy, frosty morning, led us to suppose that Orchids would not be abundant at this meeting, but on the contrary they formed a very interesting and showy part of the same.

Continental cultivators were represented by M. Chas. Maron, of Brunoy, Seine-et-Oise, France, the raiser of so many fine hybrids. Two of his plants fairly eclipsed his former efforts, viz., Lælio-Cattleya × Ernesti var. Princess Olga (Cattleya Percivaliana ♀, Lælia flava ♂), one of the most charming hybrids of its class, with bright chrome yellow flowers, the lip having an orange base, and dark, red-brown marking; and L.-C. × callistoglossa var. J. Leemann (L. purpurata var. × C. Warscewiczii imperialis), one of the most gorgeous of hybrid Lælio-Cattleyas; and both of which secured the highest award. Mr. Maron also showed a fine plant of the true Cypripedium concolor tonkinense, with clear yellow flower, fully one-third larger than the ordinary C. concolor.

M. Jules Hye-Leysen, Coupure, Ghent (gr., Mr. Coen), sent a fine three-flowered inflorescence of Odontoglossum crispum Franz-Masereel, cultivated up to the highest state of perfection, its flowers being for the greater part of a rich rose-crimson, delicately picked out with white. So marked was the improvement Mr. Jules Hye's cultivation had made, that the committee recommended a Silver Medal for it. Mr. Jules Hye also showed Cypripedium "Surprise," a handsome yellow hybrid.

Baron Sir H. Schroder, The Dell, Staines (gr., Mr. H. Ballantine), showed a charming yellow Odontoglossum, which Professor Reichenbach had named O. × Vuylstekianum, but which was adjudged to be an O. × Wilckeanum; also the rare natural hybrid O. × Cookeanum, and a yellow form of O. Pescatorei, or, more correctly, an unspotted O. × excellens.

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, showed four hybrid Phalænopsis, viz., P. × Cassandra (Stuartiana ♀, rosea ♂), P. × Ariadne (Stuartiana ♀, Aphrodite ♂), P. × Mrs. Jas. Veitch, illustrated in the last issue of the *Gardeners' Chronicle;* and P. × Hebe, a neat flower of the P. intermedia class.

W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), showed a small group of grand Odontoglossums, for which a Silver Banksian Medal was awarded. It contained Odontoglossum × excellens spectabile, a noble variety, the leading bulb bearing two fine spikes (Cultural Commendation); O. × Wilckeanum concinnum, fine yellow, with brown-red blotches; O. × Coradinei expansum, the finest of its class; and O. crispum Daphne and O. c. Dorothy, two very handsome spotted forms, the latter a small plant, which should develop into a very fine thing.

Messrs. Hugh Low & Co., Bush Hill Park, were awarded a Silver Banksian Medal for a good group, which consisted principally of fine forms of Cattleya Trianæi; with them were good examples of Cattleya Dowiana, Lælia harpophylla, L. cinnabarina, Odontoglossum crispum, O. Andersonianum, Cypripedium insigne Sanderæ, C. × Marshallianum, and various Dendrobiums, including the old but still uncommon D. nobile Tollianum.

F. Knight, Esq., Thundersley House, Essex (gr., Mr. Marston), showed a group of good forms of Cattleya Trianæi, Lælia glauca, L. superbiens, and Odontoglossum Rossii majus (Bronze Banksian Medal).

J. T. Bennett-Poë, Esq., Homewood, Cheshunt (gr., Mr. Downes), showed a group of well-grown plants of Cypripedium × Lathamianum, C. × villosum, &c.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Odontoglossum × Ruckerianum Crawshayanum, a grand form; O. × Andersonianum Bagaerdianum, and O. Rossii Crawshayanum, both good.

E. Stanley Clark, Esq., Oak Alyn, Wrexham, North Wales (gr., Mr. J. Edwards), showed Odontoglossum crispum "Mrs. Stanley Clark," a very finely blotched form; O. Rossii rubescens, and a hybrid Cypripedium (callosum × Boxalli atratum).

Sir Wm. Marriott, The Down House, Blandford (gr., Mr. Denny), again showed Sophro-Lælia × Marriott (S. grandiflora × L. flava), with bright yellow flower.

D. M. Grimsdale, Esq., Uxbridge (gr., Mr. A. Kitwall), showed good Odontoglossum maculatum, O. triumphans, O. luteo-purpureum sceptrum, Cypripedium Mastersianum, and C. villosum aureum. Major Joicey, Sunningdale Park (gr., Mr. Fred J. Thorne), showed a flower of Lycaste linguella, a large greenish flower, with whitish lip, having a thick callus; also Dendrobium atroviolaceum and Lycaste plana. G. Thompson, Esq., Stamford Hill (gr., Mr. Johnson), showed a good form of Dendrobium nobile. Mrs. Ball, Cheadle, Cheshire, sent a hybrid Dendrobium. J. Rutherford, Esq., M.P., Beardwood, Blackburn (gr., Mr. J. Lupton), showed Cattleya Trianæi Rutherfordiana, fine in form and colour. H. Shaw, Esq., Birch Vale, near Stockport (gr., Mr. J. Cliffe), sent Odontoglossum luteo-purpureum. W. Gould, Esq., Hyfield, near Stockport, sent Lælia glauca.

Messrs. F. Sander & Co., St. Albans, showed a well-flowered plant of the singular fringed Dendrobium Harveyanum.

AWARDS.

Lælio-Cattleya × Ernesti "Princess Olga" (Cattleya Percivaliana ♀, Lælia flava ♂), from M. Chas. Maron, Brunoy, France. A flower of extraordinary beauty; plant approaching L. flava in character; flowers nearly as large as those of C. Percivaliana, but with narrower segments; sepals and petals bright chrome-yellow; lip crimped orange at the base, the centre marked with bright brownish-red. The plant bore two spikes, each with three flowers, borne on scapes some 4 inches in height (First-class Certificate).

Lælio-Cattleya × callistoglossa "J. Leemann" (Lælia purpurata var. × Cattleya Warscewiczii imperialis) from M. Chas. Maron. Flower of the largest of any of the Lælio-Cattleyas: sepals and petals light-rose; lip very broad and finely expanded, of a rich dark claret-crimson (First-class Certificate).

Odontoglossum × Ruckerianum Crawshayanum, from De B. Crawshay, Esq. (gr., Mr. S. Cook). One of the handsomest of its section. Flowers, large, light yellow tinged with dark rose, especially on the reverse side, and handsomely spotted with dark brownish-red (Award of Merit).

Odontoglossum × Wilckeanum "The Dell variety," from Baron Sir H. Schroder (gr., Mr. H. Ballantine). Flowers, bright canary-yellow, the petals and lip finely fringed. Resembling a yellow O. crispum (Award of Merit).

Odontoglossum × Cookeanum (nat. hyb., O. triumphans × O. gloriosum), from Baron Sir H. Schroder. A pretty yellow flower, spotted with chestnut red (Award of Merit).

Odontoglossum × Coradinei expansum, from W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens). A showy form, with large cream-white flowers spotted with brown, and of thick texture (Award of Merit).

Cypripedium × *Surprise* (Sallieri Hyeanum × Spicerianum), from M. Jules Hye-Leysen, Ghent (gr., Mr. Coen). A fine Cypripedium, resembling a large yellow C. insigne, but with more of the form of C. Spicerianum, and white upper portion to the dorsal sepal (Award of Merit).

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., chairman; and Messrs. J. Willard, J. Smith, F. Q. Lane, Geo. Wythes, S. Mortimer, P. C. M. Veitch, A. H. Pearson, E. Shaw Blaker, W. Poupart, Jas. H. Veitch, Jos. Cheal, W. Wilks, Robt. Fife, and Alex. Dean.

Mr. R. C. Notcut, Broughton Road Nursery, Ipswich, showed a dish of fruits of a stewing Pear under the name of Winter Orange, and described as a probable seedling from Verulam. The fruits were of moderate size, deep brown in colour, and some stewed specimens were pronounced by the committee to be very good. The fruits will be again exhibited at the next meeting, and if found to be distinct, the variety may possibly be given an award.

Messrs. R. Veitch & Son, Exeter, exhibited some fruits of Mannington Pearmain Apple, said to have been obtained from the original tree. The fruits were very dissimilar to the variety now in commerce under the above name.

Another Apple named "Rouen" was sent by Mr. H. T. Martin, Stoneleigh Abbey Gardens, Kenilworth.

A large and good sample of Salsafy was shown by Messrs. R. Veitch & Son. It was described as Sandwich Island Salsafy, but had, no doubt, been cultivated in England from seeds obtained from that island.

Appliances for the manufacture of ozone for insecticide purposes was shown by Mr. J. H. Lamfrey, Brockley, Kent. In the generation of ozone, a disagreeable perfume is given off, which is said to kill green-fly, and many other insects. The appliances were not generally considered to be of practical use for the purpose.

Lecture.

THE COLOUR OF INSECTS.

In the afternoon a lecture upon "The Colour of Insects, their Meaning and Use," was given by Mr. H. L. T. Blake. The subject was freely illustrated by lantern views of a most interesting character, and in the course of the lecture Mr. Blake described and illustrated instances in insects of (1) Protective resemblance; (2) Aggressive resemblance; (3) Protective mimicry; (4) Warning colours of insects that are not preyed upon by other insects or animals; (5) Instances of several methods of defence being possessed by one insect or caterpillar. The chair was taken by Sir John T. D. Llewelyn, Bt., and subsequently some interesting remarks were made upon the subject by the Rev. Prof. Henslow.

READING & DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

By the aid of limelight-views, and under the guidance of Mr. C. H. Curtis (an old Kewite), of the editorial staff of the *Gardeners' Magazine*, a large number of members of the above Association spent a pleasant evening recently at the club-room of the Old Abbey Restaurant in listening to an account of the houses and grounds of Kew Gardens.

EDINBURGH FIELD NATURALISTS' AND MICROSCOPICAL.

February 22.—The fourth meeting of the Society this session was held on the above date, in the Hall, 20, George Street; Mr. W. C. Crawford, President, in the chair.

An account of a bryological excursion to Ben Lawers last June was given by Mr. A. Murray, who, along with another member, had encamped on the Ben for two days, with the purpose of collecting mosses. They began their collection at the Larich burn, every tree, bank, rock, and dyke being covered with them. One rock was curtained with magnificent specimens of Antitrichia curtipendula, which hung over it in festoons a foot in length. Numerous yellow-green patches of Bartramia arcuata, generally dwarf and always barren, covered the banks. Mr. Murray and his friend made a very large collection of species during their short trip, and most of them, pressed and mounted, were exhibited at the meeting. Some of the best finds were Splachnum vasculosum, Tetraplodon mnioides, and Buxbaumia aphylla. It may interest lovers of Ferns to know that many very finely-cut forms of the Brittle-bladder Fern, the Maidenhair Spleenwort, with fronds a foot long; the black Spleenwort, the Alpine Holly Fern, Wilson's Filmy Fern, &c., were noticed. And among the blowing plants may be mentioned Cerastium alpinum, Armeria alpina, Rhodiola rosea, Lychnis alpina, Silene acaulis, Thalictrum alpinum, Saxifraga nivalis, S. oppositifolia, S. aizoides, S. hypnoides, S. cæspitosa, and S. stellaris; Myosotis alpestris near the top, and a perfect cushion of highly coloured Azalea procumbens; Rubus chamæmorus, Cornus suecica, and Meum athamanticum, the last plant filling the air with its peculiar odour. Highland cattle are very fond of feeding on the leaves and fruits, their aromatic flavour being communicated to the milk of the cows. Its root is eaten by the natives as a carminative and stomachic.

Mr. Campbell followed with a paper on "Some Geological Agents, with Illustrations of their Work." The principal agents, he said, were water in the form of ice and as running water, the sea, sand, and plants. Man's action had been the cause of the large tracts of desert land now existing in Asia Minor and North Africa, once both fertile and populous; and by the cultivation at present of large areas of the globe, he said the land was being laid open to rapid denudation by the action of running water, &c.

HEREFORDSHIRE ASSOCIATION OF FRUIT-GROWERS AND HORTICULTURISTS.

February 22.—A well attended meeting of fruit-growers and farmers was held at Hereford on the above date, for the purpose of founding a Fruit-growers Association for Herefordshire. The Mayor of Hereford presided, supported by Sir James Rankin, M.P., Mr. C. W. Radcliffe Cooke, M.P., Mr. J. Riley, and Mr. Beddoe.

Sir James Rankin, M.P., proposed "That an association be formed, and that it be called the Herefordshire Association of Fruit-growers and Horticulturists." He considered the County of Hereford was a good county for the cultivation of fruit, but it had no large centres of population in the immediate neighbourhood where the fruit could be marketed. He would like them to understand, if they formed an association of this sort, they must combine in earnest, and everybody must try to do what he could to forward the objects of the association. Small fruits, he was sorry to see, had generally decreased in cultivation, and there must be more attention paid to the cultivation of the Apple and Pear.

Herefordshire was almost pre-eminent for the cultivation of cider Apples. He assured them the Technical Instruction Committee of the County Council, of which he had the honour to be the chairman, was affording information and instruction on fruit-growing, and that the secretary, who was present, would do all he could to promote the objects of the association. The Technical Instruction Committee would be able to do work to a much larger extent if it received more encouragement. Cultivation of fruit by cottagers was a most important point to encourage. He remembered a tenant of his cultivating three-quarters of an acre, and making £20 a year profit; and if this could be done by one, there was no reason a good many others might not do the same. They must not forget that there was a serious amount of competition from abroad to fight against, especially in hard fruits; but with small fruits, which did not carry so well, we had not so much to fear, and this should stimulate their cultivation.

Mr. J. Riley seconded the resolution. He gave particulars of some of his failures in fruit-growing during the past twenty years, and remarked that if an association similar to what he understood it was proposed to start had then been working, several failures and much needless expense might have been saved him. The association might be of much use in recommending suitable varieties of fruit to plant, and in indicating what stocks should be used for them. The railway companies had the power to make or mar the English fruit trade. With an association of fruit growers they would have a better chance of dealing with the railway companies, who would pay more attention to an association of several hundred members than to one individual. As regards pruning, he found difficulty in multiplying hands for this work, and something might be done in this direction. The Resolution was then adopted by the meeting.

Mr. Radcliffe Cooke, M.P., proposed the comprehensive resolution of the various objects of the association. After enumerating them, he proceeded to say that he was quite in favour of such associations, as for many years past he had endeavoured to persuade the Government of this country to do something to encourage and assist fruit-growing, and if possible, to follow the example of the Government of Canada, who had five experimental fruit farms; other things were grown on them, but chiefly fruit. The result was that one of the first things anyone taking land would do would be to visit the nearest of these experimental stations, where he would get valuable advice as to what to plant, and thus avoid experiments and possible failure. They would also supply him with trees. Whenever he had made the suggestion to the Government to do something of this nature, or make a grant to assist in starting such farms, he was always met with the retort that it was not a matter for the Government; that it must first be taken up through the energy and enterprise of the people themselves. They were now in Herefordshire going to give a practical illustration of that doctrine, viz., taking the initiative themselves. He had received an assurance from Mr. Long that if the County Councils would act in the same way as the Technical Instruction Committee, it was possible they would be able to obtain a grant. He was sorry the County Council had not applied all the money in technical education that they might have done. Herefordshire had not applied half of the amount. Worcestershire had applied all. Mr. Long had told him that if an experimental farm were established for, say, the counties of Gloucester, Worcester, and Herefordshire, there was no doubt the Government would give a grant towards it. The farmers and growers, however, must make the beginning themselves. This beginning they were making by forming the Association. The resolution was carried.

Sir James Rankin, M.P., was elected President of the Association. A committee was elected, and subsequently over fifty of those present became members of the Society.

BRISTOL AND DISTRICT GARDENERS.

February 23.—A large number of members met on the above date to hear a lecture by Mr. W. W. Pettigrew, superintendent of Roath Park, Cardiff. The subject was "An Evening with Our Native Plants," illustrated with limelight views of photographs.

Dealing with the subject in a very interesting manner, Mr. Pettigrew grouped the British plants as follows—1, Rock plants; 2, Marsh plants; 3, Plants that love shade; 4, Sylvestral plants; 5, Riparian plants; 6, Gregarious plants; and, finally, a miscellaneous race. Comparing our flora with that of other countries, Mr. Pettigrew showed the detrimental influence of cold upon the flora of any country. France boasted of 4,700 species, whilst the larger area of Norway and Sweden had only 1,857 species. Spitzbergen had 107 species; whilst we could number 1,832. He also grouped the flora according to the different parts of the world in which the same species may be found, suggesting the human agencies whereby their presence here may be explained, but finding a final solution in geology which proves that Britain was not originally in the splendid isolation she at present enjoys, but was a part of the European continent.

MANCHESTER HORTICULTURAL IMPROVEMENT.

February 23.—A meeting was held in the Albert Memorial Hall, Manchester, on the above date, when the prize essays, in a competition open to under gardeners within a 15 miles radius of Manchester, were read.

The winner of the 1st prize in the first division for gardeners over 22 years of age, was Seth Burgess, the Rookery Gardens, Pendleton, Manchester; and in the second division for gardeners under 22 years of age, Geo. Farmer, Manchester Botanical Gardens. It was decided that the annual summer picnic of the Society should take place at Hawkstone Park, Lord Hill's seat in Shropshire.

THE ROYAL GARDENERS' ORPHAN FUND.

February 24.—The usual monthly meeting of the Executive Committee took place at the Horticultural Club on the above date.

Mr. William Marshall was unanimously elected Chairman of the Committee for the year ensuing.

The following special donations were announced:—Mr. M. Todd, Maitland Street, Edinburgh, £33; Mr. H. J. Jones, Lewisham, £15 4*s*. 6*d*.; J. Colebrook, Esq., Lowndes Square, S.W., £10 10*s*.; W. Roupell, Esq., Brixton, £5 5*s*.; Leeds Paxton Society, £3 5*s*.; proceeds of concert organised by the Chislehurst Gardeners' Improvement Association, per Mr. J. Lyne, £17 10*s*.; Messrs. W. Thomson & Sons, Ltd., Clovenfords Box, £2 12*s*. 3*d*.; Messrs. J. Moss & Son, Kelvedon, Essex, £1 1*s*.; Mr. W. Howe, The Gardens, Park Hill House, Streatham, £1; Proprietors of Anderton's Hotel, Box, 10*s*.; and Mr. W. Whittaker, Bridgewater, 10*s*.

The credentials of the guardians of the newly-elected children on the Fund (in almost every case the mother) were examined and passed. This is a matter of great importance, and one to which the committee give the closest possible attention; and almost without exception, from the foundation of the Fund, this duty has been performed in a satisfactory manner.

CHESTER PAXTON.

February 25.—At the usual fortnightly meeting held at the Grosvenor Museum on the above date, Mr. Robert Newstead, F.E.S., delivered a lecture to the members, entitled, "Newly-Introduced Fruit and Coccid Pests, together with an account of the San José Scale."

As an introduction to the subject, the lecturer gave a *résumé* of the salient characters of insects generally, comparing them with the remarkable family of scale insects. A series of well-known species were then shown, which, for the aid of the horticulturist, were divided into three sections:—

(A.) Shield-bearing Coccids, in which the insects cover their bodies with a tough, leathery covering or shield, as in the "Mussel Scale," the circular scale of the Plum, the "San José Scale," &c.

(B.) Wax-bearing species, which protect their bodies with a felting of white wax, as in the "Mealy-bugs," &c.

(C.) Naked species, as in the common "brown scales" (Lecanium), and the Cushion-scale of the Vine (Pulvinaria), &c.

The lecturer pointed out that section A was most easily destroyed with insecticides, or even with a stiff brush, when in the larval or young and unprotected stages, and that it was very important the time of appearance of these larvæ should be noted, and remedial measures taken at the time of their appearance.

With section B it was much more difficult, inasmuch as all the stages of the insect were more or less protected, either by a mealy, powdery substance, or by cottony secretions of the same waxy substance; such insects, therefore, required more drastic treatment, and constant application of insecticides.

Section C were undoubtedly the easiest of all to keep in check with insecticides, from the fact the females were always naked and unprotected. But Mr. Newstead also pointed out the necessity for destroying the females before they arrived at the egg-laying stage, otherwise the work of destruction would be increased more than a thousand-fold, as many of the females were capable of producing 2000 young.

A full account of the San José scale was given, together with the recently-imported Japanese Cherry-scale, Diaspis Amygdali, D. Carnelli; on Conifers, Fiorinia kewensis, new to science, and several other interesting species.

The hon. secretary, Mr. G. P. Miln, proposed a very hearty vote of thanks to Mr. Newstead for his admirable lecture, which was accorded with acclamation.

PRESENTATION.—Mr. W. Miller, who recently retired from the superintendence of Earl Craven's gardens and estate at Combe Abbey, has been presented by the workmen upon that estate with a silver tea-pot and pencil-case.

NOVELTIES.

Messrs. Sander offer for the first time Calla leucoxantha, a cross between C. Elliottiana and C. albo maculata, Ceropegia perforata, Cyperus fertilis, Evodia elegans, an elegant Araliad from New Guinea; Helianthus mollis, a hardy perennial; Leea Micholitzii, L. Roebriana, two noble tropical climbers; Macroscepis elliptica, Mikania Sanderi, Panax aureum, P. Balfouri, Passiflora pruinosa, Areca Ilsemanni, Caryota Rumphiana var. Alberti, Geonoma Pynaertiana, Kentia Kirsteniana, K. Sanderiana, Licuala Jeanenceyi, Linospadix Petrickiana, Livistona Woodfordi, Acalypha Godseffiana, Anthurium bogotense, Bowenia spectabilis serrulata, Caladium albanense, C. speciosum, C. venosum, Dracæna Cantleyi, D. Godseffiana, Eustrepius latifolius, Graptophyllum pictum, Polygonum lanigerum, Mapania pandanæfolia, Philodendron imperiale var. Laucheana. Many of these, though now for the first time offered in commerce, have been described or figured in these pages, and several of them have been exhibited at the Ghent Quinquennial or the Temple shows, so that their value has been adequately tested. Various hybrid Begonias and Carnations are also mentioned. When we add, in conclusion, that in this list are included Acalypha hispida (Sanderiana, hort.) and Watsonia iridifolia var. O'Brieni = W. Ardernei, hort., we shall have said enough to show that the importation of new plants, other than Orchids, has not entirely ceased, and that this list is one of the most remarkable that has ever come under our notice.

CATALOGUES RECEIVED.

Sander & Co., St. Albans, Herts—New Orchids and other Plants.
Millar, Bros., 20, Market Place, Hull—Seeds.
Wm. Clibran & Son, 10 and 12, Market Street, Manchester—Farm Seeds.
Kent & Brydon, Darlington—Farm Seeds.
E. H. Krelage & Son, Royal Bloemhof Nurseries, Haarlem, Holland—Begonias, Cannas, Dahlias, Gladiolus, Gloxinias, Lilies, &c.
Edw. Pynaert van Geert, Belgian Exotic Nurseries, Ghent (English agent, Mr. A. Outram)—Wholesale list of general nursery stock.
Wm. Cutbush & Son, Highgate Nurseries, London, N.—(1) Hardy, herbaceous, and bulbous plants; (2) Dahlias, Cannas, Begonias, &c.; (3) Roses and fruit-trees.
Rivoire & Sons, 16, Rue d'Algérie, Lyon, France—New varieties of Lobelias, Dahlias, Coleus, Begonias, &c.
J. C. Schmidt, Erfurt, Germany—Horticultural requisites.
Hugo Voigt, Leipzig, R., Nostiz Strasse—Flowering plants for furnishing cut blooms.
Luigi Canè, Casalecchio di Reno, Bologna, Italy—Seeds of hardy and greenhouse trees and shrubs, herbaceous perennials, &c.
Harrison & Sons, Leicester—Farm Seeds.

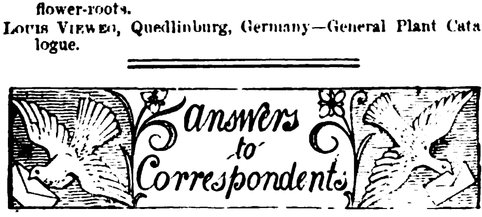
Louis Vieweg, Quedlinburg, Germany—General Plant Catalogue.



Answers to Correspondents

Basic Slag. (Thomas Slag, German Slag, and other terms): *C. B. Powell.* This substance is rich in phosphoric acid, and it may be used earlier than superphosphate, as it is more soluble. It may be used in conjunction with other artificials on Oats, land to be laid down to grass, meadow grass, Onions, Asparagus, all fruit trees, and Potatos. Of course, if in excess it is harmful.

Books: *R. C. D. Greenhouse and Stove Plants*, by T. Baines, published by John Murray, London.—*P. E.* John E. Sowerby's *British Wild Flowers*, with short descriptive notes and coloured illustrations, out of print, but to be met with in the old book shops. *British Flora*, and key, by Bentham and Hooker, furnished with wood-cuts, published by L. Reeve & Co., Henrietta Street, W.C.—Others next week.

Bow Bouquet: *W. C. H., Cape Town.* The only bouquet that tallies with your description is the feather-weight bouquet, which was recently reproduced in the *Gardeners' Chronicle.* The bouquet is composed of any light-weighing flowers, such as Carnations, Rose-buds, Lily of the Valley, Orange blossoms, Orchids, Violets, Gardenias, &c.

Cattleya: *W. R.* The disease is probably due to some fungus, the nature of which has not yet been determined. Isolate the plant; or, better still, burn it.

Earth: *H. P.* The worms enclosed feed on decaying vegetable matter, and do not, we believe, injure living plants.

Figs Falling from Pot and Planted-out Plants: *G. H.* Only the very small Figs—those of the size of marrow-fat peas—remain on a tree through the winter to any good purpose; and all others should be removed as soon as the leaves fall. You must be careful not to hasten growth by too much heat, top or bottom. The latter should not exceed at this date 76° to 78°, and you should be sure that root growth has taken place generally before the top heat is increased beyond 50°. The pot plants are likely to afford summer Figs, but those that were planted out and their roots disentangled and spread about in the soil, cannot be of any service this year; at the least, they will scarcely afford a crop of early Figs, and much forcing will do them more harm than good, although they may be pushed along fast in the summer so as to mature the wood in good time.

Gazania Seed: *S. W.* You could obtain it from Dammann & Co., nursery and seedsmen, Portici, near Naples. It is a useful plant in its several varieties, which are said to come true from seed; but, should they not do so, late summer cuttings, and old plants taken up and potted would furnish spring cuttings.

Grubs in the Soil: *H. Perrett.* The larvæ of some species of weevil, very injurious to plants by reason of their feeding on the roots. Turn over the soil and turn in the fowls; doing this repeatedly. They harbour just under the surface. If you have to use infested soil in pots, first bake it to destroy grubs and eggs.

Land near a Brickfield: *C. B.* It is not advisable to take land near a brickfield if ordinary nursery stock is to be grown, as the fumes from the clamps have an injurious effect on arboreal vegetation.

Maréchal Niel Rose: *B. & Sons.* There is no permanent cure of the gouty swelling at the point of union. Excessive root-feeding tends to make it worse. Try change of situation. If the excrescence splits, various fungi may enter. A stock which would grow as fast as this Rose is what is wanted, and we have not got that yet. Try slitting the bark of the stock; and work the Rose low down on the stocks so as to get the budded part beneath the soil. Do not plant a Rose-stock low in the soil unless the bud was put in low down. Maréchal Niel might do on its own roots under glass, but is too tender out of doors. It layers readily, so that own-rooted plants can be obtained in one season.

Mushrooms: *A. W. Le M.* We figured a bunch of Mushrooms in our issue for June 18, 1898, which numbered more than 100, and weighed 5 lb. 2 oz. So that your find is by no means unique, excepting that it grew on an outside bed in winter.

Names of Fruits: *J. C. W. & Sons.* Apple, Cornish Aromatic.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*J. T. B. P.* Dendrobium teretifolium, Queensland, yes! *R. A. R.*—*A. B.* 1, Cupressus Lawsoniana; 2, Thuya orientalis var.; 3, Abies Nordmanniana; 4, Pseudotsuga Douglasii; 5, perhaps Lonicera fragrantissima; 6, a seedling Hellebore.—*Subscriber.* Probably Saxifraga Stracheyi.—*J. J.* The white-veined leaf, Fittonia argyroneura; the other, Ruellia Portellæ.—*H. R., Cambridge.* Odontoglossum luteo-purpureum, and the best form of Odontoglossum nævium.—*G. W.* Cattleya Trianæi.—*R. T.* The Odontoglossum is a good form of O. × Andersonianum; the Cypripedium shows but little departure from some of the forms of C. × Crossianum.—*T. T., Nuneaton.* Oncidium tetrapetalum.—*G. E. K.* Iris fimbriata.—*W. W.* 1, Dendrobium × Ainsworthi; 2, Dendrobium Wardianum; 3, Cattleya Luddemanniana, commonly called C. speciosissima; 4, Dicksonia antarctica.—*J. B., Wilts.* 1, 2, and 3, all very fine forms of Dendrobium nobile; 1 has a peculiar tint of colour, but not so conspicuous as last year. Repeated 1, 2, and 3, varieties of Odontoglossum × Andersonianum. The Dendrobium Wardianum is the best form; the Dendrobium crassinode Barberianum, very fine; the Odontoglossum triumphans, a very handsome flower. When producing a many-flowered inflorescence it may not be so good. The little spray is Cœlogyne flaccida. Please number all in future.—*R. G. G., Plas Clough, Denbigh.* The twig sent as that of "a small evergreen hardy shrub" seems to be very near a species of Monardella, allied to M. nana; it is not known to have any economic uses, medicinal or otherwise.

Slitting the Bark of Trees: *W. B.* If you confine the operation to the outer bark, cutting with a sharp knife or other suitable instrument, the pressure of the bark is reduced, and a strong flow of sap takes place towards the slits in order to form a union of the parts. As a rule, a more active growth becomes noticeable in the stem or branches that are operated upon, and they increase in diameter, which is particularly useful in trees that are at a standstill, and as gardeners say, "hidebound." This often occurs in the first year after planting, owing to lack of roots and rootdisturbance. The operation is also useful when there is a marked disproportion between the size of the crown and the stem in restoring the proper balance. It may be carried out repeatedly without any injury resulting.

Soil with Iron in it: *S. S.* To prevent the hardening when dry, mix a good proportion of leaf-mould, charcoal dust, and bone-meal with it, and use mulches over the potted plants in hot weather. Do not make use of a pasture soil that is not well furnished with the roots of Grasses, &c., and do not use any which has not been in stack for twelve months.

The Post of Horticultural Lecturer: *Energy.* A candidate would most surely have to satisfy the sub-committee of a County Council having the appointment to make that he was thoroughly competent to impart instruction; and in order to do this he would probably require to be provided with suitable testimonials as to his ability and qualifications.

Vines: *J. G. F.* Probably a case of "Browning," often described in these columns.

Violets: *G. Brown, Hants.* We have never seen finer. You should oblige our readers with a note describing your methods of culture, kind of soil used, &c.

Women Gardeners: *W. B.* There are a few women employed in the glasshouses at Kew. Swanley Horticultural School has a good many: but, in regard to the other statements made in the cutting sent, we may say that they contain much exaggeration. Men are not quite ousted from the business, although women have been employed in market gardens for hundreds of years.

THE
Gardeners' Chronicle

No. 637.—*SATURDAY, MARCH* 11, 1899.

THE EUCALYPTUS, THE SOIL, AND THE GRAFT.

THE information which has been recently published in these columns on the subject of the Eucalyptus, shows that the tree may be cultivated in this country even as far north as the county of Inverness. It is indisputable, however, that the risk is always great, except perhaps in certain favourable situations, not only on account of the climate, but also for other reasons, to which reference will presently be made. The Eucalyptus at Meadfoot Rock, Torquay, which is reported to be twenty years old, must, for instance, be growing under exceptionally favourable conditions, since it resisted the winter of 1894-95, when the genus was practically exterminated from the Island of Jersey. Many of the trees, moreover, had attained to a very large size, and seemed to be thoroughly acclimatised in the Island, where the average temperature is considerably higher, and the extremes of heat and cold considerably less, than in England. The question of temperature is, indeed, not the only one to be considered in the successful cultivation of the Eucalyptus, and it is probably on this account that the limit of cold endurance of the tree is found in Western Europe to vary within comparatively wide limits, as will be mentioned at the end of this article.

Some species are undoubtedly better adapted than others to certain soils and situations, and it should not be forgotten that in the Australian continent, which is the home of the Eucalyptus, different species thrive best under very different conditions. For instance, the Spotted-gum of New South Wales, E. maculata, is generally found on stony ridges; the White-gum, E. viminalis, attains to a great size in rich soil in mountain forests, but it thrives only moderately in poor soil; and the Bloodwood, E. corymbosa, flourishes better in the mountains than on the coast. Some varieties, again, are best adapted to the northern and warmer parts of Australia, and whilst some prefer swampy ground, others thrive best in sandy or calcareous soils.

So important, indeed, is the question of soil, that in the commercial cultivation of the Eucalyptus it is well recognised, as Professor Warren states in his work entitled *Australian Timbers*, that the strength and durability of the timber depend to a great extent upon the locality in which the trees are grown. Timber, for example, of the same name, and presenting the same general characteristics, differs widely in quality when it is grown under different conditions of temperature, geological formation of soil, and amount and distribution of rainfall; or when it is grown on mountain ridges, or in swampy, low-lying ground. The Blue-gum, for instance, from a particular district of Victoria (Corner Inlet), gives excellent results compared with the timber of the same species grown in other localities under less favourable conditions. Again, the timber grown in swampy, low-lying districts is found to possess less tenacity of fibre than the product of the same tree grown at higher elevations, and in more favourable geological formations; and the granite soils of Australia, it may be added, do not appear to produce any kind of good timber.

The Eucalyptus, moreover, is subject to a defect called gum-vein, which is caused by the extravasation of gum-resin in particular parts among the woody tissue, and where an apparent injury has been sustained; or in the concentric circles between successive layers of wood. If, therefore, the Eucalyptus is so affected by local conditions in its native habitat, how much should they not be considered when the tree is grown in regions where frost is an additional, and its greatest, danger. It may be mentioned in this connection, as Señor Sempere has stated in his Monograph on the Eucalyptus, that the cultivation of the tree has been very successful in Spain, because it finds there three climatic conditions which it requires, viz., "the proper temperature, the necessary humidity, and the suitable quality of the ambient air."

The opinion of M. Félix Sahut is also of great value in this connection, inasmuch as he is one of the best authorities as regards the acclimatisation of the tree in Europe. He states that while the minimum winter temperature must first be considered, the relative atmospheric humidity and other local circumstances must not be overlooked, as is indeed proved by the following circumstance. Fifty-three species of Eucalyptus were growing near Montpellier in the winter of 1864, when the temperature fell to 10·4° F., which completely destroyed twenty-eight species, nine others being more or less injured, whilst sixteen completely resisted the cold. Moreover, other experiments, made under different local conditions, showed that some of these species, in certain cases, withstood lower temperatures, while under other conditions they suffered more when the cold was not so severe. It has also been found that several of the species which most successfully resist the winters in the south of France are unable to exist in the soil of Provence. M. Sahut gives a very remarkable account of an Eucalyptus which, planted at Lattes in 1864, resisted 32° F. of frost during the memorable winter of 1870-71, nor did the tree suffer in any way, and even its leaves remained intact. It had been raised from a seedling among seed of E. Risdoni, and its identity was never traced. It grew to a height of nearly 40 feet during its comparatively short life, for at the age of twenty years it gradually began to show signs of weakness and ultimately it died. This tree which had been provisionally named E. lattensis by M. Naudin, indicated a species possessing cold-resisting qualities, but as it never blossomed, M. Sahut's foresight led him to graft it on an allied species with a view to its cultivation as an ornamental tree in more northern parts of France. Two methods were employed: one, the cleft graft, with moderate results only; and the graft by approach, or inarching, with much greater success. The stock being more susceptible to cold than the scion, the operation was purposely made as near as possible to the root. The union of the plants was practically perfect, and five or six dozen plants developed vigorously and with great promise. Some of them grew to a height of 6 feet during the first year, but during the next season they all began to fail, and at the end of the third year not one was alive.

The operation of budding was not tried by M. Sahut in these experiments, because he did not think it would succeed, and it is interesting to note that this method has been adopted with good results elsewhere. The *Revue Horticole* published in 1893 an account of work of this character conducted in Palestine by M. Justin Dugourd, who budded E. Globulus on E. resinifera. The former variety is one with spreading roots, and is a less resistant to the influence of the wind, &c., than the latter, which was used as the stock, because it grows into a strong tree. It appears to be necessary for the complete success of this operation to support the scion in some suitable manner, so that the sap may the more readily reach it. As the stock increases in growth, it is also desirable to remove any shoots which it may produce, unless the operation is unsuccessful, when the subject may then be allowed to grow. It should be mentioned that M. Sahut is of opinion that the E. resinifera in question is the popular but incorrect name given by many French gardeners to a variety of E. rostrata, which is very generally found in the south of France, where it thrives best in the calcareous soils, and is more resistant to drought than many other kinds.

Considered in the light of past results in connection with other plants, M. Sahut is of opinion that the graft may be the means of greatly extending the cultivation of the Eucalyptus in Europe. He himself has proved that certain rare species of Pinus will not grow in a particular limestone district, except when grafted on P. halepensis, or P. nigra, or P. pinea. To quote M. Sahut verbally from his paper on the subject, in the *Annales de la Société d'Horticulture de l'Herault*, the problem is as follows: "Given one or several species of Eucalyptus which develop vigorously in a certain soil, it is required to employ them as stocks whereon to graft species which will not themselves thrive therein." And he illustrates his proposition by the following evidence: Of the 130 species of Eucalyptus experimentally grown at Lattes, the larger proportion were killed by the cold; others succumbed to the heat; while yet others, after languishing for several years, ultimately perished, not on account of the cold, but because the nature of the soil was unsuitable, and different from the mountain regions of Australia, whence the trees originally came.

As regards the limit of cold endurance of the Eucalyptus, it may be added that, with a view to the cultivation of the tree in America, the United States Government made an inquiry on the subject through its consular service in the year 1894, and the reports received from various parts of the world are of very great interest. The officer at Marseilles reported that, generally speaking, 'some species which have been thoroughly acclimatised in southern Europe are capable of resisting a temperature as low as 8·6° F.; but successful cultivation of desirable sorts cannot be hoped for in localities where the winter maximum of cold exceeds 21·2° to 17·6° F.

The report from Rome stated that the Eucalyptus is killed by the cold in Italy when the thermometer marks 12° F. below freezing. The consul at Madrid, writing in March, 1894, stated that E. Globulus and other allied species had resisted the climate of Barcelona and Madrid, where the temperature is frequently as low as 6° or 7° C. (20·7° F.), without any diminution in vigour or vitality.

The consul at Zanzibar reported that an attempt had been made to cultivate the tree in his district, but without success, owing to want of care or to the unsuitability of the soil.

Further evidence could be given to show that

*

the experimental cultivation of Gum-trees must be regulated by a consideration of various factors other than the temperature of the district. It may be added, for instance, that in the Punjab, planting in groves gives a better chance of success than when the tree is planted singly along the roadsides, and that its general failure in that district is mainly attributable to three causes, viz., failure of the rains; injury to the young stems by sunburn; but principally to the white ants, which destroy the roots.

It may be interesting in conclusion, to give the following information from a comparatively recent Spanish work on horticulture.* E. Globulus is the favourite variety in Spain, where it thrives in humid soil, but not in humid air; E. resinifera is found to resist the wind remarkably well, and to accommodate itself to every soil; E. urnigera is suited to the mountainous districts and to low temperatures; E. Gunni and E. coriacea are indifferent to cold; E. marginata is rather sensitive; E. amygdalina grows best in sandy soil, E. fissilis prospers in poor soil, E. odorata thrives in dry soil.

In Bois' *Dictionnaire d'Horticulture*, the following species are mentioned as extensively grown in Provence, and to be as rustic as E. Globulus:—E. calophylla, E. cornuta, E. gomphocephala, E. robusta; and E. Gunni, E. polyanthema, and E. viminalis, which are also specially named as among the most hardy of the species.

A large number of species have been experimentally planted in the Landes of the south-west of France with unsuccessful results; and in the region of Paris the tree is taken to the temperate-house as early as the month of November. Hence, M. Bouquet de la Grye defines the northern limit of the Eucalyptus in Europe to be the same as that of the Orange—a statement with which many growers do not agree, and which is not unlikely to be disproved by cultivation of the tree under the selective conditions to which allusion has here been made. *Scion.*

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM UMBELLATUM.

M. Cogniaux sends us from Verviers the following communication on this subject: With respect to the Epidendrum umbellatum mentioned in the *Gardeners' Chronicle* of February 18, there are two remarks I wish to make: first, by reason of priority, E. umbellatum, Swartz (1788), should be named E. difforme, Jacq. (1760); second, the plant figured in the number of the *Gardeners' Chronicle* mentioned above, p. 98, fig. 39, is not E. difforme, Jacq. (E. umbellatum, Sw.), but E. latilabre, Ldl. Although these two species are very variable, it is always easy to distinguish them: E. difforme has usually oblong, sometimes nearly linear leaves; many-flowered umbels, the petals narrowly linear (1 to 2 mm. wide) and not spatulate; the lip nearly flat, half as wide again as it is long. E. latilabre has leaves often oblong-oval, the upper ones sometimes sub-orbicular, umbels with two to four flowers, the petals linear-spatulate (2 to 4 mm. wide); the lip has widely reflexed edges, and is sometimes four times as wide as it is long. According to some hundred of herbarium specimens which I have studied, these are the maximum measures of the lip: in E. difforme 1 to 2 cm. long and 1½ to 3 cm. across; in E. latilabre, 1 to 2 cm. long, and 3½ to 5 cm. across.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.

The last number of this useful little publication, No. 22, dated October, 1898, contains the following plates:—

Angræcum superbum, Thouars.

Cirrhopetalum guttulatum, Hooker, f.

Cirrhopetalum ornatissimum, Rchb. f., in *Gard. Chron.*, 1882, xviii, p. 424.

Cœlogyne speciosa, Blume, C. salmonicolor, Rchb. f., in *Gard. Chron.*, 1883, xx, p. 328.

Cypripedium aureum ×, a hybrid out of C. Spicerianum by C. nitens.

Cypripedium Calypso ×, out of C. Spicerianum by Boxalli.

Cypripedium T. W. Bond, out of C. Swanianum × by C. hirsutissimum. C. Swanianum is itself a hybrid between C. Dayanum and C. barbatum.

Masdevallia Harryana, Rchb. f., fig. in *Gard. Chron.* 1871, p. 1421.

Odontoglossum Rolfeæ ×, a hybrid raised by M. Vuylsteke from Pescatorei by Harryanum.

Odontoglossum Schlieperianum var. xanthina.

Oncidium Jonesianum, Rchb. f., in *Gard. Chron.*, 1883, xx, p. 781.

Sophronitis cernua, Lindley.

Stauropsis lissochiloides, Bentham.

"LINDENIA."

A very remarkable series of fine varieties is figured in the last number of this publication:—

Cattleya Mendeli var. Princess Clementine, t. 647.—The flowers are white, with the exception of the lip, which has a yellow blotch at the base, and a small crimson one on the anterior lobe just before it divides into two lobes.

Cypripedium Wiertzianum × L. Lind, t. 644.—A hybrid from C. Lawrenceanum, by C. Rothschildianum.

Dendrobium nobile, Lindl., t. 645-646.—A double plate devoted to the illustration of numerous forms of this variable but ever-welcome species, viz., anomalum, luteum, majus, albo-luteum, splendidum, excellens. Some thirty-two hybrids from this species are also enumerated.

Habenaria Susannæ, R. Br., t. 642.—A long-known and widely-distributed Orchid, with large white flowers, 7 cent. across; the outer segments are ovate, the petals linear, the lip three-lobed, with a long spur twice or thrice the length of the flower; the lateral lobes deeply laciniate, the intermediate lobe linear.

Lælia præstans var. Luciani, t. 643.—A highly-coloured variety, the blotch on the front of the lip being especially rich in colour.

Miltonia vexillaria, Benth., var. Memoria Lindeni, t. 648.—Remarkable for the intensity of its rosy-lilac coloration; the lip has at the base a yellow blotch, striped with rosy-lilac.

Odontoglossum crispum var. La Merveille, t. 641.—A splendid variety, introduced by M. Lucien Linden, having broad, undulate acute white segments, marked by one or more large purplish-brown blotches. The lip, which is narrow and contracted, so as to separate the anterior lobe, is similarly marked.

PINUS MONTEZUMÆ.

Our illustration (fig. 53), taken from specimens obligingly forwarded to us by J. Rashleigh, Esq., Menabilly, shows the foliage, the male and female catkins, together with other details of Pinus Montezumæ. This is one of the most variable of Mexican Pines, but all the varieties are probably tender in this country, unless in sheltered situations in the south and west. The tree grown by Mr. Rashleigh is now about 20 feet high, and as many feet in diameter. It bore female cones for two years, and last year it had five or six fine cones on it. Mr. Rashleigh raised several seedlings, but all but one damped off, the survivor now looks strong and healthy.

"Very seldom in my experience," says Mr. Rashleigh, "are fertile seeds produced of these Mexican Pines. I have had a sackful of cones of P. patula, but no perfect seed. I have about twenty trees of Pinus Montezumæ, each about 7 to 8 feet high, from seed sent to me from Mexico by our consul there, and besides these, I have given away as many more. The two varieties of P. Montezumæ which are growing here, are very distinct in the colour and form of the foliage. The variety with rigid, upright, glaucous foliage, has been called P. Montezumæ vera. The variety with drooping foliage of a bright green colour, is perhaps the variety Lindleyana.

"Both these varieties have, with me, borne cones, which were similarly curved in shape, but different in the colour and form of the scales. My two original largest plants are about the same size and dimensions. That which I had from Lawson under the name P. oocarpa is P. Montezumæ Lindleyana, and the living seedling (home-grown) is from this plant, as also are all those which I procured from the consul at Mexico.

"I had several conversations with the late Dr. Lindley about this variety, and I remember my indignation at his refusal to believe that I had succeeded in rearing a cutting of P. Montezumæ into a living plant. He said it was impossible. But I did succeed in doing this, and I reared it from a young growth which had sprung from a broken branch, and by cutting off a small portion of the old wood. It was planted in silver-sand with a bell-glass over it, the soil being kept constantly moist, so that the bell-glass was constantly filled with moist vapour, and was never removed for three or four months."

We have on former occasions published illustrations of the cones, March 3, 1894, p. 273, fig. 29; see also October 25, 1890, p. 466.

STAMPING OUT POTATO DISEASE.

The Potato crops of the last few years having been so largely affected by the Potato disease, perhaps a few facts as to experiments I have made, and the success attending them, with regard to raising Potatos free from this pest, may be acceptable to your readers, and I would therefore ask your indulgence in granting me a little space to set forth the same.

Having come to the conclusion that this evil could be disposed of, if only sufficient patience and perseverance were given to it, I determined to try, and some seven years ago commenced experiments, the result of which can be judged from the fact that from a few seedlings I then raised I have now a stock of over 300 distinct varieties. I do not grow from seed Potatos, but from the seed found in the Potato-apple, and my belief that by so doing I could get *bonâ fide* disease-resisting Potatos has been fully justified, for while other crops have been largely affected by the disease during the past season, my stock has been and now is entirely free from it, and the Potatos are perfect in every shape and form. My system, as can be seen at once, entails a great amount of labour, and also expense, but nevertheless I am quite satisfied with the result, for not only have I a splendid stock of seedlings, but I have also increased my knowledge and proved my belief to be correct, that this is a sure way of eradicating this pest, and once more giving a sure supply of this important edible. About 100 varieties of my seedlings have been named, and one, Dr. Kitchin, has been tried by several local gentlemen with every success, testimonials of a very encouraging nature having been received by me to this effect. Not only is this satisfactory, but I have also received great encouragement by having three certificates awarded to my seedling Potatos, viz., two at the Winchester Gardeners' Mutual Improvement Association Exhibition, held in the College grounds, Winchester, and one at the Winchester Chrysanthemum Society's Exhibition, held in the Guildhall, while many gentlemen of note have taken up the matter with much fervour, and on several occasions favourable notices of my efforts have been published in the local press. Several influential members of the Winchester Chrysanthemum Society named for me the following varieties at their last show in November—Lord Kitchener, Admiral Sampson, Alfred Bowker (ex-mayor), Alice Bowker (ex-mayoress), and W. H. Myers, M.P. These are splendid varieties, not to be found in cultivation. The Potato, Admiral Sampson, professional gardeners acknowledge they have never seen surpassed. The Alfred Bowkers are perfect models. These facts need no further comments from me, but I may point out I have for cultivation this season ten tons of seedling Potatos.

I trust these facts will be acceptable, and that I have said enough to show my endeavours are meeting with success, and that my experiments are satisfactory. *Francis Dibbens, 22, Jewry Street, Winchester.*

[Our correspondent has carried out in his own way what Messrs. Fenn, A. and R. Dean, Findlay, Messrs. Sutton, and many other raisers of new Potatos have been trying to do for thirty years past,

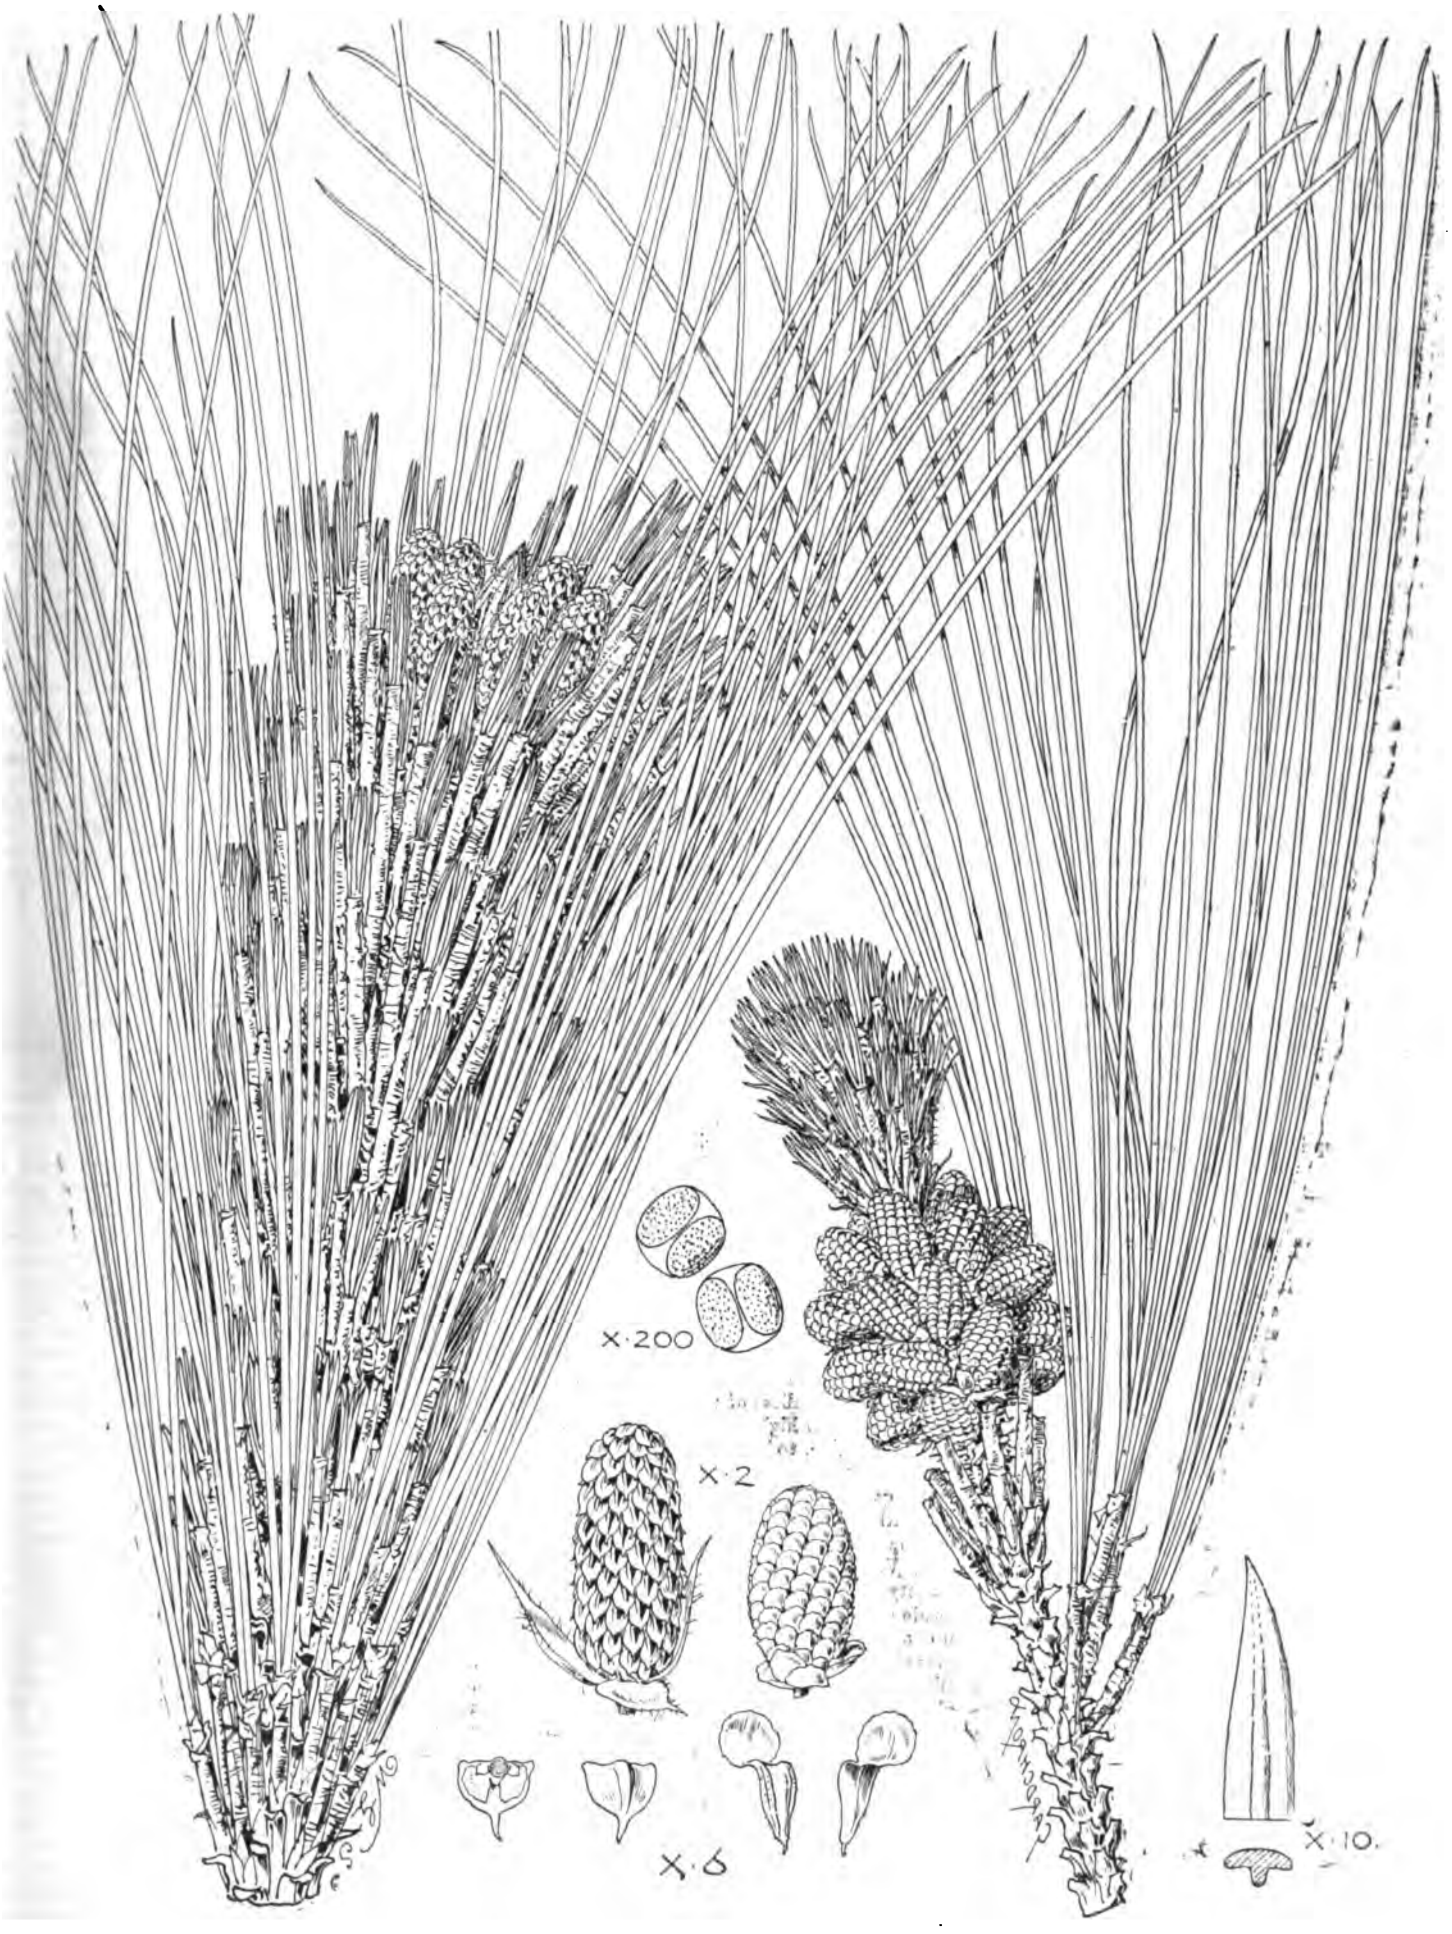

FIG. 53.—PINUS MONTEZUMÆ, SHOWING MALE AND FEMALE FLOWERS, POLLEN GRAINS, ETC.

namely, to introduce seedling varieties endowed with a constitution more or less proof against the Potato murrain. If his success should prove greater than theirs, a great stride will have been made in the direction of preserving an important article of daily consumption from loss. For good or evil, the Potato has come to stay, for no other equally valuable tuber, bulb, or root, suitable for field or garden cultivation, is known to us; and if disease-resisting varieties can be raised, we, in these islands, with their restricted cultivable area, ought certainly to possess them. Ed.]

NOTES FROM A SCOTTISH MANSE.

(Continued from p. 100.)

When last I wrote to the *Gardeners' Chronicle*, Nature was still enjoying her period of repose. Nevertheless, even then, in what may be termed the bulbous world, there was activity of a very important character going on underground. The process of root-formation, so essential for the subsequent upward growth of the plant and the development of the flowers, was silently being transacted. And the result of this energy is already sufficiently visible above the ever-gladdening surface of the ground. Bright and radiant forms, which the venerative nature cannot behold without emotion, are springing into life. Nothing is more touching to the lover of Nature than this annual re-awakening from the grave of winter, of the new-old flowers. They are those which charmed us with their beauty in other years; the same, yet not the same. And thus, in the beautiful language of Longfellow, "with child-like, credulous affection, we behold their tender buds expand." They seem to speak to our hearts with an eloquence peculiarly their own.

The earliest of all flowers, the graceful, drooping Snowdrops, are perhaps of all the floral treasures of the gardens and woodlands the dearest to our thoughts, for they come to us with the impressiveness of a veritable revelation; however, unobtrusive to our vision they may appear, they have flowered from an art our utmost efforts fail to find. We may comprehend the culture of nobler flowers; we may generate new and more elaborate forms, by hybridisation; but the secret of their origin, of their primal creation, eludes our utmost intellectual powers.

The Snowdrop is more beautiful than usual this year. At present it is the greatest ornament of the woodland enclosures which environ this manse, while around Logan House the fields look as if they were covered with a shower of snow. Here the purity of this earliest and best loved of all spring flowers, is greatly intensified by the intermingling golden hues of the earlier Crocuses, which, when thus planted at intervals among Snowdrops, are highly picturesque. In similar situations the deep blue flowers of Scilla sibirica (which by reason of its capability of producing rich contrasts should be universally cultivated) are also finely artistic in effect. Such pictures as these are not sufficiently studied by amateur or even professional horticulturists, many of whom might learn from Nature and especially from her arrangement of the woodland flowers, valuable lessons too frequently ignored. Nature is profuse, and often prodigal, in her floral affluence; yet we never find that of one colour she gives us too much. She has always a massive green environment for her myriads of glowing flowers. We sometimes exhibit our fairest blooms without foliage; Nature rarely does this. We did not learn from her majestic volume our meretricious arts.

I sometimes think there is too much glare, not only in our exhibitions, but in our modern gardens; too much of floral splendour, too little of soothing and sheltering umbrageousness. I am sure that the late Dr. Nathaniel Paterson, the eminent author of *The Manse Garden*, the first book on gardening I ever perused, would have agreed with me in this. He had the great privilege of being an intimate friend of Sir Walter Scott, of whom he was a near neighbour, when he (Dr. Paterson) was minister of Galashiels. The great novelist often consulted the Rev. Dr. regarding the trees he planted around Abbotsford, on the banks of the silvery Tweed. A gifted daughter of Dr. Paterson, wife of the Rev. James Cavan, resided for forty years in this sequestered yet beautiful parish—in Kirkmaiden Free Church Manse. She was a great cultivator of climbing flowers, especially such forms as Eccremocarpus scaber, Clematis flammula, and C. montana, which I trust her successor may cherish, with equally patient and loving care. The climber last mentioned is well worth preserving for its fragrance alone. I am much disposed to sound the praises of a plant much less obtrusive, of microscopic loveliness, which covers in spring and early summer the walls of my garden with its exquisite, miniature flowers; which, lilac and white in colour and profusely produced, have throughout the entire long season of blossoming, a most fascinating effect. At present it is only beginning to grow, but ere this tribute to its gentle beauty has been published, its tender flowers will have appeared; Linaria Cymballaria is its classical name. When preparing to seed, it grows, by some wise instinct, into the crevices of the walls, where it meditates only rapid floral production, it grows outwards to the light. Of late it has acquired two interesting companions, whose germinating seed has probably been blown by the winds, or carried by the birds from the neighbouring glen, viz., the pink-coloured Campion, and Geranium Robertianum. These climb gracefully upwards till they reach the Linaria; the Periwinkle, less ambitious, flowers at its feet. *David R. Williamson, Kirkmaiden Manse, Wigtonshire, N.B.*

SPONTANEOUS HYBRIDS OF HARDY PLANTS.

(Continued from p. 132.)

The readiness of the members of the large genus Verbascum to hybridise with one another is well known. E. Boissier describes about 120 oriental species in his *Flora Orientalis*, of which 90 per cent. are biennials (though he makes the mistake of calling V. nigrum biennial, whilst it is really a long-lived perennial). He warns us that he takes no notice of the hybrids. In Godron's *Flora of France*, only fourteen species are enumerated, and if we join V. nigrum and V. Chaixi into one species, this is the only one perennial; but eighteen wild hybrids, all of them biennial, are also described. Godron also states the fact, to which I have never been able to find an exception, that hybrids of Verbascum are entirely sterile. As a rule, the species produce seed in such abundance that while its production proves a true species, its absence affords a strong presumption of the plant being a hybrid; and chiefly for this reason I have always considered the tallest of perennial Mulleins, which grows 6 or 7 feet high, and is named V. Wierzbickii, syn. V. vernale, to be a hybrid.

About seven species of Verbascum are grown in Edge garden. I have had more, but not permanently established. Besides the tall, doubtful kind mentioned above, only two species are perennial, V. nigrum, of which I have also the white variety in plenty, and V. phœniceum, of every shade between dark purple and white; this comes up abundantly all over the garden, including gravel-walks. The biennial kinds are V. Lychnitis, Blattaria, including the white form, phlomoides, olympicum, and I may add that Thapsus keeps re-appearing, in spite of weeding out. All these show hybrids with one another, so that I can count more hybrid forms than species. From a gardener's point of view, by far the best hybrids are those between V. nigrum and V. phœniceum. I think the former is generally the seed-parent, from the places in which they appear. The commonest, but not the best, colour is some shade of copper, such as one would expect from a mixture of purple and yellow. Others are pink, or pale purple, or nearly white. They all throw up a succession of dense flower-stalks, which it is better to cut down when they begin to be shabby, to make room for more. They are only perpetuated by root-cuttings. I have had perennial hybrids evidently between V. nigrum and either V. olympicum or V. phlomoides, showing that a hybrid of a biennial is sometimes perennial. The presence of V. nigrum was obvious in the purple wool of the stamens, whilst the size of the flower and the texture of the leaves bespoke the larger biennial. Sometimes a hybrid between V. phœniceum and phlomoides has copper-coloured flowers. Some of the prettiest, whilst they last, are from Lychnitis, and I still have a perennial which I believe to be between that species and the white form of V. nigrum. V. Blattaria often takes the colour of V. phœniceum, differing little in other respects from its own type; but I have never known one of these to prove perennial.

Of seven or eight species of herbaceous hardy Spiræa grown at Edge, hardly one ever shows a spontaneous seedling except S. Aruncus, from which abundance of them come; but nearly all prove to be green-flowered, owing, I believe, to the damp soil. One other, S. camtschatica (so spelt in *Index Kewensis*), is peculiar. Every year since it has been in my garden two or three seedlings have appeared near it; not one of these has proved true to type: they are little more than half the height—4 feet instead of 8, and the flowers are pale pink instead of dull white; the panicle is looser, and longer. They are hybrids either of S. palmata or S. venusta, both of which grow near, or of a plant itself said to be a hybrid between S. palmata and S. Ulmaria, and called S. palmata var. elegans, which grows nearer still. I have distributed these seedlings, which were certainly less cumbrous than their gigantic parent, to several gardens. This is the only instance I have seen in which the seedlings produced from a typical species are all hybrids. *C. Wolley Dod, Edge Hall, Malpas.*

(To be continued.)

FERN HYBRIDS.

The presumed cross between our native Polypody (P. v. grandiceps) and the exotic P. nigrescens (figured in the issue of November 19, pp. 362 and 363), though not presenting such absolutely conclusive evidence of the cross as Mr. Schneider's previous success in P. Schneideri (P. v. elegantissima × P. glaucum), certainly arose from a prothallus which had intentionally been grown in juxtaposition with the other crested variety of a species with the intent that they should cross, and equally certainly the immense bunchy crests developed from the normally pinnate P. nigrescens is precisely what we might expect from the cross. The writer is, therefore, strongly inclined to impute the sport to a cross, and not to regard it as a purely independent variation. Mere cristation, however, has arisen spontaneously in so many species, that a simple cross of this cristate character is always open to doubt, and to establish the fact of a cross, other characteristics must be plainly transmitted, in which event the evidence becomes enormously strengthened. In P. Schneideri we have a model example of this class, the P. vulgare parent being not only divided in a peculiarly abnormal fashion for the species, but it is also erratically inconstant since not only do fronds of three types appear, viz., normal, bipinnate, and some of very fine cutting, but all these three characters may appear in one frond, some divisions being plain, and others redivided in two fashions. This variety, too, has only been found once, and no parallel to it is known to exist in any other species of Polypodium. Hence, when the spores of this are sown, or its prothalli mixed with those of a plain bipinnate form, like P. glaucum, which differs also from the other extremely in size, and we obtain a huge Fern fully the size of P. glaucum, but with fronds varied precisely like those of the abnormal P. vulgare, inconstancy and all, we cannot doubt that the characteristics of both parents have been intermingled, an independent sport being out of the question. In order, therefore, to eliminate doubt in cases of this kind, it is highly desirable, assuming the cross intended to be between a variety of one species and the normal form of another, that the varietal parent should have some special peculiarity beyond that greater or less ramification of the rachis constituting cresting, and which, as we know, is liable to originate, *per se*, in any species.

The greater liability of our native species to sport as compared with exotic species, as illustrated by the greater number of wild fronds, coupled with the demonstrated possibility of crossing with by no means closely-allied species of the same genera, opens up a wide field of operations, the first fruits of which we see amply illustrated in P. Schneideri, and fairly in P. nigrescens var. grandiceps. In view of Mr. E. J. Lowe's undoubted hybrid between Ceterach officinarum (Asp. Ceterach) and Scolopendrium vulgare, a cross evidenced by scaleless Ceterach fronds becoming confluent at their tips and bearing the dual fructification of Scolopendrium, we have before us the possibility of introducing variety into the peculiarly constant family of the Asplenia. In Asplenium nidus avis we have the relationship accentuated by similarity of form, and recently by an imported find of a form which is broadly pinnatifid, with crested tips to the side divisions, very much on the lines of S. v. laceratum. Asplenium nidus avis is such a grand Fern, that, in the opinion of many, any varietal introduction would spoil it; but we beg to differ from this view. Nature has a knack of harmonising her combinations; and we venture to assert that, if some fortunate hybridiser succeeded in crossing A. n. avis with one of our finest fertile forms of S. crispum, and got a thoroughbred, deeply frilled A. nidus avis as the result, there would be no lack of appreciation of his prize; neither would there be of a finely-crested form, or a fimbriated one, or indeed of a score of others of the right sort. "The right sort." "Aye! indeed, there's the rub!" There is no profit in crossing for crossing's sake, and filling the world with mongrels. Now that we have such a coterie of high-class symmetrical varieties, we can afford to ignore the imperfect ones. Recurring to the Polypodium genus, the name of the exotics is legion, many of which could doubtless be induced to follow the example of P. glaucum, and mate to mutual advantage, not only with P. v. elegantissimum cristatum and grandiceps, but also with the finely-cut form of P. v. pulcherrimum, and the long, slender type of P. v. bifido-cristatum. Unfortunately, in this species the true plumosums, P. v. cambricum, P. v. plumosum Haduni, P. v. Prestoni, and the like, are absolutely barren, and hence precluded from union; the aforesaid P. v. pulcherrimum, however, is a fertile form on similar lines to them, and P. v. semilacerum and omnilacerum are varieties which need precisely a robust-growing mate to bring out their too often latent excellence to perfection. Our little Asplenium Trichomanes, in its crested form, could, doubtless, despite its comparative smallness, affect beneficially some of its large exotic relatives. The Cyrtomiums are near relatives of our Lastreas, and could well afford to contribute their boldness of pinna to some of our tasselled forms of that ilk, or *vice versâ*. The exotic Osmundas might be crossed with O. r. cristata; and last, but not least, Polystichum setosum would be none the worse for a dash of not one but many of our lovely P. angulares. This is a field in itself, to say nothing of other exotic Polystichums, each species of which might afford charming combinations under the influence of our native varieties.

Finally, a word as to sowing: Mr. Schneider, we understand, sows the species apart, and subsequently pricks out small patches of prothalli of the same stage of development, and inserts these side by side prior to the period of fertilisation. This is done because exotic spores requiring warmth, develop into prothalli much more rapidly than do our native spores under cooler treatment, hence a simultaneous sowing of both together would result in self-fertilisation of the exotic batch before the others were mature. As, however, our native species do not object to some warmth in their prothallic state, it might be equally or more efficacious to sow our native spores first and not too thickly; let them grow on to a certain extent, and then sow the exotics broadcast among them, giving just sufficient warmth to start them, and bring them on both together to the crossing stage. Arrived at this we would immerse the pan in warm water until the water just flooded the prothalli, letting them stand thus for an hour or so, to permit of a general diffusion of the escaping antherozoids. Given then any affinity at all, it is clear the chances of cross-fertilisation will be enormously multiplied as compared with that of simply juxtaposed patches of prothalli, only the outermost of which are in contact with their possible mates. *D.*

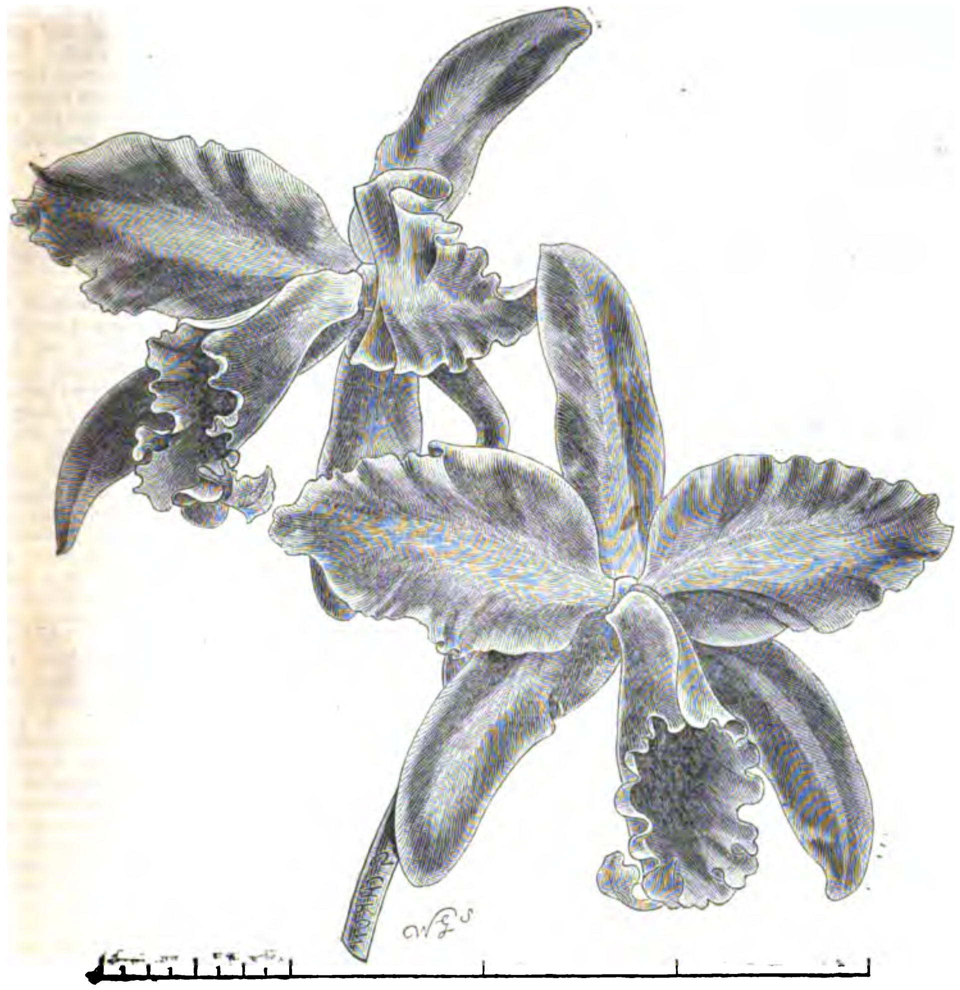

Fig. 54.—LÆLIO-CATTLEYA × ERNESTI, "PRINCESS OLGA:" COLOUR OF THE FLOWERS, RICH YELLOW.

LÆLIO-CATTLEYA × ERNESTI,

"PRINCESS OLGA."

Our illustration (fig. 54) represents one of the prettiest of garden hybrid Orchids. It was produced by M. Chas. Maron, of Brunoy, Seine-et-Oise, France, and shown for the first time at the Royal Horticultural Society, Feb. 28 last, when a First-class Certificate was unanimously awarded by the Orchid Committee. The plant is all the more interesting as the seed-bearer was the somewhat despised Cattleya Percivaliana, crossed with the clear yellow-coloured Lælia flava, whose colour wholly supplants the flowers of the rose-coloured female parent, in a similar manner that yellow has been known to do in hybridising other plants. The habit of L.-C. × Ernesti is like that of Lælia flava in a great measure. The flowers bright chrome-yellow, with an orange base to the lip, and red-brown. The plant, which bore two spikes of three flowers each, passed into the collection of Norman C. Cookson, Esq., Oakwood, Wylam.

AMERICAN NOTES.

BEGONIA GLOIRE DE LORRAINE IN THE UNITED STATES, AMERICA.

This winter-flowering Begonia, to which frequent reference has been made in your columns, is, you may be interested to know, having a great "boom" at present in America. Although the plant has been in the hands of a few growers for the past two or three years, it was comparatively unknown until last fall. One or two wide-awake persons, notably R. & J. Furgutad & Co., and Mr. William Edgar, of Boston, knowing the value of it commercially, made considerable importations of it from England, and worked up a large stock of it. Mr. Edgar staged a fine table of it at the Chrysanthemum exhibition of the Massachusetts Horticultural Society in Boston last November, when it was the centre of attraction for all visitors. Since that time there has been a great call for it, both from the trade and from private growers; and few persons over here owning a greenhouse are now without it. The florist stores in Boston sold large quantities of plants during Christmas week at from 5 to 15 dollars each; in fact, it was more in demand than any other flowering plant. The plant is figured and extensively advertised in the many leading seed catalogues now being sent out, and before the end of the present year it will probably be in the hands of nearly all flower-lovers. We find that Gloire de Lorraine, while more difficult of propagation than most of the other Begonias, roots quite freely from soft-wood cuttings or from leaf-sections. It seems to succeed well in an intermediate-house temperature, and stands a fair amount of sunshine; while a rich compost of half loam and well-rotted manure, with a good dash of sand and plenty of liquid-manure when the flowers show, give the best results. Of course this, like all other soft-wooded plants, succeeds in stronger compost, and stands more generous feeding than in England, owing to our more exhausting climate.

ENGLISH TOMATOS IN AMERICA.

Some of the leading English Tomatos are at last being recognised as standard varieties for forcing purposes in the States. For years growers have been relying more or less on such American varieties as Stone, Perfection, Lorillard, May's Favourite, &c., which, while admirable as outdoor kinds, are very unsatisfactory setters under glass. We have always found English kinds far more trustworthy for forcing, and it is pleasant to note that at last the merits of the varieties used by our transcontinental cousins are getting proper recognition. The best varieties here are Sutton's Best-of-All, Frogmore Prolific, and Eclipse. On plants of Best-of-All and Eclipse, grown to three stems in 10 and 12-inch pots, we had last winter from sixty to eighty-five fruits each. Quite a number of seed-growers are this year offering English Tomato-seed, and they will speedily usurp the places of the American varieties in indoor cultivation. A local market-grower marketed last season 2½ tons of Frogmore and Best-of-All from a house 100 feet by 15 feet, planted in January. The present wholesale price of Tomatos here is from 30 to 45 cents per pound; whereas, six or eight years ago as much as 1½ to 2 dollars per pound was frequently asked and obtained. The Tomato called Best-of-All succeeds very well out-of-doors with us, but all other imported varieties have turned out failures, the fruit coming soft, and cracking badly. *W. N. Craig, Taunton, Mass., U.S.A.*

PLANT NOTES.

APHELANDRA AURANTIACA ROEZLI.

THIS charming stove plant is now seldom seen in our plant-houses, and many of the younger members of the craft do not know it. It is quite a miniature plant, seldom growing more than 6 to 9 inches in height, the bright orange-scarlet spikes and grey foliage making it conspicuous among other stove-plants. The species grows best from seed, which is rather difficult to procure, except through the best houses in London. The seeds should be sown in strong heat, and the plants grown on in peat, leaf-mould, and sand, with a sprinkling of broken crock, the plants being kept in brisk heat, and well syringed daily. A flower-pot 4 to 6 in. wide is the largest required, and a plant will flower two and three times in a season. As a "dot plant" on a dinner-table, among suitable cut flowers, this plant has a very pretty effect. *A. J. L.* [It was described by us in *Gardeners' Chronicle*, 1867, p. 1214. ED.]

PLUMBAGO LARPENTÆ,

Owing to its distinct characteristics, deserves a place in all herbaceous borders, or such as are devoted to mixed hardy plants, if for no other reason than that it is so very distinct from other hardy subjects. Its specific name was given in honour of Lady Larpent, the fact may be recorded, as Sir William Hooker says it ought to be known as Valoradia plumbaginoides, which, I assume, was the name given it by Boissier. Considering Bunge (*Botanical Magazine*, 4487) named it Ceratostigma plumbaginoides, it would seem well to rely on Lindley's classification as above. Though the form of its flowers, and their intense blue colour, may not much resemble the ordinary Leadworts, that the leaves resemble the latter none can gainsay. Of Chinese origin, it may be said to have a distinctly tropical appearance. The young shoots, somewhat attenuated, rarely grow more than 18 or 20 inches in height, the blooms being thinly scattered amongst their apices. It requires a sunny situation, and is usually propagated by division, though it can be increased by cuttings dibbled out under handlights.

MERTENSIAS.

As herbaceous, or rockery plants, the several species of Mertensia are pretty, not to say showy, grown and flowered, as they deserve to be, in prominent positions. Mertensia virginica, the Virginian Cowslip, has blue flowers, resembling in tint that of the Gentians. It blooms early in the spring when the peculiar drooping, or more properly speaking, arching cymes of flowers always attract attention. Its suitability for rock-work shows itself from the fact that it succeeds best partly shaded by a boulder from the full sunshine, hence it will thrive upon somewhat westerly aspects, and it may be added that it has a preference for a peaty soil. Mertensia sibirica atro-cœrulea, probably the most robust-growing species, or sub-species, makes a good companion to the above; whilst M. sibirica has tubular, lighter blue flowers, of which a white-flowered form has lately been introduced. *William Earley.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

General Remarks on Shading.—That it is expedient to have ready for use all the necessary appliances, whether for affording heat or shade, was strikingly illustrated by the days of February 23 and 27 last. The former was a warm and cloudless day, with a temperature that reached 63°, whereas on the latter day the atmosphere was fog-laden, and the temperature several degrees below the freezing-point during the whole time. To be prepared for sunny days, the roller-blinds and other means of shading should be ready for use. Lath-roller blinds are rightly preferred by most growers for shading the Cattleya, Mexican, and Dendrobium-houses. They are suitable also for Odontoglossums, if a little extra shading be provided with garden mats on particularly bright days in summer. But for Cypripediums, Phalænopsis, Masdevallias, and numerous other species that have no pseudo-bulbs, some shading material is required that will break the sun's rays up a little more than do the lath blinds. The situation and aspect of the house should determine to some extent whether the shading material need be closely woven or not. Whatever material is used, it should always be raised 6 or 8 inches above the glass. Permanent shading of any description should be avoided as much as possible. For sides and ends of the houses, the canvas may be stretched on frames, which may be suspended on hooks, and thus be convenient of removal when necessary. Such questions as: When is shade required? How dense should it be? can only be answered in general terms, for certain species appreciate a fair amount of direct sunlight—such are Cattleyas, Lælias, Catasetums, Cycnoches, Dendrobiums, &c., and it is only necessary to shade them when the leaves feel warm to the touch. Vandas or allied genera must be shaded before strong sunlight reaches them, so also must most of the Cypripediums and Odontoglossums, Oncidiums, Maxillarias, Miltonias, &c. Masdevallias, Phaius tuberculosus, the warm-growing Zygopetalums, Anæctochilus, and Phalænopsis must be shaded, even when there is no absolute sunshine, if the light be of a glaring nature. There may be only a day or two during the present month when blinds need be used, but the variability of our climate is such that they should be fixed without delay.

Cycnoches chlorochilum, popularly known as the "Swan Orchid," is now making new roots, and tmay be repotted. The old roots die with the decay of the leaves, and they should be cut off to within 2 inches of the base of the pseudo-bulb, the length of dead roots left being useful to assist in firmly fixing the bulb in the new soil. The latter may consist of one part each of fibry loam, Orchid-peat, and sphagnum-moss. The plants do capitally in 4-inch, perforated pans, which should be suspended in the sunniest position in the East Indian-house. Very little water will be necessary until the weather is much warmer. Sometimes young growths appear some distance from the base of the bulb, and when these have thrown out roots, the bulb may be cut through about an inch below, and the separated piece potted, as advised above.

Catasetums should be repotted immediately signs of new roots appear, using pans which are just large enough to contain the plant conveniently. The compost recommended for Cycnoches may be used, with an addition of some small crocks. Catasetums are very susceptible to injury if water lodges in the growths, and the plants are safer suspended in the warm-house, where water from the syringe or other sources will not reach them. For a long time after they have been repotted, it is dangerous to apply any water, but the pan may be dipped occasionally about half its depth in warm rain water.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore Maidenhead.

Miscellaneous Operations.—As the buds of the fruit-trees are fast swelling, all arrears of pruning, nailing, and training should be pushed on with speed. The lower temperature experienced during the past week or two has been beneficial in checking the opening of the flower-buds, especially those of some varieties of Pears, and the blooming period will be deferred to probably milder weather. The planting of trees and bushes should be finished forthwith, the sun having considerable power, and the prevailing east wind being very drying, and consequently trying to such as are newly planted. Let all prunings be collected and burnt when the work is finished. The nails which may have dropped in manipulating the trees should be collected, and after burning them in a shovel and oiling them, they may be used again. After the nailing and tying of wall-trees is completed, the fruit-tree alleys should be cleaned with a rake, and the surface hoed, or be very thinly pricked over, just simply breaking up the surface. A light mulch of half-rotten stable-dung may afterwards be applied, which will be clean to walk upon in attending to the trees, and running together, it will not exclude sun-heat. With milder weather the borders near the wall should be examined, and if found to be dry, a good quantity of water should be applied. The beds of Gooseberry and Currant cuttings should have an examination, and where lifted by frost, the soil should be made firm about them. Now that the fruit and wood-buds are prominent, sparrows and bullfinches will be getting troublesome, and a sharp look-out must be kept, or the Gooseberry-bushes and Plum-trees will quickly be stripped of buds. While the weather continues dry, a thick coating of lime-wash is fairly effective as a deterrent, but it must be repeated after every shower.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge.

Musas (Bananas).—Where these plants are grown in tubs or large pots, it is necessary to detach the suckers before they are far advanced, or their removal will result in injury, both alike to parent plant and sucker. Where they cannot be planted in a natural manner in a border, pits formed with walls are the best, as such give facilities for affording fresh soil to the mass as the roots extend, loose brick walls being quickly taken down and rebuilt, so as to include an increased area. By this method of treatment, the same site can be permanently devoted to the plants, as the mother plant, after the fruit-cluster is cut, may be readily removed, and the sucker at its base allowed to remain. The exhausted soil in which the plant grew should be replaced by new, and the work is not nearly so laborious as that attending tub or pot-culture. Stove temperature and a rather lofty house are necessary for success in Musa cultivation. The moist air of an ordinary plant-stove suffices, together with the usual syringings. In regard to plants freshly potted or planted-out, water should be carefully given at the first, but as the plants get established they will take it in abundance during the summer. The planting or potting must be firmly done, and the soil and manure should be used in a lumpy, rough state, which renders this the more necessary. When in full growth liquid-manure may be freely employed. Soot sprinkled on the surface and stirred in, or in the form of clear soot-water, is excellent for imparting depth of colour to the leaves.

The Cucumber-house.—If the plants are in good health, growth will now be more vigorous than hitherto, and a frequent stopping of the shoots will be called for, as well as the removal of the weaker shoots and old leaves that have fulfilled their functions, and are now almost useless. Let all shoots left for fruiting or extension be tied to the trellis at short intervals of time. As fast as the roots appear at the surface of the beds or hillocks, apply a top-dressing of rich pasture loam and rotten stable-manure, omitting the latter, however, if the plants possess desirable vigour. Water should be afforded at the root in accordance with the state of the soil, the weather, and the method of affording heat, beds situated directly over hot-water pipes needing it more frequently than those made up on beds of fermenting stable-litter and tree-leaves. The cultivator should endeavour to maintain the beds in an uniformly moist state. Let the foliage be syringed morning and afternoon, and be sure to damp the floor, walls, &c., often. The variable weather at this season renders the giving of air a rather tiresome matter, as while bright sunshine prevails there is usually a piercing wind from east or north, which, if admitted untempered, work ill on the plants. The ventilators should be covered with pieces of Nottingham hexagon netting, in order the better to distribute the air; and they should, if possible, only be opened on the side from which the wind does not blow.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Propagating Plants.—Most species of stove and greenhouse plants may be progagated during the present month; and as a rule, those cuttings strike the most readily which are taken from plants starting into growth after a period of rest; and therefore plants from which it is intended to propagate, should now be encouraged to make a strong short-jointed growth. This may be accomplished by introducing them to a house where a higher temperature and a moister atmosphere is maintained than in that they have hitherto occupied. The cuttings should be taken off as soon as they have attained a sufficient length, which varies with different plants, but the shoots are generally long enough when they have made from three to five joints. Many soft-wooded plants emit roots readily from any part of the young shoots, but as a general rule, it is best to make a clean cut immediately below a joint. Cuttings of Panicum and Tradescantia for furnishing the edges of stages and for decorative purposes, should be inserted in such quantities as may be required. Likewise Clerodendron fallax [Fine also from seed. Ed.], Justicias, Libonias, Gardenias, Begonia Gloire de Lorraine, and other Begonias, both species and crosses; Ixoras, Franciscea, Coleus, Abutilons, Fuchsias, Heliotropes, &c., all of which strike readily in the propagating-frame, or in an ordinary hotbed-frame. Plants of Isolepis and Eulalia gracillima variegata may be divided and potted in small pots.

Hippeastrums (Amaryllis).—The latest batch of bulbs should now be re-potted. After shaking the soil from the roots, preserving all of the latter which are in a sound condition, place the bulbs in 6-inch or 7-inch pots, according to size, affording a porous compost, consisting of two parts good loam and one part flaking leaf-soil, with plenty of sand. When the potting of a bulb is finished, half of its height should be above the soil. Plants required to bloom late may be allowed to start into growth in a temperature of 50°, but those that are to flower quickly should be placed in a moist heat of from 55° to 60°. Bulbs which have started into growth should not have the soil shaken from the roots, but the drainage should be examined and made good if defective, and the surface-soil removed to the depth of 1 or 2 inches, and replaced with fresh soil, to which may be added a sprinkling of bone-meal.

Seeds.—Many of the tender and half-hardy annuals are extremely useful for the furnishing of the greenhouse and conservatory. Among these may be mentioned Celosias, Cockscombs, Schizanthus, China Asters, Balsams, Globe Amaranth, Nicotiana affinis, Petunias, Ipomœas, Exacum affine, Maurandyas, Lophospermums, Rhodanthe, Torenia, &c. The following, although perennials, are best treated as annuals. Celsia arcturus, Hibiscus Manihot, and Trachelium cœruleum. Seeds of the above may be sown in pots and placed in an intermediate-house or pit on a cinder-bed, or plunged in a mild hot-bed not far from the glass, and carefully shaded. When the seedlings have made a "rough" leaf, they should be pricked off into pans or boxes, and returned to the same house or frame for a few days, after which they may be removed to a cooler pit or frame. When large enough, the seedlings should be pricked off into other pots, and subsequently potted. They will require one or two shifts before the final one, which may be into 48's or 32's. Exacum affine and Ipomœas succeed best in a warmer temperature until the beginning of June, when they may be transferred to the greenhouse or conservatory.

Carnations.—The remainder of the autumn-struck tree Carnations should now be placed in the pots in which they are to flower. If the plants have been wintered in 60's, they may be shifted into 6-inch pots; but if they are strong plants in 48's, a 7 or 8-inch pot will not be too large. Keep the Souvenir de la Malmaison varieties in a pit, or near to the glass in the greenhouse; but the summer-flowering show varieties of Carnations may be stood out-of-doors at the end of the month or early in April, thereby affording house-room for more tender subjects.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.

Herbaceous Phloxes.—In order to obtain fine trusses of bloom, these old stools should be taken up, and from the circumference of the clumps pieces with half-a-dozen strong shoots should be selected for replanting. The new stations or beds should be deeply dug after being manured, some good loam being also used. Phloxes delight in abundance of water in the hot weather, and to have plenty of subdued light, and no exposure to full sunshine. For the purposes of exhibition, the plants should be grown from cuttings taken in the early autumn and struck in a cold frame, or from young shoots taken at this season from potted roots brought on in gentle warmth. These cuttings should be struck in pots filled with sandy soil and plunged in a mild heat. The shoots should be reduced to three or four, and no others allowed to grow. The varieties of P. suffruticosa flower early in the summer, and those of P. decussata in the autumn months. There are splendid varieties of both of these, but the self-colours and those with a symmetrical eye of bright colour are the more effective.

Gladiolus.—Any corms starting into growth may be planted in borders of other plants or in beds by themselves, or amongst small dwarf shrubs. The soil should first be well dressed with rich loam, stable-dung, or crushed bones, and be trenched or deeply dug. When the ground has settled, let the corms be planted 6 inches deep, and before covering them with the soil, sprinkle them with soot. When the plant is grown in beds for cutting purposes, it suffices to draw deep drills 9 inches apart in prepared land, and plant the corms at 6 inches apart. Any which have not started may be planted in about a fortnight; they will form a succession. M. Lemoine's hardy hybrids are dwarf, and beautiful early-flowering varieties. G. Childsii has flowers of great size and substance; G. Brenchleyensis, one of the hardiest, and therefore the best for planting in shrubberies, is of a dazzling scarlet colour; and generally G. gandavensis varieties, with regard to brilliancy and variety of colour, are unequalled.

Begonias.—If the seed sown as was advised by me in the month of February has germinated, the plantlets, when strong enough, may be pricked out in pans, prepared as for sowing, at 1 inch apart, and large enough to take the roots without cramping them. Lift each little plant with a flat stick, notched at the bottom, and let the roots fall into the holes; press the soil gently over them, taking care not to bruise the young leaves; sprinkle the soil lightly with a fine-rose pot, and cover each pan with a sheet of glass for a few days. Avoid damp, and watch that insects do not harm them.

Sweet Peas.—These flowers are beautiful when cut for house decoration, and effective in the garden, and by sowing at about this date, and successively to the middle of the month of June, a lengthy supply of them may be obtained. Many gardeners fail in growing the plants to perfection by having a soil that is too rich in nitrogen, and putting in the seed thickly. Let the seeds be placed 2 inches apart, not nearer, in drills 3 inches deep. The ground should be deeply trenched, but not recently manured, and the position should be cool, and not fully exposed to the sun. Where the plants show blossom, liquid manure is beneficial.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Sea Kale.—The plants reserved for the latest supply should now be covered up, and the crowns kept in darkness. The forcing pots and heating material must be removed from the beds where the crop has been gathered, a slight covering only being left to protect the crowns. About the end of the month the crowns may be cut over 2 inches beneath the soil, this applying also to crowns which have not been forced. This will have the effect of preventing flowering, which is always injurious. New plantations may now be made, using straight pieces 6 inches in length and of uniform thickness, leaving the smaller sizes for planting on one side of the beds, so that when the roots are lifted, the best may be taken up in rotation. The sets may be planted with the tops 2 inches below the surface, and the holes filled to the surface with fine soil, or a little sifted coal-ashes. Any good crowns kept for a very late supply, may be kept in bundles and well covered under a north wall till growth commences, when they may be removed to the Mushroom-house to be blanched.

Globe Artichokes.—If more plants are wanted, suckers or side-shoots should be taken up, potted, and stood in frames till established, and then be planted on well-prepared land, or at a later date in the warmer parts of the country. The suckers may be dug up and planted straight away in groups of three at 12 inches apart, and 4 feet between the groups. Seeds of Globe Artichokes may be sown in pots and pans, and the seedlings forwarded under glass. These with care will yield a moderate supply of heads towards the end of the summer. Some growers sow one seed in a 60-sized pot, or three seeds in a 48.

Tomatos.—A sowing of seeds of the Old Red or other free fruiting variety in the open air, should be made, if the situation be very favourable for ripening the fruit of the Tomato out-of-doors. Ham Green Favourite, Chemin Rouge, and Sutton's Perfection, are also suitable, and great crops are harvested in ordinary seasons. The plants should be kept steadily growing the whole time. The plants, especially in the colder parts of the country, should be fully 2 feet high or more at planting-time, and the stems kept clear of side-shoots. The first week in June is early enough to plant them out-of-doors.

Capsicums and Chilies.—A sowing may be made in heat at this date, and the seedlings grown on in the intermediate-house. In very warm parts, the plants may be planted in June at the foot of a south-wall, and they will fruit well, but ordinarily the plants should be kept under glass the entire season.

Chives, &c.—The old clumps should be divided and replanted on fresh heavily-manured land at a distance of 1 foot apart. Fresh beds of Camomile may be formed by planting shoots with roots attached at 1 foot apart. Seeds of this plant may also be sown. The situation of the bed should be warm and dry.

Pennyroyal may now be planted, also any other herbs that will grow from divisions of the roots. A timely attention paid to the herb border will always result in plenty of herbs for kitchen and still-room use, whereas neglect of this necessary part of the garden usually brings never-ending complaining.

Paris Exhibition of 1900.

IT is high time that intending exhibitors in the horticultural department should notify their intentions to the Secretary of the Horticultural Department, Paris Exhibition, St. Stephen's House, Victoria Embankment, Westminster. The full details are not as yet to hand, but the space allotted will be seen marked "Grande Bretagne" on the ground-plan shown in our Supplement. The situation is an admirable one, and it is to be hoped that British exhibitors will avail themselves to the full of the opportunity offered them. It is suggested that in due season exhibitions of British-grown fruit should be made.

A committee has been appointed to look after British interests in the matter. This committee is presided over by Sir TREVOR LAWRENCE, Bart., the President of the Royal Horticultural Society, and contains among its members Sir W. T. THISELTON DYER, Mr. HARRY VEITCH, Dr. SCHLICH, Dr. MASTERS, and others.

The plans show the general nature of the building, with ground plan, section of one of the domes, &c. We may mention, that in some other departments of the agricultural section, the applications for space are already very numerous, and for the credit of British horticulture, and the interests of the exhibitors themselves, it is very important that those intending to take part in the exhibition should notify their intentions to the secretary of the committee, whose address is above given.

The Gardeners' Royal Benevolent Institution.

WE most willingly give a place to the following letter from Mr. OWEN THOMAS, of the Royal Gardens, Frogmore, and we cordially endorse his statements :—

"As a member of the committee of the above Institution, I hope I may be excused for approaching my fellow gardeners for the purpose of endeavouring to influence them to give a more general and generous support of its funds. I am not asking others to do what I have not attempted to do myself, as I have striven to do my best for the Institution. It is difficult to understand why all gardeners do not rally round this splendid property of £30,000, especially when it is said that every shilling of it is their own. One would think that even from motives of selfishness, if from no higher motive, every gardener would strive to do all in his power to promote its usefulness and prosperity. There cannot be fewer than 30,000 gardeners, nurserymen, growers, and others engaged in horticultural pursuits who are, or ought to be, interested in its welfare, and if as many of these as can afford it subscribed their guinea a year, and if the remainder who are unable to do this were to collect small sums annually for the benefit of its funds, the question of old age pensions, so far as it relates to gardeners, would be solved.

"Objections have been advanced by many persons against the Institution because it is not founded on the lines and principles of a benefit society, where a member can claim help at any time in case of need. On the surface this may appear to be a reasonable objection, and, I am afraid, it has been the cause of many not subscribing to its funds ; but on a little consideration, this objection may be proved to be an erroneous one, and especially so in the case of gardeners whose wages are scarcely ever stopped in time of sickness, and who, therefore, do not feel the pinch of poverty at this time as mechanics and others who are paid by the hour, and whose pay is stopped when work ceases. As bearing on this point, I may say I have been a member of a benefit society for upwards of twenty years, paying about 22*s*. a year, and if I am to remain a benefit member I shall have to go on paying that sum as long as I live, and in case of sickness and permanent disability from work, I am entitled to 10*s*. a week for the first year, about 7*s*. the second year, and after that I believe the pay is reduced to 3*s*. per week for life. Let me ask my fellow-gardeners who are still sceptical on this point, to compare this with the advantages offered by the Gardeners' Royal Benevolent Institution, even from a benefit point of view, where, after subscribing a guinea for fifteen years, or £10 10*s*. down, a member or his widow is almost certain to be placed on the pension list if the case is deserving and the candidate is incapacitated from work and in need, receiving without any further cost or trouble £20 or £16 a year for life.

"Another objection has occasionally been levelled at the institution, viz., that some gardeners who had subscribed but little, and others who had not subscribed at all, are occasionally elected pensioners. On this point I may say that, we must not lose sight of the fact that by far the largest proportion of the funds of the institution has been, and is, subscribed by people indirectly connected with gardening out of pure benevolence for the relief of aged and distressed gardeners. I, for my part, should be very sorry to see this principle of benevolence infringed upon or curtailed in any way. I hope and believe it will not be allowed to impose a barrier to prevent subscriptions flowing in. The committee have introduced a clause into their rules giving almost absolute certainty of election to those candidates for assistance who may have subscribed for fifteen years, and the new rule passed at the special general meeting (December, 1892) will give subscribers substantial advantages over non-subscribers, inasmuch as a subscriber for four years will have fifty votes credited to him, and fifty more added for every year subscribed afterwards up to fourteen years, and thus the gardener with few influential friends is placed more on an equality with those who have that advantage.

"In addition to the above advantages, giving benefits only to those who have subscribed, and who may unfortunately some day become candidates for the help of the charity for themselves or their widows—we none of us know, the wheel of fortune is always turning round, picking some up, and casting others down daily.

"In 1897 (the Diamond Jubilee year), at the instigation of Mr. HARRY J. VEITCH (one of the best friends the Institution has ever had), the Victorian Era Fund was established, and although this Fund is not yet two years old, so great has been the success attending its formation that the sum of £5000 has been subscribed, which sum is invested in Great Western Railway Stock, bringing in an annual income to the charity of £130. This Fund was conceived and established entirely in the interest and on behalf of those gardeners who had befriended the Institution by subscribing to its funds, and no non-subscriber will ever receive a penny benefit from it. The money is expended in the form of gratuities to unsuccessful candidates at each election. Each one who may read these lines, and has a touch of kindness in his heart, can depict to himself much better than I can describe the comfort this gratuity affords. The gratuities range from £10 to £1, according to the number of years the candidate may have subscribed. I have mentioned this fund in order to show my fellow gardeners that the Committee are not unmindful of the prior claims of those who have helped the Charity in their days of health and strength, and also in the hope that this action of the Committee will favourably commend itself to gardeners generally, and as a result help to bring in a large accession of gardeners' annual subscriptions and donations.

"May I point out a way that has been opened out within recent years which makes it practical and easy for gardeners to help the unfortunate members of the Craft in their own district or county, as well as the general interests of the Charity. I allude to the Auxiliary Committees which have been established at a few centres in county districts, notably those of Worcester, Bristol, Wolverhampton, and Exeter. Each of these centres has established strong local effort, and is doing most useful work. Worcester especially, in consequence of the energetic and strong lead of Mr. WHITE and Mr. CRUMP, have done yeoman service for the Institution ; so also have Mr. J. H. VALLANCE, the admirable Bristol secretary, Mr. R. B. LOWE of Wolverhampton and his colleagues, and Mr. W. MACKAY of Exeter, as well as friends in Birmingham. This opens out a way for any district or county to place their own local candidates

on the funds with their own votes (all they have to do is to secure plenty of local subscribers) as the auxiliaries I have mentioned are now able to do, and if they are fortunate enough not to have a local candidate, then they still have their votes to give to whom they please.

"Let me appeal to the gardeners in every county to appoint a local committee in every centre of importance in order to band themselves together to do some little in any way which may suggest itself to them to help forward the good work of this splendid charity. It only wants a few kind hearts and willing spirits to take the lead, and hundreds, nay, I hope thousands, will follow.

"The executive committee in London give cheerfully and freely their time and their thought at considerable cost to many of them living at a distance, without hope or wish for reward further than the pleasure always derived from association with the work of benevolence and charity. But the responsibility is great. The institution has 174 pensioners on its hands, at an annual cost of £3,164. My friends, this is no light matter. Is it, therefore, too much to ask and to hope that our gardening friends in the country will imitate and emulate the successful examples I have quoted, and come more to our help.

"Our excellent and indefatigable secretary, Mr. Ingram, 175, Victoria Street, Westminster, S.W., will be delighted to help in any way possible to bring about this desirable result. *Owen Thomas, Royal Gardens, Frogmore, March* 2, 1899."

ROYAL HORTICULTURAL SOCIETY.—A meeting of the committees of this Society will be held on Tuesday next, March 14, in the Drill Hall, Westminster, when a lecture on "The Duke of Bedford's Experiments at Woburn: their Object and Method," will be given by Mr. SPENCER PICKERING, at 3 o'clock, P.M.

LINNEAN SOCIETY.—The next meeting will be held on Thursday, March 16, at 8 o'clock, P.M., when the following papers will be read: Mr. P. CHALMERS MITCHELL, M.A., F.L.S., "On so-called Quintocubitalism in the Wing of Birds;" Mr. W. P. PYCRAFT, M.A., A.L.S., "Some Facts Concerning the So-called Aquintocubitalism of the Bird's Wing;" Messrs. W. WEST, F.L.S., and G. S. WEST, A.R.C.S., "A Further Contribution to the Freshwater Algæ of the West Indies."

THE ST. PETERSBURG EXHIBITION.—Through the intervention of the Royal Gardens, Kew, we have received a document from the Russian Government stating the conditions under which plants will be received at the forthcoming show in May next. 1. The transport of plants and other objects from the frontier to St. Petersburg will be made without any reduction in the tariff, but these goods will be exempt from customs duties, provided they are despatched from Russia through the same station as that by which they entered. 2. The transport of these goods from St. Petersburg to the frontier station through which they entered will be effected gratuitously. 3. To avoid all misunderstanding at the frontier, all goods intended for exhibition should be marked "Transit—Exposition," and bear a label, which will be furnished by the Imperial Horticultural Society to every exhibitor on application, one label for each package. 4. The customs examination will take place in the exhibition buildings. 5. All plants should be provided with a "Phylloxera Certificate." The Russian railway authorities undertake to provide several waggons adapted specially for the transport of plants, and provided with water for purposes of watering, and of heating. In the interests of the exhibition it is desirable that persons taking part in the exhibition should avail themselves of a reduction in the cost of the railway tickets, Signed "STAAL."

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* will take place on Tuesday, March 14, at 6 P.M. The subject for discussion will be, "The Planting and Pruning of Single Roses," to be introduced by Mr. GEORGE PAUL, V.M.H.

RAILWAY RATES.—We extract the following from the *Daily Mail*, and trust that a subject of such vital importance to cultivators who supply our markets will be vigorously taken up by those concerned:—

> The preference rates given by the South-Eastern and Chatham railways to foreign farmers are to be fought strenuously. Messrs. W. WOOD & SON are organising a vigorous attack.
>
> "The hour is now ripe for prompt and concerted action," write Messrs. W. WOOD & SON, Ltd., horticultural sundriesmen, of Wood Green. "The astounding comparisons between rates for foreign produce and those at present in force in the districts which are to be served by the South Eastern and Chatham railways should have the effect of rousing those to whom this is a matter of a struggle for existence, to take some steps to upset this monstrous anomaly."
>
> Messrs. WOOD & SON propose to call a public meeting at a convenient City centre. This meeting should be attended by every Englishman who desires to see, at the very least, the same treatment accorded to the British producer as is accorded to the foreigner by the South-Eastern and Chatham Ry. Companies.
>
> Messrs. WOOD & SON'S address is Wood-Green, London, N.; their telephone is "10 Tottenham." They are ready to assist in every way to fight this battle of home against foreigner, and they will be glad to hear from anyone and everyone willing to join with them.

TASMANIAN FRUIT.—Messrs. ANDERSON, ANDERSON & Co., of the Orient Steamship Co., inform us that they have received a telegram to the effect that the quantity of Apples shipped in the *Cuzco* is 11,000 cases, and in the *Britannia* 10,000 cases. This quantity includes Apples from Australian ports as well as from Hobart. Vendors here will appreciate the value of this communication. The *Cuzco* is due to arrive on April 1.

ADIANTUM × FARLEYENSE VAR. ALCICORNE.—*Apropos* of the illustration in last week's issue of this journal, RICHARD SMITH & Co., Worcester, write:—"We are pleased with the capital illustrations you give in to-day's *Gardeners' Chronicle* of Adiantum × Farleyense var. alcicorne, and with your remarks thereon, which we would supplement by saying that it originated here as a 'sport' nearly twenty years ago, and that it was very largely distributed by us at the time."

ANTON BARTIK, formerly head gardener to the Royal and Imperial Horticultural Society of Vienna, died, after a short illness, on January 8, in the sixty-second year of his age.

"THE AGRICULTURAL GAZETTE."—Our old ally, so long edited by the late JOHN CHALMERS MORTON, affords pleasing evidence of vitality. Not long since, it added a special department devoted to the interests of market gardening; and now its price is to be reduced to one penny. It is so ably conducted that we cannot doubt that the large measure of success which it deserves will be attained.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual general meeting of this Society will take place on Monday, March 13, at 8 P.M., at the Caledonian Hotel, Adelphi Terrace, Strand. Mr. JOHN FRASER, of the *Gardening World*, will preside on this occasion.

WELWITSCH'S PLANTS.—The third part of the catalogue of the African plants collected by Dr. FRIEDRICH WELWITSCH, prepared by Mr. HIERN, has lately been issued. It extends from the Dipsaceæ to the Scrophulariaceæ. Dr. WELWITSCH'S notes are of great interest, and Mr. HIERN'S known accuracy and thoroughness give ample guarantee that his share in the work is well done. We notice that the spelling, Willugbæya, is adopted in place of Willoughbya, and Elichrysum instead of Helichrysum. Compositæ and Asclepiadaceæ are largely represented, but Ericaceæ and some other orders very scantily.

FORTHCOMING HORTICULTURAL EXHIBITIONS IN BELGIUM.—We have before us the schedule of the Exposition Internationale d'Horticulture, organised by the Société Royale d'Horticulture et d'Agriculture of Antwerp, to be held from April 9 to 13. Also the programme de la Grande Exposition Internationale d'Horticulture, to be held at Mont St. Amand, Ghent, from April 30 to May 9. Both these exhibitions are likely to be on a large scale, judging from the number of sections included in the programmes and the awards offered. It is fortunate for intending exhibitors and visitors that the two shows are not to be held concurrently.

THE COLD IN AMERICA.—The *Florists' Exchange* records that in Chicago there was only one day in which the thermometer was above zero from January 27 to February 13; and for ten days the thermometer ranged from 10° to 21° below zero! At Cincinnati, during the same period, 8° to 30° below zero were chronicled; at Grand Rapids, Michigan, 10° below zero "seems to be the rule;" at St. Louis, the temperature on three occasions was 20° below zero; at Kalamazoo, the extreme temperature was 34° below zero.

"ORCHARD MANAGEMENT."—On the occasion of a meeting of the Bedfordshire Chamber of Agriculture on Saturday, February 25 last, at the Bedford Corn Exchange, a practical and interesting address by Mr. R. L. CASTLE, manager of the Duke of BEDFORD'S Fruit Farm, at Ridgemont, was read in his absence by H. T. EVE, Esq., the Hon. Sec. A lively discussion followed the reading of the paper, and a hearty vote of thanks was accorded Mr. CASTLE.

THE ROMAN FLORA.—Mr. DWIGHT BENTON is contributing to the *Roman World* a series of articles on the flora of Rome and its environs. The Campagna is not the desolate malaria-haunted region it is generally supposed to be. Its scanty population is the result of the system of hiring-out to the shepherd, and the tender of cattle, the privilege of wandering in freedom with their charges. Under a proper system of cultivation, half the grain required by Italy could be produced, whilst abundant water-power is at hand "to grind never a greater harvest." The first plants to make their appearance are the species of Romulea.

MR. BARR.—American and Canadian papers are much interested in the wanderings of Mr. BARR. Here is what a Canadian paper (London, Ontario) says:—"Mr. PETER BARR, a Victorian medallist in horticulture, of London, England, has been on a visit to the city during the past two days. Mr. BARR is making a tour of the world in search of knowledge and pleasure, and expects to return to England in 1902. He left Liverpool on April 5 last, and since that time he has been in the most important cities of the United States, from the Atlantic as far west as the Yellowstone Park. From London (Ont.) he goes to Arizona and California, and after spending a considerable time in each place, he will sail for Hawaii, Japan, China, Australia, New Zealand, and the Cape of Good Hope. 'And if Mr. RHODES has that railroad from the Cape to Cairo built by the time I reach the former,' said Mr. BARR, 'I will in all probability go that way home. If not, I will take the Nile trip at another time.'"

THE GUERNSEY GROWERS' GAZETTE, of which the first number is before us, is established to promote the interests of the Guernsey cultivators and to secure co-operation for the common benefit. The present number consists of trade advertisements only, but it is hoped shortly to introduce articles of general interest. From the energy and enterprise manifested in the island, we cannot doubt the success of this new venture; and if good wishes could ensure it, there would be no doubt as to the result.

"THE BOTANICAL GAZETTE."—The February number of this publication, issued by the University of Chicago, contains a paper on some new or little known N. American trees, by Prof. C. S. SARGENT, including Thrinax floridana, n. sp., T. Keyensis, n. sp., and T. microcarpa. Coccothrinax is a new genus split off from Thrinax, and including

T. argentea, T. radiata (T. gracilis, elegans and aurita of gardens). C. jucunda is the Thrinax parsiflora of Sargent Tenth Census Report, not of Swarz. C. Garberi replaces Thrinax Garberi. Serenoa arborescens, sp. n. These are all Florida Palms.

"Transactions of the English Arboricultural Society."—The last part contains the report of the annual meeting held at Penrith on August 17, together with an illustrated account of the excursion, in the course of which Messrs. Herds' nurseries were visited. On the second day, visits were paid to Eden Hall, the seat of Sir R. S. Musgrave, and Patterdale Hall, Hallstead. On the following day, Castle Rigg Manor, Armathwaite Hall, Mire House, at all of which places the plantations were inspected. Notes are also given of an excursion to Blagdon, the residence of the Right Hon. Sir M. W. Ridley, the Home Secretary. Practical papers include, "Remarks on the Measurement of Timber," "The Management of Plantations," "The Preparation of Bark," and "The Re-Afforesting of Palestine."

National Auricula and Primula Society.—The twenty-second annual report of the Southern Section of this Society lies before us. The exhibition held in the Drill Hall, James Street, Westminster, on Tuesday, April 26 last year, was, it is stated, considered a late one, and owing to the backward season, growers in the midland northern counties were unable to exhibit, and the exhibits of the Rev. F. D. Horner, Mr. P. J. Worsley, Mr. Simonite, Mr. Meaking, and others, were greatly missed. The show, however, was a success, exhibits being fairly numerous, and of good quality. A few new varieties were shown, and alpine Auriculas made, as usual, a brilliant display. The premier show Auricula, a fine example of Abbé Lizst, was shown by Mr. J. Sargent, and the premier alpine, Mrs. Martin R. Smith, having a gold-coloured eye, was shown by Mr. C. Phillips. The committee, with a view to encourage the cultivation of gold-laced Polyanthus, have added two classes to the schedule for these pretty flowers—one for three dissimilar varieties, and one for one variety. The committee draw attention to the desirability of an increase of membership, and tender their thanks to the members of the Horticultural Club, for the use of the club-room during the season. The twenty-third annual exhibition is to take place in the Drill Hall as heretofore, on Tuesday, April 18.

Cactaceæ.—Dr. Schumann, of the Royal Botanic Museum of Berlin, has published a monograph of the Cactaceæ under the title of *Gesamtbeschreibung der Kacteen* (Neudamm: J. Neumann; Williams & Norgate). It consists of a full description of the Natural Order, with illustrations of its chief peculiarities. The several genera are treated in the same manner, together with artificial keys. All this is in German; but in the case of the species, a short Latin diagnosis is given, for which non-Germans will be specially grateful. It is singular to see how in half-a-dozen lines of Latin information may be given that which would necessitate double the number of German words for its exposition. The relative disuse of Latin by German naturalists is a real misfortune to botanists. One hundred and four species of Cereus are described, thirty-two of Pilocereus, fifteen of Phylocactus, one only of Epiphyllum, eighteen of Echinopsis. Of Echinocereus, thirty-nine species are recorded. One hundred and thirty-eight species of Echinocactus are enumerated, and reference is made to their literature and iconography. It is a pity that no reference is made to the excellent illustrations which appeared in these columns of species of this genus. Of Melocactus, fourteen species are enumerated, but only one of Leuchtenbergia; ninety-nine species of Mamillaria are described, and forty-seven of Rhipsales. No fewer than one hundred and thirty-one species of Opuntia are monographed. The remaining genera consist of but few species. Mr. Hirscht contributes a chapter on the cultivation and propagation of these plants, together with an account of the insects which attack them, and the means of dealing with them. A good index concludes the work, which no lover of Cactaceæ who can read German can afford to do without.

Stock-Taking: February.—The terrible weather during the whole of the past month has doubtless had much to do with the falling-off in the imports, as recorded in the Board of Trade Returns for February. Seldom has there been such a record of wrecks, with loss of life; and as we are the largest carriers upon the sea, so are we the principal losers. The returns of imports show a deficit of £184,180. The figures are £35,586,694 for last month, against £35,770,874 in February of last year. The decrease in dutiable provisions is £137,997; articles of food and drink, duty free, show an increase of £299,924—this, in face of the fact that the price of Wheat is down 10*s*. 2*d*. per quarter; Barley, 1*s*. 5*d*.; and Oats, 11*d*. Our usual summary extract is as follows:—

Imports.	1898.	1899.	Difference.
	£	£	£
Total value ...	35,770,874	35,586,694	—184,180
(A.) Articles of food and drink — duty free	11,615,507	11,915,431	+299,924
(B.) Articles of food & drink—dutiable	1,959,202	1,821,205	—137,997
Raw materials for textile manufactures	7,223,664	6,276,019	—947,645
Raw materials for sundry industries and manufactures	2,680,854	2,926,154	+245,300
(A.) Miscellaneous articles	1,226,896	1,312,992	+86,196
(B.) Parcel Post ...	139,180	95,027	—44,153

We may note an increase in the value of sugar imports of over a quarter of a million sterling, as compared with February, 1898. The two months' imports show an advance of £1,103,135, as against the same period last year. We come now to—

FRUIT AND VEGETABLES,

our comparative figures being as follows:—

Imports.		1898.	1899.	Difference.
Fruits, raw:—				
Apples ...	... bush.	176,736	308,225	+131,489
Grapes ...	... ,,	795	1,859	+1,064
Lemons ...	... ,,	...	...	...
Oranges ...	... ,,	1,368,398	1,272,695	—95,703
Pears ...	... ,,	2,782	2,868	+86
Plums ...	... ,,	775	439	—336
Unenumerated ...	,,	49,221	53,636	+4,415
Onions ...	... ,,	362,263	569,654	+207,391
Potatos ...	... cwt.	532,843	62,787	—470,056
Vegetables, raw, unenumerated ...	... value	£71,571	£92,753	+£21,182

The plus figures are well worth study. Notable, also, is the quick reply of the market to what has been placed upon it. We fancy that our friends at the Antipodes are this season "selecting" their export fruits with care. Growers probably found this the most profitable course to follow; certainly the average quality has been improving of late years. Coming now to—

EXPORTS,

we note with pleasure that they have increased, as against February in last year, by £1,740,557, the figures being, last month, £19,382,406; February, 1898, £17,641,149. The increase is led off by £553,533 in raw materials; £361,825 in machinery and mill-work—still making up for losses in the great strike. Metals, and articles manufactured therefrom (excepting ships and machinery), have gone up by £221,614; yarns, &c., increased by £105,605; and the section, "all other articles, either manufactured or partly manufactured," shows an increase of £188,270; chemicals, &c., increased by £53,138; apparel, &c., £48,911; and parcel-post, £30,291. Taken altogether, these returns may be considered to be satisfactory and promising. The value of the exports for the two months is £39,729,640, against £36,873,253 in February, 1898—a gain of £2,856,387.

Artificial "Natural" Flowers.—Some Londoners are encouraging the lavish use of flowers for funerals, that we have, until lately, been more accustomed to associate rather with foreign or American capitals than with our own. The idea just now, judging by a stroll past the principal florists of the West End, seems to be to employ for such a purpose as many flowers as can possibly be crammed together, to the destruction of the individual beauty of them all, and the artistic effect of the whole. Artificial blossoms, indeed, would be quite as successful in appearance. To so great an extent is this fad carried, that one kind of flower is not infrequently flattened out, and a second pinned down in the middle of it. For example, every violet that was used in a certain "set piece" of this kind, lately, had a single Lily of the Valley thus added! The background of the crosses, harps, and books that are so modelled, as it were, in flowers, often consists of white stocks, deprived of their stems, and so closely packed together that no foundation is visible between them. On the page of one open book was displayed a text carried out with single pips of scarlet Pelargoniums. Not satisfied with this, the florist had arranged across it a book-marker of broad heliotrope ribbon, veiled with sprays of Asparagus, and what was apparently white heather. After the sight of so much artificiality and bad taste, it was a relief to turn to another shop window, in which were placed boxes full of beautiful crimson Roses, unwired and untortured in any way, and looking as fresh as if they had only that moment left the tree. They had been provided with no foliage except their own, and called forth the undisguised admiration of every passer-by.

"Advertising."—This is the name of a monthly publication, issued by Smith's Advertising Agency, 132, Fleet Street, as a guide to those business men who are desirous of advertising successfully and effectively. In the February number an attempt is made to suppress fraudulent dealings by giving a list of "genuine advertising media," which has been compiled with the assistance of the proprietors of the principal journals and magazines. Additions to this list will be made in subsequent issues.

An Exhibition of Drawings for Fountains and Vases.—A small exhibition is now open at the Dutch Gallery, 14, Brook Street, Hanover Square, of drawings of fountains, figures, vases, and balustrades, suitable for the decoration of gardens. Many of these are the production of M. Alphonse Legros, and are carried out in silver point, crayon, sepia, and water colours. Although the drawings themselves are very skilfully executed, there is nothing strikingly original in the many groups of children, masks, and dolphins, that are specially intended for fountains. Two studies of horses, probably inspired by some classic frieze, are full of life and energy, and are to be carried out in relief. The Countess Feodora Gleichen gives several proofs that she is at least as skilful in this branch of art, as in others, with her work in which we are more familiar. She contributes some charming designs for fountains, among them being one representing a graceful female figure coming down some steps, over which water is flowing, and bearing a pitcher on her shoulder. At the base are groups of children toying with dolphins. Another drawing by the same artist shows a garden terrace, with a short flight of low steps, widening out at the bottom. These are finished with balustrades in a pleasing classical design of rams' heads, and floral swags disposed alternately. Sculpture is not fully represented, but one of the most striking examples, by M. LEGROS, is a mask forming a portion of the base of a fountain, destined for the gardens of Welbeck Abbey. It is scarcely fair to judge such drawings as those in this exhibition, for the result would be so very different when they are reproduced in the stone or plaster for which they are intended. The apparently coarse physiognomy of some of the children, in particular, would then be softened, and the rounded surface would contribute grace to the design.

THE NURSERY AND SEED TRADE ASSOCIATION, LIMITED.—The objects of this Society are to protect and promote the trade and business of nurserymen, florists, and seedsmen, in the United Kingdom and abroad; to collect and disseminate information calculated to protect the members of the Association (as nurserymen, florists, and seedsmen, and others interested in horticulture) from fraud; to arrange for the speedy and economical collection of debts due to members. The establishment of unity amongst those interested in the welfare of the nursery and seed trades is aimed at. The interchange of opinions on questions of importance relating to such trades is also promoted. The doing of all such things as may be incidental or conducive to the attainment of the above objects, and all such objects as may from time to time be determined by the Association is the object of the Association. Investigating matters in bankruptcy, and attending meetings of creditors on behalf of its members; making trade enquiries and giving information generally useful to its members are also within the Association's purview. Debts are collected at a commission of 5 per cent. on amounts not exceeding £20, and 2½ per cent. on amounts exceeding £20.

The special benefits obtained from being a member of this association (not given by ordinary trade protection societies), are that it is confined to the nursery and seed trade and the trades allied therewith; its members agree to give to each other, through the secretary, mutual private information as to the financial position, and character of purchasers, and the extent of credit which may be safely given to old or intending customers. If information cannot be obtained from the recordsof the Association or its members, special inquiries are made in the districts where the customers reside; 1813 special inquiries were made during the last three years at the expense of the Association. Advice and assistance is given to members, through the solicitor, in reference to disputes and liabilities which arise out of the sale of seeds and plants, rating of nurseries, punishment of persons adulterating seeds and fraudulently obtaining goods, and questions affecting landlords and tenants and the trades generally. The subscription for members resident in the United Kingdom is £1 1*s.* per annum. For members abroad £2 2*s.* per annum; commencing on January 1 or July 1. Mr. J. P. WORRELL, 30, Wood Street, Cheapside, London, is the Secretary.

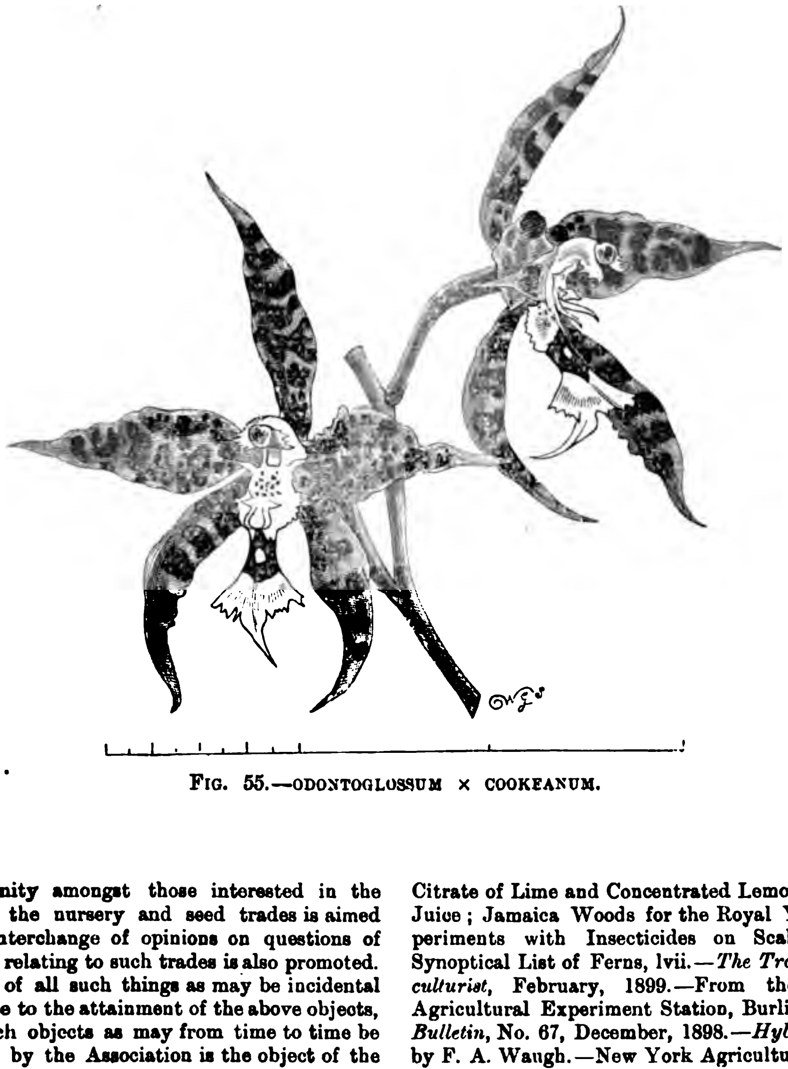

FIG. 55.—ODONTOGLOSSUM × COOKEANUM.

PUBLICATIONS RECEIVED.—*The English Illustrated Magazine*, March.—*Bulletin of the Botanical Department, Jamaica*, December, 1898. Contents Citrate of Lime and Concentrated Lemon and Lime Juice; Jamaica Woods for the Royal Yacht; Experiments with Insecticides on Scale Insects; Synoptical List of Ferns, lvii.—*The Tropical Agriculturist*, February, 1899.—From the Vermont Agricultural Experiment Station, Burlington, Vt., *Bulletin*, No. 67, December, 1898.—*Hybrid Plums*, by F. A. Waugh.—New York Agricultural Experiment Station, Geneva, N.Y., *Bulletin*, No. 146, November, 1898; *Some Experiments in Forcing Head Lettuce*, S. A. Beach; and *Bulletin* 147, December, 1898, *Variety Tests of Strawberries, Raspberries, and Blackberries*, Wendell Paddock.—*Annales Agronomiques*, February 25. Including papers on: La baisse des prix et la crise agricole; Observations sur la dosage de l'azote, par le procédé Kjeldahl, par MM. Maquenne et Roux; Influence des pluies et de la nature des terres sur le rendement des fourrages, par M. Pagnoul; and notice, sur les travaux de M. G. L. Prosper Demontzey, par M. Emile Mer.—*Annual Report, List of Members, &c., of the National Dahlia Society*, 1899.—*Nature Notes*, March.

ODONTOGLOSSUM × COOKEANUM.

THOUGH not one of the showiest of Odontoglossums, the blossoms of this natural hybrid are attractive, and the plant is floriferous. It is, moreover, a rarity, and but few have yet appeared out of the importations of Odontoglossum triumphans which, with Odontoglossum gloriosum, are the species whose natural intercrossing when growing together has resulted in this hybrid. An excellent example, from which our illustration was taken (fig. 55), was shown by Baron Sir H. Schroder, The Dell, Staines (gr., Mr. H. Ballantine), at the Royal Horticultural Society, on February 28, an Award of Merit being secured for it. The flowers are yellow, blotched with reddish-brown, the blade of the lip being creamy-white.

NOTICES OF BOOKS.

BUSH FRUITS. By F. W. Card.

THIS is a work which treats upon a comprehensive variety of bush fruits, as cultivated under the climatic conditions of the United States, but, in our opinion, it contains but little matter of any practical value to the British fruit grower; at all events, our own experience with those numerous varieties we have given honest fair trial to from time to time has been, to say the least of it, very disappointing. Our treatment has certainly been at variance with that recommended, and which we are very sceptical about, for the author tells us at p. 346, that "Gooseberries and Currants succeed especially well with mulching. Any refuse material, like straw, wild grass, weeds, or even coal-ashes may be used."

We should be sorry to use coal-ashes on our land in any form.

Again, p. 373, one of the remedies suggested for mildew is a mulching of manure, stone, tin cans, or old boots; we certainly shall not experiment with the tin cans, nor old boots either. "Vigorous pruning is recommended for Gooseberries that are to be picked green." There, again, our notions are antagonistic, our method has hitherto been to prune less for this crop than the other trees which are left to ripen their crop, and we have also found it advantageous to go over the trees immediately the crop was gathered, removing the thin and exhausted spray wood, with a view of admitting light and warmth to ripen the newly-formed wood left for next season's supply.

A "Planet Gem Cultivator" is also said to be the best fertiliser. This is stated in a chapter headed "Raspberry Cultivation," which makes us again sceptical, seeing what a surface-rooter the Raspberry is in this country.

Elaborate botanical descriptive lists of the most approved respective kinds of berried fruits are furnished. Insect pests are described and methods given how best to control them.

Concerning the evaporating, drying, and canning of bush fruits there is a vast amount of sound, useful information, but at the present time chiefly applicable to the States' fruit growers. To sum up, the entire book is, to our mind, much more technical than practical to the ordinary British fruit grower. *W. C. M.*

WOOD AND GARDEN.*

"I think there are but few things so interesting as to see in what way a person whose perception we think fine and worthy of study will give them expression in a garden." p. 279.

Some of us have looked upon the lady-gardener as being in some sort a modern innovation, but in reality she has an ancestry dating from the days of Eden. Even the manual labour of the garden was performed by female hands in early times, just as it is to-day in many little-known lands between ourselves and the equator. All through mediæval times the gardens of castle or of moated grange alike depended mainly on the able lady-gardeners of the period, who now and then did splendid architectural work as well, of which the beautiful example at Hardwick, erected by Elizabeth of Shrewsbury, must now serve as illustration.

---

* *Wood and Garden:* Notes and Thoughts, Practical and Critical, of a Working Amateur, by Gertrude Jekyll. Illustrated from photographs by the author. 8vo, pp. 286, with index (London: Longmans, Green & Co., 39, Paternoster Row, E.C.).

Men in early times did the fighting and hunting, and even the writing or compiling of books on gardening was, as a rule, done by them also in the sixteenth, seventeenth, and eighteenth centuries; but we are glad to say that the modern lady gardeners are writing books on the craft themselves. To woman's taste and influence, even though aided by manly labour, is due much, even if not most, of the best gardening of our time. Good and gentle gardeners at heart, it is very pleasant to see that they are taking up the pen as well as the spade and pruning-hook, so as to give us precepts as to how our gardens may be made satisfying, or in other words more economically useful, more exquisitely beautiful than man has already caused them to be. During the past few years we have had quite a little library of gardening books by ladies added to our shelves. Amongst many others there are *Days and Hours in a Garden*, by E. V. B. (Hon. Mrs. E. V. Boyle); and *Gardens and Woodlands*, by the late Miss F. J. Hope, of Wardie, Edinburgh; then there is *Pot-Pourri from a Surrey Garden*, by Mrs. Earle, exceedingly interesting from the broadly human, as well as the special gardening, point of view; and now this charming *Wood and Garden* comes upon us as fresh and as welcome as a summer's shower. Like the last-named work, too, this one deals with beautiful Surrey, with its flowery lanes and Heath and Juniper-clad commons, its pretty cottage and roadside gardens, and the flowers, which seem to be most happy there.

Miss Jekyll is well known to many of our readers as having long been a practical artist gardener, and her art was nothing to her if it could not be used to elevate and ennoble homely things. One of her first phases of teaching was that which led some of us to try and plant our herbaceous borders so as to obtain floral and leaf-beauty for at least most part of the year. Then again she led us to mass or group our colours, so that they helped each other, avoiding the jarring note and the dotting of all sorts of tints over the same area. Again, in the choice and use of cut flowers, our authoress has been essentially helpful, and a series of simple flower-glasses she designed have been very generally used in both town and country houses, and their use alone has led to a more simple, natural, and more enduring manner of using beautiful blossoms and leafage indoors.

Like all really good gardeners, Miss Jekyll has a firm and clear idea of what she likes best, and of how much of it she wishes to employ, in simple accordance with the effect desirable of attainment. On nearly every page of the book before us the reader is clearly shown that one may possess in plenty the best of plants, on the best of soils, and give all the advantages of good culture, and yet fail in having a pleasing and enjoyable garden.

The plants represent, let us say, form and colour; the garden itself is the palette and canvas combined. The summation of the artist's ideal depends on how they are grouped, or mixed, or arranged; for to the trained eye, unless there is what is called feeling or drawing in the arrangement, much, or even all effect is lost.

In other words, as Miss Jekyll herself tells us at p. 157, "It is not the paint that makes the picture, but the brain, and heart, and hand, of the man who uses it."

Again (p. 70), she says:—"I always think it desirable to group together flowers that bloom at the same time. It is impossible, and even undesirable to have a garden in blossom all over, and groups of flower beauty are all the more enjoyable for being more or less isolated by stretches of intervening greenery."

Again, the following extracts tell their own tale, and will give the reader interested a far better and higher notion of the book itself than any words of mine could do:—

"In the following chapters I have laid special stress upon gardening for beautiful effect . . . . I am strongly for treating garden and wooded ground in a pictorial way mainly with large effects, and in the second place, with lesser beautiful incidents, and for so arranging plants, trees, and grassy spaces, that they look happy and at home, and make no parade of conscious effort.

"I try for beauty and harmony everywhere, and especially for harmony of colour. A garden so treated gives the delightful feeling of repose and refreshment, and purest enjoyment of beauty . . . . For I hold that the best purpose of a garden is to give delight, and to give refreshment of mind, to soothe, to refine, and to lift up the heart in a spirit of praise and thankfulness."

1. The lesson I have thoroughly learnt, and wish to pass on to others, is to know the enduring happiness that the love of a garden gives.

2. "The love of gardening is a seed, that, once sown never dies, but always grows, and grows to an enduring and ever increasing source of happiness."

3. The conditions of different gardens vary so greatly, even when soil and situation appear to be alike, and they are in the same district. Nature is such a subtle chemist, that one never knows what she is about, or what surprises she may have in store for us.

On pp. 14 and 15 we are told of the finding of the white Iris stylosa by the Rev. Edwyn Arkwright twenty-five years ago or so at a place called "El Sahel," about five miles from Algiers, where it grew amongst scrub of Myrtle, Cistus, and dwarf Oaks, &c. Mr. Arkwright dug up the one plant and put it into his garden, where Durando saw it and took off his hat to the lonely flower!

Of the late Mr. Webb's Nut-tree nursery at Calcot, near Reading, a bright little sketch in words is given on p. 11. The place was secluded by a wall, and one had to wait, as at a monastery, until someone answered the deep-toned bell. Then the great mastiffs barked, and the quaint owner appeared, and our authoress saw the rows and clumps of great Nut-bushes, and the pale double Cernuus Daffodils and Polyanthus, at that time so remarkable there; a delightful old-world tone hung over the place, and as Miss Jekyll says, "It was the only nursery I ever saw where one would expect to see fairies on a summer's night." Now and then we are told that the best arrangements are the natural ones, "over the garden wall," so to say, as on p. 154. "Near my home is a little wild valley, whose planting, wholly done by Nature, I have all my life regarded with the most reverent admiration."

And again, on p. 156:—"No artificial planting can ever equal that of Nature, but one may learn from it the great lesson of moderation and reserve, of simplicity of intention and directness of purpose, and the inestimable value of the quality called 'breadth' in painting. For planting ground is painting a landscape with living things; and as I hold that good gardening takes rank within the bounds of the fine arts, so I hold that to plant well needs an artist of no mean capacity. And his difficulties are not slight ones, for his living picture must be right from all points and in all lights."

P. 176, as to the size of gardens, we are told:—"I do not envy the owners of very large gardens. The garden should fit its master, or his tastes, just as his clothes do; it should be neither too large nor too small."

P. 177:—"Nothing is more satisfactory than to see the well-designed and well-organised garden of the large country-house, whose master loves his garden and has good taste, and a reasonable amount of leisure."

P. 60, May, music in the wood:—"The song of the nightingale, and the ring of the woodman's axe, gain a rich musical quality from the great Fir-wood. Why a wood of Scotch Fir has this wonderful property of a kind of musical reverberation I do not know, but so it is; any sound that occurs within it is, on a lesser scale, like a sound in a cathedral. The tree itself when struck gives a musical note. Strike an Oak or an Elm on the trunk with a stick, and the sound is mute; strike a Scotch Fir, and it is a note of music."

P. 176, Then of the clergyman as a gardener:—"The conditions of the life of a parish priest would tend to make him a good gardener, for while other men roam about, he stays mostly at home, and to live with one's garden is one of the best ways to ensure its welfare. And then, among the many anxieties, and vexations, and disappointments that must needs grieve the heart of the pastor of his people, his garden, with its wholesome labour, and all its lessons of patience, and trust, and hopefulness, and its comforting power of solace, must be one of the best of medicines for the healing of his often sorrowing soul."

P. 73:—Rhododendrons and Tree Pæonies are especial favourites of our authoress, who, like many others, regrets that they are so often sold grafted on common stocks, that prove a source of trouble instead of being established on their own roots. With regard to the Tree or Moutan Pæony she writes:—

"It is a matter of regret that varieties of the better kinds of Moutan are not generally grown on their own roots, and still more so that the stock in common use should not even be the typical Tree Pæony, but one of the herbaceous kinds, so that we have plants of a hard-wooded shrub worked on a thing as soft as a Dahlia-root. This is probably why they are so difficult to establish, and so slow to grow. . . . Every now and then, just before blooming time, a plant goes off all at once, smitten with sudden death."

Of perfume, p. 234:—"Perhaps the most delightful of all flower scents are those whose tender and delicate quality make one wish for just a little more. Such a scent is that of Apple-blossom, and of some small Pansies, and of the wild Roses, and the Honeysuckle."

Page 236:—"But of all the sweet scents of bush or flower, the ones that give me the greatest pleasure are those of the aromatic class, where they seem to have a wholesome resinous or balsamic base, with a delicate perfume added. When I pick and crush in my hand a twig of Bay, or brush against a bush of Rosemary, or tread upon a tuft of Thyme, or pass through incense-laden brakes of Cistus, I feel that here is all that is best, and purest, and most refined, and nearest to poetry in the range of faculty of the sense of smell."

The book is well printed, on good paper, and consists of 286 pages with index, and 60 or 70 illustrations from photographs taken by Miss Jekyll herself, and many of them are very beautiful, special justice being done to the native Juniper, and to the Birch-trees, Rhododendrons, and hardy flowers, both in the borders and wild garden. The views of Clematis and Roses, &c., over the arched doorways and pergola are charming; and "The Woodman," at p. 159 is quite a picture in its way, as also is the frontispiece of Iris near doorway, and the Giant Lily, p. 96, with the Savonarola-like figure gazing up at their great white bells.

Miss Jekyll's book is so fresh and good, so welcome and enjoyable, that it certainly ought to find a welcome wherever gardening is appreciated, and we hope a second edition will afford the fair authoress an opportunity of correcting and amending the few errors and misprints it contains, such as Corchorus for Kerria on p. 50; Amelancheir for Amelanchier on p. 52; families for genera on p. 53. Again, we are told that the Carnation was made the subject of a whole chapter in Parkinson's *Paradisus Terrestris*, "a distinction shared by no other flower;" but we always thought that the same distinction was conferred by that dear and genial old gardener on the Narcissus, the

Tulip, to say nothing of the Fritillary, and the Rose.

The arrangement of the book is calendarial, a chatty article on the flowers and shrubs and trees being devoted to each month of the year. There is also a pleasant introduction and special chapters on the Primrose Garden, Colours of Flowers; the Scents of the Garden; the Worship of False Gods; Novelty and Variety; Weeds and Pests; the Bedding Fashion and its Influence; and a very potent and suggestive article on "Masters and Men," one-sided though it be, for there are narrow-minded, and so far as gardening goes, very ignorant masters as well as men. *F. W. Burbidge.*

HOME CORRESPONDENCE.

WHAT CONSTITUTES ODONTOGLOSSUM WILCKEANUM.—As Mr. Rolfe "quite disposes" of most of my remarks hereon, by reciting his phrase anent the "Golden Queen," viz., "it is quite possible that it is a form of the variable O. Wilckeanum, &c."; for a definite statement that Golden Queen is a Wilckeanum I am pleased, and here the discussion ends. Henceforth it ranks as O. Wilckeanum Golden Queen, and one of the most beautiful varieties of this handsome hybrid. I can pass over his interpreting my letter as "bad taste;" and as to the words "strictly true,"—well, perhaps, he might have used others, though I do not take them in any sense "personal or offensive." Far from forgetting his article on O. Wilckeanum (*O. R.*, July 1893, pp. 201 to 204), I was astonished in 1897 at his remarks upon O. Wilckeanum Golden Queen, for in 1893 he had laid down precedent enough to include it "definitely," but his remarks implied (to me) that he thought he may have gone too wide in 1893, and felt it needful to draw in a little closer. Now we are agreed. Mr. Rolfe has "no desire to dogmatise." I do not call it dogmatising, to have as definite a standpoint in a crispum as in a luteo-purpureum. This latter is, in all its forms, a more constant species than crispum, or what has been included under crispum, up to the present time. If we take the two extremes of crispum and luteo-purpureum, laying down clear definitions for the true species, we shall then be able to travel inwards from the two species to the midway hybrid, viz., an O. Wilckeanum, having equal shares in the characters of both parents, such as O. Wilckeanum var. Leroyanum, the first Odontoglossum that bloomed from seedlings raised in Europe, its description is roughly, sepals white, the brown of luteo-purpureum, broken into the usual three bar-blotches of Wilckeanum, petals ditto, having the large outer blotch and two inner large spots, these two being placed one above the other. The lip is almost entirely covered with reddish-brown, of which colour are the markings of the sepals and petals. In form, shape, and colour, this variety is fairly intermediate. I think if Reichenbach had been more dogmatic, Mr. Rolfe and I would have had nothing to discuss. In reply to his request for home-raised hybrids, I think he must have forgotten that I have been, and am doing, all I can to clear up this matter, and if he, or anyone, will tell me how to germinate the seeds in greater quantity, it will take but a very short time to set it all at rest once and for ever. Why can not a great national establishment like Kew Gardens render all orchidists a great help by having a scientific collection of Orchids, and work them out botanically? [It has. Ed.] *De B. Crawshay, Feb.* 27.

WINTER ACONITE.—I should like to add my contribution, which, though not in harmony with what others have said about the Winter Aconite, is, I am quite sure, perfectly accurate. When I was a boy I passed a great deal of my time in the East Riding of Yorkshire, and the rectory garden of Hotham, near Market Weighton, was, and is still, the home of my affections. An uncle, who passed all his life of considerably more than 80 years there, and his father before him, who exceeded 90 years in the same spot, were alike devoted to their garden, and Winter Aconites were held in the highest estimation, and suffered to grow wild. They covered every inch of soil in the large shrubberies on either side of the garden; they used to run over into the kitchen garden, from which they should have been constantly expelled. They were to be found here and there in the borders of the flower garden, and a small paddock was invaded by them without any restriction being made. I have never seen such a profusion of Winter Aconites anywhere else, and though I know that the whole place has gone to wrack and ruin since the period to which I refer, I feel certain that if any of your readers are at all near Hotham Gardens in the East Riding of Yorkshire, they would find there still myriads of these Winter Aconites, for they never can, by any possibility, be exterminated after the strong hold they were allowed to get upon the place. Now, my point, after all this long story, is the following:—Mr. Stillingfleet has over and over again said to me in the last day of the year, "I always expect to find an Aconite in blossom before the old year is out, and I am seldom disappointed in my search." There was something like a superstition about it, and things were always supposed to be going very wrong if no specimen was found. In remembrance of this, I always expect my Aconites in the Isle of Wight to give me a blossom or two *on the last day* of the year; at any rate, I never fail to look for them, and now and then I am rewarded with success. But the case at Ryde is vastly different from what I remember at Hotham. I can only afford to have a patch here and there on account of want of room, and though the climate fights for me, and does it well, it is in early January and not in December at all that the first blossom generally appears. The outcome of it, so far as Winter Aconites are concerned, is the following:—If it be a great point to have them soon, or rather, I should say, very late in the year, it is everything to grow these plants in multitude, to leave them quite alone, to let them get well hold of the ground, and then I should think that in other parts of England besides the cold and bleak East Riding of Yorkshire, the dates which some of your correspondents have given for their appearance will be left far behind, and whether the preceding summer has been hot or cold, dry or wet, Winter Aconites will be quite true to their name if December 31st is a winter day. *Henry Ewbank.*

BEGONIA GLOIRE DE LORRAINE.—In the interesting notes that have lately appeared in connection with this hybrid, it seems to be generally admitted that female flowers are produced, although generally not more than two or three are to be found upon a plant. In 1897 one plant was bought here, and last year a number of plants was raised from it, two or three of which have always produced female flowers in considerable numbers. On one there were counted twenty-four, on another eight capsules. These two plants are those in the front of the photograph which I send you, and it will be noticed the great difference in the habit of these plants, being more compact and their flowers produced on much shorter inflorescences, on each of which inflorescence may be counted two or three female flowers. The plant at the back represents the ordinary type of growth in this plant, and on none of these are found more than two female flowers, and many are without them altogether. Seeds saved in 1897 were sown, but none germinated, and this year I have sown seed which is supposed to be cross-fertilised, but no sign of germination has yet been observed. Examined under the microscope, the pollen grains present a very empty appearance, compared with other species and varieties more readily fertilised, although they are found in good numbers. *R. L. Harrow, Edinburgh.*

PRUNING SHRUBS.—How greatly I agree with the protest made in your leader of Saturday last against the too common barbarous practice of pruning, so called, but really clipping of all shrubs, no matter what, into round headed forms all alike, all wretchedly formal. It is the practice here in Kingston, on our otherwise charming promenades and recreation grounds, and protesting seems to be of no use whatever. It is a case literally of uselessly striving to make silk purses. There is no taste, natural or artificial, and the public from lack of better knowledge, seem to regard the practice as the right thing. Except on a hedge, where their use may be sometimes tolerable but not always, shears should never be allowed to touch a shrub; a good sharp knife is the proper instrument, and its use judiciously always enables shrubs to be kept within bounds and yet to retain their natural forms. I have no doubt, those who shear shrubs in the offensive way referred to, excuse the practice on the ground of want of time to prune with a knife. But in the case of shearing, the process must be done annually, whilst with many shrubs knife pruning need be performed but once in two years. It is most exasperating to any one endowed with natural tastes to walk along our promenades and see thousands of otherwise fine shrubs hard-trimmed to one rigid form or outline. It is something so obnoxious that it would never be tolerated in any good private garden. Much of the planting at the outset was bad, coarse growing and dwarf-habited shrubs being mixed up indiscriminately, and now the shears are applied to make the stronger ones to be in unison with the growth of the others. *A. D.*

MARÉCHAL NIEL ROSE.—In reply to correspondents you say of this rose, "a stock which would grow as fast as this Rose, is what is wanted;" that is to prevent the gouty formation of bark or cambium at the union, because the stock is incapable of passing it rootwards. Why do nurserymen persist in budding on to Briar and Manetti stocks, when they could work from cuttings Madame Berard, Gloire de Dijon, or other very free growing variety, and use those as stocks. Better still if pains be taken to work these on to the Briar-stock, then rebud into the strong growing Rose. I adopted that plan of double working at Bedfont years ago, including also for secondary stocks Marie Henriette and Lamarque Versailles, both strong growers, and was never troubled with gouty swellings. On a direct Briar-worked plant, the scion-stem became inordinately swollen. *A. D.* [Now is the time to obtain and plant the strong growing Roses that our correspondent names, and others of equal or stronger growth, as for example the Ayrshire Rambler, Crimson Rambler, and others of that sort, which make strong, long shoots, and grow well on their own roots. Ed.]

MR. BENNETT'S STRAWBERRIES.—Is it not probable that the odd or contradictory action of Royal Sovereign and Noble Strawberry plants, when forced this season, mentioned by Mr. Bennett, is due to the diverse action upon them of so hot and dry a season as was that of last year. It would be inferred from the unwonted earliness of Royal Sovereign this season that it was more capable than Noble, with its broad leathery leaves, of withstanding great heat and drought, hence it has produced stronger or at least more quickly matured crowns. Then Royal Sovereign may have similar capacity to throw runners earlier under such conditions as existed last year than Noble. No doubt when plants of diverse varieties, treated alike in all respects in pots and forced alike, show as a rule infinitessimal flowering differences; but that one should fruit three weeks before the other is remarkable. *A. D.*

SUBURBAN GARDENS.—The following may be useful as addenda to the interesting remarks on "Suburban Gardens," p. 113. Evelyn twice mentions the Orange trees at Bedington, the second time in 1700, when he states they "were now in decay." At this period they were neglected. Their age is mentioned as 120 years. The Caper-bush (Capparis spinosa) at Cambden House, had also a history. Miller refers to it as "an old plant growing out of a wall in the gardens, which has resisted the cold for many years, and annually produces many flowers, but the young shoots are frequently killed to the stump every winter." (!) A strange experience if we accept the statement literally. Queen Anne's work at Kensington Gardens is thus described by Switzer (Ichnographia Rustica, vol. i.). "Her first works were the rooting-up of the Box, and giving an English model to the old made gardens at Kensington; and in 1704 made that new garden behind the greenhouse, which is esteem'd amongst the most valuable pieces of work that has been done anywhere. The place where that beautiful hollow now is was a large irregular gravel-pit, which according to several designs given in was to have been fill'd; but that Mr. Wise prevail'd, and has given it that surprising model it now appears in." Wise succeeded Rose as royal gardener, and is perhaps now best known as a partner of the great nursery firm of London & Wise, at Brompton. *R. P. B.*

THE DROPMORE CEDAR AVENUE.—The illustration of this avenue (fig. 52, in last issue), recalls an interesting conversation I once had with that clever old gardener whose name is so intimately associated with Dropmore—Philip Frost. We were standing by the famous Dropmore Douglas Fir, and he was describing in his unctuous manner how, after a visit to Kew, he brought, in his waistcoat pocket, the cutting from which it was raised. I asked him how he came to plant this tree on such an elevated mound. He gave me one of his comical looks, and replied in his favourite curt fashion, "The mound wasn't there when I planted the tree." I saw he wanted to give an explanation of this paradox in his own way, so I humoured him by putting on an air of contradictory incredulity, which was rewarded by a graphic account that would occupy too much space to repeat verbatim. I will therefore give the results of what he told me. Many years ago his mistress, Lady Grenville, anxious to give her husband a pleasant surprise on his return from the Continent, determined, during his absence, to much enlarge his lordship's favourite fish-pond. Frost was told to set about the work and get it done, and in carrying out the order came upon a bed of marl of such value that he determined to carefully save it up for use in the kitchen garden. He was for a time at his wits' end to know where to store it, for there were many hundreds of loads. At last he fixed upon a large space behind the Cedars in the avenue; and there it remained for two or three years undisturbed. When at length he wanted a supply for the garden, he found the marl full of healthy young roots, which he soon satisfied himself were roots of the Cedars. This set him thinking, and led him to begin, tentatively, top dressing some of his conifers with marl, among them the Douglas Fir. A very dry summer following caused him to bring the fire-engine into use to pump water from the fish-pond to saturate the ground about this and other trees. Rapid growth resulting from this treatment, he from time to time repeated it, until, he told me, he put altogether more than 300 loads of marl over the roots of this one tree, and thus made the mound I had asked about. He expressed a very confident opinion that it was to this feeding of the surface roots with marl and pond water that the development of the tree in such an unusual degree was to be attributed. Many of the conifers at Dropmore were similarly treated, and generally with satisfactory results. *F. W. B.*

ADIANTUM FARLEYENSE VAR. ALCICORNE.—I notice in your issue of March 4, that this is described as a hybrid variety, which I think is incorrect. In our native species, A. capillus veneris, the plumose forms are precisely akin to Farleyense and its sub-variety alcicorne in the great expansion of the sub-divisions in the one case and the incised character coupled therewith in the other. In these varieties, both found wild in this country, there is obviously no question of hybridism, since there are no other indigenous species, and the history of Farleyense, so far as I am acquainted with it, involves no reason to consider it as other than the plumose form of A. tenerum. I notice that in *Ferns, British and Foreign* (J. Smith), the observation is made that "This has the general habits of A. tenerum, but it is a much larger growing plant, and as it does not produce fructification, it is supposed to be a hybrid originated in a garden in the island of Barbados;" but its barrenness proves nothing, plumose sports being often quite barren, as in the case of our plumose Polypodies (P. v. cambricum in several forms), and Scolopendriums (S. v. crispum), and only sparsely fertile as compared with the normal in all cases. In the cases of true hybrids, moreover, the barrenness takes a different form, incipient seeds and spores, or at any rate, ovaries and sporangia appearing sometimes in abundance, though nothing results from sowing. I venture, therefore, to class A. Farleyense and A. F. alcicorne as simply true plumose sports of tenerum (or possibly tentum) and certainly not hybrids, the variation being identical with that of A. cap. veneris cornubiense, a natural sport. *Chas. T. Druery, F.L.S., V.M.S.*

SEVERE WEATHER IN FLORIDA.—On the night of Sunday, Feb. 12, 1899, we had one of the worst frosts that poor Florida has ever had. On my way to the station to catch the early train for Jacksonville, my ears and fingers felt as if they had been frost bitten. On arrival at Jacksonville the streets were one sheet of ice, as it had rained the night before. I could not post my letter at the first pillar-box as the lid was frozen, so had to go elsewhere to mail it. The steamer for Mayport was covered with icicles, and had a most arctic appearance. The thermometer went down to 6°. I saw ice over 4 inches thick, and fear that there are now few Orange groves or patches of Pineapples left alive in Florida. *E. Burslem Thomson, St. Augustine, Feb.*, 1899.

MUSHROOM-MOULD.—It is not very obvious why D. M., in the last week's issue, p. 131, should be so very anxious for the name of this fungus, why he should call it "nameless," or why he should dread the possibility of an application to Germany for a name and description. Growers of plants have generally shared with me a great contempt for fungus names. Names will not clear the grimy old railway tunnel of its tartarean darkness, its stagnant air, its foul dung, its nematoid worms, and its microbes, the "Mushrooms" that emerge from such subterranean and infectious places are not Mushrooms at all, they are—D. M. is anxious for a name—microbe-infested Psalliotæ. What a difference there is between the true Mushrooms, as I find them here in the sweet upland pastures and on the breezy downs, and the dung-borne maggoty abortions I sometimes see exposed for sale in town markets. Now the name of the fungus of Mushroom-mould is as well known as the name of the "disused Scotland-street" railway tunnel, and if D. M. will look through the Answers to Correspondents of back numbers of the *Gardeners' Chronicle*, he will see the name given over and over again, and also discover that the name was not given by the all-knowing Kaiser. If he cannot get at back numbers of the *G. C.*, he should buy the *Guide to the Models of Fungi*, British Museum, Cromwell Road, London, price 4*d.*, post free 5*d.*, and on page 33 he will see the name given as "Mycogone alba, Letell, a stage in the development of a species of Hypomyces." That information ought to spread consternation amongst the spores and microbes of the railway tunnel; if not, let D. M. repeat the following in a loud voice:—"Hypomyces is an Ascomycetous genus of the Sphæriacei allied to Hypocrea, Oomyces, and the Mushroom-bed infesting Xylaria pedunculata." Descriptions and "life histories" of all these will be found in elementary books in and out of Germany. *W. G. S, Dunstable.*

THE CAPER-BUSH.—Bradley's *New Improvements, &c.*, affirms that seeds of the Caper-bush must be sown on an old wall as the only method of inducing the plant to grow out of doors in England. A letter from Bradley to Laurence, headed Camden House, January 25, 17$\frac{17}{18}$, and copied in *The Fruit Garden Kalender* of the last named, points to a very strong probability of Bradley having been the person who either sowed, or as having given directions for sowing, the Caper on the old wall. The proprietor of Camden House was "Mr. Balla," a friend of Bradley's. *R. P. B.*

FUCHSIAS.—Although these plants may be easily raised from seed, a fact which should commend itself to amateur gardeners, still very few persons seem to do so, probably because the plants and the finest varieties can be so easily propagated by cuttings. But this method of increase can only be conducted successfully where there is a greenhouse or frame to winter the old plants, if kept through that season, or the cuttings, if put in in the autumn; then from cuttings only the old variety is produced, whereas from seed diverse varieties are produced. Then seed is fairly cheap, and readily germinates. It should be sown in gentle warmth as soon as is now possible, using for the purpose 5-inch pots, well drained, and fine sandy soil. The seeds should be thinly placed, be gently pressed in, have a sprinkling of fine soil put over them, be then very lightly watered and stood in the greenhouse or frame to germinate. A little heat enables growth to ensue early. If no heat can be furnished, it is a good plan to stand the pots in a shallow box, which is covered closely with glass, and place that into the greenhouse or frame, as in that way a more equable temperature is created, and the box can be covered up at night. But such sowings should not be made until the middle of March, as without heat nothing is gained by the slow rate of germination which follows too early sowing. Seedling Fuchsias need to be grown quickly. Naturally of a free pyramidal habit, it is desirable to encourage the seedlings to develop that habit rapidly when quite young, as in that way the foundation of a good specimen is laid. Seedling plants also less readily flowers, which is again all the better, as they form finer plants first. But when raised in warmth from an early sowing, the young plants, when 4 inches in height, should be put singly into 3-inch pots; from these latter into 5-inch pots, and then, a month or so later, they should get a final shift into 7 or even 8-inch pots. They make quite fine specimens, and will bloom through the autumn finely and profusely. Such plants, when got into the larger pots, may be very effectively used in beds and borders, burying the pots in the soil, this, whilst giving more root-run, also helps to check undue growth, and promotes flowering. These plants, partially shortened early in the winter, can be housed in any cool place from which frost is excluded, and when removed into a greenhouse, and the light in the spring, new shoots break out, and the plants are soon furnished. In such case they can have a shift into 9-inch pots, to flower as specimens during the summer; or in May they can be planted out into beds thinly, where they will bloom finely all the summer. Where Fuchsias are needed for bedding, of one colour and form of growth, of course the plants must be raised from cuttings; and where needed for exhibition, not only must the plants be so raised, but they should be from the best varieties. Not that those which produce the largest blooms are best for that purpose, by any means; it is rather those which, whilst very free and continuous bloomers, also bear transit well, a matter of the first importance in the case of many exhibition plants, but in none more so than with fine Fuchsias. Whilst the showing of these peculiarly beautiful objects as exhibition specimens seems fast falling into desuetude, a matter much to be regretted, they have taken quite a new lease of life as bedding or ordinary garden decorative plants. In not a few cases noble bushes several years old blooming profusely all the season, and in large pots sunk into lawns, or standing beside walks, or on corridors, make very beautiful objects. No doubt, for this purpose, the massive bush form is best, as being less exposed to wind than are tall standards or pyramids, yet if placed where somewhat sheltered from rough winds these make very beautiful objects. Possibly, wider knowledge that Fuchsias can be raised so readily from seed may do much to help promote wider culture for them. *A. D.*

SOUVENIR DE LA MALMAISON CARNATIONS.

Permit me to describe my methods of cultivation in regard to "Malmaisons" for the information o others who may not be well versed in the matter. I will assume that the fact of the plants possessing peculiarities, and that they are not amenable to the methods found to answer with other varieties, is known to all readers of the *Gardeners' Chronicle*, and I will begin with the operation of layering. My practice has been to secure the cleanest plants, and layer at about nine inches from the tip of the leaves, although in the case of two-year-old plants four inches is best, the plants not being leggy. Let the incision be made under and halfway through a node, slitting the shoot up to the next node or joint, and press the hooked peg firmly in the earth. The layers root quicker when nearly severed. Afford the plant and layers an abundant application of water, and keep the frame close for three weeks or a month, when you will be able to detect roots, and air should be given for about three days. On the fourth day sever the layers from the plants and pot them, keeping them close for a few days afterwards.

Souvenir de la Malmaison Carnations like shade and moisture; never, therefore, allow strong sunshine to fall direct on them, or permit the air to get very dry. The layers may first go into 2-inch pots, and at the next shift into 4-inch ones in six weeks, and either in the first week of the new year for early flowering, or later for your latest batch, repot into 6-inch pots; but never allow the largest plants to become pot-bound by waiting for the smaller ones, rather pot the former, and the latter in about three weeks later. The proper kind of soil consists of loam two-thirds (which should be pulled to pieces by hand, and the fine particles sifted out of it), one-third of leaf mould, a small quantity of soot, a 9-inch pot of quarter-inch bones to a wheelbarrow load of loam, and some silver sand. not pot the plants very firmly, and for the final potting use half-inch bones over crocks. On all favourable occasions let the plants be syringed with rain water, twice a day in the summer and once a week in the winter, or whenever the air will dry the plants. An insecticide may be used in this way once a week.

I would advocate the use of rain water solely, and in the winter to keep on the dry side, although a plant should never be so dry as to flag. In the summer the plants require to be afforded water carefully, using soot in it occasionally, and artificial manure much diluted in water, or sprinkled as powder on the surface.

In mild weather the ventilators should be kept open at all seasons, reducing the air inlets to an inch in width when frost is slight, but closing them quite in bad weather. Warming the heating-apparatus slightly in cold weather dries the air, and the moisture does not condense on the plants, and run down to the collars of the plants, but the staging must be kept damp; and for covering, the use of coke crushed small, or coal ashes in lieu of it. The temperature should not fall below 40° F. The soil should be stirred with a pointed bit of stick whenever it has got hard, or the air will not be able to reach the roots, and the soil will sour. The plants which are to be potted for flowering in their second year should be those which have broken low down, and these should be put into 8-inch pots soon after flowering, and then again into 10-inch about ten weeks after. It is advisable then to layer such after flowering, as they may have become inconveniently large. If green-fly appears on the plants, use Richards' XL-All, or as another means of prevention fumigate once a fortnight. Against red-spider use a wash consisting of soft-soap of the size of a hen's egg, a 3-inch potful of flowers-of-sulphur, and two gallons of rain water, and apply with the syringe. Plants which have the Carnation-rust will grow out of it if they are looked over weekly, using methylated spirits with a camel's-hair pencil on the rust spots. This process prevents the rust spores from blowing about; then the infected parts should be cut out and burnt. Last autumn I witnessed a houseful of Malmaison Carnations thickly coated with the rust, and the spores blowing about in quantity. In a case like that, one should advise syringing each plant with an insecticide, the stage and woodwork being well syringed with petroleum in soap-suds. The plants usually flower at the end of May and June. In order to have plants in flower in July and August, they must be placed in the spring in cold frames on the side of a north wall or tall building. These plants, which can only be layered towards the end of the month of August, will be the best for affording flowers the following July and August. For winter blooming the plants that flowered early in May, and were soon afterwards shifted into 8-inch pots, are best. They should be given a night temperature of 55° during the flowering period. In order to have flowers at the end of the month of April, and during the first half of the next month, let the best of the two-year-old plants be chosen, affording them a night temperature of 55° after the New Year is passed. *John Owles, Newby Gardens, Ripon.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

February 28.—*Present:* Dr. Müller, in the chair; Rev. W. Wilks, Mr. Michael, Mr. A. Sutton, Mr. E. F. Im Thurn, and Rev. G. Henslow, Hon. Sec.

Celery, &c., attacked by Grubs.—This was sent by Mrs. Barnet, of Bilton Hall, Rugby, and proved to be much infested by millepedes (vegetable eaters) and centipedes (insectivorous), but not wireworm. The best remedy for these troublesome grubs is gas-lime, or ordinary slaked lime (builder's second quality), well mixed and dug in. It may possibly injure the next year's crop to some extent.

Sweet Pea Seed.—Mr. Sutton described specimens of the seed of certain varieties grown at Reading, remarkable for the skins becoming wrinkled like a Marrowfat Pea; while in one or two cases the Peas were so small that customers had thought they must be defective; whereas the smallest sorts really gave rise to plants bearing the largest and best type of flowers. In another variety the skin is invariably split. With none of these peculiarities, however, is there the slightest deterioration in the quality or character of the blossoms.

Shirley Poppy Seed.—Mr. Wilks observed that the seeds of these Poppies are becoming of a pale grey colour, instead of being nearly black, as was originally the case with the old type of the cultivated Papaver Rhœas bearing black anthers.

Apple Graft Variation.—Mr. Wilks showed samples of the Mannington Pearmain Apple sent by Mr. Peter Veitch, and taken from the original tree which supplied the fruit described by Dr. Hogg, fifty years ago. It is a medium-sized Apple, Russet in appearance, and rugose, with raised lines, though the sample has scarcely a trace of bright coloration, as stated in Hogg's description. The "improved" form was devoid of all roughness, and brightly coloured with yellow and red. It is now widely distributed by grafting, and this improved form is the present recognised Mannington, though widely different from the original type. Professor Bailey records an analogous case in America, in that since the original Newtown Pippin has been distributed over the United States, it has assumed various forms, specially characteristic of Apples growing in the different States, and even in Australia it has also acquired local characteristics.

WARGRAVE AND DISTRICT GARDENERS'.

March 1.—At the last fortnightly meeting, Mr. W. Pope (chairman) read a paper on "Palms, and their Uses for Decorative Purposes."

Mr. Pope illustrated his remarks with some good specimen plants, and gave directions for their successful cultivation, either from seeds or suckers.

The Hon. Sec. (Mr. H. Colesby) also read a short paper on "Plant Defences," showing the various means of defence with which Nature had furnished certain plants for enabling them to protect themselves from enemies or objectionable visitors.

DEVON AND EXETER GARDENERS' ASSOCIATION.

March 1.—A paper was read on "Plants for House Decoration," the Essayist being Mr. G. Camp, gardener to E. Byrom, Esq., of Culver, near Exeter.

To those who have limited space it is essential that the plants employed for the decoration of dwelling-rooms should possess long-lasting qualities, and, in this respect, Palms are perhaps more useful than any other class. Livistona chinensis, Chamærops excelsa, and Thrinax elegans, are reliable species; Chrysalidocarpus (Areca) lutescens being of graceful and feathery habit is a valuable decorative plant, and so are Geonoma gracilis, Cocos Weddelliana and C. flexuosa. Kentia Belmoreana, Seaforthia elegans, and Phœnix rupicola in large specimens are most valuable. For the entrance-hall or the corner of a broad staircase few plants are more useful than Araucaria excelsa. Among Ferns suitable for house decoration were mentioned Asplenium bulbiferum, Pteris cretica and its crested forms, and Adiantum cuneatum, provided they be grown in a low temperature. Amongst plants with coloured foliage, Pandanus Veitchi, Ananassa sativa variegata, Acalyphas, and the variegated form of Ficus elastica, are useful. Some of the Begonias, such as B. rex, B. metallica, and others; Caladiums, Codiæums (Crotons), especially those with long, pendulous, undulating foliage, when carefully grown and well coloured are exceedingly useful. But Codiæums should be changed more often than Palms, as they suffer most from the dry air of a drawing-room. Euphorbia pulcherrima (Poinsettias) are very effective, but they will not stand draughts, and they should be accustomed to a lower temperature before being brought into the house. Two or three-year-old plants of Deutzia gracilis in flower brighten a room nicely. For furnishing baskets, Calanthe Veitchi, Asparagus plumosus, and A. Sprengeri, Grevillea robusta, and Cypripedium insigne, are very effective and cheerful. Amongst Orchids, the old Dendrobium nobile is the most reliable. Primulas and Cyclamens are very popular for such purposes, Azalea mollis and its many varieties are useful in the early months of the year, and with A. indica and its varieties, yield a constant supply of ornamental house plants. Among sweet-smelling plants, Freesias and Lilies of the Valley are to be recommended. Of trailing plants, Oplismenus Burmanni (the Panicums), the Zebrinas (Tradescantias), and Cissus discolor, are very useful. Among bulbous plants, Tulips are more useful than Hyacinths, the powerful odour of the latter being objectionable. For table decoration, one of the most useful materials are sprays of Smilax (asparagoides); these can be used in many ways one of the most effective methods being to festoon a candelabra with it, and trail along from one table ornament to another. Small Cordylines (Dracænas, Palms, and Euphorbias are effective on the dinner-table. Care must be taken that plants placed upon a table will not obstruct the view the guests should have of each other. If a long succession of dinner-parties has to be arranged, a different tone of colour and arrangement should obtain on each succeeding night.

ISLE OF WIGHT HORTICULTURAL.

March 4.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport.

Dr. J. Groves presided over a good attendance of members who had come from all parts of the Island to hear a paper read on the "Cultivation of Peaches and Nectarines," by Mr. W. Tribbick, Brooke House Gardens, an expert in the cultivation of these fruits. The lecturer dealt exhaustively with the details of their cultivation, and especially impressed upon his hearers the mistaken economy of cropping their Peach borders with Potatos, &c.

The exhibits included a collection of large and well-grown Cyclamens, staged by Mr. G. J. Cole, Broadlands, Sandown; and a group of flowering and foliage plants from Mr. A. G. Cave, of Newport Nurseries. In each case a Certificate of Cultural Merit was awarded. The total number of the Society is now 320.

PRESTON AND FULWOOD HORTICULTURAL.

March 4.—At a largely attended meeting of this Society, held on the above date, at the Old Legs of Man Hotel, Preston, an interesting paper upon "Daffodils," by Mr. P. Rudolph Barr was read. A subsequent discussion showed that the members are desirous of creating a greater interest in these flowers in Lancashire.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

March 7.—At a crowded meeting on the above date there were several interesting exhibits. One of an Acacia, probably grandis, a fine variety of pulchella, some magnificent examples of white-flowered Cyclamen giganteum, collections of fine cut blooms of Camellias of the elegans type, some fine trusses of the fragrant hybrid Rhododendron Countess, shown by Mr. Johnstone, who is very successful in raising new varieties of these plants; a three-flowered Richardia, much rarer than double-flowered. An Acacia named cordata, which was new to all present, was shown. Mr. Todd, the late president, had seen it in Covent Garden that morning, had purchased six plants, and placed one of them on the table. The plant was covered with tiny flowers in long spikes, and was growing in a 4-inch pot.

The paper for the evening was "Garden Peas," by Mr. N. N. Sherwood, of Messrs. Hurst & Sons, Houndsditch, London, and read some time since before the Royal Horticultural Society, which was noticed in the *Gardeners' Chronicle* at the time. *D. T. F.*

[The term "accumulated temperature indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Obituary.

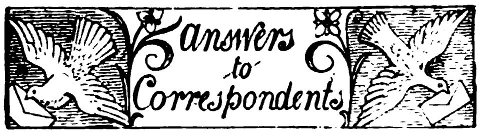
Sudden Death of a Gardener.—Mr. C. J. Rowe, who has for fourteen years held the position of head gardener to Mr. W. H. Scott, of Nunfield, Dumfries, died on Sunday morning after a very brief illness. He had complained of a cold on Wednesday, and this appears to have developed into influenza, complicated by bronchitis. Deceased, who belonged to Exeter, was a man of good attainments in his profession, and of a kindly nature. He held the office of Senior Warden in the Dumfries Kilwinning Lodge of Freemasons. He is survived by a widow and a son and daughter, the former of whom is serving his apprenticeship as a gardener. The funeral takes place to-day (Saturday).

Mr. F. Howcroft.—We regret to hear of the death of this gentleman. The business at 10-11, Floral Street, Covent Garden, will be carried on as usual under the style of Howcroft & Watkins.

CATALOGUES RECEIVED.

Otto Frœbel, Zürich—Plants for Indoors Decoration, Hardy Perennials, Alpines, Bulbs and Tubers, Ornamental Trees and Shrubs, Conifers, Roses, Climbers, and Fruit Trees.

Thomas Kennedy & Co., High Street, Dumfries—Farm Seeds.



Answers to Correspondents

A Climber for a House with a Minimum Temperature of 60°: *In Doubt.* You may select any of the following plants, viz., Passiflora quadrangularis, P. Buonapartea, Ipomœa Leari, I. Horsfalliæ, Bomarea Carderi, B. conferta, Bougainvillea speciosa, or Gloriosa Planti. Most of these only succeed satisfactorily when planted in suitable borders, Bomareas and Gloriosas excepted.

A Greenhouse containing a Nectarine in bloom, a Fig and an Apricot Tree, Vines, Roses, and various Plants: *A. L. V.* The house being a cool one, the plants must be allowed to make very gradual progress. The Vines, fruit trees, and Roses may be lightly syringed night and morning, or in the morning only if the weather is frosty. The temperature may range from 45° at night to 60° by day, affording air in moderation in fine weather, and shutting the ventilators about four o'clock. Do not wet the trees or Vines when in bloom, neither should you aim at keeping the air very dry—it is unnatural, and therefore injurious. If red spider appear on any of the plants, sponge the leaves with soapy water, and apply clear water from a syringe to the under sides of the leaves. Clay's manure would benefit any of the plants that are in active growth. It may be applied three or four times, at tri-weekly intervals.

Books: *Norbiton.* No modern work on the subject, as has been stated scores of times of late years in the *Gardeners' Chronicle.—Fruit Growers' Guide.* This is a useful, modern publication, and you may ascertain its place of publication by writing to the author at 8, Rosehill Road, Wandsworth, S.W.

Calla with White Leaf: *D. N. M.* We get many such specimens.

Double-flowered Gorse: *E. Peden.* Short cuttings of young wood, taken off with a heel, strike freely in sandy soil, under a handlight, placed on a half-shady border, if taken in August and September.

Grafting Orange Trees: *Harbinger.* The operation may be performed in July with nearly ripe wood of the current season, the stocks being placed in a double frame, that is, a frame within a frame, or in an unheated close propagating-case. Tongue grafting, or, in the case of very stout stocks, whip, or even cleft grafting, may be employed. The grafts must be furnished with leaves, which should be reduced in size one half; and they should consist of the firmer butt-ends of the shoots. The stocks must be carefully shaded from bright sunshine, and kept moderately moist, but being in a close atmosphere root watering will not be much required. When the grafts have taken, remove them to a less close frame, affording more and more air gradually. The stocks should have all weakly growths removed, and the main shoots shortened severely previous to grafting.

Green Leaves: *Trood, Lamoureux & Co.* Impossible to name with certainty from the material sent.

Lawn Tennis Court and Bowling Green: *R. P.* The base line and small Courts at each end of the Court are in width 27 and in length 18 feet. The space on each side of the net measures 21 feet, width as before, i.e., 27 feet. The total length of the Court is therefore 18 by 21 by 21 by 18 feet. A Court for a four-handed game has a space on each side of the net of 42 feet; and there are side Courts, having a width of 4½ feet, running the entire length of the Court, but not carried round the ends. A Bowling Green may measure 40 to 60 feet square, i.e., it may contain 1,600—3,600 square feet.

Maréchal Niel Rose: *J. Kettle.* The bloom is certainly of a deeper tint than usual in this variety. You might take buds from the shoot and by inserting them upon different stocks determine whether or not the variation may be made constant.

Misleto Germination: *P. F.* The thrushes and blackbirds disengage the sticky seeds from their beaks by rubbing them against the bark, to which the seeds become attached. The seeds which germinate in the spring develop a sort of sucker, from whose centre a fine root appears, which pierces the tissues of the cortex. All that you have to do is to stick the seeds on the moist, i.e., the under side of a branch of an Apple, Poplar, Maple tree, &c., and wait patiently.

Names of Fruits: *Stratford-on-Avon.* 1, probably Blenheim Orange, but much bruised; 2, not known—certainly not Ribston; 3, one fruit is Mabbot's Pearmain, others same as No. 2.—*Heath & Son.* Not known, some local variety.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. M.* Schomburgkia crispa.—*H. crispum.* The Odontoglossum seems to be a very bad form of O. crispum.—*Mackenzie.* Lygodium scandens—a Fern.—*Querist.* Ophiopogon Jaburan variegatum; 2, Casuarina stricta; 3, Vanda tricolor.—*G. T. R.* 1, Cryptomeria japonica; 2, one of the evergreen Oaks; 3, Pinus, we do not recognise the species; 4, Picea Morinda; 5, a Cedar, we cannot tell which one; 6, Abies cephalonica; 7, Thuya plicata, gigantea of gardens; 8, Sequoia sempervirens, Red wood; 9, Viburnum Tinus, Laurustine; 10, Prunus Lauro-cerasus, Cherry-Laurel; 11, Sequoia gigantea (Wellingtonia); 12, Abies nobilis.—*H. J. R., Florence.* The Dendrobium flower that you send has some of the characters of D. × Ainsworthi; but D. nobile itself is so variable, that this can only be regarded as a variety of it. D. × Rolfeæ and its varieties have appeared in importations of D. nobile, resulting from the inter-crossing of D. primulinum and D. nobile, but in these the colour in the lip is partially suppressed. In yours the disc is that of D. nobile.—*A. F.* Dendrobium aureum; 2, Dendrobium Boxalli; 3, Dendrobium Wardianum; 4, Dendrobium nobile; 5, Phaius × hybridus, a cross between P. grandifolius and P. Wallichi.—*H. R. W.* 1, Alternanthera amœna; 2, Alternanthera spatulata; 3, Alternanthera paronychioides major; 4, Alternanthera paronychioides; 5, Sedum carneum variegatum; 6, Pelargonium "Little Trot"; 7, Saxifraga hypnoides; 8, Sedum glaucum.—*W. T.* Nos. 1 and 2 are both varieties of Odontoglossum × Andersonianum, which frequently appear among O. crispum, and results from the intercrossing of that species with O. gloriosum; 3 is a good Odontoglossum triumphans.—*Veritas.* Cymbidium ensifolium has the reputation of being an irregular flowerer. Its flowers usually appear in the end of the summer.—*L. T.* The Cœlogyne cristata seems to be of the form known as "Chatsworth variety."—*C. A. B.* Next week.

Osier on Sewage-Farm Land: *R. H.* We would caution you against planting on land that is always saturated with moisture, as then the crop of Osiers rarely comes to perfection. The trade name "Osiers" means the soft-wooded varieties, mostly of Salix viminalis, the common white Osiers, which are preferred by basket makers. The following are also good basket willows:—S. purpurea, S. helix, or Rose Willow, and others. A small manual containing much valuable matter on *The Cultivation of the W[illegible] or Osier*, by Mr. William Scaling, was published in 1868 by the firms of W. Kent & Co., Paternoster Row; and Allen & Co., Caxton House, Long Row, Nottingham.

Palms: *W. Brown.* We cannot say definitely what has killed the plants. The portions of leaves sent appear to have been injured by gas, sulphur, or some such injurious agency, but this would hardly have killed the roots. Exactly these conditions would result if, through inadvertence, the plants were not supplied with the necessary moisture at the roots.

Patent: *C. W. D.* Write to the Comptroller-General, C. N. Dalton, C.B., or to Chief Examiner Henry Hatfield, Patent Office, 25, Southampton Buildings, W.C. You must thoroughly describe the nature of your patent, and they will then inform you if anything identical has been already patented by anyone.

Peaches Dropping: *E. M. B.* This misfortune is due, in most cases, to an over-abundant set of fruit, or to dryness at the root. It may also occur from a low temperature, or a check caused in some other manner. If it is due to over-abundance, a few timely thinnings may stop wholesale dropping, and if the soil is found to be dry below the surface, afford a thorough application of water.

Richardias: *W. D.* The double spathes are due solely to excessive vigour, brought about by manure in the soil, and probably by a persistent constant selection of the best and strongest budded portions of the tuberous roots. It might in time, by seeding or selection, become fairly constant.

Vine Layering: *A. B. C.* The layering may be done at any season during active growth, the rooting process taking place freely and in a comparatively short time. As the Vine can seldom be moved with a good root mass, the layering should be performed in a basket, which will admit of the whole mass of roots and be removed intact. There is no necessity to remove the basket when planting. Pots may be used, but the roots form a mat at the sides, and must be disentangled in planting, and this causes a check.

Violets Damping off: *W. W.* The plants seem to have "fogged off" from an attack of the species of fungus which is a common cause of damping in seedlings, &c. We think that in future you should dress your Violet plants occasionally with sulphide of potassium, half oz. to one gallon of rain water, not waiting till the fungus appears before affording it. The frame should be placed, not directly on the soil, but on a wall of loose bricks 1½ feet high, the enclosed space being filled up with such hard material as brickbats, gravel, and the like, finishing off with fine gravel; and over this may be placed half-spent hotbed materials or tree leaves, not for affording heat, but to raise the bed of soil that will be placed on them to about 6 inches from the glass. By this means good drainage will be secured, and the air will permeate the bed from below as well as from above. No heat should be used, and thick linings of bracken or exhausted dung-bed materials be packed tightly round the frames, and rather higher than the sides. Air should be afforded the frames whenever the sun shines, excepting after three o'clock in the winter months. Lack of air always favours damping off.

Gardeners' Chronicle
No. 638.—*SATURDAY, MARCH* 18, 1899.

ORCHARD CULTIVATION.

A SUBJECT of the utmost importance to fruit-growers is dealt with in *Bulletin* No. 52, issued by the University of Illinois, Agricultural Experiment Station, Urbana, last year. The report briefly describes some experiments undertaken with the object of ascertaining the relative progress of Apple-trees in cultivated land, and in that occupied by various crops. Some interesting facts have resulted, but we cannot help wishing that the experiments had been carried still further, and that more details had been given in the report under consideration. It is so rarely that we can accord anything but commendation to the admirable records issued from the American Experimental Station, that we regret to notice several defects which might easily have been remedied, and which detract from what would otherwise have proved a most valuable production.

It seems from the introduction that the peculiarities resulting from neglect, too often painfully apparent in British orchards, are similarly predominant in Illinois, for the report says, "Throughout large sections may be found the rotting remnants of once extensive orchards, representing large original expenditure of both labour and money." It is further remarked that on investigation the "true reason" for this is found to be "lack of sufficient, or the entire absence of proper cultivation and care." This is a serious indictment, but there is little doubt it is founded on fact, and the same charge might be brought against many orchard owners on this side of the Atlantic. As is usual in other cases, failure is attributed to many causes except the right one, the unsuitability of the soil is urged occasionally, whereas examples of success can be shown in the same district, and under precisely similar conditions, save in the matter of attention. The Report proceeds to state that the most commonly assumed cause of failure is winter pest, yet "it is found that orchard injuries and exceptionally severe winters do not coincide," and the real cause is more frequently directly traceable to summer drought. There is, no doubt, a good deal of truth in this, and British cultivators have occasionally had ill results in hardy fruit plantations or orchards from the same influence, though not so frequently as in the United States. It is correctly said that "a scanty supply of water tends to check growth, to ripen that already gained, and then to terminate, in effect, the season's period of development. Subsequent spring-like influences cause a second development of activity, and more or less resumption of growth late in the year. The tree now goes into winter in poor condition to withstand even the ordinary vicissitudes of the season. It suffers not so much because of severe climatic influences as because of its own abnormal, if not enfeebled, condition."

One of the leading objects of the American cultivator is, therefore, rightly held to be the preservation of soil-moisture during the spring and summer, and this is just as applicable here in its principle as it is there. Frequent surface cultivation is recommended to form a "dust-mulch," to prevent the escape of water from the soil, and every word of this we could confirm and enforce by examples from our own experience.

The special objects of the experiments undertaken and treated in this report, were to demonstrate the beneficial effects of clean cultivation upon fruit-trees in comparison with others grown on similar land occupied with various crops, or in a partial state of neglect. The experiments were commenced in 1887-88, but not systematically, and little more was done than sufficed to show that "the effect of cultivation was to conserve the soil moisture." The work thus commenced was extended in a more systematic way in 1890, when six rows of Apple-trees, i.e., three of Ben Davis and three of Grimes' Golden were planted, and the plantation was then divided into five plots. It is not definitely stated how many trees there were in each plot, but it appears from the tabulated results that there were twenty-four in each, except in the plot devoted to grass, where there were half that number. The trees were planted 15 feet apart, and, judging by the illustrations, were low standards; but no information is given as to their age at the time of planting, nor with regard to the stocks upon which they are worked. The five plots were treated in the following way:—No. 1 was clean cultivated, No. 2 was cropped with Oats, No. 3 with "corn" (Maize), No. 4 with Clover, and No. 5 with "Blue-grass." According to the report, "this system of cropping and cultivation has been since continued," so that the trees had been treated in the same manner for eight years when the record was taken, yet not a word is said about the "fruit," though details are given respecting the growth, which are of great interest, though unfortunately they do not deal with the whole of the trees, but only one row of each variety, or four trees in each plot, except in the grass where only two have been measured. The averages are not, therefore, strictly comparable, but, notwithstanding this defect, there is such a marked increase of growth in favour of the trees in cultivated clean land, that the figures are reproduced in the following table:—

Average Measurements of one row of Apple Ben Davis.

	Diameter of trunk.		Height.		Diameter of top.	
	At surface of soil.	At 1 foot.				
	In.	In.	Ft.	In.	Ft.	In.
Cultivation ...	19 3/16	16½	18	9¾	15	4
Oats	16 11/16	14¼	18	0	13	6
Corn	20¾	17¾	18	8¾	14	4½
Clover	18¾	16¾	17	6¾	13	10½
Grass	9⅝	8½	11	0	8	0

Average Measurements of one row of Apple Grimes' Golden.

Cultivation ...	12¼	10½	14	1¼	10	0¾
Oats	9	8	11	10½	7	7
Corn	14½	12 1/16	14	9	10	7½
Clover	10¼	9¼	12	11	8	11½
Grass	8¼	7⅝	11	3	7	6

As indicating the dangers attending averages derived from a small number of individuals, it may be mentioned, however, that one tree of Grimes' Golden in the cultivation plot, shows a foot less in the diameter of the top (or spread of the branches) than one of the two trees of the same variety in the grass plot taken for the average; namely, the former measured 8 feet 6 inches in diameter, and the latter 9 feet 6 inches. Still, regarding the results generally, both as shown in the tables and in the illustrations which accompany them, there is a striking difference between the development of the trees in the cultivated plots, and in these under crops.

It is remarkable that the Clover plot should show so low an average, as assuming that this crop has enriched the soil in nitrogen, it is evident this has not been sufficient to counteract the ill-effects of moisture exhaustion. The trees in the Corn-plot show a high average, but this is attributed, by the recorders, to the fact that the trees being so near to each other (15 feet apart) had shaded the spaces between, and prevented the Corn attaining half its usual size.

The effects upon the root system of the trees are reviewed, from which it appears that the cultivation rendered the roots more compact, and forced them deeper into the soil, the advantage of the latter being obvious in some light soils and dry climates, though in others it might be disastrous. One tree in each plot was also cut down, and the five being depicted in one illustration the differences are very striking as regards the size of the stems.

The soil was examined in the autumn of 1897, with a view to testing the amount of moisture present in the different plots, and as the result of repeated trials dealing with the first 27 inches of the depth, the average percentage of moisture was found to be as follows:—Clean cultivated, 12 per cent.; Corn, 8; Clover, 10; Oats, 8; and Grass, 8. These percentages are all low, owing to the very dry season experienced, but it is pointed out that as "the moisture must exceed 10 per cent. to make it available to the plant to any extent," the cultivated plot, even in this, shows a marked advantage as compared with the Grass-plot.

In England, the experiments at the Woburn Fruit Farm have fully demonstrated the injurious effects of grass growing round either dwarf or standard trees in their early years, growth, foliage, and fruit sharing in the evil results, but how far this is due to the exhaustion of soil-moisture or food constituents, has yet to be determined. It will probably be found that the loss of moisture is literally at the root of the evil. *Observer.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA LUDDEMANNIANA.

Of all the forms of Cattleya labiata, this fine Venezuelan type, which is more commonly known in gardens as C. speciosissima, is one of the largest, most variable, and also the most beautiful, though unfortunately many who succeed in flowering the other forms, fail to get good results with this one, and hence it has a, perhaps, not undeserved character for uncertainty of flowering.

Some cultivators, and especially those who reside in sunny districts, flower it regularly, and one who is very successful is Mr. Joseph Broome, of Sunny Hill, Llandudno. Each year with fine examples of Cattleya Trianæi, or C. labiata, comes one or two examples of this fine Cattleya, which appears all the more striking in that they are less often seen than the others.

Together with some very handsome forms of Cattleya Trianæi, Mr. Broome sends a noble flower of C. Luddemanniana, of fine proportions; the sepals and petals bright rosy lilac, the lip veined with purple on a lighter ground, the broad, crimped front portion of rich velvety crimson-purple. Some good examples of Cattleya bicolor, Cœlogyne cristata alba, C. c. Lemoniana Dendrobium Brymerianum, and other showy things, testify to the good cultivation given to the plants at Sunny Hill.

THE ROSARY.

THE ROSE GARDEN IN MARCH.

By Rose garden, I mean those gardens which have a space larger or smaller, as the case may be, especially devoted to the culture of Roses, and I leave out of view all the gardens of professional growers and those of amateurs who cultivate so large a quantity of plants as to bring them almost on a level with professionals, and who require no instruction, but are much more capable of giving it; but I rather write for the smaller amateurs, who are always glad to receive any scrap of information.

Amateurs' Gardens.—These gardens may be divided into two sections, those in which Roses are grown for exhibition, and those in which Roses are grown for the personal gratification of the owner. These will at this season present a very different appearance; in the case of the former the beds will be covered with a thick coat of farmyard manure, which the grower is anxious to leave on, not merely for protection, but in order that the plants may derive all the nutriment possible from it. I need hardly say this does not improve the appearance of the beds, however useful it may be. But the grower who has only his own gratifications in view, and who dislikes to see untidy beds, will remove all the long, strawy portions, and fork-in all the short manure, and will generally make his bed neat and clean. In forking-in, care must be taken not to disturb the roots.

Pruning.—This needful operation will now, of course, be much in the mind of the grower, and it is astonishing, considering all that has been written on this subject, and the number of questions that have been asked and answered, that so much ignorance should still prevail on the subject. An amateur would never entrust this operation to the gardener unless he is one whom he has specially trained for it, and upon whose carefulness and intelligence he may thoroughly rely; for a man may understand all about Vines, stove plants, &c., yet put him into a Rose-garden, it is certain that he will make a muddle of it. He has learned that hard-pruning is necessary, and so he treats all alike, whether they are strong or weak growers; whereas an amateur usually knows that the hard pruning applies to the weaker growers, and if he applies it to the stronger ones, he will get plenty of shoots, but few flowers. After such a season as we have just gone through, where in this south-eastern part of England we have had neither frost nor snow of any consequence, the grower may be tempted, when he sees the extremities of his Rose-shoots covered with foliage, to think it is time for him to apply the knife; he will be unquestionably wrong if he does so, because I do not think anything should be done to encourage a too early start of the buds towards the base of the shoot, on which he will rely for his blooms in the coming season. If the shoots are left long, there may be growth at the extremity which will absorb the sap, and so prevent the lower buds from swelling.

After a mild winter such as we have just experienced, the temptation to prune early will be all the greater, but it is best to wait till the usual date, i.e., the end of the present month; and, indeed, there is some truth in the contention of your correspondent last week, that seeing the change which seems to have taken place in the past few years in our springs [?], it might not be advisable to postpone the operation of pruning until the early part of next month. We generally experience towards May 20 a severe turn of frost, and if we could so retard the young shoots as to save them from this, it would doubtless be a great gain for our Roses, although the shoots may not be seriously injured; yet, without doubt, a sharp frost cripples the buds, and so the first growths are comparatively useless. There are some varieties which are uniformly vigorous in all situations, but I have heard great difference of opinion amongst rosarians in different localities concerning the same Rose; for instance, Etienne Levet is considered to be a most vigorous grower, but I have never found it so, and I therefore think that the amateur will be well advised were he to consider not what the character of the Rose may generally be, but what he has found it, and if his plant is weakly to prune it hard, and if strong to spare the knife. Two or three buds may be left on shoots of the weaker, and half-a-dozen on the stronger growers.

Pruning of Climbers.—There have lately been introduced a number of Roses more or less of the rampant character, and which go under the name of climbing Roses, though they do not climb; to treat these as one would treat the dwarfs or standards would be most injurious. Take, for instance, Turner's Crimson Rambler; how often it has been said to me, "I think Crimson Rambler is altogether a mistake. I have had it for two or three years, but I cannot find any buds on it." "But how have you treated it?" is my question; "especially in the matter of pruning?" "Oh, I cut it pretty hard, or else it would be all over the place." Yes, and you have done exactly what will eventually prevent its blooming. Young shoots if strong ought to be left alone, and the old ones thinned out, in order to make space for the younger; if this is done, you will be pretty sure to have a quantity of bloom. The same rule holds good with regard to our rampant Noisettes; and to all the varieties of the Gloire de Dijon section, which should have all the old wood removed, and space left for the development of the new shoots. Some of this section, like Madame Berard, Gloire de Dijon, Madame Trifle, and others, make long, lanky shoots, and are bare of foliage for a long distance; while others, such as Bouquet d'Or and Rêve d'Or, are beautifully covered with foliage all the way up. I know no Rose so well adapted for covering the wall of a house as the latter, its beautiful foliage and brilliant yellow flowers always impressing those who see it in this condition for the first time with a sense of its great beauty. Some of the Polyantha Roses, such as Polyantha simplex, may, on the other hand, be left to wander at their "own sweet will." I had one of these planted in my own garden, and it was certainly a very pretty sight when in full bloom; but it grew large and absorbed so much space that I was obliged, to my great regret, to root it up.

Such are a few general remarks on the condition of, and seasonable work in, our Rose gardens at this season. Those who want more precise directions should consult Mr. W. F. Cooling's observations at the Rose Conference at Halifax last year, published by the National Rose Society, in which, I believe, he will find all the information necessary on the subject of pruning. *Wild Rose.*

MARKET GARDENING.

VEGETABLE CULTURE.

Well-grown vegetables, whether the product of garden or field, always command a ready sale in the neighbourhood of cities and large commercial towns and seaside resorts, whither the produce can be taken in the growers' own vans at a small cost. A light rather than heavy soil of fair depth is capable of producing all kinds of vegetables of first-rate quality under good cultivation. A good coating of short manure should be laid on the ground, and the latter double ploughed, in order to provide proper depth for the several crops, especially root crops, such as Parsnips, Carrots, and Beet, to push their roots into in search of food and moisture, as well as in the process of root-development, depth of soil being absolutely necessary in this respect, in order to secure good specimens of the root-crops indicated above. Assuming that the ground has already been manured and ploughed in the manner described, it should be harrowed, and, if lumpy, rolled, and again harrowed as soon as the condition of the weather and ground will permit of the work being done without the soil adhering much to one's boots, and the crops put in forthwith. Parsnips, Carrots, and Onions should be sown as early in February as the state of the ground will permit of the necessary preparations and work being performed.

Parsnips, Carrots, and Onions may be drilled-in in drills 1 foot apart, the soil being afterwards closed in over the seeds with a light roller. Only seeds of the best quality should be used, sowing seeds of Parsnips and Carrots more thinly than the Onions, seeing that the latter can be drawn young for salading—that is, the thinnings can be used for salading purposes, being tied up in small bundles while being thinned, for marketing. Should soot be available to strew over the ground in sufficient quantity to discolour it immediately after drilling-in the seed, especially in the case of ground cropped with Onions, it will tend to preserve the roots from the attacks of the Onion-maggot and wireworm, creatures which in some soils are very destructive to root crops. The Onion-plants may be left at from 2 to 3 inches apart in the row in thinning, allowing about 9 inches from plant to plant in the case of Carrots of the Long Surrey type, and Parsnips. At this distance, the yield of one acre would be 4840 roots, which being of average quality would, according to current wholesale prices, realise from 6*d.* to 9*d.* per dozen for Parsnips, giving a sum total of from £121 to £181 10*s.* per acre. While the same area cropped with Onions would yield from 10 to 12 tons of bulbs, which, at the current wholesale prices of 6*s.* 6*d.* to 7*s.* per cwt., being respectively £65 and £70 for 10 tons per acre, £78 and £84 being realised for the heavier crop of ripe bulbs; these returns being in addition to those secured by the marketing of the thinnings during the early summer months. Thus, it will be seen that after all expenses involved in producing and marketing the several crops, including rent of land, have been deducted, a good balance will remain on the right side.

After the young plants have come through the soil, the latter should be stirred between 1 and 2 inches deep within as many months, not only with a view to destroy weeds (which are sure to appear), but also to stimulate growth in the plants.

Peas are also a paying crop. Good, dwarf growing, early varieties, and prodigious bearers, such, for instance, as Carter's Lightning, should be sown early in ground prepared as described above, drilling-in the seed in drills about 2½ feet asunder. *H. W. Ward, Rayleigh.*

THE EUCALYPTUS GLOBULUS.

As a good deal has recently been written on this tree, perhaps I may be permitted to record my little experience regarding the same. When at Lucknow, I used to receive seeds of various kinds of Eucalyptus from the late Baron von Mueller. Of course, the E. Globulus was among them. I raised several plants of the latter, and planted a row of them. They made rapid progress, and in a few years gained the height of between 20 and 30 feet, with a thick stem in proportion.

I began to be proud of having introduced this wonderful tree, which then had the reputation of draining marshes. Well, one monsoon came with torrential rains, and every one of my beautiful E. Globulus died from too much water at the roots, and an atmosphere saturated with moisture. I began then to be sceptical about the supposed properties of this fast-growing tree of draining marshy land.

The only variety which I succeeded in growing was the E. citriodora, which, when it sheds its bark, leaves the stem as white as snow. It flowered and seeded; but I do not know what the result was after I left.

On another occasion I landed at Naples from Bombay in January. It was snowing, and the pools round the fountains were hard frozen—a very unusual occurrence in that latitude. On my way from Naples to Rome I saw a number of large Eucalyptus-trees—presumably E. Globulus—killed by frost.

The only place in India where I saw the Eucalyptus Globulus thrive was on the Nilgherry Hills at Ootacamund. The frost there is very slight, and occurs only on the highest ridges; and the drainage on the hill slopes is very good. It was a beautiful sight to see a hill-side covered with the young blue trees. The only use they make of the tree there is for firewood. As to the Eucalyptus-oil, a lady in London told me that when she caught a cold, she rubbed a little of this oil round her mouth and nose, and the cold was scared away. I thought I would try this wonderful oil the first time I caught a cold. I had not long to wait; and one night I rubbed some as directed, and got into bed. In a very short time my face felt as if it were on fire. I had to jump out of bed and put my face in a basin of cold water, when I got some peace!

REV. GEORGE H. ENGLEHEART,
A Vice-Chairman of the Narcissus Committee of the Royal Horticultural Society.
(See p. 168.)

A friend of scientific culture assures me that in the City there is an insurance company who employ a large number of clerks. During an epidemic of influenza, the porter was instructed to go round and drop Eucalyptus-oil on the blotting-pad of each clerk, and my friend asserts that not one of those clerks got influenza. They were all the time inhaling an atmosphere containing the essential oil of Eucalyptus. Such a thing, it would seem, might easily be verified. I am not aware, however, that any scientific investigation has ever been made of the properties of this oil. When a new drug is introduced, the sellers of it exaggerate its curative properties to such an extent that it soon falls into discredit and neglect. There are few things in Nature that have not some use.

The history of the metal "thorium" is a lesson. It was very rare, and was thought to be very useless. Now, however, as Thoria, it is used everywhere for incandescent lights. The demand for this metal caused geologists and chemists to search for it, and it was found that, after all, it was not so very rare. When a thing is pronounced useless, it means that no use for it has yet been discovered.

In an article in the *Gardeners' Chronicle* on "Rome," it was stated that the Trappists near Rome can now live where, before they planted Eucalypti, they could not live. In the *National Review* for February, 1899, in an article on the "Rule of the Chartered Company," by H. C. Thomson, p. 901, this is stated:—"Look at Tasmania . . . with a glorious climate, in which it is difficult to feel ill, with Eucalyptus forests in which fever cannot exist," &c. Now is all this true, or is it mere hearsay? If Tasmania has such a glorious climate, why should the non-existence of fever be attributed to Eucalyptus forests?

Then in the *Standard* of February 14, 1899, it is stated that "Influenza has made its appearance again . . . and alike in church and on 'Change the odour of Eucalyptus is significantly perceptible."

Rightly or wrongly, many people evidently believe in the property of Eucalyptus oil of staving off influenza. Investigators of the future will have to find out what is true and what is not true, not only in this, but in many other things. In a butcher's shop I saw a miserable-looking plant of E. Globulus in a pot. I asked why he kept it there? He said, "It keeps away flies." I thought I would try the experiment in my room, where flies abound in summer. I cut some branches off a blue Gum-tree I have, and placed them in a jug of water on the mantelpiece. Lo and behold, that very same evening there was a fly on the wall a few inches above the Eucalyptus leaves, and I have been told that flies have been seen to actually settle on its leaves! *E. Bonavia, M.D.*

REV. GEORGE H. ENGLEHEART.

We have pleasure in affording our readers an excellent presentment of the Rev. G. H. Engleheart, rector of Appleshaw, Andover, a Vice-Chairman of the Narcissus Committee of the Royal Horticultural Society, and well known among horticulturists as the raiser of a number of mostly beautiful varieties of Narcissus. Mr. Engleheart has been engaged in the delightful occupation of raising new varieties of Narcissus from seed for several years, as a reference to our reports of the Royal Horticultural Society will show. Last year his stand of new seedlings at the R. H. S. meeting on April 12, was the centre of attraction in the Hall, the beauty of form and colour which, displaying in many instances a wide departure from all known varieties, and appealing to the tastes of almost every beholder.

The *habitués* of the Drill Hall have doubtless a similar if different display in store for them this season.

Mr. Engleheart's experiments are conducted on scientific lines, but withal a practical aim. He has repeated and confirmed many of Dean Herbert's experiments, and has greatly extended the work of that famous physiologist and cultivator.

FORESTRY.

THE HOME NURSERY.

(*Continued from p. 102.*)

The raising of ordinary forest trees on a large scale in the home nursery is most advantageous in the case of a species which is particularly well adapted to the locality, and which not only produces seed in large quantities but also develops rapidly during the seedling stage. Heavy soil, and situation, if taken together, will be found suited to some particular species better than any other, and if this suitability can be discovered accidentally or by experiment, it is a pity not to take advantage of it. Well-grown seedlings are always saleable if more are grown than are required for home use, and nurserymen are usually only too glad to get hold of a lot at a low rate, or in exchange for other plants. Oak, Ash, Beech, Birch, Scotch Fir, &c., are easily raised in soil adapted to their respective requirements, and as such species as these seed freely where they are thoroughly at home, the expense of collecting and sowing is all that has to be reckoned with. The chief difficulty in some soils and situations lies in keeping the ground clear of annual weeds, especially when near a wood or waste ground, and with coniferous seed clear ground is of the first importance. With large seeds, sowing in rows usually enables hoeing to be effectively carried on.

The most useful function of the home nursery, however, consists in the raising or, rather, growing on to a fairly-large size those ornamental trees and shrubs which are chiefly used for immediate effect, or which are too expensive to risk planting out in small sizes. Such plants are constantly required on an estate of any size, and the advantage of having them close at hand, and being able to lift and re-plant them on one and the same day if necessary go a long way towards ensuring success. Large plants are not only very expensive to purchase, but their removal is attended with considerable risk if unlooked-for delay or unfavourable weather intervene during the transfer from the old to the new quarters. Removed in a careful way from the home nursery, and during favourable weather for the work, few failures occur, and that severe strain upon the vitality of the plant, which usually accompanies transplanting, is avoided to a great extent. On this score alone, the home nursery justifies its existence, in spite of the fact that the cost of repeated transplantings may make the home-grown plants as expensive at the time of planting-out as purchased ones. The better results obtained from the use of the former will always give them the advantage when the final reckoning arrives, and this advantage increases with the size of the plants used.

A great deal of discretion is required in stocking a home nursery, both as regards number and variety. If used chiefly for the purpose we have indicated, it will probably be under rather than over-stocked, for there is usually a good demand for ornamental stuff amongst farm and cottage tenants, who want plants on the spur of the moment, and who are not exacting as to the species. As to variety, this should be determined to some extent both by the soil of the nursery and that prevailing on the estate, as those trees and shrubs which thrive best in the locality should be most in evidence. As a general rule, the nursery should be situated on the prevailing soil of the estate, but this may not always be convenient or practicable, and the stock may have to be modified accordingly. The immense variety found within the boundaries of any public nursery demonstrates the possibility of growing most plants on any kind of soil, but in such cases the necessity of meeting many and varied calls upon its resources accounts for this, and it does not follow that the question of soil can be ignored. If a piece of ground can be selected which contains both light and heavy soils, or a happy mean between the two, so much the better, and so much the greater latitude is offered in stocking the ground. But on soils of a very pronounced type, such as clay, or light sandy loam, there is no advantage to be gained in attempting to raise species which prefer the opposite extreme, whichever it may be, to the soil of the nursery. If the latter be of a lighter and drier nature than that adapted to the growth of the species, it suffers in time of drought, its vigour is greatly decreased, and the plants are liable to insect and fungoid attack. On the other hand, a heavy soil results in badly-rooted plants of those species which like a light, dry soil, and a wet autumn produces badly-ripened wood. In fact, for any but moisture-loving species, a stiff nursery soil is not desirable, and seldom produces plants favourable for transplanting besides being much more difficult and expensive to work than light ground.

Where a permanent nursery cannot be established on a soil adapted to nursery stock in general, and plants are required which do not succeed well in it, temporary nurseries on more suitable soils come in very usefully at times, and for ordinary forest trees are often preferable to permanent ones. They are exceptionally useful when planting a large area of ground which has to be repeatedly "broken up" for some reason or other; most frequently from the poor, arid, or shallow nature of the soil, in which plants from better ground are difficult to get established. A few poles of ground trenched over in the best situation that can be found, and fenced round with wire-netting, is usually the form this kind of nursery takes, and is only maintained so long as the particular class of plants it holds are required in the plantation. Another form of temporary nursery, and the most inexpensive of any, is one of those patches of seedlings which are frequently found in hardwood plantations. Hundreds of good young plants can be lifted out of these patches and planted on adjoining bare ground, and in cases of systematic natural regeneration, this operation is usually a necessity before the area is fully stocked.

The most important qualification a nursery of any kind can have for all but very hardy species is a situation out of the reach of late and early frosts, for a young tree cut back by frost rarely becomes a well-shaped specimen under two or three years, while if the injury from this cause is repeated two years in succession, many plants are almost worthless for planting out. *A. C. Forbes.*

(To be continued).

BOOK NOTICE.

The Municipal Parks, Gardens, and Open Spaces of London, their History and Associations. By Lieut.-Col. Sexby, V.D. (with numerous illustrations). (Elliot Stock.)

The title-page fairly indicates the nature of the contents of this book. It is a detailed and descriptive list of the pleasure-grounds of the metropolis, other than the Royal Parks, Wimbledon Common, Epping Forest, and others not under the jurisdiction of the London County Council. Our first impression, on perusing the book, is one of profound satisfaction that so large an area has been secured, free from the intrusion of the builder. The next feeling is, that whilst the outer borders and the suburbs of London are, as it is shown, well provided with breathing spaces, the central portions of the great city are still lamentably deficient in open spaces. The reservation of a large number of small areas, well distributed throughout the densely crowded parts of the metropolis, is now a matter of much greater importance for sanitary purposes than the acquisition of large parks at a distance.

Those who look in this book for many details relating to landscape gardening or to horticulture as practiced in the parks, will be disappointed. These subjects are, of course, not wholly ignored, but they are treated very scantily as compared with the "history and associations." As we are told this outright on the title-page, we have no right to complain, however much we may regret what we may think a lost opportunity. What we have is an account of each park or enclosure, together with a very full presentation of the historical associations connected with it. Thus, while only two or three pages are devoted to a description of the Embankment Gardens proper, about twenty-five are taken up with the history of the Cleopatra obelisk, the Savoy Chapel and Hotel, and other edifices, having only indirect connection with the gardens. It is satisfactory, however, to have so many details of surrounding structures, and so many dates recorded in so accessible a form. From this point of view Col. Sexby's volume will form a valuable work of reference.

Under the head of the Albert Embankment Gardens, we have a short account of Lambeth Palace, including a statement to this effect, "In this hall was held one of the most famous trials of modern times—that of Dr. King, Bishop of Lincoln, for ritualistic practices. The case was tried before the Archbishop and five other Bishops, and in the end Dr. King was acquitted of all the charges except two." What this has to do with the Albert Embankment Gardens, it is not easy to estimate. Some mention of the old physic garden of the Society of Apothecaries near to the Chelsea Embankment Gardens would have been more in place, even though it did not technically fall within the scope of the book. Under the heading Waterlow Park, we find reference to the Hon. and Rev. George Spencer, who is said to have adopted the name of "Father Ignatius." If so, there must have been two Richmonds in the field, for we believe the family name of the present Father Ignatius, of Llanthony Abbey, is Lyne. While so much is said of Wapping, which has little or no connection with Wapping Recreation Ground, it is remarkable that nothing should be said about the notorious Tichbourne Claimant, who has as good a claim to commemoration in these pages as Judge Jeffreys, to whom some space is devoted.

The beauty, picturesqueness, and interest of some of the London commons is duly alluded to, and the account of Bostall Heath is enough to make one want to visit it forthwith. Comparatively little mention, however, is made of those geological and natural-history features which give so great a charm to these open spaces, and which, indeed, furnish the key to their beauty and interest. The botanist and entomologist may still find plenty of material for their researches, even in places which at first sight seem very unpromising. Perhaps it is as well that the author has been reticent upon these points, but he would have been quite in order, and done no harm, had he given us lists of the trees and shrubs which thrive best in the London squares and on suburban commons, and a few hints on the most appropriate methods of laying out these enclosures according to varying circumstances. Whilst we cannot look upon Col. Sexby's book as at all complete, especially from the horticultural point of view, we may commend it to the reader for the great variety and interest of the information the author has got together, information which will be of interest to every Londoner, whether within or without the twelve-mile circuit. The book is full of interesting illustrations, and has a good index.

SPONTANEOUS HYBRIDS OF HARDY PLANTS.

(Continued from p. 148.)

The genus Dianthus makes a great variety of hybrids out of a few species grown in my garden, and as most of the hybrids are fertile, and their progeny seems to be more disposed to depart further from the parental types than to revert to them, a nondescript medley is the result, in which it is difficult to find any consistent characters. I will first mention three good species which I have grown almost annually from home-saved seed for many generations without noticing any signs of hybridising. These are D. alpinus, D. neglectus, and D. sylvestris. Also D. deltoides, both the pink and the white form, comes up spontaneously in many parts of my garden year after year true to the type; but it certainly lends its pollen to form hybrids with one other species which I raised from seed sent as D. viscidus, but I believe it to be D. pubescens. Anyhow, seedlings from it are intermediate between that and D. deltoides. I next mention two species, both of which I have repeatedly raised quite true, viz., D. superbus from imported seed, and D. cæsius from seed collected wild for me on the Cheddar rocks. The seed I save from these species never comes true to the parent. D. superbus is only biennial in Edge garden, but the hybrids I raise from it are perennial, and very prolific in the way they spread. The flowers of one form exactly resemble the portrait of one named D. Fischeri in Sweet's *Flower Garden*, and looks as if the pollen-parent had been D. barbatus. Other forms are much dwarfer, and the flowers might be called intermediate between those of D. superbus and cæsius. These may be increased without end by pulling off and striking the tufts; but they also produce seed, which grows into various and, for the most part, worthless forms. D. cæsius itself always shows hybrids from the seed I save in my garden. These mostly tend in the direction of what I suppose to be dwarf forms of D. plumarius, having generally a conspicuous dark purple eye and a white fringed edge, and retaining the glaucous tufts of D. cæsius; these, too, are fertile, and in one or two more generations some of them grow in size, and have a tendency to become double.

I have no knowledge of the wild type of D. plumarius, to which the garden Pink is referred; but whether D. cæsius is a recognised factor of the garden Pink, or whether, by repeatedly crossing with the double garden forms, it gradually assumes all their characters, I feel certain that in a very few generations from genuine D. cæsius, garden Pinks may be produced. Other doubtful elements in the medley of small nondescript Pinks which abound in my garden may be D. rupestris, D. fragrans, D. caucasicus, names under which I have bought and raised seed, though I have seldom been satisfied that it was genuine; but when mixed together, they result in densely tufted plants, flowering more or less plentifully on stalks from 6 inches high to more than a foot, the solitary flowers being either much fringed or nearly plain, and from half an inch to 1 inch and a half across; all of them produce seed freely, which I distribute to my friends as "mixed dwarf single Pink." They are very fragrant, many having the usual clove scent, but some smelling distinctly of Jasmine. Besides these I grow recognised hybrid forms, such as that called Cyclops, some of which are fertile, but I have never found any constant from seed.

Aquilegias, when grown together, are as difficult as Mulleins to keep true to the parents from seed; but in Aquilegia, the species are less clearly defined. It is not many years since Bentham announced, in *Genera Plantarum*, that the fifty or sixty species of Columbine ought probably to be reduced to five or six; but leaving this to be settled by botanists, there is no doubt that if the distinct forms are isolated, they may be kept perfectly constant from seed for an indefinite time, as the kind called A. glandulosa has been in the Highland nursery at Forres. When flowering simultaneously in Edge garden, they are visited and crossed by humble bees from the hour that the flowers open until they drop to pieces from the repeated probings of these bees, and though I regularly mark the best flowers for seed, I never know what the seed will produce.

In Columbines, however, there is always a tendency to revert, and the best forms sometimes come again after a generation or two, though the general tendency is towards the more robust kind, and, unless weeded out, the stronger A. vulgaris seems to prevail. A. canadensis, A. chrysantha, A. cœrulea, long spurred kinds, make hybrids indifferently with one another, and with the short-spurred A. vulgaris and A. glandulosa; only two or three species, from flowering at a different season or being unsuited for the foreign pollen that comes in their way, continue true. The first is a A. viridiflora, a distinct and delicate kind, rarely seen, though I have raised it from seed more than once, but soon lost it. Another is A. Skinneri, of which I once got true seed, though hybrids of A. canadensis generally do duty for it. I found the genuine plant wanted a warmer climate and soil than those of my garden. At first it flowered well in July, then less well in August, then shabbily in September, and dwindled away. A third kind, which I am glad to keep true, is the dwarf crisp-leaved, large-flowered A. pyrenaica, a delightful little rock plant. This does not flower till late in June, when the coarser kinds are over, and makes true seed, and is an ornament to my rockery all through July. All the other so-called species I have tried coalesce in the next generation with those they find already in the garden. I would add, that my friend the late Mr. Rawson, of Fallbarrow, used to hybridise Columbines successfully, both as to colour and mixed characters, by complete isolation when in flower, and cutting out the anthers. I have tried hybridising in the open garden without any definite results. Nearly all Mr. Rawson's hybrids could be matched by some of my spontaneous hybrids, but he could ensure the result which in my case is accidental. *C. W. Dod.*

(*To be continued.*)

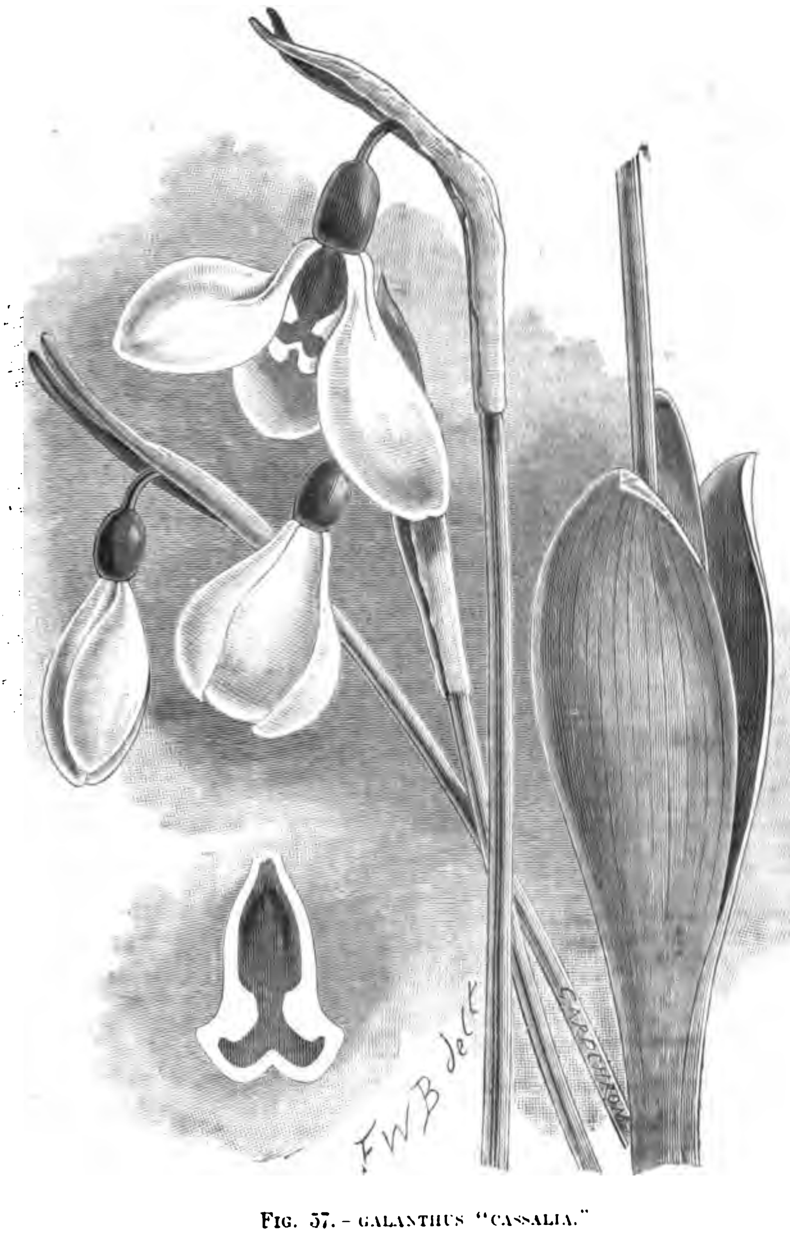

Fig. 57.—Galanthus "Cassalia."

GALANTHUS "CASSALIA."

This is one of the best, and most distinct of all the new Snowdrops from Asia Minor, and was sent to us from Smyrna by Mr. Ed. Whittall, who also sent the noble form of G. latifolius "Ikariæ," and more recently the giant form of G. Elwesii Whittalli, which, by general consent of all Snowdrop growers, will, as I hope, long bear his respected name.

G. Cassalia (fig. 57) grows a foot high, or more. Its broad foliage is very hoary-looking, being covered with a thick grey bloom, which is easily rubbed off by the fingers. The flowers are large and bold, but quite distinct from those of G. Elwesii in the blotch on the three inner perianth segments. As shown in my sketch, the basal blotch and the two apical dots, or deltæ, are conjoined, and not separate as in the last named kind. *F. W. Burbidge.*

SCOTLAND.

FORESTRY ABROAD AND AT HOME.

On February 20, an interesting lecture on the "Native Indian Forest Service" was delivered in the Conveyancing Class-room of Edinburgh University, by Sir Dietrich Brandis, K.C.I.E., LL.D. The lecturer, the place, and the subject-matter of the lecture, as well as the fact that the same gentleman, who is ex-Inspector-General of Forests in India, has undertaken to lecture for the Royal Scottish Arboricultural Society, at their Rooms, 5, St. Andrew Square, on Friday, the 24th inst., at 7.30, under the presidency of the Earl of Mansfield, gives the subject unique and timely importance. The subject of the lecture on Friday next will be "Pure Forests and Mixed Forests.'

It was a happy coincidence that though Sir Dietrich's subject on Monday at the University was the "Native Indian Forest Service," he began by sketching the progress that was being gradually made all over the world in the science and practice of forestry; and though it was a far cry from India to Edinburgh, he cited, in confirmation of the ameliorating influence of judicious planting on the world's landscape and climate, the remarkable changes that had come over for the better, the Heriot's Row and Queen's Street districts of Edinburgh, which were described in 1814, in *The Memories of a Highland Lady*, as an untidy wilderness.

Since then Edinburgh has become a beautiful town, and similar progress might be seen in all parts of India. The lecturer, however, said nothing to the effect that the planter had not yet added his last touches of grace, tints of colour, or powers of treating, to either Edinburgh or India. Few cities need more care bestowed on trees and shrubs, and none needs bright colours more as a relief to its endless lines and masses of grey that tower so high and spread so far and wide in all directions. But the lecturer hastened to remark, that enthusiastic foresters hoped that regular forest management might change the climate of India. While admitting that the improvements in the climate of India, with its extremes of heat, deluges of rain, and parching droughts, would be very desirable, and worth all their efforts as planters, the lecturer seemed doubtful whether very great changes of this sort were within their reach as foresters. There were, however, many smaller benefits which improved forest management might confer upon India. Happily, the forests, which covered 51,000,000 acres, were in the hands of the Government. They were the great sources of fuel, not only for home use, but for manufactures in the form of charcoal. To provide sufficient fuel for the peasantry, forests would have to be planted not only on the hills but also in the open country, and this might interfere with the grazing or other customs of the people. For instance, as more iron is made in Southern India, sufficient charcoal will need an extension of forest areas, and this would curtail the extent under grass for grazing. Such delicate questions are best settled by native forest officers on the spot.

Three classes of officers are needed for these great forest estates in India: 1st, protective officers, men of the locality, without any professional education; 2nd, executive officers, forest rangers; and 3rd, controlling officers, and the condition of such officers must be so improved as to induce natives of the first families to enter the Government foreign service. Doubtless the lecturer's object in this lucid division of labour is to interest all classes and castes in India in the progress and prosperity of the national forests, on which so much of the health and happiness of India depends. *D. T. Fish.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet.

Potatos.—Large breadths of Potatos may now be planted, the Ashleaf and dwarf-topped varieties being planted on warm borders. It is good practice in the gardens to allow a space of 2 to 2¼ feet between the rows of the main crop varieties, and even the Ashleaf crops better if given 2 feet. As with other vegetables, Potatos need a change of seed occasionally, and of soil annually. If the land be in good condition it should be stirred with a fork, and the drills drawn at from 2 to 2½ feet apart according to the strength of the variety, and 4 inches deep. Although the quality of Potatos varies a good deal in different soils and seasons, I do not advocate the growing of a great many varieties, but prefer to grow a few good ones. Land which has been planted some time should be looked over occasionally, and a small quantity of soil put over the tops as soon as they appear. Where large plots are planted, the early and dwarfer-growing varieties should be set on one side of the plot, the future furrows between them being planted with early Savoys or other vegetable, a sort of inter-cropping that is of great use in small gardens.

Peas.—As soon as the plants are 2 inches high, draw some earth to them and put in the stakes, these affording some little protection against wind and frost, twigs of Laurel or Spruce stuck in between improving the protection. Those Pea-plants raised in small pots, in drills cut in turves, or in shallow boxes and troughs, should be kept cool preparatory to being planted on the south border. As soon as planted, let them be protected in the manner indicated. Peas may be sown at intervals of twelve days from the beginning of April till the middle of June, when the last sowing for the season is usually made, not omitting to sow twice during the present month.

Turnips.—A fairly good breadth of Extra Early Milan may now be sown in drills drawn 1 foot apart; most other varieties require 15 to 18 inches. As the first sowing may bolt, sow again in a fortnight Early Milan, Snowball, and Red Globe. The Turnip needs a soil rich in nitrogen, and for the summer crops the position should be as cool as can be found. Early Milan is remarkable for its earliness, and it is a variety of fairly good quality when used young; but its season is brief, like the Flat Dutch, and a good, white-fleshed, more-enduring variety should be sown at the same time.

French Beans.—Those being forced in a hot-house should not have a lower temperature than 60° by night, with a rise of 10° to 15° with sunshine, nor should the plants lack water at the roots, nor liquid-manure at alternate applications. Hard water is injurious to the French Bean, but liquid-manure alternately afforded with water seldom fails in producing a satisfactory crop of Beans and healthy leaves. Syringe the plants early in the afternoon, when shutting up the houses, pits, or frames. Sow seed at intervals, according to the demand and the available means for growing the plants.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.

Helleborus niger and other species.—Those who wish to increase their stock of these plants should, now that the flowering season of most species is past, and growth is commencing, take up each clump, wash every bit of soil from the roots, and divide them with a knife, removing all of the remains of old flower-stems. Having selected a piece of ground facing north, or at the least somewhat shady, trench it 2 feet deep, placing a thick layer of rotten farmyard manure at the bottom of the trenches. When it has settled a bit, make it firm by treading it regularly all over, and plant each Hellebore crown 18 inches apart. It is best not to lift the whole stock of plants, but a few plants annually, as the plant requires to be thoroughly established before it will flower freely. They should not be allowed to become dry at the roots.

The Pruning of Roses.—The Rose bushes and standards are, owing to the mildness of the season, a fortnight earlier in starting into growth, and they will have to be pruned so much earlier. It is advisable that each standard or bush be cut back in accordance with its vigour; for example, strong-growing varieties, such as Captain Christy, Mrs. John Laing, Madame Isaac Pereire, &c., should have the small shoots thinned out, the strong growths shortened back to six buds, and those of only moderate growth to two buds. Bush Roses, when budded on the Manetti and seedling Briar, should be kept to six strong shoots, left 1½ to 2 feet in length, these being pruned in the manner advised for standards, shoots being left according to the strength of the same, with four, six, or eight buds each; and all probably flowerless and weak shoots removed without leaving any snags. Suckers, that is, shoots coming up from the stock, should always be pulled or dug up, not cut off, when young, but if own-root Roses throw suckers, these ought to be retained.

Pillar Roses are very ornamental when in flower, but they should not be planted in great numbers unless it be in a Rose-garden proper, as flowering but once in the year, they are not nice-looking at other seasons. The plants when planted should be afforded rich loam, and be fed liberally afterwards, they then give an abundant harvest of bloom. Turner's Crimson Rambler, Alister Stella Grey, Fellemberg Noisette, W. A. Richardson, L'Idéal, Bardon Job, Aimée Vibert, and the Penzance Briars, are excellent as pillar Roses. I have had them fastened to iron supports, but larch-poles with the branches shortened to a foot are better. The poles should be 12 feet high, and the Rose-shoots trained round them. The side-shoots on last year's wood should be shortened back, and all shoots from the root allowed to grow, and in time they will replace the older stems which will have to be removed. The Penzance Briars are beautiful when allowed to grow wild similar to the Dog Roses of our hedges. Pillar Rose shoots should be cut at various heights, from 2 to 12 feet.

China Roses.—These compact growing species and varieties of Roses, sometimes called monthly Roses, are very suitable for forming beds and edgings to beds of other Roses, and they may be had in bloom for about seven months in the year. It is advisable to prune them as soon as the first flowers have passed. The strongest shoots should be cut over regularly, leaving them from 6 inches to 1 foot long, and retaining as many of the good shoots as possible which come from the base of the plants. The later growth will keep up a long succession of bloom. Archduke Charles, Cramoise Supérieur, Fabvier, and Red Pet, with brilliant crimson flowers; Madame Breon and Queen of the Belgians, rose and flesh-coloured, are excellent varieties.

Tea Roses.—These attain great perfection when grown on a north border, or on an aspect where, during frosty weather, sunshine does not reach them much. For several years Madame Van Houtte, Madame Lambard, Madame de Watteville, Madame Willermoz, and Catherine Mermet, have grown here unprotected, and trained on a wall with a northern aspect, and produced blooms finer in texture and colour than those grown on a southern aspect with protection. These Roses only require to have the thin and weakly wood cut out.

Tender Annuals.—Seeds of Asters, Stocks, Phlox Drummondi, Zinnias, Salpiglossis, Sunflowers, golden Pyrethrum, Sweet Sultan, Tagetes, Scabious, &c., should be sown, in pots, pans, or boxes, and placed near the glass in cold frames; other annuals are best when sown in the open ground towards the end of the month.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to the Dowager Lady Howard de Walden, St. James's House, Malvern.

Lilies.—The Lily bulbs growing in pots plunged in beds of coal-ashes, &c., should now be examined weekly, taking out of the ashes those which have made growth of an inch or two above ground, and placing them in a cold frame. When the Lilies are well rooted, they may be introduced to gentle heat in numbers as may be required. By placing a batch under glass at intervals of ten to fourteen days, and allowing the latest to remain plunged in the open air until the flowers are on the point of opening, the flowering season will be prolonged until towards the end of the summer. These remarks apply mostly to Lilium longiflorum var. Harrisii.

Herbaceous Calceolarias.—If aphis be noticed, let the plants be fumigated lightly, and repeat the operation till none is seen. If extra large Calceolaria plants are required, the main flower-stems must be pinched once as soon as they appear, and a shift into pots one size larger afforded. Such plants will flower later than the smaller plants, and the heads of bloom will be much bigger.

Show and Fancy Pelargoniums which have not been shifted into their flowering-pots should be attended to in this respect forthwith. In the case of large plants, the shoots must be tied out with green-tinted carpet-thread or fine raffia. The ties should fit loosely round the shoot, and be passed under a wire or piece of strong twine fixed below the rim of the pot, and the shoots carefully drawn in the required direction. The shoots are easily broken, and much care is necessary that not too much strain is used at one time; but if necessary, the plants should be gone over several times, bringing down the shoots a little at a time.

Phyllocactus.—Such of the plants as have been kept comparatively dry during the winter will now be making growth, needing light applications of water, and on fine days an overhead sprinkling with the syringe. Even in the season of growth these plants should not be afforded water unless the soil has become dry. Applications of weak liquid-manure may be afforded occasionally during growth and flowering. The drainage should be in a perfect condition. Propagation by means of cuttings may now be carried out, using cladodes of last year's growth 4 or 5 inches in length, and placing them in sandy loam in well-drained small pots, which may be stood on a shelf in the stove, scarcely any water being required till rooted beyond what reaches them from the daily syringing of the house.

THE ORCHID HOUSES.

By W. H. Young, Orchid Grower to Sir Frederick Wigan, Bart., Clare Lawn, East Sheen.

Cœlogyne pandurata.—The genus Cœlogyne contains many interesting species, but none can compare with pandurata in size or in the remarkable colouring of its blooms. When established and placed in a suitable position, few Orchids grow so readily, but to flower it regularly requires just the right kind of treatment at just the right time. The plants are now in a suitable condition for removing old or adding new material to the growing rhizome. My method, which has the merit of having good results, is to grow the plants on teak rafts, so that the rhizome travels across the bars, and to fasten it down to about 3 inches of the wood, and beneath it place a few large crocks, on which lay some peat and sphagnum-moss in equal proportions up to the base of the rhizome, and about 4 inches on each side; do not press it, but simply place it alongside, and as the rhizome advances over the edge of the raft, another piece has to be fixed to the original one, and the process repeated. The best position for it is the shady side of the East Indian-house; and if there is no open stage, let the rafts be raised upon Orchid-pots, so that the air may circulate amongst the plants. From now onwards afford water freely till the bulbs are fully grown. A partial rest should be given by keeping the plant on the dry side for fourteen days. Our plants usually make two pseudo-bulbs on each rhizome each year, the second one never flowering, and it is after this second one is completed that no more water is given than will keep the rooting materials moist, and in the depth of winter it should be allowed to remain unsupplied with water for a week at a time. The spikes are now appearing in the centre of the new growths, and nothing can be prettier than a spike with a dozen or more of its green and black flowers. No insect infests or harms the plant, but an occasional sponging of the leaves is necessary to free them from dust.

Cœlogyne asperata is another shy flowerer, but if subjected to the same kind of treatment as that described, it seldom fails to bloom. It should be planted in a well-drained perforated pan, using one-third each of fibry-loam, peat, and sphagnum-moss for compost, and sprinkling in a quantity of very small crocks during the repotting. It should occupy the same kind of position as C. pandurata.

Cattleya labiata and C. Gaskelliana. — These species having started to grow early this season, much care will be called for in order to prevent hasty development. No doubt it is the propensity to start into growth before there has been complete restoration of strength, which curtails the life of most Cattleyas grown in gardens, and we should endeavour to enforce rest so long as it is not injurious or contrary to the nature of the plants. To this end, a mild temperature, and a moderate degree of dryness at the root and in the atmosphere should be afforded, taking care that the pseudo-bulbs last made do not shrivel to any great extent. Cattleya Trianæi benefits by a long and thorough rest after the flowering is over, and even when new growths appear no difference in the treatment should ensue before the leaves are partially developed.

Odontoglossum citrosmum.—Our plants are now sending up their flower-spikes, rendering it very essential that the baskets or other receptacles in which they are growing should be wetted by immersing them in water for a minute or two, and water should be afforded often enough afterwards to keep the materials moist.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

The Fig-house.—Those Figs which are the earliest in point of growth will require close attention in regard to water at the root, as any lack of moisture in the soil may result in the dropping of the fruit. Endeavour should be made to afford moist surroundings without syringing the foliage, which leads to the ripening fruits being injured. The object with these early trees is the development of an early crop of fruits. A successional crop will result from suitable pinching of the current year's shoots when they have made from four to six leaves. Pinching tends to the formation of fruits, and preserves a well-balanced head. The use of artificial or other manures must be governed by the actual condition of the trees, and if there is ample foliage, but few fruits, root-feeding must be given up; on the other hand, if the crop of fruit is abundant, and the pots are filled with roots, and the growth is moderate, then manures will do good if applied in weak doses. The ventilation should be regulated in accordance with the state of the weather, but no opportunity should be lost of admitting fresh air to the house. A night temperature of 70° will be ample, with a rise by the aid of sunshine during the day to 85°.

Cucumbers in Frames.—Where a Cucumber-house or pits do not exist, or are not available, the Cucumber may be grown in dung-heated frames and pits during the summer and autumn months. The beds to afford bottom and top-heat may consist of fresh stable litter and tree-leaves of a lasting nature, as Oak, Beech, and Chestnut, which should be mixed together and thrown into a heap to induce fermentation before setting to work to make the bed. In quantity there should be enough to make the required hot-bed of an average height of 3½ feet. When the rank steam has been got rid of by the repeated turnings, the bed may be carefully built up, keeping much of the strawy litter towards the sides of the bed. The bed, if compactly made, that is, the materials are well mixed and made quite firm, will not get violently hot and then decline just as quickly, but will afford a lasting warmth, which warmth may be maintained for four months by the aid of dung linings. The bed should be made 1 foot bigger than the frames all round, and should be kept in form by having stout stakes driven into the ground at each angle. The linings may be put round the frames on the top of the bed at first, and later they must be built up from the ground. Each light of an ordinary frame will accommodate two plants, but for small frames one plant per light is sufficient. Under each light place several wheelbarrowfuls of rich soil in the middle in the form of a low hillock, additions being made later in such a manner as to make a level flat bed. Do not plant out the Cucumber plants until it is ascertained that the bottom-heat has declined to 85°, and the soil to 80°. Having set out the plants, keep the frame-lights as close as it may be safe to do, but as there is usually a good deal of hot ammoniacal steam for the first ten days, a chink of air should be afforded at night. If in the early morning pearly drops hang on the edges of the leaves, that is a good sign, and the plants will make fast progress, and will need no dewing over till 3 P.M., and perhaps not even then if the day is wet or dull. In sunny weather shade must be employed so long as air is afforded, and a light sprinkle of the leaves afforded at closing time. The treatment of the plants is in other respects similar to that given to Cucumber plants in houses. A test-stick or plunging-thermometer should be used to ascertain the degree of heat in the bed of soil, which should be kept to about 80°, by the means indicated above. To obtain straight fruits of varieties that grow to a great length, boxes or glasses should be used. The management in ordinary brick pits is the same.

THE HARDY FRUIT GARDEN.

By C. Herrin, Gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead.

Grafting.—Where this operation is to be carried out, either as a means of working a variety on to one whose fruit is less valued, or the rejuvenescence of an aged tree, the materials required by the grafter should now be prepared. First there is the clay, which in this country is commonly used for covering the point of union, to be mixed with short chaff or horse-droppings, and well "pugged" with a mallet so as to render it pliant and homogeneous. In place of horse-droppings or chaff alone, fresh cow-dung may be used alone or in conjunction with these, but not to exceed altogether the bulk of the clay. The whole, when fit for use, should be like stiffish mortar, and till the work begins, it should be put in a cool shed, and the heap covered with litter. Wait till the weather becomes milder before commencing to graft, and take Plums and Cherries (sweet) first, following on with Pears and Apples. When wood-buds on the branches burst, grafting may begin. The shoots which will supply the scions will have been laying in the earth on a cold border, and consequently they will be less forward than the growing stocks, and here they must remain till wanted.

Methods of Grafting. — A common method of grafting, and that adopted by nurserymen, is whip or tongue-grafting, the simplest and best form for all sorts of small stocks and scions. The scion and stock should correspond very nearly in diameter, the length of the first being 5 to 7 inches, and it must be furnished with two or three buds, two of these being above the junction of scion and stock. Having cut off the latter near to the ground or the spot desired, remove a thin slice of wood and bark from the stock about 3 inches long on the side where the upward cut was made in beheading it, and cut a similar slice from the scion, leaving a slight shoulder to rest on the top of the stock. Make a downward incision in the upper part of the stock about half an inch deep, and a similar upward cut in the scion, the one fitting into the other, and making a firmer join than it is possible without it, helping also to hold them together till secured by bast or worsted. The rind of the scion and stock when thus adjusted should meet together on both sides if possible; then proceed to bind them together, drawing the material moderately tight, but not so as to injure the rind of either. The last operation consists of "claying" the grafts. First, rub a little in and on to the matting, in order to exclude the wet, and then take a ball of clay, and gradually spread it round the graft, but not covering the top bud, so as to form an elongated egg-shaped mass, tapering off nicely at the top and bottom. If the fingers be dipped in wood-ashes or fine sand, the clay will not stick to them, and the moulding into shape will be the more easily done. Other methods of grafting will be mentioned in my next Calendar.

THE APIARY.

By Expert.

Condition of Stock.—Bees have from abnormal causes dwindled a good deal, and are therefore less able to keep their brood-nest warm than they were a month ago; and this, too, at a time when they naturally have commenced brood-rearing. Occasional cases may discover themselves during such hasty inspections as we have referred to where dysentery has set in, necessitating a partial transfer to clean, wholesome combs and a dry hive; but only in a very bad case should we do more than give the cake of soft warm candy.

Loss of Queens.—Queenlessness may be suspected where the bees exhibit unusual restlessness, but if they survive in any considerable strength we would prefer to leave them as they are until early in March, when the feeding-bottle may safely be used as an inducement to egg laying, should there chance to be a still-laying queen, or a frame with eggs may be given from some other stock. This would not only betray their actual queenlessness, by showing queen-cells a few days later, but quicken and preserve the bees, and supply them with the young bees necessary to the easy and successful introduction of a strange queen a few weeks hence. Entrances should be cleared of dead bees when such are observed. Those stocks will be best off which require no attention at all; all others must be handled with as little disturbance as possible. One of the worst habits a bee-keeper can acquire is that of constantly pulling bees about whenever the slightest excuse offers itself. Sometimes, of course, an inspection is imperative, and should not be delayed if at all possible. When any unusual appearance is noticed in a particular hive, say when a quantity of dead bees are seen on the floor-board, or no bees at all show themselves when other stocks are busy, an immediate examination must be made, and the necessary steps taken. So long, however, as the bees are seen flying when occasion offers, all may be assumed to be going well, and the less the bees are interfered with the better.

Seasonable Hints.—Plenty of indoor work, which should not be neglected, will now be found to occupy the spare hours of the evening. As spring advances time becomes more precious, and everything which can be got ready now will save time in the future. Sections, supers, and frames may be fitted with foundation ready for use, and stowed away till wanted. Provide a few frame-holders, i.e., rough boxes without top or bottom, made of half-inch stuff. They must be of the same dimensions, as insides of the hives used are very useful for holding frames fitted with full sheets of foundation, or when extracting.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	Mar. 21	Truro Show of Daffodils (2 days): Deputation from the Royal Horticultural Society.
WEDNESDAY,	Mar. 22	Show of Torquay Gardeners' Association.
SATURDAY,	Mar. 25	Royal Botanic Society, Meeting.

SALES.

TUESDAY,	March 21	The "Waddesdon Manor" Collection of Orchids, by order of Miss Alice de Rothschild, at Protheroe & Morris' Rooms (two days).
FRIDAY,	March 24	Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period March 5 to March 11, 1899. Height above sea-level 24 feet.

1899. March 5 to March 11.	Direction of Wind.	Temperature of the Air. At 9 A.M. Dry Bulb.	Temperature of the Air. At 9 A.M. Wet Bulb.	Temperature of the Air. Day. Highest.	Temperature of the Air. Night. Lowest.	Rainfall.	Temperature of the Soil at 9 A.M. At 1-foot deep.	Temperature of the Soil at 9 A.M. At 2-feet deep.	Temperature of the Soil at 9 A.M. At 4-feet deep.	Lowest Temperature on Grass.

Remarks.—The week ending March 11 was remarkable for clear, bright, spring-like weather. Once only was there any rain, viz., on the evening of the 8th.

Average Temperature for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—42·6°.

Actual Temperatures:—

London.—*March* 15 (12 P.M.): Max. 60°; Min. 40°.
Provinces.—*March* 15 (6 P.M.): Max. 59°, W. Ireland; Min. 42°, The Scaw.
Foggy, mild, damp.

The Daffodil Show at Truro.

The show of Daffodils and other spring flowers which is to be held at Truro on the 21st and 22nd inst., is of greater importance, and may have more far reaching consequences, than local exhibitions usually have. It is on this account, we presume, that a deputation from the Royal Horticultural Society has been told off to visit the show. As this involves a journey of about 280 miles, and an absence of at least three days, this is no light matter. We do not suppose that the Council would esteem the difference even between Magnicoronatæ and Parvicoronatæ as worthy of such a sacrifice if there were not some more important aims to be attained. Those who have the opportunity, as we have, of seeing the enormous quantities of flowers which reach the adjoining market from the South of France and elsewhere, a considerable proportion of which might have been grown here, must welcome the signs that our own cultivators are beginning to see that an opportunity is before them. The Scilly Islands furnish an excellent illustration in point. Thanks to the initiative and fostering care of the late Mr. Augustus Smith, and of the present Mr. Algernon Dorrien Smith, a brisk and profitable industry has sprung up on what, for our purposes, might have been called barren rocks. Now, the dwellers on the mainland are also waking up to a sense of the possibilities of the case, and endeavouring to supplement the tottering resources of agriculture by the more hopeful capabilities of fruit and flower-farming, and the Royal Horticultural Society very properly lends its aid and influence in the good cause.

The activity in Truro has been largely stimulated by the interest and energy displayed by the Hon. John Boscawen, who bears a name remembered with honour in the horticultural world. The amateurs of the county who are enthusiasts, have supported their secretary, and stimulated the professional growers. The Truro show will therefore be, in all probability, amply worth seeing. A journey to that part of Cornwall at this season is like going to the Riviera, whilst in some respects, as in the glorious masses of Rhododendron, Cornwall has the advantage.

Twenty-three classes are allotted to the exhibition of the several kinds of Daffodil in groups or otherwise, the premier prize being for forty distinct varieties of Daffodils. Spring flowers comprise Anemones, Polyanthus, Wallflowers, Tulips, Violets, and what must surely render the show magnificent, Azaleas, Camellias, and other outdoor shrubs, as well as Rhododendrons, Sikkim and other.

An article in the *Cornish Magazine* for November last gives an excellent idea of what Cornish Daffodils are. The growers aim at earliness, which, of course, is desirable; size, which is of minor moment, and may, if excessive, be objectionable; and colour, which Cornish light and air develop to a marvellous extent.

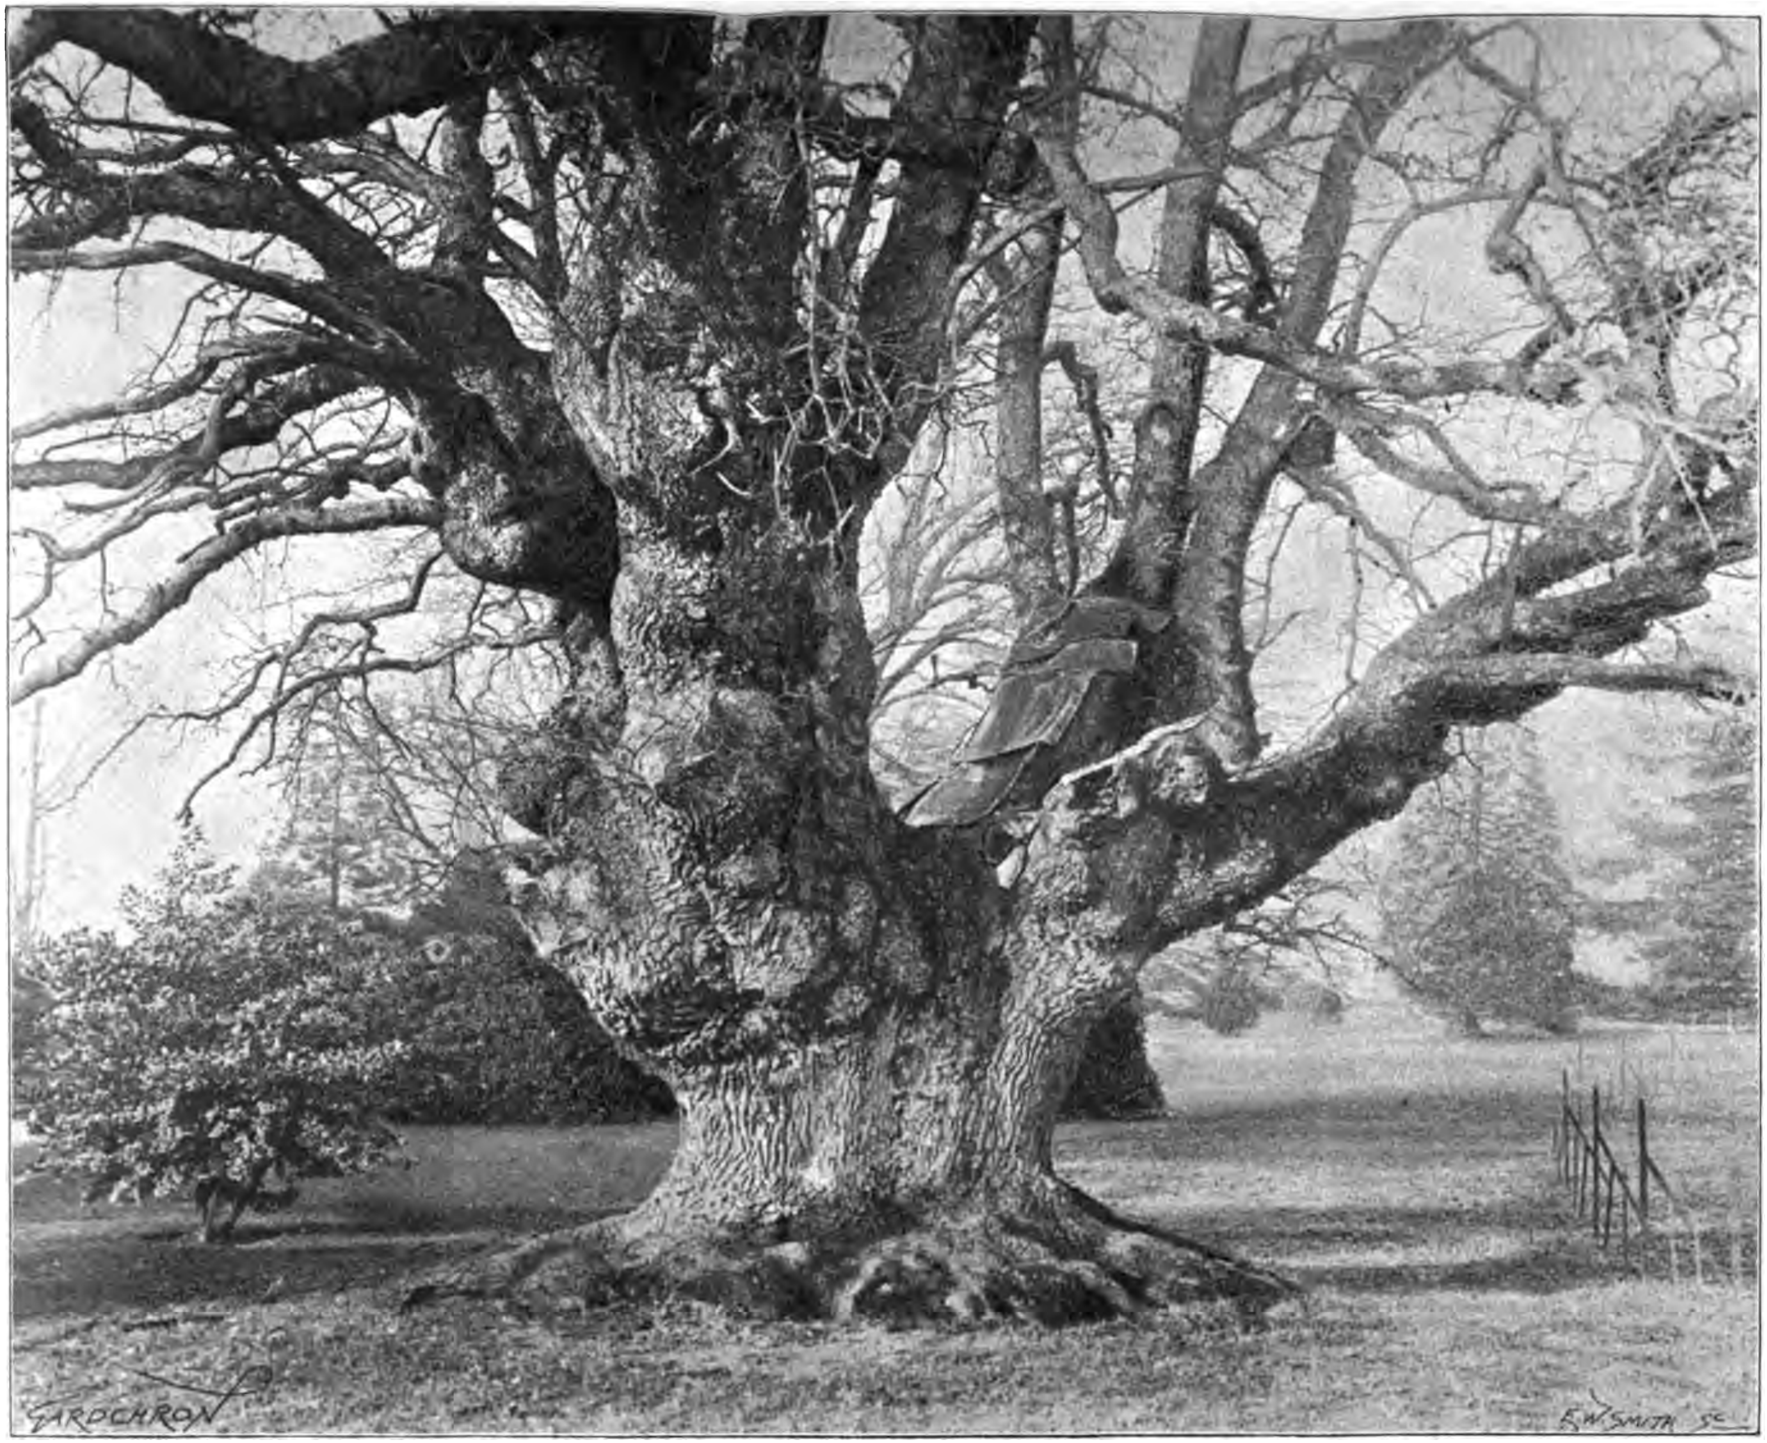
"For magnificence of [Cornish Daffodils], grown to perfection on a large scale, I have," writes Mr. Engleheart, "seen nothing to equal Mr. Andrew Lawry's flower-farm in Mount's Bay; the view of acre upon acre of the silver Poeticus ornatus, and the great waxen clusters of Grand Monarque stretching under the brilliant spring sky of Cornwall far away towards the blue bay, and the ancient mount of St. Michael upstanding in the sunlight, would need the idyllic gift of a Theocritus to describe worthily."

As giving some idea of the extent to which the cultivation is carried, Mr. Engleheart tells us that Mr. Dorrien Smith alone forces a million Poeticus ornatus annually! In short, then, looking to the opportunities of the Daffodil trade alone, every foot of suitable soil in Cornwall must steadily rise in value.

We have said enough to justify what we have said concerning the importance of the Truro show. Let us turn to another aspect of the occasion. Cultivators may do much, but their powers, after all, are limited by the "environment," as the scientific slang of the day denotes the conditions under which a plant has to live. With the careful hybridist the limitations are not so soon reached. The mere cultivator is relatively soon pulled up short—so far and no further can he go; but the possibilities of the judicious hybridist are much wider in their scope. There is no telling what new beauties may be in store for us. True, many (perhaps most) of the crosses raised may, for cultural purposes, be worthless, or no better, if so good, as the parental forms; but many of them will grow under conditions where others will not, and they are all of value to the scientific botanist. Amidst the crowd of undistinguished forms, one is pretty sure ultimately to blaze forth superior to anything before known. This is no enthusiast's dream. Has it not been already proven? Among the workers in this field we have had our Leeds and our Backhouse, and now we have among us one on whom the mantle of the late Dean Herbert has fallen. George Herbert Engleheart bears noble names, recalling at once the saintly George Herbert and the Dean, sagacious observer and skilled experimentalist—the forerunner of Darwin in many points, one whose work was hardly appreciated to the full by the generation in which he lived. Mr. Engleheart, as our readers well know, has taken up Herbert's work, has confirmed many of his assertions, and extended his observations, with what results the visitors to the spring shows in London and elsewhere can judge for themselves. At Truro, there will be no more competent critic than he, no one who is more completely master of his subject than he. Many a time and oft, our readers have had the benefit of his experience in these columns, and they will, we are sure, feel no slight interest in seeing the portrait of one to whom we, and they, in greater degree than they know, are under such obligations (see p. 163).

Let us bring this note to a close by quoting from the magazine before-mentioned two extracts from Mr. Engleheart's pen, which serve to show the spirit in which he is working:—

"This fearlessness of our rough English spring—March is 'the roaring moon of Daffodils'—has made it pre-eminently an English flower, and the hands of Englishmen have fashioned it to its present beauty. Over two and a half centuries ago Parkinson had anticipated Mr. Peter Barr in employing Pyrenean 'root-collectors,' and describes some hundred kinds of Daffodil. The magic art of cross-fertilisation was then undreamed of, and the possibilities latent in Parkinson's store awaited the coming of Herbert, first Dean of Manchester. Herbert, who in one side of his versatile genius, was something of a pre-Darwinian Darwin, published in 1843, the results of many years' experiments at his Yorkshire rectory of Spofforth, and demonstrated that the short-crowned Narcissi of the reputed 'species' N. incomparabilis are really hybrids between the trumpet Daffodils and the pheasant-eye, or N. poeticus. The first to avail themselves of this discovery, of such paramount importance for the enrichment of the spring garden, were Messrs. Leeds, of Longford Bridge, near Manchester, and Backhouse of Walsingham. By effecting this cross in variety, and inter-crossing the resultant seedlings with other flowers and one another, they obtained the host of lovely forms now in common cultivation. These, again, are being sedulously used by the hybridist for the further evolution of size, form, and colour. The subsequent workers in the same field have all been Englishmen. A few fine Trumpet Daffodils have been raised in Holland, notably the very beautiful white Madame de Graaff, by Messrs. de Graaff, of Leyden, but these seem to have been chance seedlings, and it is a curious fact that the Dutch, reputed quick to discern any avenue of profit, have never deliberately taken in hand the hybridisation of the Narcissus. The best Polyanthus Narcissi or Tazettas are, it is true, of Dutch origin, but these do not rank in general esteem or money value with other Daffodils, and have scarcely been improved for a century. Leeds sold his entire collection for a hundred guineas, and the sum was thought so large that it was found by a small company of purchasers. Twenty times the amount would now be thought a small price.



[From a Photograph by H. Dunning, Usk.

THE GREAT OAK IN THE PLEASURE-GROUNDS AT BRYNDERWEN, NEAR USK, MONMOUTHSHIRE.

At the death of JOHN HORSEFIELD, the Lancashire weaver, who raised the fine white and gold Trumpet Daffodil bearing his name, the few bulbs were sold by auction for eighteen pence a piece—*ic vos non vobis.*"

"Should a seedling ever attain to full red in both cup and petals, it would command an enormous price, but artistically considered, it would be somewhat of an outrage. The most disdainful of all Daffodils in its rejection of red is the dainty little N. triandrus, with pale, clustered, Cyclamen-like blossoms, as common in parts of Portugal as the Primrose in Cornwall, but practically unknown in England until fifteen years ago. From this, crossed with the larger garden kinds, I have a series of perfectly lovely hybrids with pendent Fuchsia-like flowers of the most refined cream and ivory-whites. But cross it as you will, with the most brilliant of the red-cupped sorts, the seedlings perpetuate its own simpler apparel, and never show a trace of red.

"A race more delightful to myself than perhaps any other are the Leedsii varieties, intermediate between N. poeticus and the white trumpets. It is remarkable that in this cross the former parent effaces the weakliness of the latter, and supplies a diversity of vigorous and very lovely white flowers. In the cups of some of these a quite exquisite range of colouring occurs, which can be only imperfectly conveyed by such words as salmon, citron, pricot. Recent seedlings, perhaps, foreshow the oming of true pink in the Daffodil. To appreciate hese delicate tints, the flowers should be studied n the late afternoon, when the sun is off them, nd they seem to create a still, magical atmosphere bout themselves."

THE BRYNDERWEN OAK.—As a Supplement to ur present issue, we present our readers with a hotographic illustration of a noble and magnificent ak upon Major-General GILLESPIE's estate, near Usk. A description of the locality and the measurements of the tree itself have been obligingly urnished us by Major-General GILLESPIE as follows:—"The house, grounds, and estate of Brynderwen are named after this tree. The literal translation of Brynderwen in the Welsh language being 'Oak on the Hill,' (Bryn) Hill, (Derwen) Oak. The house is built on a low range of hills which run parallel to the river Usk. The tree is 100 yards o the south-east front of the house. The hill range s a Silurian upheaval, and runs from north-east to outh-west, commencing about half a mile north of rynderwen, and extending nearly to the town of sk, some two and a half miles south. Some 2 feet below the surface there is a fine stratum of ravel, and all Conifers grow here in the greatest alth and luxuriance. Oaks flourish splendidly, d the slopes of the low range, and the banks of e river are noted for the magnificent growth and e of the Beech trees, many of which are well orthy the artist's brush. The back of the house es the river Usk some 80 yards distant. From e windows of the house the salmon can easily be scerned when on the move; and a magnificent norama of the Welsh mountains, including the gar Loaf, Blorenge, and Pontypool hills bound e horizon. The following are the measurements the Brynderwen Oak:—Circumference of bole at ound-level, 51 feet; trunk, at 4 feet from the ound, 22 feet; circumference of gnarled parting boughs from the trunk 6 feet 6 inches from the ound, 35 feet." The photographs were taken by r. G. DUNNING, of Usk, Monmouthshire, a well own local photographer.

LINNEAN SOCIETY: MARCH 2.—Dr. A. GÜNTER, F.R.S., President, in the chair. Mr. G. C. UCE, F.L.S., exhibited and made remarks on ecimens of Dianthus gallica from Jersey. Mr. C. DRUCE, F.L.S. read a paper on the reported urrence in Ireland of Carex rhynchophysa, and re reasons for believing that Carex rostrata var. ifolia had been mistaken for it. Typical specians of both were exhibited, and also a coloured wing by Mr. N. E. BROWN, A.L.S., of one of the plants collected by Mr. LLOYD PRAEGER near Mullaghmore Lough, Armagh. Some further remarks were made by Mr. C. B. CLARKE, more especially with reference to the descriptions of plants believed to be new to the British flora. Mr. EDWARD STEP, F.L.S., read a paper on the fertilisation of Glaux maritima. After examining some hundreds of flowers gathered along the coast near Port Scatho, Cornwall, he had come to the conclusion that the flower is protogynous. When open, the calyx-lobes at first separate but slightly, affording only a narrow entrance. The curvature of the style is sufficient to bring it within the fold of a calyx-lobe, from which the stigma projects so as to be in the way of any insect that visits the flower for the liquid that exudes from the ovary and base of the style. When the yellow pollen is shed, the style is either quite erect, or retains its original bend sufficiently above the anthers to make self-fertilisation probable. Owing to the lowly habit of the plant, and its customary crowding in with sea-sedge and grasses, it is not an easy one to watch. Doubtless it is often fertilised with its own pollen by the agency of flies and other insects; but from the position and precocity of the stigma, Mr. STEP considered that cross-fertilisation is quite as frequent. He was consequently unable to agree with Mr. HENSLOW (*Trans. Linn. Soc.*, n.s., Bot. i., 1880, p. 377, pl. 44, fig. 35) as to self-fertilisation in this plant, believing his conclusion to have been drawn from the examination of an abnormal specimen. Dr. JOHN LOWE, F.L.S.:—The flowering and fertilisation of Araujа albens, G. Don.

PARIS EXHIBITION OF 1900.—The total amount of space, including gangways, at the disposal of British exhibitors in the horticultural section, shown on the plan given in our last number, amounts to 3527 square feet.

THE SOUTH-EASTERN AND CHATHAM & DOVER RAILWAYS.—A petition extensively signed by the principal receivers of fruit in Covent Garden Market has, the *Times* is informed, been forwarded to the London County Council protesting against the proposed amalgamation of these companies, and pointing out that the combination would be detrimental to the interests of the growers in Kent. It is stated that "during the past few months fruit has been delivered in the market from six to twenty-four hours late without comment; this with the soft fruit will simply mean ruin to the fruit-grower. The amalgamation will be very serious to all interested in the fruit trade, as no benefit is likely to accrue by the proposed fusion."

—— At a large and influential meeting of Kentish fruit-growers and farmers, held at Maidstone last week, the amalgamation of the South-Eastern and Chatham & Dover Railway Companies was discussed. Mr. LENEY (chairman of the Maidstone Farmers' Club) stated that Mr. WILLIS had assured him that the companies were prepared to give the Kent farmers every facility if they would only say definitely what they wanted. The following resolution, proposed by Mr. CORNWALLIS, M.P., was passed:—"That no rate at present in existence on either line for the conveyance of fruit or other agricultural produce should be raised, and that a clause should be inserted in the Amalgamation Bill to this effect. That this meeting also draw the Companies' serious attention to the late delivery of fruit by them, and the great difficulty experienced in obtaining a prompt return of empty baskets."

—— A deputation consisting of members of Parliament, representing constituencies served by the South Eastern and Chatham Railway Cos., and representatives of fruit-growing and other important industries, waited upon Mr. COSMO BONSOR, M.P., chairman of the managing committee of the joint lines, at Charing-cross Hotel, recently. The deputation, which was introduced by Sir WILLIAM HART-DYKE, M.P., included Messrs. GEORGE WYNDHAM, M.P., LAURENCE HARDY, M.P., A. S. T. G. BOSCAWEN, M.P., J. PENN, M.P., A. H. A. MORTON, M.P., J. H. DUDLEY RYDER, M.P., HENNIKER HEATON, M.P., Colonel WARDE, M.P., and Lord CRANBOURNE, M.P. Sir WILLIAM HART-DYKE said the deputation would like to hear the policy proposed to be adopted by the joint lines in the event of the Bill for amalgamation receiving the sanction of Parliament. [It has since passed the second reading.] Two years previously the then chairman of the South Eastern Railway made certain very satisfactory promises with regard to rates for agricultural produce, &c., but said it would be impossible to give effect to such promises until a working arrangement had been arrived at with the Chatham Company. Mr. COSMO BONSOR, in reply, assured the deputatien that the pledges given by Sir GEORGE RUSSELL should be loyally fulfilled by the managing committee, and the key to the reform which the deputation were so desirous of effecting was the provision of new capital, and that capital, so far as the Chatham Company was concerned, could not be provided except by means of the present Bill, consequently the rejection of the measure would mean that the reforms referred to must be indefinitely postponed, whereas the passage of the Bill would ensure their being carried out. He also gave the deputation assurances with regard to workmen's trains, and other matters. Sir WILLIAM HART-DYKE then thanked Mr. COSMO BONSOR, and the deputation withdrew.

CAUTION TO ADVERTISERS.—The Publisher desires us once again to warn advertisers as to the tricks and devices of those who seek to obtain money from them under the promise of obtaining situations for them. One such epistle is before us, dated from 16, Air Street, Regent Street, London (a newsvendor's shop). In it the writer makes mention of a nurseryman at Highgate, who has also four retail shops at the West End, and contracts for the supply of flowers, fruit, and forced vegetables to all the principal West End Hotels. The name of the nurseryman with this extensive business is quite unknown to us, and finds no place in the Horticultural Directories, so far as we can see. A "security" of £2 is asked of the advertiser for an introduction to this desirable employer. We trust no advertiser will be so unwise as to accede to the suggestions of anyone who makes such a demand.

A NEW HORTICULTURAL PAPER.—Messrs. Cassell & Co. announce a new weekly penny gardening paper, to be known as *The Gardener*. The first number will appear next week.

CAPE FRUIT.—The *Tantallon Castle* has arrived from the Cape with 792 boxes of Grapes, 63 of Peaches, 16 of Pears, 87 of Plums, and 5 of Nectarines. The Plums once more proved of excellent quality, and quickly sold at high prices. There seems to be a good market here for this kind of fruit, and it is to be hoped that we may be favoured with larger supplies next season. Of the Black and White Grapes most were in good condition, securing good prices—the black as usual fetching the higher figure. The Pears, it may be noted, were poor in quality, and hardly worth selling. The Nectarines were not put on the market. The Peaches were first-class fruit, and sold at good prices.

HYBRIDISING.—Our energetic American contemporary, *American Gardening*, of New York, announces in its issue of March 4, an important prize offer for articles on hybridisation. In all, thirty pounds (£30) will be given in three prizes, of fifteen, ten, and five pounds respectively. The offer is contained in the following words: "For the best paper on hybridisation, treating the subject from the point of view of its value to science and to horticulture. No special group of plants is specified, the writer being expected to give, in concise form, a general treatment of the subject, and to treat it from an historical as well as from a practical and scientific point of view. No paper to be under

1000 words in length, nor to exceed 5000 words." Papers in the competition must be sent in to the Editor, *American Gardening*, 136, Liberty-st., New York, U.S.A., on or before April 15 next.

SPECIES OF ROSA WHEREWITH TO EFFECT CROSSES.—It is stated in our contemporary, the *Rosen Zeitung*, that of species to operate as seed-bearers or pollen-bearers, are R. Harrisoni and R. sulphurea flore-plena. The former consist of Maréchal Niel, Jean Pernet, Madame Falcot, Medea, and Sunset; and the pollen-bearers, Beauté Inconstante, Belle Lyonnaise, Gustave Regis, Comtesse de Frigneuse, and Madame Pernet Ducher. Rosa sulphurea plena might be similarly crossed both ways. This is an extremely floriferous hardy plant, flowering in June, and bearing fruits freely. It is considered extremely probable that some distinct and beautiful varieties would result from crosses effected between the two species and the five varieties named.

THE BOTANICAL MAGAZINE. — The March number contains coloured plates and descriptions of the following plants :—

Dryandra calophylla, R. Br., t. 7642.—A low-growing shrub of tufted habit, with numerous spreading leaves, about 1 foot long; linear pinnately sect, the lobes ovate, triangular, dark green and glabrous above, rufously hairy beneath. The yellow flowers are densely arranged in close heads, surrounded by a short involucre of leafy bracts. Flowered in the temperate-house at Kew in 1893.

Passiflora pruinosa, Mast.. t. 7643.—See *Gard. Chron.*, 1897, vol. ii., 393, f. 17.

Kniphofia Tuckii, Baker, t. 7644.—See *Gard. Chron.*, 1893, i., f. 68.

Gynopleura humilis, Romer, t. 7645.—A much-branched, low-growing annual, with hairy, linear, oblong leaves, and terminal corymbs of whitish flowers, with much of the structure of a Passion-flower, and very interesting botanically. A native of Peru and Chile.

Rosa acicularis, Lindley, var. nipponensis, Hook., t. 7646.—A single-flowered Rose, originally derived from Japan; more or less covered with glandular bristles; leaves with four pairs of pinnæ and a terminal leaflet, stipules leafy; flowers deep rose-pink, surrounded by a calyx of five linear, entire sepals; pedicel studded with glandular hairs, fruit elliptical red, contracted at the throat and surmounted by the withered sepals.

"PARK AND CEMETERY" is the title of a monthly publication issued at Chicago, to which we have nothing precisely analogous. It is "devoted to art out-of-doors, parks, cemeteries, town and village improvements." Certainly, great improvements are needed in the decoration (?) of our cemeteries, where too often the beautiful lines of the landscape-gardener are defaced by the obtrusive productions of the cemetery-mason. A society exists called the Association of American Cemetery Superintendents, the object of which is to "cultivate a sense of the beautiful;" and the journal before us has the same object.

"GÄRTNERISCHES CENTRAL BLATT."—This is a new German periodical devoted especially to nomenclature, the knowledge of plants, plant nutrition and plant protection, the industrial and hygienic properties of plants, as well as the educational and literary aspects of botany. The editor is M. ANDREAS VOSS; the business manager, to whom all letters are to be addressed, is Mr. C. DARMER, Weissenburgerstrasse 66, Berlin.

NEW CREATIONS IN FRUITS AND FLOWERS.—This is the catalogue of Mr. LUTHER BURBANK, one of the greatest of hybridists. Visitors to his grounds at Santa Rosa, Sonoma County, California, "are not allowed, as no possible benefit can accrue, and we have no time to spare." Nevertheless some who have penetrated into the fastness describe their astonishment at the vast number of experiments carried on, and we venture to think that in exceptional cases great benefit would accrue from a visit to such an establishment. The present number is largely occupied with the description and illustration of new Plums which have not as yet found their way here, but which represent types of Plums of totally different origin to our European varieties.

DEATH THROUGH LOCKJAW.—Mr. WYNNE E. BAXTER, coroner, held an inquest recently, at the London Hospital, on the body of WILLIAM ANDREWS, aged 15 years, a nurseryman's assistant, late of 193, Higham Hill Road, Walthamstow. The evidence showed that the deceased was employed at TRICKER'S nursery, Walthamstow, and called out to some painters who were working there, "You lazy fellows." One of the painters ran after the deceased, who caught his foot in the frame of a greenhouse, and fell to the ground on some broken glass, sustaining a cut on the knee. This did not appear serious; but on Thursday last his neck and then his jaw became stiff, and death took place from tetanus. The coroner remarked, that it was now a well-known fact that the tetanus bacillus was found in the earth, and the mischief was evidently done when the deceased fell to the ground. A verdict of "Accidental death" was returned.

CARNATIONS IN AMERICA.—We extract from *The Florists' Exchange* some details relating to an offer of 5000 dols. for a Carnation superior in quality to "Mrs. Thomas W. Lawson," the stock of which was lately bought for 30,000 dollars.

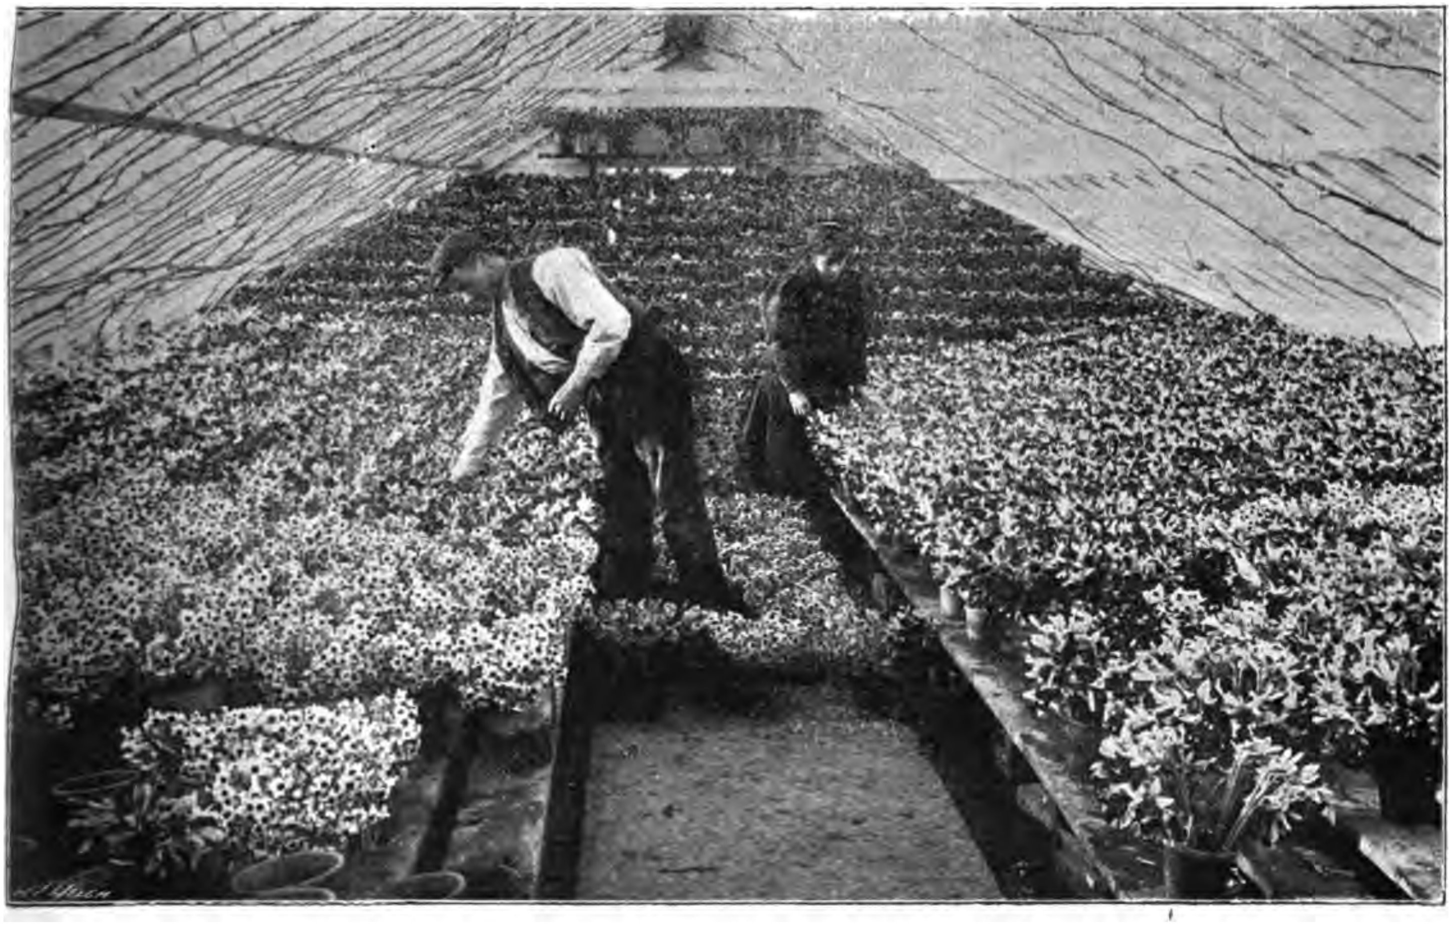
> "I hereby agree to pay over to the owner of the Carnation which shall be adjudged to be equal to the Mrs. Thomas W. Lawson Carnation the sum of Five Thousand Dollars (5,000 dols.) upon the following terms and conditions :—
>
> First.—The competition shall take place at the next annual meeting of the American Carnation Society, to be held February 16 and 17, 1899.
>
> Second.—If my prize is not awarded at this competition the competition shall be renewed at the succeeding annual meeting of this society in 1900, at which time, if my prize has not been awarded, I reserve the right to withdraw my offer.
>
> Third.—The judges are to be three in number, one selected by the American Carnation Society, one selected by me, and the third named by these two.
>
> Fourth.—The payment of the prize of Five Thousand Dollars (5,000 dols.) to be made by me to the successful competitor upon the presentation to me, by him or his duly authorised agent, of the certificate of award and the transfer to me of all plants owned or controlled by him and a full title to the ownership of the flower and the right to name it, or to rename it if it has already been named (that is, as it has been said that 5,000 dols. is an enormous price to pay for any Carnation which has not already become known and largely advertised, it is understood and agreed by all competitors, that in the event of their being awarded the sum of 5,000 dols., they will part with their ownership in the name of the winning Carnation, in other words I will not be offering a premium of 5,000 dols. to destroy the large investment that I have already made in the Carnation I now own, but instead will be offering 5,000 dols. for another Carnation the equal of the one I now own).
>
> That no misunderstanding may arise as to my desire, I will say, it is now my intention to present the Mrs. Thomas W. Lawson Carnation to the City of Boston, with a proper fund for its propagation, for the benefit of her hospitals and public institutions, and to also present in the same way and for the same purpose the Carnation which I may acquire through this competition.
>
> Fifth.—The Carnation eligible for this competition must be pink in colour.
>
> Sixth.—In judging, the value of points must be in the following order:—
>
> First.—Colour (light pink, or what is known as the cerise shade, to be the starting or perfection point; due weight is to be given to the colour that is most attractive and brilliant under artificial light).
>
> Second.—Size of flowers.
>
> Third.—Length and strength of stem.
>
> Fourth.—Habit, calyx must not split, commercial value, freedom from disease, propagation whether free, and freedom of flowering.
>
> Seventh.—Each lot for competition must consist of one hundred blooms."

BELGIUM ON THE CONGO.—"The activity of the Belgians has, says an Exchange, created in the heart of the mysterious Dark Continent twenty-four commercial companies, with a capital of about £3,800,000. Belgian commerce, which in 1885 was almost nil, amounted in 1897 to £500,000 for exports from the Congo to Belgium, and to £6,000,000 for imports from Belgium to the Congo, or a commercial movement of £1,100,000. There are few instances in the history of colonies of so rapid a commercial development. The country is hardly explored before merchants and manufacturers come forward and found companies for the building of new railways, create new plantations for the numerous rich tropical products, raise cattle, and build hotels and trading posts. In consequence of the King's speech at Antwerp on October 16 last, Belgian capitalists have become interested in the project of establishing a line of steamers between Antwerp and the Congo Free State, to be manned and officered by natives of the country. The idea, as reported, is to put shares on the market at such a rate that the people will be able to subscribe for them; and it is confidently expected that there will soon be a considerable increase in the Belgian merchant marine. The number of Belgian inhabitants, according to a late estimate, is 1060; acres cultivated by the State, 24,710; under concession to private parties, 79,072,000; Coffee-trees, 4,000,000; Cacao-trees, 125,000; Tobacco plants, 76,000; steamships on the Upper Congo, 41; tonnage, 1060."

AUTUMN COLORATION OF LEAVES.—In a recent number of *Nature*, Mr. E. OVERTON notes that he observed the leaves of Hydrocharis morsus-ranæ, or frog-bit, to become of a reddish-brown colour when placed for some days in a weak solution of cane-sugar. The colour is due to the appearance of red cell-sap in the palissade cells and in the cells lining the air chambers of the leaf. This red cell-sap occurs normally in the tissues of the plant, especially when exposed to the sun and to a concurrently low temperature; but is much more abundantly produced when the plants are cultivated in sugar solutions. Mr. OVERTON concluded from these experiments, and from the observation of autumnal leaves in Switzerland, that an increase of sugar at the cost of starch might be one of the factors concerned in the production of red pigment. LIDFORSS has shown that during the winter the leaves of our native plants are devoid of starch, but contain much sugar. The red colouring matters are probably of the nature of glucosides and are in most cases unions of tannin compounds with sugar. The climatic conditions of autumn—viz., bright light, and relatively low temperature—favour the production of the pigment. It is possible, says Mr. OVERTON, to produce red tints at any time of the year by feeding them with glucose, but only in those cases where the colour is in the central cells of the leaf. Where the coloration is in the epidermis, experiments with glucose are unsuccessful. Here is a fine field for experiment opene up to the student, and one the practical importanc of which is obvious.

TILLAGE.—The great advantage of tilling t soil, says M. DEHÉRAIN, is to assure the retentio in the soil of reserve stores of moisture—moistu which is necessary as the condition requisite for th operation of the ferments which fix the nitrogen i the soil, and render it assimilable. *Comptes Rend February* 20.

SOCIÉTÉ ROYALE D'AGRICULTURE ET D BOTANIQUE DE GAND.—At a meeting of the abov held at Ghent, on March 6, the following awar were made:—Certificates of Merit for Chr Madame Bral-Fortie, from M. B. Fortie; Erioc-nema Mémoire de Madame Rigouts, from M. A. Rigouts; Eriocnema Brilliant, also from M. A. Rigouts; for a seedling Dracæna, from MM. d Reuse Frères; and for Dendrobium Wardianu grandiflorum, from M. L. De Smet-Duvivie Certificates of Merit for cultivation and flowerin were awarded for Polygala Dalmaisiana, fro M. E. Bedinghaus (*à l'unanimité*); Acacia Sophor Acacia rupicola, and Erica arborea, all from M



From a photograph by] [*R. H. Preston, Penzance.*

Fig. 58.—The Narcissus harvest in Scilly: preparing blossoms for the market.

E. Bedinghaus (*par acclamation*); for Imantophyllum Madame H. de Bisschop, from M. V. de Bisschop (*par acclamation*); for Odontoglossum roseum, from M. L. de Smet-Duvivier; Boronia megastigma, from M. E. Bedinghaus; and for Acacia acinacea, also from M. E. Bedinghaus (*par acclamation*). Certificates for novelty were awarded for sport Azalea Petite Simone, from M. A. Cardon; and for Eriocnema Perfection, from M. A. Rigouts (*par acclamation*). Certificates for a good variety were allotted to Odontoglossum Alexandræ, from M. le Comte J. de Hemptinne; and to Lycaste Skinneri elegantissima, from M. J. de Cock. Honourable Mention was awarded for Odontoglossum flaveolum, shown by M. L. de Smet-Duvivier. Honourable Mention for a good variety was awarded for Kentia robusta, from MM. de Reuse Frères. The jury hope to see staged at the next meeting the collection of plants imported from the Congo, by MM. Haes & Son, of Saffelaere.

The Surveyors' Institution.—The next ordinary general meeting will be held on Monday, March 20, when a paper will be read by Col. G. W. *Raikes* (Fellow), on "The Report (No. 2) of the Royal Commission on Local Taxation, especially dealing with Valuation and Rating in respect of Tithe Rent-Charge." The chair will be taken at eight o'clock.

Proposed Special-Certificate Examinations, 1899.—Notice is also given that the next Special-Certificate Examinations in Forestry, Sanitary Science, Land-surveying and Levelling are proposed to be held on Tuesday, Wednesday, and Thursday, June 13, 14, and 15. Particulars of these examinations can be obtained from the Secretary.

Country Meeting at Bristol.—It has been decided, on the invitation of the Somerset, Gloucester, and North Wilts Provincial Committee, to hold the next country meeting at Bristol on April 26 and 27. The first day will be devoted to papers and discussions, with a dinner in the evening; the second day to excursions to various places of interest in Bristol and its neighbourhood. Full particulars will be issued a little later on.

New Orchids.—W. J. Klinge, Botanices Doctor, has reprinted from the *Transactions of the St. Petersburg Garden*, vol. xvi., a series of descriptions of new Orchids, cultivated in the stoves of the Imperial Botanic Garden. The new species figured are Aërides siamense, t. 1, figs. 1 to 5; Catasetum rostratum, t. 2, fig. 22; Cattleya bicolor var., t. 1, fig. 6; C. brasiliensis, t. 1, figs. 7 and 8; Cirrhopetalum ciliatum, t. 1, fig. 15; C. pileolatum, t. 1, fig. 9; Cymbidium Queeneanum, t. 2, fig. 13; Maxillaria guianensis, t. 2, fig. 18; Microstylis madagascariensis, t. 2, fig. 20; Pleurothallis flaccida, t. 3, fig. 35; Polystachya quinqueloba, t. 3, figs. 30 and 31; Sarcanthus pendulus, t. 3, figs. 32 to 34; Stanhopea oculata var. constricta, t. 2, figs. 26 and 27; S. oculata var. geniculata, t. 3, fig. 28; Zygopetalum ovatilobum, t. 3, fig. 29; Habenaria claviformis, t. 2, fig. 11 and 12; Maxillaria cepula var. pallida, t. 2, fig. 17; Stanhopea intermedia, t. 3, figs. 23 to 25.

Primula obconica.—The following note is taken from the paper of Dr. Kirk's in the *Lancet* of March 4, referring to the irritant nature of this plant:—"It turned out that my patient had all along been cultivating and frequently handling this plant, and she stated that she had occasionally chewed the flowers and swallowed the juice, but could not say whether she had done so shortly before either of the acute attacks here recorded. The noxious plant, being now discarded, there was no further return of the mischief, except on one occasion, when from curiosity she held a leaf in contact with her lips for a short time, soon after which they, together with the point of the tongue, swelled up for some hours. The important facts remain to be added, that she had handled the plant for one or two years before the first blistering of the lips was experienced, whilst the rest of the family had been unaffected by it, although a sister was as much given to chewing the flowers as the patient herself. Numerous cases in which this irritant has produced similar, but rarely, if ever so severe, effects as those observed in this case have been recorded of late in both medical and lay journals, and from these several sources the following facts stand out prominently:—(1), that the effects are described as erysipelas, uticaria, but more especially as eczema of the face and hands, sometimes attended with much swelling; (2), that some constitutions are specially susceptible, while others enjoy immunity; and (3), that apparently the majority of sufferers have been females, although on the latter point the evidence is not decisive.

THE NARCISSUS IN SCILLY.

In our issue for March 26, 1898, we gave an illustration of a Narcissus garden in one of the Scilly Islands, showing a number of men and boys engaged in gathering Narcissus blooms for market. The illustration in the present issue (fig. 58) affords an idea of the subsequent treatment of the cut blooms previous to their being packed in wooden boxes, containing a dozen or more bunches.

It is the practice of the cultivators of these flowers to gather them before they are fully expanded, and to place them in vessels containing water, which are stood in a building having a temperature of about 50°, so as to force them to expand.

The fact of this being done without, as it were, ageing the flower, enables it to remain in good condition for a longer period of time than would be the case if it expanded fully in a natural manner.

HOME CORRESPONDENCE.

THE BLACKBERRY AS A PROFITABLE FRUIT.—In the January monthly number of *Chambers' Journal* attention is drawn to the fact that the common wayside berry has been successfully cultivated in various parts of England and Scotland, so much so, that the fruit has found a place in the fruiterers' shops, and a ready sale effected. A few particulars are given as to the method of culture adopted by Mr. Cabell at Larbet in Sutherlandshire:—"Each bush is planted 3 feet from its fellows, and trained on wires, which are fixed on posts 6 feet in height. There are two rows of bushes, each 20 yards in length, and running north and south, so that the sun can act equally on both sides of the rows. At first little manure is needed, but by the third year the plants will have reached maturity, and can be treated more liberally." From the two rows of bushes described there was gathered in 1897 about 99 lb. of luscious fruit, and as the weather last year was more favourable, the crop may, no doubt, have been greatly increased. This really looks as if the culture of the Blackberry might be made a profitable industry. When we think how hardy the plant is, and what fine crops of fruit it will bear in hedgerows and copses, where it does not receive any cultivation, and what fine fruit can be met with during a favourable summer and autumn, it is not difficult to imagine that the Blackberry might take a high place among our cultivated fruits. Perhaps there is no fruit less liable to the attacks of insects and birds, and for the space of three months—that is, through August, September, and October—fruit can be gathered in prime condition. The Blackberry-bush produces successive crops, which is more than can be said of a good many of our cultivated fruits. Instances are not wanting of the improvement made in the common Blackberry under cultivation, for, given a congenial soil, the berries come of large size and fine quality, size in the fruit, and improvement in their flavour. Of European Blackberries, R. laciniatus seems to do remarkably well [R. laciniatus is British]. I remember some fifteen years ago seeing a glorious bush of it at Castle Ashby laden with fruit; and Mr. George Beech, who was then the gardener there, stated that it was invaluable to him in making up large desserts. He was at the time gathering really magnificent fruits, but he cultivated it well. I often wonder this fine Blackberry is not more grown by gardeners. When cultivated, it is found to bear earlier than the bushes in the hedgerows. Kittaating and Wilson, Jun., are earlier still in bearing, and the former is perhaps the best flavoured, while it is of a robust constitution, and the core to the fruit is not so large as that of Wilson, Jun. *R. D.*

PASSIFLORA RACEMOSA.—I recently noted a fine specimen of this charming species in capital condition in the garden of F. C. Stoop, Esq., West Hall, Byfleet. The plant was trained on wires attached to the roof, and extended the full length of the house, about 25 feet. It was a mass of flowers and flower-buds. The gardener, Mr. Carpenter, considers it one of the finest plants for a cool-house, as it is almost continually in flower, and the cut blossoms are useful for indoors decorations. The flowers are of a deep red colour, large in size, and borne in terminal pendulous racemes. Although not suitable for small glasshouses, unless much pruned, it deserves mention by reason of its attractive colour, free flowering, and the ease with which it may be grown. When planted out in turfy loam, peat, and sharp sand, it grows quickly, soon covering a large area. Propagation is by means of cuttings of the young shoots, taken in the spring, with a heel attached, and struck in a close frame or under a bell-glass in moderate heat. This species is a native of Brazil, introduced from thence in 1815. A synonymous name adopted by some authorities is that of Passiflora princeps, under which it was described by Loddiges in his *Botanical Cabinet*, p. 84. *E. S., Woking.*

AVENUE TREES.—A stately avenue is usually an admired feature in a gentleman's demesne, or being a public road; but this mode of planting is not favoured by present-day landscape gardeners. I remember seeing a few years ago an avenue of Populus alba on the Earl of Pembroke's estate, near Salisbury—an avenue worth walking a good many miles to see, and one that is probably unrivalled in this country. Not many miles distant, near Romsey, a fine avenue of Elms may be seen. An avenue, if the trees planted suit the use and the soil, is a desirable feature, and when it forms the road to the residence, the importance of the latter is enhanced. In well-timbered parts an avenue may seem out of place; on the other hand, if big timber is scarce, and there is no fine scenery to preserve, then, I think, an avenue is an improvement. It is important not to plant the trees nearer to the sides of a road than 10 feet, especially if Conifers are chosen for forming the avenue. Most deciduous trees have a good length of clear stem, and some planters like to see this class of tree, when grown up a good height, meet across the road, and so form a leafy canopy; and to enable this canopy to form early, the trees could be planted nearer to the roadside. I would recommend the distance apart to be 24 feet for the Conifers, and 18 feet for the deciduous class, more or less accordingly, as the natural habit is spreading or compact. As good avenue trees I may mention Horse-Chestnut, Pavia, Limes, especially the American; the wild Cherry (Gean), very desirable on account of its masses of white flowers in the spring, and the rich bronzy leaves in autumn—it is like the Beech in the counties of Oxford, Berks, and Bucks, or wherever the soil is chalky. Among Conifers are Cedars Deodara, atlantica and Libani, Abies nobilis glauca, Pinus austriaca, Abies Nordmanniana. Conifers, if they are to live long, need a deep loamy soil. Other species often planted are Araucaria imbricata, Sequoia sempervirens, S. gigantea, and Cryptomeria japonica, and in good, well-drained soils, they are eminently satisfactory trees. *A. J. L., Wyfold Court.*

THE DROPMORE DOUGLAS FIR.—Your correspondent, "E. W. B.," is in error in stating the Douglas Fir at Dropmore to have been raised from a cutting. The late Mr. Frost has left the history of the tree in his own writing:—"The seed that produced this tree was sent from the Horticultural Society to Lord Grenville about mid-winter 1827-28, by the name of Abies taxifolia." Probably "E. W. B." has confused this with some other tree, unless, which is probable, he fell a victim to one of my worthy predecessor's waistcoat-pocket stories, which he was so fond of relating in characteristic style. *C. H.*

GARDENERS' BENEVOLENT INSTITUTION.—For fully forty years past I have been permitted to read regularly the pages of the *Gardeners' Chronicle*; I can honestly say that up to now no article printed therein has seemed to me so well timed, sympathetic, and logically written for the purpose intended as the one by Mr. Owen Thomas, at p. 152, referring to the above-named Institution. In my opinion it should be printed with good type in letters of gold, by the thousand, then framed, and hung up in every gardener's cottage and bothy in the three kingdoms. Few gardeners can have more respect for gardeners and horticulturists as a body than myself. I must add that I think it somewhat of a blot on their otherwise fair fame that hundreds, if not thousands, more of the gardening fraternity do not support the Institution in question. Having had my say in your columns some years since, I will, with your permission, only add this thought now. Is it not possible to get the wives, sisters, and daughters of gardeners to interest themselves generally in this matter, as some few do now? What I would suggest is, that every gardener's cottage in the country should possess a plain, neatly-made box, with "Garden Charities" stamped upon it in good bold letters. Into this box the female who presides over the household might put in a small sum weekly, as opportunity offered. The box could be opened annually when the time for paying subscriptions arrives. As a rule, the amount necessary to make these up would not be large, and not prove a serious drain on the amount at hand for general household expenses. Having had a fairly large family to bring up and educate, with the too often unavoidable expenses of illness, &c., I have known something of this difficulty. Sixpence per week put on one side, as I suggest, would pay the annual subscription to both the Gardeners' Royal Benevolent Institution and its close relative the Royal Gardeners' Orphan Fund. To those of my brothers of the craft who may not be in a position to spare the whole amount at once, I respectfully commend this suggestion, and would ask them, in all good faith, to bring it to the notice of their wives, daughters, or sisters, as the case may be. It only requires the will to begin, the rest is certain to follow. *Henry J. Clayton, Grimston Gardens, Tadcaster.*

MR. DIBBENS' POTATOS.—As the Winchester raiser of Potatos appraises the merit of his seedlings, it may be suggested that he send us over some twenty tubers of a few of his best to Chiswick for trial this season. He may be assured that if sent there they will receive every attention, and be estimated by the Fruit Committee when seen in the autumn with the utmost fairness and impartiality. The Committee have no partialities, and treat everybody's product with equal courtesy. Of course, it does frequently happen that what seem to be swans in one place are, when tested with the best at Chiswick, but ordinary ducks. Mr. Dibbens may take it for granted that although some hasty persons have drawn false conclusions from statements of the President of the Royal Horticultural Society not long since, that the garden [illegible] exhausted; and though that is to some exte[illegible]pherically true, yet the soil is not at [illegible]hausted; and last year, in spite of the dro[illegible] it produced some grand crops of Potatos, bet[illegible]n which I have never seen. We specially [illegible] to see how these Winchester seedlings come [illegible] the disease ordeal. So far no variety [illegible] yet proved itself to be absolutely disease-resisting, but many have proved to be comparatively so, [illegible] in that respect there has been great gain, which [illegible] all Mr. Dibbens tells us be true, may be [illegible]ally added to. *A. D.*

CHOISYA TERNATA.—This beautif[illegible]green shrub gives promise, owing prob[illegible] the abnormal heat of last summer, of [illegible] than usual abundance of bloom. Almost [illegible]shoot is set at the point with flower buds. As [illegible]tive subject at any season, but especially so d[illegible] the months of May and June, when bedecked [illegible] its sweet scented white blossoms, the merits of this shrub deserve that it should be grown more commonly in the South of England and other warm localities where the climate is suitable. In these parts it looks charming in the form of a bush in corners and angles of buildings, also trained on warm walls where it attains a height of more than six feet. It grows well in any free garden soil, but in soils of a heavier nature, planting in a compost of loam, peat, and sand, is recommended. Young plants can be quickly raised from cuttings, which root readily on a mild, hot bed. *James Baxter.*

GALANTHUS MELVILLEI.—In my remarks upon Snowdrops on p. 129, I accidentally omitted any reference to one of the finest of our varieties of Galanthus nivalis. This is the variety Melvillei, which is very fine in every way, and can hardly be excelled for its beauty. Whether it is due to the climate or soil, it appears to be even finer at Dunrobin Castle than with us in the South-west of Scotland. Mr. D. Melville very kindly sent me some flowers from Dunrobin, and their beauty surpasses that of any flowers I have had here of the same variety. *S. Arnott, Carsethorn, by Dumfries, N.B.*

NEW INVENTION.

Our illustration (fig. 59, p. 173), shows a new device, patented by the Rev. E. Darnley Smith, of Landscove Vicarage, Ashburton, for protecting ripening fruit from the attacks of birds, wasps, snails, and other injurious creatures. The protector is made of celluloid-netting, so that it is very light and neat in apperance and free from smell. The figure shows a form adapted for Pears, but others of different sizes and patterns are manufactured for Peaches, Grapes, nd other fruits. The protector is made in two alves with a hinged-joint so that it can readily be pplied to the fruit without risk of undue handling r bruising. When placed in position, it may be uspended from the branch, and the appliance closed y clamps fixed to the edges. It can, of course, be tilised for a variety of purposes, one of which may e the protection of flowers that have been cross-ertilised and from which it is essential to exclude nsects.

Though the material is nearly as light as muslin, t admits as much or even more light to the fruit, nd it is, of course, much more durable. We are informed that trials have been made with the protectors for the last three years, and that they have been continuously exposed in all kinds of weather, fierce sun and heavy winter-rains, without injury. We ought to add that the material is readily inflammable, and we have known serious accidents arise from this circumstance, but the risk in this particular instance is small, unless perhaps from lightning where walls are wired. The cost will vary from about 24*s*. per gross for Peaches, and to 30*s*. per gross for Pears. The ice will vary according to the size of the otectors and the quality of the material ployed in their construction, but consider- their durability it will doubtless be found t economical to employ those of the best ality.

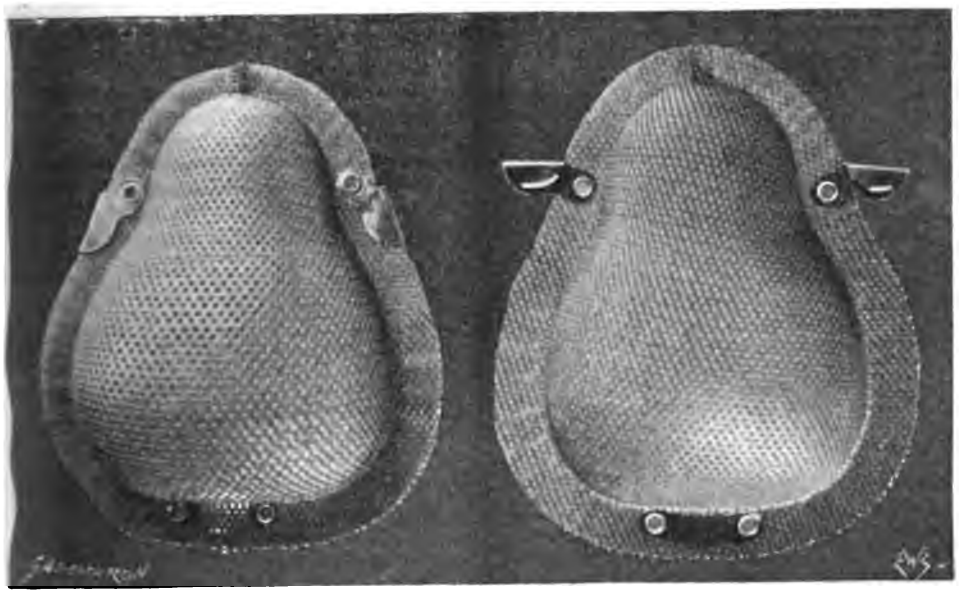


FIG. 59.—A PATENTED PROTECTOR FOR RIPENING PEARS, PEACHES, OR OTHER FRUIT. (SEE P. 172.)

It is stated that the ripening process is hastened d the flavour enhanced. Similar appliances de in paper will be utilised for the purpose of king fruits and flowers for exhibition or other rposes.

Some specimens were exhibited before the Fruit mittee of the Royal Horticultural Society on day last, and no doubt in the coming season tensive trials will be made of them. The paratus is to be placed on the market, in e first instance, through the agency of W. H. eck, Esq., 115, Cannon St., London, E.C., whom application should be made.

LAW NOTES.

RE SOLON DENSON.

The public examination of this debtor took ce at the London Bankruptcy Court, before Mr. istrar Hope, upon a statement of affairs showing liabilities amounting to £1150, and assets expected to produce £686 11*s*. 5*d*., from which £32 19*s*. 6*d*. had to be deducted for the claims of preferential creditors payable in full, leaving nett assets at £653 11*s*. 11*d*., and showing a deficiency of £463 13*s*. 10*d*. Replying to questions put by Mr. Hough, senior official receiver, the debtor stated that he had failed on a previous occasion in 1882 or 1883, and he had not obtained his discharge under those proceedings.

SOCIETIES.

ROYAL HORTICULTURAL.

March 14.—Not for some years has a meeting of the Royal Horticultural Society been held in such wretched weather as was the case on Tuesday last. The fog that on Monday was quite sufficient to make London unpleasant, developed into a thick, dense sheet, that did not lift during the whole of Tuesday. It was dark enough out-of-doors, but the interior of the Drill Hall was so obscure that it was quite as difficult to inspect the exhibits as we have ever known it to be at the Royal Aquarium. In spite of all this, the Hall was very well filled with a grand display of exhibits, a circumstance that may be explained by the fact that country exhibitors had no idea of the kind of atmosphere into which they were bringing their plants.

Orchids were very numerous, and as many as six Awards of Merit, and three First-class Certificates were awarded to novelties in these plants. The Floral Committee, though recommending fewer awards, had to deal with a large number of exhibits, including a very remarkable one from Captain Holford, whose Hippeastrums were generally admired, and thoroughly deserved the Gold Medal awarded to Captain Holford. Several of the seedling Hippeastrums (four), were recommended Awards of Merit. There were gay collections of Azaleas, Cyclamens, Camellias, Cinerarias, &c., a large exhibit of choice Ferns, and many miscellaneous exhibits of a floral nature. The only other award to a novelty, however, was to a variety of Azalea mollis from Messrs. R. & G. Cuthbert.

The Fruit and Vegetable Committee recommended a First-class Certificate to Apple Allen's Everlasting, and an Award of Merit to Apple Barnack Beauty, in the latter case to mark the worth of the variety as a market Apple. Several collections of fruits and other interesting exhibits were staged.

The lecture was one by Mr. Spencer Pickering, who, described the nature of the experiments in relation to fruit culture, now being conducted on the estate of the Duke of Bedford, at Woburn.

Floral Committee.

Present: Chas. E. Shea, Esq., Chairman; and Messrs. Chas. T. Druery, H. B. May, R. Dean, R. Wilson Ker, Wm. Howe, Thos. Peed, Chas. E. Pearson, J. W. Barr, J. D. Pawle, Geo. Gordon, E. H. Jenkins, C. R. Fielder, E. T. Cook, C. Blick, D. B. Crane, Jas. Walker, H. J. Jones, Ed. Mawley, J. Fraser, Chas. Jeffries, and W. Marshall.

Mr. Jno. R. Box, West Wickham and Croydon, showed a group of Cinerarias, nice dwarf plants, well flowered, and of distinct and rich colours (Bronze Floral Medal).

Messrs. J. Hill & Sons, Lower Edmonton, contributed a large group of choice Ferns, all of them tinted or variegated varieties. We noticed a cream variegated variety of Pteris serrulata cristata, and of Pteris cretica, some very well coloured plants of Pteris arguta, and of Pteris tricolor. The tinted Adiantums in a number of varieties would have made a fine display in better light; indeed, the entire exhibit was one that suffered terribly in effect from the extreme darkness in the building (Silver Banksian Medal).

The St. George's Nursery Company, Hanwell, Middlesex, again made a magnificent display with a very fine strain of Cyclamens. The plants were better flowered than when shown on the last occasion, but in other respects were very similar (Silver Flora Medal).

Messrs. R. & G. Cuthbert, Southgate, showed a floral picture of Azalea mollis and A. sinensis hybrids. This exhibit filled the greater part of one of the central tables, and was composed of abundantly flowered plants of exquisitely tinted varieties, but few of the seedlings were named. A. mollis, Geo. Cuthbert, apricot coloured, with deeper spots, was very pretty. Six new varieties of Hyacinths were contributed by the same firm (Silver Flora Medal).

Messrs. F. Sander & Co., St. Albans, exhibited a group of plants of Deutzia Lemoinei = D. gracilis, and D. parviflora (figured in the *Gardeners' Chronicle*, Aug. 5, 1898, p. 153). It is a very pleasing plant when seen, as on this occasion, covered with rosettes of blooms of the purest white.

Messrs. Sander & Co. again displayed plants of Acalypha hispida, Dracæna Sanderiana, and a plant in flower of Hæmanthus cinnabarinus superba.

The most remarkable exhibit before the Floral Committee was an immense group of Hippeastrums from Captain Holford, Westonbirt, Tetbury, Gloucestershire (gr., Mr. A. Chapman). One half of one of the long central tables was thickly furnished with them, and it was said that the plants had been selected from a collection of 2000 plants, 1500 of which are now in flower. The collection was remarkable from many standpoints. The plants were most healthy-looking, and the flower-scapes of great strength, most of them bearing three or more flowers. The blooms generally were very large in size, and the colours bright and very effective. In a few of the varieties only could any trace be seen of the green throat that was once so characteristic of the Hippeastrum. There were self-coloured flowers, others with a very prominent white band through each segment; also flaked and mottled flowers. A considerable variety of form could also be observed in the collection. Several of the best of the varieties are described below as obtaining awards, but it would be easy to make the selection a much larger one. A Gold Medal was awarded to Captain Holford for this exhibit, which was probably the best collection of Hippeastrums ever shown by an amateur.

A slender and dwarf-growing white-flowered Calla, known as Perle von Stuttgart, was shown by Mr. W. Pfitzer, Stuttgart, but how it differed from "Little Gem" is not apparent, and a plant of Corylopsis pauciflora in flower was shown by Messrs. Paul & Son, Waltham Cross Nurseries.

Messrs. Barr & Sons, King Street, Covent Garden, showed a table of Narcissus, Helleborus in variety, Chionodox , Cyclamen species, Anemone, Tulipa Leichtlini, Lachenalias, and a particularly vivid crimson-flowered Primula sinensis. (A Silver Banksian Medal.)

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, N., showed potted Clematis in six varieties, viz., Lord Londesborough, Lady Londesborough, a pale variety; Sir Garnet Wolseley, purplish-lilac, one of the best; Fair Rosamond, rather shrubby in habit, and free, white with a carmine stripe on each petal; Miss Bateman, a white flower; Mrs. Quilter, also white. All of these were small examples, trained in each case to an upright stick, and more or less abundantly bloomed. They had been, as we were told, brought on quite cool in a vinery. Besides these, there were four nice plants of Acalypha hispida (Sanderiana). A Silver Flora Medal was awarded.

Messrs. W. Paul & Son, The Nurseries, Waltham Cross, showed, as on a recent occasion, a fine assortment of Camellia japonica, in large and small examples, most profusely flowered, besides ten show boxes containing two dozen blooms apiece, and all of them in the best condition. C. Mathiotiana alba, Pride of Waltham, flesh colour; Montironi, and Donna Maria Pia, a flower of the palest flesh tint, may be regarded as the pick of the varieties shown. A Silver-gilt Flora Medal was awarded.

Messrs. Thos. Cripps & Son, Tunbridge Wells, exhibited a small group of early-flowering Clematis in pots, and a large number of cut blooms of the same in much variety of colours in boxes filled with moss (a Bronze Flora Medal was awarded).

Mr. G. Mount, Exotic and Rose Nurseries, Canterbury, showed two boxes filled with most admirable Roses, consisting of H. T.'s and H. P.'s, and a number of Roses was shown cut with long stalk and stuck into bottles. These consisted of Mrs. John Laing, Niphetos, Captain Haywood, &c. (a Silver-gilt Banksian Medal was awarded).

Messrs. Jas. Veitch & Sons, Royal Exotic Nurseries, Chelsea, showed plants in flower of M. Lemoine's Deutzia, D. hybrida Lemoinei, also of a variety of Azalea mollis, known as Alphonse Lavallée, with orange-coloured flowers, with pale centres; also the curious Azalea linearifolia, with its rose-coloured thread-like petals; Spiræa confusa, &c. Also four varieties of Hippeastrums of much merit, and a very fine plant of Cliveia Orion.

AWARDS.

Hippeastrum Murelli.—A large and well-formed flower of deep crimson, having an unusual amount of substance in the segments. The scape bore four flowers. From Capt. HOLFORD (Award of Merit).

H. Apple-blossom.—The ground colour of flower is white, the segments having usually a broad stripe of white in the centre, and flaked and coloured with bright red. From Capt. HOLFORD (Award of Merit).

H. Robin.—A fine crimson flower, with white in throat; substance very good. From Capt. HOLFORD (Award of Merit).

H. Virginia.—A light-coloured variety, in which white is feathered sparsely with red. From Capt. HOLFORD (Award of Merit).

Azalea Mollis Purity.—A lemon-coloured variety of much attractiveness. From Messrs. R. & G. CUTHBERT, Southgate (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch Esq., in the Chair; and Messrs. J. O'Brien (Hon. Sec.), De B. Crawshay, J. Colman, H. Little, F. Sander, A. Outram, H. J. Chapman, W. H. Young, H. Ballantine, E. Hill, H. T. Pitt, J. Jaques, W. H. Protheroe, C. Winn, J. Gurney Fowler, T. W. Bond, W. H. White, and S. Courtauld.

Like the last meeting, the show was held in foggy weather, but so far from interfering with the display other than rendering examination difficult, even with the full lighting power of the Hall, a more than usually fine collection of Orchids was staged. Sir TREVOR LAWRENCE, Bart, Burford (gr., Mr. W. H. White), made a very effective display, the whole of the exhibits being characterised by vigorous health and profuse flowers. Of the specimens very remarkable for their fine culture were Brasso-Cattleya-Lælia × Lindleyana with twenty-nine flowers, the rare Cœlogyne conferta (Cultural Commendation), with a profusion of bloom; a noble example of Dendrobium × Burfordiense, covered with its showy rose-tinted blooms; fine forms of Masdevallia Harryana and M. ignea, a few noble examples of Odontoglossum crispum, that named maculosum being profusely spotted like O Wilckeanum, a charming example of the white and violet Epidendrum Endresii and another of its hybrid E. × elegantulum; Cymbidium eburneum, with many large white flowers; and a fine lot of Calanthe Sanderiana, which made a separate group. Other remarkable things were Spathoglottis Lobbi, with several spikes; the singular blue flowered natural hybrid, Vanda × Moorei (Kimballianum × cœrulea); Chysis × Chelsoni, Bulbophyllum barbigerum, with a long raceme of its sensitive feathery flowers; Dendrobium × Wigania xanthochilum, clear yellow, with purple disc, very superior to the original; D. × Juno, Cœlogyne pulchella, Spiranthes colorata Forgetiana; two examples of Cypripedium × hirsuto-Sallieri, differing much in colour; Galeandra devoniana; Cypripedium × Alice, fine Cattleya Trianæi, &c. A Silver-gilt Flora Medal was awarded.

To Baron Sir H. SCHRODER, The Dell, Staines (gr., Mr. H. Ballantine), a Silver Flora Medal was awarded for a small but select collection of Odontoglossums, including the still best purple-blotched form, O. Pescatorei Veitchianum; the equally rare O. Leeanum, with a noble spike of sixty-two flowers; fine forms of O. Wilckeanum, O. luteo-purpureum, &c.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, staged a fine group, in which were some new and very rare hybrids. Of the former were Phalænopsis × Hermione, a very remarkable flower, resembling P. × Mrs. Jas. Veitch, but densely spotted with rose colour; P. × Cassandra (Stuartiana ♂, rosea ♀), with blush-white flowers and bright rose lip; and Sophro-Lælia × lacta superba, a better form of the original, with reddish-rose flowers. Of better-known things, one of the most interesting was a fine form of Phalænopsis Aphrodite, raised from true seed sown in 1882, and giving another example of the utility of raising desirable species usually imported. Also in the group, prominent were Cattleya × intertexta, several Lælio-Cattleya × Nysa, Epiphronitis × Veitchi, Dendrobium × Euryalus, D. subclausum, Epidendrum Wallisii, E. × elegantulum, spikes of the brilliant scarlet E. × O'Brienianum superbum, Calanthe × gigas, Phaio-Calanthe × Niobe, Cymbidium × eburneo-Lowianum, Phalænopsis rosea leucaspis, &c. A Silver Flora Medal was awarded.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, had a grand group, for which a Silver-gilt Flora Medal was awarded. The main feature in it was about forty-five specimens of the noble Phaius × Norman (Sanderianus × tuberculosus) which is perhaps the highest example to be obtained in its section. The plants bore a number of spikes of very large flowers, varying in the tint of the sepals and petals from pale yellow to copper colour and reddish-rose, and in the colouring of the lip from rosy-purple to dark claret-purple. All the forms may well be called florists' flowers of great beauty.

A series of nice forms of Lycaste Skinneri, including the best white form, the brightly coloured Dendrobium × Sibyl, still the only D. bigibbum cross-proved; the chaste D. × Doris, some specimens of D. infundibulum covered with flowers, Cypripedium Youngianum, Oakwood variety, a noble flower; fine forms of Odontoglossum crispum, O. Edwardi, Cattleya Trianæi, Cypripedium × Doncasterianum, &c., were among the plants shown.

W. THOMPSON, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. Stevens), showed Odontoglossum crispum Duke of York, a very large flower, profusely spotted with rose-purple.

J. LEEMANN, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge), showed Odontoglossum crispum, Mrs. J. Leemann a very remarkable variety, distinct in the peculiar arrangement of its bright reddish-brown spotting on the French-white ground colour of the flower, and in their more dense arrangement on the flower-spike. The general appearance of the flower suggested a very large finely-spotted O. Andersonianum, but the crest denoted typical O. crispum. Mr. LEEMANN also showed a fine form of Zygopetalum × Perrenoudi.

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, staged a good group, remarkable for the fine varieties of Cattleya Trianæi and with them forms of Cypripedium insigne, including C. i. Sanderæ, good Odontoglossum crispum, O. Halli, O. Pescatorei, Dendrobium Wardianum, with very fine flowers; D. crassinode, Lælia harpophylla, L. glauca and L. cinnabarina, Lycaste Skinneri alba, Miltonia Roezli, Oncidium splendidum, Cochlioda Noezliana, &c. A Silver Banksian Medal was awarded.

Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, staged an effective group, in which were good examples of Cypripedium × Pitcherianum, Williams' var., C. × Winnianum, C. × grandiflorum, Williams' var., C. × Harrisianum × Sallieri Hyeanum, C. Boxalli nigrescens, C. × euryandrum, C. villosum, C. × vernixium, Dendrobium Wardianum giganteum, and two white varieties of it; Cattleya Schroderæ, Cymbidium eburneum, C. Lowianum, varieties of Lycaste Skinneri, Cœlogyne cristata alba, Odontoglossums, &c. A Silver Banksian Medal was awarded.

M. JULES HYE-LEYSEN, Coupure, Ghent (gr., Mr. Coen), showed Cypripedium × Œdipe, a very handsome hybrid with rose-coloured upper sepals, banded with white; O. × virginale "Venus," a fine large pure white; O. triumphans nigrum, and others enumerated in the List of Awards.

M. CHAS. MARON, Brunoy, Seine-et-Oise, France, showed Lælio-Cattleya × Imperatrice de Russie (C. Mendeli ♀, L. Digbyana ♂), a fine flower, equalling in beauty the famous L.-C. Digbyano-Mossiæ, and with a similarly fringed lip; also L.-C. × Ernestiæ (O. Percivaliana ♀, L. flava ♂) the typical form, with yellow flower, tinged with rose colour.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Odontoglossum Rossii Crawshayanum; O. R. rosefieldiense; the fine O. × Andersonianum Bogaerdianum, and O. × excellens Crawshayanum.

Mr. JOHN STEVENS, Pope's Grove, Twickenham, showed Odontoglossum × Murrellianum Stevensii.

Messrs. F. SANDER & Co. showed a small group, in which were the new Cypripedium × Furzeanum (callosum pulcherrimum × hirsutissimum), a very pretty hybrid, with the peculiar form of C. hirsutissimum in the petals, which were shining claret-red, with darker spots, the whole flower suffused with rose-colour; the pretty Phaius × Joiceyanus (Blumei × amabilis), very quaintly marked; fine forms of Cattleya Trianæi, Odontoglossum × Mulus, Dendrobium Wardianum, of a very large type, &c.

WELBORE S. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Barrell) showed Odontoglossum Pescatorei, Ellis's var. a good purple-spotted form, and O. × Andersonianum Hazelbourne var. a very showy flower.

J. F. Ebner Esq., Beckenham (gr., Mr. Waite), showed well-bloomed varieties of Cypripedium villosum, &c. J. T. Gabriel, Esq., Streatham Hill, sent a very large form of Dendrobium Wardianuml W. P. Burkinshaw, Esq., Hessle, Hull, sent Dendrobium × Hessleiense (Findlayanum × splendidissum grandiflorum).

AWARDS.

Lælio-Cattleya × Imperatrice de Russie (*C. Mendeli ♀, L. Digbyana*) from Mr. CHAS. MARON, Brunoy, France. Flower very large; white, delicately tinged with rose-pink. Lip heavily fringed like L.-C, × Digbyano-Mossiæ (First-class Certificate).

Odontoglossom crispum 'Sultan' from M. JULES HYE-LEYSEN, Ghent (gr., Mr. Coen). Nearest to O. c. Sanderianum, flowers heavily marked with red-brown over the greater part of their surface (First-class Certificate).

Odontoglossom crispum 'Duke of York' from W. THOMSON, Esq., Stone, Stafford (gr., Mr. W. Stevens). A fine large white flower evenly spotted with rather small purplish rose spots (First-class Certificate).

Odontoglossum × excellens Hyeanum, from M. JULES HYE-LEYSEN. A very large pale yellow flower richly spotted (Award of Merit).

Odontoglossum crispum 'Mrs. J. Leemann,' from J. LEEMANN, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge). A distinct novelty with French-white flowers evenly spotted with red-brown in a manner seen in fine forms of O. × Andersonianum (Award of Merit).

Dendrobium × Wiganiæ xanthochilum (signatum × nobile), from Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. H. White). This was raised at Burford, and the flowers are of better shape and brighter yellow than the original (Award of Merit).

Masdevallia ignea Boddaertiana, from Sir TREVOR LAWRENCE. Flowers the largest of any variety of the species, suffused with bright reddish-scarlet (Award of Merit).

Cypripedium × Talisman (Sallieri Hyeanum × Harrisianum superbum), from M. JULES HYE LEYSEN. A very fine dark form, with distinct traces of C. × Harrisianum superbum (Award of Merit).

Phalænopsis × Hermione (? Stuartianum × Luddemannianum), from Messrs. JAS. VEITCH & SON. Flowers almost identical with P. × Mrs. J. Veitch, illustrated in *Gardeners' Chronicle*, but densely spotted and tinged with rose (Award of Merit)

Phalænopsis × Cassandra (rosea ♀, Stuartiana ♂), from Messrs. JAS. VEITCH & SON. Of the P. × intermedia class Flowers blush-white, with dark rose lip (Award of Merit.)

Sophrolælia × L. laeta superba (S. grandiflora × L. Dayana), from Messrs. JAS. VEITCH & SON. Flower finer than the original reddish rose with purple lip (Award of Merit.)

Odontoglossum Mirandum and Cœlogyne pulchella from Sir TREVOR LAWRENCE, Bart. (Botanical Certificates).

Narcissus Committee.

Present: Rev. G. H. Engleheart, chairman; Mr. C. R. Scrase-Dickens, Secretary; Miss Willmott, Messrs. J. H. de Graaff, J. Walker, A. Kingsmith, W. Ware, P. Barr, R. Sydenham, and others

The promise of an early season has proved faithless in the Narcissi as in other departments. The mild winter scarcely compensated for the unusually late start of the bulbs into root-growth in summer and autumn, 1898, attributable to the long drought. The winter months, too, were deficient in bright sun, and the cold nights of late have been a check. No open-air flowers came before the committee.

Messrs. BARR sent an interesting set of Dutch-raised hybrids between poeticus ornatus and various Polyanthus Narcissi, their main value being that of greater hardiness than N. Tazetta, derived from the poeticus. One of the best had trusses of three flowers approaching the poeticus in size. As the plants were in pots, the committee recommended a Vote of Thanks, and desired to see the strain again from the open ground. Messrs. BARR were also awarded a Banksian Silver Medal for a well-grown group of pot-Narcissi in variety. The white Madame De Graaff was especially well shown, and the fine new bicolor Victoria seems better adapted for forcing than the older kinds.

Fruit Committee.

Present:—Geo. Bunyard, Esq., Chairman; and Messrs. Robt. Fife, Jas. Smith, Geo. Wythes, W. Pope, J. W. Bates, W. Iggulden, Alex. Dean, S. Mortimer, A. F. Barron, Jas. Basham, E. Shaw Blaker, and Jas H. Veitch.

Mr. JOHN WATKINS, Pomona Farm, Hereford, showed a collection of seventy dishes of excellent Apples (Silver Knightian Medal).

Mr. A. J. THOMAS, Rodmersham, showed fifty dishes of culinary and dessert Apples, admirably kept, mostly well developed fruits, with clear skins, plump, and of high colour. A Silver Knightian Medal was awarded.

A Seakale named Russell's "Solid Ivory" was shown by Mr. J. Russell, Richmond; evidently what is known as Ivory-white, a capital lot of heads (Vote of Thanks).

H. A. BLYTH, Esq., Swanstead House, Swanstead (gr., Mr. Barker), showed fair-sized, ripe fruits of the Tree-Tomato, Cyphomandra betacea.

Good examples of the seldom-seen Barnack Beauty Apple were shown by Mr. GILBERT, gr. at Dykebourne House, Lincolnshire.

Mr. J. Masterton, gr. to Lord CAMPERDOWN, Weston House, Shipston-on-Stour, showed six fruits of Uvedale's St. Germains, stewing Pear, fine examples, and well kept (Cultural Commendation). A fine large fruit of a crimson cheek on the sunny side, and evidently it is a long-keeping variety (Award of Merit). He also showed Apple Allen's Everlasting, Blenheim Pippin, and Royal Russet.

Mr. CROOK, gr., Forde Abbey, Chard, showed a dish Sturmer Pippin Apple (Vote of Thanks).

Various dishes of Apples were shown for name or honours but nothing which calls for special comment.

Mr. MASTERTON, gr., Weston House, showed half-a-dozen very fine examples of Onion Ailsa Craig, receiving a cultural commendation. Some fine Leeks were shown by Mr. COCKS, Peterborough.

A dish of a new seedling kidney Potato was shown by LEOPOLD SALOMONS, Esq., Norbury Park, Dorking (gr., Mr. G. Kent).

Lecture.

THE EXPERIMENTS AT WOBURN.

In the afternoon a lecture was delivered by Mr. Spencer Pickering, F.R.S., upon "The Duke of Bedford's Experiments at Woburn; their object and method."

Mr. Pickering commenced by explaining away the fallacy that there can exist any real antagonism between science and practice, claiming that the genuine scientific worker of the present day is essentially a practical labourer. It was the ideal of the scientific worker of the present day to lessen the distance that lies between the cultivator and the results the latter seeks to obtain; to devise easier and quicker methods. Theory without practice, or practice without reflection, and consequent theory, is not satisfactory.

Mr. Pickering, in referring to the fact that in the case of agriculture, scientific experiment and research had been employed to a much greater degree than had as yet been attempted in the case of horticulture, said that in horticulture or fruit growing there were many difficulties that did not present themselves to the scientific agriculturist. In conducting experiments, it was very necessary that a large number of plants or trees be subjected to them, or the results would be worthless. Then arose the question of space, for one tree covered a large a portion of land compared with a plant of Wheat, Barley, or Turnip. Then the length of life of a fruit-tree was another difficulty, because the value of experiments would be small if they were only concerned with a few years growth. But many other difficulties were enumerated by Mr. Pickering relating to the large number of varieties there are of fruits, and to the question of pruning, differences of soil, climate, and season, of which latter the lecturer gave an instance in the case of Strawberries, one variety in one season being very prolific, whilst it was quite the reverse in another season, when some other variety took the lead. Such difficulties, however, said Mr. Pickering, should not prevent the carrying out of such experiments as the Duke of Bedford had commenced. Results are, of course, comparative, and Mr. Pickering stated that in an experiment it was necessary that the treatment afforded should be modified from the normal in one particular only, or there would be uncertainty in connecting effect with cause.

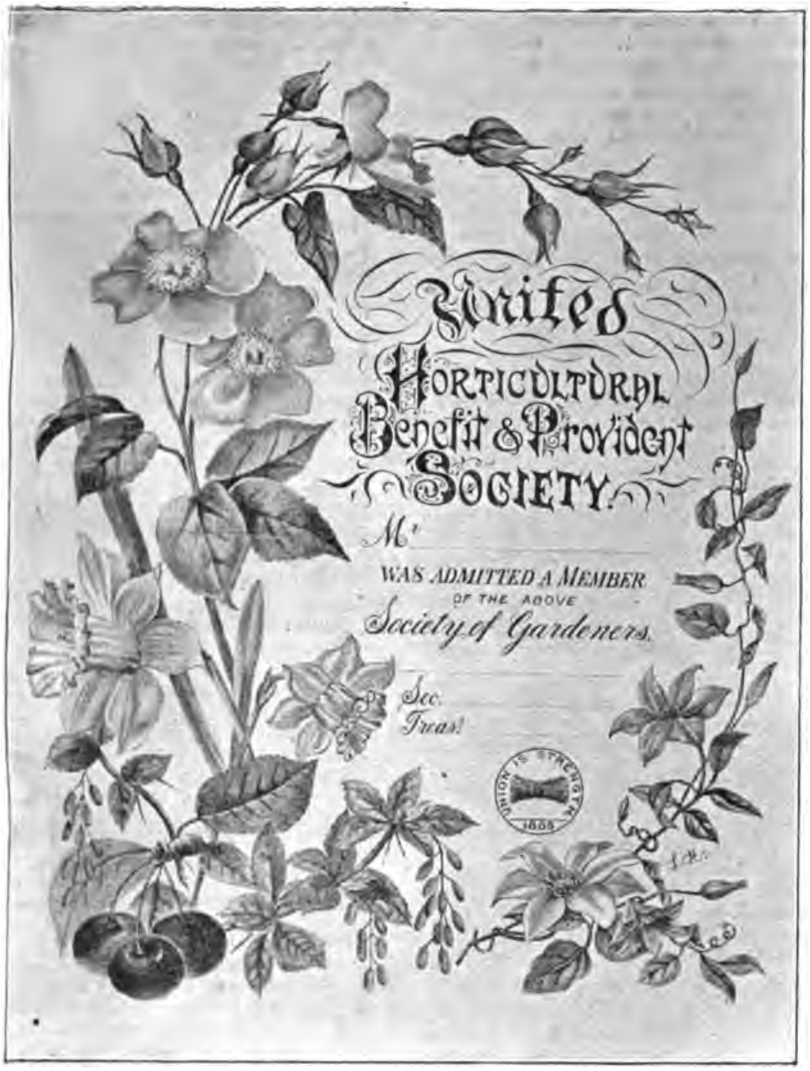

FIG. 60.—FLORAL EMBLEM OF THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

For instance, the lecturer mentioned the experiments that are being made with dwarf Apple-trees. These are planted in rows, and the treatment given each row differs only in one particular, but always a different one, from the normal. Hence, if the result was different in comparison to those known under normal treatment, the cause of such variation was clear. The great care necessary, and the means taken to thus preserve the experiments from influence from outside sources, were explained in some detail by Mr. Pickering.

The manuring of soil for fruit-tree [cultivation has received attention, and to this purpose have been used chiefly natural (dung) manures and potash, nitrogen and phosphates.

Having so far described how the Woburn experiments had been organised, Mr. Pickering discussed the means to be taken to measure the results, and showed that this process is far more difficult than would at first sight appear. In judging the produce of an Apple-tree, for instance, which should be accounted most valuable, quantity or quality? Was a crop of large, finely-coloured Apples better than a crop of smaller ones but of the same weight in bulk? If so, how much better?

TESTING OF VARIETIES.

Experiments to test the varieties of fruits, said Mr. Pickering, conducted at one spot only, such as Woburn, would have no value, but the result on the contrary would be most misleading. If varieties of Apples could be tested satisfactorily, and the present list enormously reduced, the person doing this would be a public benefactor, but it would be necessary to possess experimental stations in many localities, and under one organisation.

PESTS AND DISEASES,

said Mr. Pickering, were fortunately not productive of the amount of injury in this country that was the case in some of our colonies, and in America. The only pest that had so far troubled them seriously at Woburn was the Black Currant-mite, which, said Mr. Pickering, threatened to destroy the Currant plantations in this country. At Woburn they had tried many specifics for the destruction of these mites, but so far all of them had failed.

In conclusion, Mr. Pickering said that the experiments at Woburn were commenced in 1894. A report had been issued during last year, and a second report was now commenced, and data for it were gradually accumulating. But experiments must be continued through a course of years before actual results could be published, and above everything it was necessary that scientific workers should not jump to results, but everything must be done to ensure that the results may be reliable and fairly comparable.

Mr. Geo. Bunyard, Maidstone, said that he had gathered from Mr. Pickering's remarks, that he, in association with the Duke of Bedford, were doing, with other means, at Woburn what practical people had done by what is called "Rule-of-thumb," which meant that they adopted the experience of generations of fruit-growers that had gone before. Mr. Bunyard was grieved to learn that no good result had followed the measures for ridding the Currant-bushes of mite. In Kent these Currants used to be the best paying crop, but the industry was now crippled and menaced by this pest.

Mr. HARRY J. VEITCH (Chairman), said that he thought that it would be interesting if Mr. Pickering stated what kind of soil they had at Woburn. Mr. Pickering, who replied to a very cordial vote of thanks, said that the site was on the Oxford clay, and above that there were nine inches or so of clay and sand, but few stones. The remedies that had been employed against the Currant-bud mite included kerosene emulsion, turpentine, carbolic acid, benzine, alcohol, a German proprietary insecticide, &c.

BRISTOL AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

MARCH 9.—A large audience assembled at St. John's Parish Room, to hear a lecture by Mr. C. BRIDGES, on "The Culture of Hyacinths and Tulips."

The lecturer in a racy manner dealt with the early history of the bulbs, and their introduction into this country; the treatment required for their successful cultivation in the flower-garden, or for conservatory decoration, and for exhibition.

Prizes for Tulips and mixed pots of bulbs were awarded to Messrs. BANNISTER and PIDGEON.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

AN interesting lecture on "The Onion" was given by Mr. A. DEAN, of Kingston-on-Thames, on Monday evening last before the members of the above Society, the President, Mr. C. B. Stevens, presiding over a good attendance of members.

The classification of the Onion, its various divisions, and the different varieties, were treated in a very able manner, followed by many practical hints on the preparation of the ground, manuring, time of sowing, and a few remarks on the enemies of the Onion and their treatment, judging at shows, and the uses of this most useful vegetable. A discussion followed, in which Messrs. Woolford, Hinton, Purkiss, Neve, and Martin took part. A vote of thanks was heartily accorded to Mr. Dean for his paper.

The exhibits included some well-kept specimens of Onions, including Sutton's Globe. Improved Reading. Ailsa Craig, &c., contributed by Mr. Bright, gr., Whiteknight's Park; Mr. J. Pound, Sen., gr. to Mr. G. May, Caversham; Mr. Neve, gr. to T. R. Harman, Esq., Sindlesham House; also some splendidly flowered Freesias, by Mr. Dockerill, gr. to Mr. G. W. Palmer, M.P.; and several vases of blooms of Primula obconica, by Mr. Townsend, gr. to Sir William Farrer, Sandhurst Lodge.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MARCH 13.—The annual meeting of the members of this Society, whose usefulness to gardeners we have many times insisted upon, was held on Monday evening last, in the Caledonian Hotel. The chair was filled by Mr. JOHN FRASER, F.L.S., and there was a moderate attendance. The following paragraphs have been taken from the report of the Committee for 1898:—

"Eighty-three members joined during the year, sixteen lapsed, and eight died, one being a lapsed member, and the amounts standing to their credit have been paid. The membership now stands at 741. The amount of subscriptions paid by members to the Benefit Fund, including arrears for 1897, was £1163 11*s.* 2*d.* The amount paid to sick members was £258 17*s.*, a rather heavy amount, several cases being of a long and serious character. The amount is covered by deductions from members' deposit accounts of 8*s.* 7*d.* and 5*s.* 9*d.* respectively.

"Subscriptions to the Benevolent Fund from honorary and benefit members amounted to £141 13*s.* 3*d.*, and £35 5*s.* 6*d.* has been granted in small amounts to members from this fund. The first member (No. 4) to receive a regular allowance, being over 70 years of age, is now on the funds, and taking into consideration that he has worked on the committee from the commencement of the Society, has been granted 8*s.* per week.

"The Convalescent Fund continues to be useful, and is now incorporated in the rules. Subscriptions to this fund were £23 3*s.* 3*d.*, and £6 has been paid out. All members are invited to contribute to this fund. The Management Fund shows a balance of £109 19*s.* 4*d.* The Treasurer's statement of accounts is also very satisfactory. The amount invested in Corporation Stock for the past year was £1250, the total amount of funds invested being now £14,350, and the treasurer has a balance in hand of £128 15*s.* 11*d.*"

The report was accompanied by a balance sheet duly audited. The Treasurer's statement showed that the Society has a balance of £88 3*s.* 5*d.* over and above all liabilities.

The report and balance-sheet having been accepted by the meeting with unanimity, the chairman said that he had availed himself of an opportunity that had been afforded him to thoroughly inspect the books of the Society, and this inspection had convinced him that the members had every reason to be satisfied with the manner in which their affairs were managed. Mr. Fraser had something to say of each fund, declaring that they were all valuable ones, and that each had been worked to profit. The membership, which twelve years ago was 200, is now 769, and the expenses of management for the year, including Secretary's salary, and all administrative expenses, was the modest sum of £99 19*s.* 5*d.* The advantages the Society has to offer to young gardeners above those that any similar society can give them, were plainly pointed out by Mr. Fraser, who incidentally mentioned that one of the members has now a sum of nearly £100 to his deposit account in the Society. Even in the case of lapsed members, the sum standing to their credit is not confiscated by the Society, 'but is retained until such lapsed member has attained a certain age, when it is paid over to him, or in the case of death occurring earlier, to his nominee.

Subsequently, it was decided to print 2500 copies of the Report and Balance Sheet for distribution.

Messrs. Peerless, Burge, and Forward, were elected members of the Committee, and in the places of Mr. G. W. Cummins and Mr. Wheeler, who retire through change of residence, Messrs. Harding and Taylor were elected. Mr. Harding, who is a young gardener, at present employed in the gardens at Gunnersbury Park, is the first under gardener to be given a place upon the Committee.

Replying to a Vote of Thanks, the Treasurer, Mr. J. Hudson, referred to the new emblem, or certificate, which we illustrate on p. 175. It has been designed by Mrs. Harvey, (*née* Miss Lilian Hudson), and the design itself measures 18 inches by 10 inches; the probable cost to each member will be eighteen pence. The emblem is a very artistic production, in which flowers and fruits are associated. The Penzance Sweet Briar will be readily recognised, also the Clematis, Narcissus, Berberis, and Cherries.

The re-election of Mr. Collins, as Secretary, was proposed by Mr. A. Hemsley, and several members, including Mr. Hudson, supported the motion.

The turnover during the past year between the Secretary and Treasurer, said Mr. Hudson, had been about £2,000, and when they compared their books each agreed with the other to a penny. Mr. Collins was re-elected with enthusiasm. Votes of Thanks to the Trustees, Committee, Press and Chairman, concluded the proceedings. The address of the Secretary is 9, Martindale Rd., Balham, London, S.W.

American Carnation Society.—The annual meeting of the Society on February 16, at Philadelphia, was somewhat interfered with by the severity of the weather. The encouragement held out to raisers of new seedlings by the colossal price paid for "Mrs. T. W. Lawson" was alluded to. It may, we think, be doubted whether this abnormal occurrence will do anything but harm in the long run. We understand that the proceeds from this Carnation are to be devoted to the hospitals and charitable Institutions of Boston, so that some good, at least, will be done. Mr. Lawson, we see, has offered 300 dols. for prizes to be awarded at the next year's show of the American Carnation Society. The most satisfactory manure was found to consist of nitrate of soda, 3 lb. 14 oz.; dissolved bone-black, 1 lb. 1 oz.; muriate of potash, 1 lb. 13 oz.; the quantity being estimated for a bench space of 100 square feet. The Society adopted the following scale of points for judging:—Colour, 25; size, 20; calyx, 5; stem, 20; substance, 10; form, 15; fragrance, 5. Flowers of Mrs. T. W. Lawson were exhibited, and are described in the *Florists' Review* as being of "wondrous beauty and size." Nevertheless, Mr. Silvers hopes to beat this flower in 1900 with his Hannah Hobart.

TRADE NOTICE.

We understand that Messrs. Cooper, Taber and Co., Limited, have purchased the old-established business of Messrs. Rutley and Silverlock, of Victoria Embankment, London, W.C., and from March 14 the business has been conducted by them at the above address, and at Witham, Essex. Mr. Rutley will continue to have an interest in the business as heretofore.

ENQUIRY.

Fragrant Roses.—Will some kind Rose amateur oblige M. D. P. with the names of a number of varieties of Roses, which retain their fragrance in the hottest weather? Many ordinarily fragrant Roses, as for example, La France, lose their perfume on hot days.

COLONIAL NOTES.

THE BERMUDA JUNIPER.

We in Bermuda find "the Cedar" a most valuable wood for all purposes. It is very durable as posts or ship timbers and planks, and makes nice furniture. I myself have several old chairs and chests that were made by the early settlers, and the wood is as sound as it ever was. This island is, in most parts, densely covered with the trees, and there are many beautiful groves of large trees as high, I should say, as 100 feet. Trees fit to cut are continually being taken to the saw-mills, making room for the younger trees to grow, to be made into rafters, &c., though not so much used as formerly when the entire woodwork of a house was made of "Cedar." I see in your paper that Evelyn says, "and we might have of the very best kind in the world, from the Summer Islands, though now almost utterly exhausted there also." He evidently alludes to timber-trees, trees fit to be shipped to England and elsewhere. In the old records of the colony, discovered, deciphered, and published in two excellent volumes, by Governor Lefroy, frequent mention is made of vessels carrying back to England logs of "Cedar," and chests of the same wood, but the colonists were so improvident and wasteful, that laws had to be made forbidding the cutting of "Cedar," except by the owner, and a stop was also put to the shipping of Oranges, &c., in boxes or chests of Cedar. During later periods, when shipbuilding was an industry of the island, the poor Cedars again suffered, but of late years no vessels have been built here, and the Island is becoming densely wooded again. The largest trees now growing are to be found in the salt-water marshes, the heart-wood is much darker than that of trees on high ground, but it is not nearly so durable.

I have lived for ten years or so in Florida, and have "hunted" and camped in the great Gulf-hammock. This is where the Cedars are cut for the large pencil-mills at Cedar Keys. We used to burn large branches of these felled trees for our camp-fire, and would have gladly used any other kind of wood because it invariably "spluttered" and sent large pieces of burning coals flying all over our camp, and we had often to get up in our blankets and stamp out the fire. This tree is presumably J. virginiana [yes]. At all events it serves to show what a difference there is between it and J. Bermudiana, which we daily burn in our kitchen, and which never plays us such pranks. The Gulf-hammock is swamp-land densely timbered with different hard and soft woods, the "Cedar" not by any means predominating.

The Bahama Juniper I never noticed, but I brought a stick from there made of the wood, and had a handle made for it of J. bermudiana. There seems to be no distinguishable difference between the two woods. *Arthur Haycock, Bailey's Bay, Bermuda.*

ANSWERS TO CORRESPONDENTS.

Books: *E. P. A.* The book named is to be obtained at Macmillan & Co., St. Martin Street, W.C.—*E. J. G.* The English edition of *Lindenia* has been discontinued. The work can still be obtained, however, in the French language, and is published at 117, Rue Belliard, Bruxelles, Belgium. The price is sixty francs, or about £2 10*s.* per year. *Lindenia* is issued in monthly parts, but occasionally the parts for two months are issued together.—*H. J. H.* A number of small well written manuals by men of great experience are published by Mr. Upcott Gill, 170, Strand, W.C. The price of same runs from 1*s.* to 1*s.* 6*d.*

Chickweed on a Lawn: *P. G.* You might try the effect of some substance that, by increasing the growth of the finer grasses, would smother out of existence this weed and others. Fish manure, Watson's lawn sand, sold by the sundriesmen; wood ashes, sifted decayed dung, &c., if put on now that the grass is growing, would do this. Chickweed, Stellaria media, flowers from March to October, and you must take every means of preventing the ripening of the seeds by mowing the lawn weekly.

Cubic Contents of Glasshouse: *Alpha.* The house contains 3318 [illegible] cubic feet.

Forcing produce for Market: *A Subscriber.* Any good general work on gardening is suitable, say *Thompson's Gardeners' Assistant*, published by Blackie & Sons, Glasgow and London; *The Culture of Vegetables and Flowers*, by Messrs. Sutton & Sons, Reading. There is nothing that is new in market garden operations, only so far as contrasted with the same in a private garden, the desired results are obtained by cheaper means.

Glazing Forcing Houses: *Duplex.* The best kind of glazing is that which prevents drip, and is yet air-tight without the use of putty or paint, which is practically imperishable, can be easily erected, is secure against the heaviest wind, and affords the maximum of light. These conditions are obtained in the galvanised steel sash bars.

Hampton Court, and other Big Vines: *A. S.* The Great Vine at Hampton Court is said to be about 150 years old. It bears annually about 1700 small bunches. We do not know if it ever bore a greater number than this. The roots have travelled far away from the original border, and they have been found, it is said, in large numbers in the Palace sewer. So far as we know of, no feeding of the Vine is now performed. The Cumberland Lodge Vine is twice as large as that at Hampton Court, and the crop of bunches is correspondingly greater. It fills a house 138 feet long by 20 feet wide. It is probably older than that at Hampton Court. A Vine at Manresa House, Roehampton, the largest in the country, planted in 1862, now fills a house 420 feet long and 24 feet wide. It has borne 800 bunches of good fruit. There are several other big Vines, but we would refer you to Mr. A. F. Barron's book on *Vines and Vine Culture*, published at *Journal of Horticulture* Office, Temple Chambers, 1, Wine Office Court, E.C.

Horticultural Examination: *H. D.* Write for particulars to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster.

Leaf: *J. W. D.* The drawing is apparently that of a Fig-leaf, but not being certain we should like to see the actual leaf and a shoot.

Names of Fruits: *W. L. Farmer.* 1, Cox's Pomona; 2, Yorkshire Beauty; 3, Royal Somerset; 4, Hambledon Deux Ans.

Names of Plants: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*C. A. B.* 1, We cannot name without flowers; 2, Opuntia microdasys; 3, Gasteria glabra; 4, Rochea falcata; 5, Gasteria verrucosa; 6, Aloe albispina.—*A. B.* Prunus spinosa; the Sloe, nothing to do with the Glastonbury Thorn.—*J. B., Llantrisant.* 1, Daphne laureola (Spurge Laurel); 2, Forsythia suspensa.—*Acorn.* 1, Cryptomeria elegans; 2, Cephalotaxus drupacea; 3, Retinospora obtusa; 4, Cryptomeria japonica; 5, Tsuga canadensis; 6, Cornus sibirica (what a scrap!).—*E. M. C.* Cymbidium aloifolium.—*N. C. D.* Cœlogyne cristata.—*F. Crook.* 1, Pittosporum undulatum; 2, Polygala myrtifolia, the form is known in gardens as P. Dalmaiseana; 3, Alonzoa incisifolia.—*R. R.* If the coat of the corm is netted, your Crocus is C. reticulatus, otherwise we should refer it to C. Imperati.

Soluble Ferments and Seed Germination: *G. W. A.* See *Gardeners' Chronicle*, p. 431, December 11, 1897.

Violets: *J. W.* See the reply to W. W., in our last issue, p. 160.

Communications Received.—M. D.—Dr. Zahl Bruchner, Vienna.—Dr. Engler, Berlin.—C. Frères, Mortefontaine.—M. Chabanne, Lyon.—G. E.—W. G. S.—J. S.—W. M. B.—J. D.—G. F.—G. W.—P. B.—G. A. K.—Attwood & Co.—R. P. B.—J. B. S.—R. D.—A. P.—C. W. D.—G. H. Engleheart.—S. A.—General Lamprey.

THE
Gardeners' Chronicle
No. 639.—SATURDAY, MARCH 25, 1899.

THE POTATO IN FRANCE, 1781, A.D.

It seems strange to think that the Potato should have had a great struggle for existence when a book on this subject was written by M. Parmentier, a noted Parisian physician of his day; but so it was.

The author first discusses what constitutes true nourishment; but, as the nitrogenous nature of albumin, casein, fibrin, &c., was not well, if at all understood at that time; he lays more stress upon the farinaceous food, such as starch, &c., as holding the first rank. For he considers the gluten of Wheat not to have the high value which Beccari (who discovered it) and other savans declared. He ridicules the idea as being entertained in consequence of its apparently close resemblance to animal tissues, such as cellular tissue, horn, &c. Of course, the author was wrong, and Beccari right; but from his point of view, all roots containing starch should be useful for food.

His argument is that, as so many nutritious plants used as food contain little or no "glutinous matter," such as Barley, Oat, Rice, Maize, Chestnut, Sweet Potato (Patate), &c., but all contain much starch; therefore, this substance must be the most important element of vegetable foods. He then launches out on the virtues of the Potato, as being excessively charged with starch. "Its culture," he observes, "began in Ireland, it then passed over to England, thence to Flanders, Germany, Switzerland, and France. It grows in all sorts of climates, and most soils suit it. Three or four months suffice to bring the plant to perfection. It scarcely ever fails." He evidently never anticipated the ravages of the Phytophthora! "Finally, the vegetable kingdom offers nothing more useful, more wholesome, since it serves equally well for the baker, the kitchen, and for cattle. If Wheat is the first among cereals, the Potato is first among vegetables." He tells us that M. le Baron de Saint-Hiliare wrote to him to say that a single Potato had given him 986 tubers, though the majority were small.

So little known was it in 1770 in France, that people still confounded it with the Jerusalem Artichoke and the Sweet Potato; so he describes these plants for the benefit of the ignorant, adding, that the Potato belongs to the genus Solanum or Morelle. This word was the name of Solanum nigrum in the middle ages in England.

"When one reflects seriously that those years which yield a poor result in cereal grains affords an extremely abundant crop of Potatos, and, *vice versâ*, one is scandalised to see the indifference which certain people show to the detriment of the cultivation of the Potato." He refers to the great number of children in Ireland, as being due to the general use of the Potato by the inhabitants, inasmuch as it keeps them healthy when young, and gives to the parents a more robust constitution. The author also gives a number of cases of invalids who were greatly benefited by eating Potatos, even using them as a remedy for sleeplessness! He also strongly recommends the Potato for cattle, as improving the quality of the milk, and increasing its quantity.

If Wheat and Barley be scarce, then he strongly recommends adding Potatos to the flour, and describes several such uses to which it could be put. M. Parmentier then proceeds to describe a number of trees and herbs which might be useful in times of scarcity as furnishing starchy foods, such as the Horse-Chestnut (Marrons d'Inde), of which he observes that it was first brought from Northern Asia by Bachelier, the first tree being planted in the Jardin de Soubise, the second in the Jardin du Roi, 1656, which died in 1767, and the third at Luxembourg. The Acorn, Aristolochia rotunda, Belladonna, Bistort, Bryony, Colchicum, Drop-wort, bulbous Fumitory, Gladiolus, Black Hellebore and many others, he suggests, might be used as supplying farinaceous food.

The concluding part of the book, which runs to 600 crown octavo pages, is devoted to the refutation of twenty-four objections to the cultivation of the Potato. They appear to be mostly *à priori* assumptions, and all trivial. The following are specimens; of course the author had satisfactory answers for all of them.

"Some say the varieties of the Potato are more than sixty; but no one asserts which should be grown. They are, doubtless, only degenerations from the same plant."

"The Potato takes up too much of the soil, and will render it incapable of growing grain."

"The cultivation of the Potato is quite as costly as that of grain."

"That between spring and autumn is an interval of six months, during which one is deprived of this resource of food; whereas grain will keep indefinitely."

"If the Potatos get frozen or germinate in the winter, then they are lost altogether."

"Must we abandon our fields and soils so useful for corn? By paying too much attention to Potatos one will neglect corn, which is always beneficial."

"The use of Potatos for beasts is not so good as has been maintained; for observers have already remarked that the lard of pigs, which have been fattened on Potatos, has not much consistence."

"As an aliment for man, the Potato is not without reproach, for one must have a strong and vigorous stomach to digest the viscous and gross matters which the root furnishes."

The most complete answer to all these absurd objections has been supplied by the fact that, since the book was written, Potatos have been and are eaten all over France at the present day. *George Henslow.*

EVOLUTION IN THE GARDEN.

Your most interesting article (p. 72) will, as I sincerely hope, awaken a lively and more appreciative interest in some, at least, of the many phases of hybridisation and cross-breeding as carried on in British and Irish gardens. With all you say of the late Dean Herbert, I most cordially agree. He was "a Darwinian before Darwin," as also was the late T. A. Knight, in a somewhat different degree; and as you wisely observe, it was the fact of Herbert being a staunch churchman that did much to disarm the adverse criticisms of those who held that it was almost impious for man to interfere in the generation of plants by hybridism or cross-breeding, though no one of that epoch ever seems to have entertained the slightest objection to the art of grafting or budding being performed.

So unpopular was hybridism in gardens half a century or more ago, that some raisers of cross-bred seedlings were most unfortunately led to conceal the real origin of their hybrids and crosses, and this confusion they still further confounded by giving to them latinised specific names. This was largely done in the case of Ericas, Pelargonia, and the earlier hybrid Calceolarias, Cinerarias, Rhododendrons, and Fuchsias. This is a well-known matter of history, and it has, in some cases, moreover, led to confusion and misapprehension in recent times. Even the earlier Orchids and Nepenthes hybrids had Latin names, and it is only during recent years that either Latin or popular names and signs have been devised that show at a glance —firstly, whether a plant is a hybrid; and secondly, that afford one some clue as to its parentage.

To the action taken at the first Narcissus Conference held at South Kensington on April 1, 1883, we owe a good deal, seeing that previously there existed no rule against the affixing misleading specific names in Latin to new seedlings reared in gardens.

In view of the forthcoming Hybrid Conference at Chiswick, we may fitly show here the purport of the resolution then passed. It was proposed by Mr. H. J. Elwes, and seconded by Mr. J. G. Baker, and reads as follows:—

> "Resolved—That in the opinion of this Conference uniformity of nomenclature is most desirable, and that garden varieties of Narcissus, whether known hybrids or natural seedlings, should be named or numbered in the manner adopted by florists, and not in the manner adopted by botanists."

Though this resolution was worded and passed only in connection with the genus Narcissus, it is as naturally applicable to all "known hybrids and natural seedlings" whatever, and as before indicated, a good deal of confusion would have been prevented had such a resolution been passed and acted upon fifty or sixty years ago, or at a time when hybridism and cross-breeding was practically begun in British gardens.

In any case, I trust that the above resolution, or some more clearly-expressed modification of it will be passed at the forthcoming Conference, so that for our own time at least we may have and hold to one uniform plan of naming all cross-bred plants whatever as reared in our gardens.

At the present day hybrid plants possess as deep scientific interest, and one may say, almost, that "the stone which the builders rejected has now become the head of the corner," i.e., that hybrids of known origin are, biologically, most instructive as illustrating the constant progress of adaptation or evolution. We have only to look at Macfarlane's beautifully illustrated study of hybrids, or to read Prof. Henslow's paper on the hybrid greenhouse Rhododendra in the *Journal of the Royal Horticultural Society*, London, or Mr. Hurst's papers in *Nature* on "Orchid Hybrids," to realise what the products of cross-breeding can teach us, provided careful records are made and kept during the progress of the work.

I also sincerely hope that the now vast and widely-scattered bibliography of hybridism and cross-breeding will receive all due attention at the Conference, and that coloured sketches, drawings, photographs, or dried specimens of hybrids, &c., will be exhibited, as well as the living hybrid progeny, and their parents, side by side, whenever possible. Special histories of some of the most remarkable bigeneric and specific hybrids might be given, say, for example, of Messrs. Clibran's hybrid (Urceocharis) between the Urceolina and the Eucharis; some of Messrs. Veitch's wonderful bigeneric Orchids, and their Philageria,* a hybrid between Philesia and Lapageria. Apart from hybrids altogether, there is a wide and fertile field of observation open in relation to those solitary species like Cyclamen latifolium, Primula sinensis, Reseda odorata, Dianthus Caryophyllus and D. chinensis, Crocus vernus, Althæa rosea, Anemone hortensis, Callistephus hortensis, Iris xiphion, I. xiphioides, Zinnia elegans, and many others that have never been known to hybridise with other species, notwithstanding which their cross-bred progeny is so very variable and distinct. Are these natural hybrids?

---

* This name marks an epoch in the intelligent naming of garden hybrids, being one of the first of those that give a clue to bigeneric parentage, &c.

As opposed to this class or group of ultra-variable species, we may glance at those ultra-stable species that so far have defied all the hybridist's efforts to cause them to vary in colour or in form, viz., Richardia africana, Tropæolum speciosum and T. aduncum, Vallota purpurea (there is said to be a white-flowered form, but it has never been exhibited), Caladium esculentum, Dielytra (Dicentra) spectabilis, Eucharis amazonica (with one exception only), Gloriosa superba, Anthericum liliastrum, Rosmarinus officinalis, Schizopetalon Walkeri, and many others. It is not contended that seedlings of this last list of species always "come true" precisely, but that they very rarely vary at all, and when they do so it is in a very limited degree.

Then come the questions of "graft hybrids" and of "sports;" the former now and then, even if not often, resulting in cell-unions that lead to a marked modification of after-growth and development, as has been proved in the case of Cytissus Adami, grafted or budded fruits such as Pears, Apples, Vines, Potatos, Tomatos, and in the case of variegated plants, such as Jasmine, Mountain Ash, and Abutilon. Information on these branches of the subject would be very valuable, and might lead to our being able to formulate some general law concerning their appearance under certain conditions.

One great, even if not the greatest, want in the gardening literature of to-day is a good and full alphabetical list of garden plants, as opposed to, or rather in addition to what are called true, or botanical species. Useful though the great *Index Kewensis* is to botanists, its value to the cultivator is sadly marred by the exclusion of garden hybrids and seedling variations, and it is to be hoped that one practical outcome of the forthcoming Hybrid Conference at Chiswick may be some well-directed attempt at a full and, as far as is possible, accurate list of garden plants, with their origin and history, when such are known. In no other way could the Royal Horticultural Society do a higher service to horticulture and its progress than by helping forward a real "Index Hortensis," recording in simple alphabetical order at least the principal plants grown or reared in British and Continental gardens during the past half century.

This, moreover, is no new cry or want, since so long ago as Nov. 19, 1878, Dr. M.T. Masters, in reading a paper "On the Nomenclature of Garden Plants" before the Scientific Committee of the Royal Horticultural Society, used these pregnant words:—"In the first place, an authoritative garden catalogue is a crying want of our times." It seems inexplicable that in this publishing age, when catalogues are flying by post all over the country, "as thick as leaves on Vallambrosa," that we must still plead the want of any good and reliable list of garden plants up to date, and this at a time when the biology of our gardens is more than ever a matter not only of individual but of immense national importance.

In conclusion, let us ask ourselves for a moment what our gardens would be to-day if all the hybrid and cross-bred plants were swept away? As a matter of fact, no absolutely pure or wild species are grown for food, and but few for beauty, if we except the denizens of our parks and lawns, the grasses and the trees. So different in many cases are the cultivated as compared with their wild progenitors, that, as De Candolle tells us in his *Origin of Cultivated Plants*, they are mostly so different as to be unrecognisable. Wheat, Onions, Maize, Sugar-cane, Rice, and many other vegetables either unknown, or so changed as to be praccally unrecognisable in the wild or natural state.

On the other hand, new genera, new species, and new varieties by the thousand, have been born in our gardens. Even in our own days, that is, within living memory, new groups of fruits and flowers have appeared—Melons and Grapes, Peas and Beans, Apples, Pears, and Peaches, either earlier, larger, better coloured, or richer in flavour, or in some other way more desirable, i.e., more adaptable than those that went before.

It is written, that "man cannot live by bread alone," and so, curiously enough, it is in the case of flowers grown for their brightness and beauty, that the greatest strides have been made, and we have merely to glance at the tuberous-rooted Begonia, the modern Cannas, zonal Pelargoniums, Primulas, Cyclamen, Pæonies, Delphiniums, Gladioli of the new Lemoinei and Childsii types. Look again at the new race of hybrid Streptocarpus, for which we are not ungrateful to Royal Kew, or at Mr. Lynch's new race of hybrid Cinerarias, from Cambridge; plants that emulate the best and softest-coloured of Michaelmas Daisies, in their enormous and graceful panicles or corymbs of many-tinted flowers, and which are destined to supplant in many gardens the dense and squat-habited plants with colours as harsh and as violent as are the crudest of aniline dyes.

Even the Mignonette, the modest Violet, Lily of the Valley, and our dearest and sweetest of cottage window-plants, the common Musk, have felt the thrilling touch of the modern magician's wand. Even Queen Rosa is so far like the great Cleopatra herself that "age cannot wither nor custom stale her infinite variety," now that the new hybrid Teas and Noisettes, and even the Sweet Briars have come forth in all their glory.

But the end is not yet. On all sides we may observe the ennoblement and glorification of the hybrid, the cross-bred, and even the seedling, until we are reminded of the canny Scot's dying advice to his son—a saying we may appropriately paraphrase as follows: "Make more hybrids, make more crosses; but in any case, rear seedlings by the dozen, by the hundred, and by the thousand." For in our gardens, as elsewhere to-day, the demand is for added use and adaptability, added beauty, additional variety; and of the last-named, we all know that in its deepest and widest sense, "*La varietie c'est la vie.*" *F. W. Burbidge.*

THE HEPATICA.

For many generations the Hepatica has been grown in British gardens. As one looks upon its flowers open to our gaze, we cannot but think of the flower-lovers of past days, whose eyes—now for ever closed—were gladdened by the Hepatica in the early spring-time. Although the doctrine of signatures gave it a place in medicine, and its name of Noble Liverwort, it seems to have been more prized for its beauty than for its supposed medicinal virtues. When it was introduced into Britain we know not, but it must have been many years ago, as we find references to it in some of our earliest works on plants; and although a few new varieties have been introduced, there has been little improvement for 300 years or so.

Botanically an Anemone, and properly called A. Hepatica, what we know best as Hepatica triloba, was originally introduced from the Continent; but it, or a plant closely akin, and not different in any marked feature, is also plentiful in the woods of North-East America. In Canada it is known to some as the Snow-flower, while in some parts of the United States Liver-leaf is its popular name. According to some, what is occasionally sold as H. acutiloba from North America is distinct. The flowers appear to be the same, and a well-informed correspondent in Canada, who has sent me plants, says that plants with five lobes and those with three are found in the woods together, and that there is some variation in the form of the leaves, one running, so to speak, into the other. From a gardening point of view, there is no difference between the blooms of the two. From comparison of American and European plants in growth, I am of opinion that the latter are neater in habit and more easily grown in our climate.

The large-flowered Hepatica, Anemone angulosa, which comes from Transylvania, has been said to be an American species, but one imagines that this has arisen from the similarity in name between Transylvania and Pennsylvania. So far as I can ascertain, this Hepatica does not occur in North America. Some years ago I saw in the Edinburgh Botanic Gardens a Hepatica named H. transylvanica which did not appear to differ from angulosa, and which, at the time, Mr. Robert Lindsay, then Curator, said appeared to be the same as that species. Another Hepatica with marbled leaves has been called variabilis, but one can hardly consider it as more than a variety of the ordinary triloba.

Some of our earliest gardening books refer to both single and double flowered Hepaticas. The latter have always been prized, and varieties keenly coveted, although less robust than the singles. The best of the double varieties for garden purposes is the peach-coloured one, which, when in clumps, is one of the brightest and most effective of our spring flowers. Its vigour never seems to decrease, and it is as easily grown as ever it was. The double blue Hepatica is, however, always scarce, and it is in few gardens that we see it grow into clumps. Where it does so, one would counsel its owner to be chary of removing it or of reducing its size. In speaking of the double blue, one must not forget that there are, in reality, several varieties differing in shade, in doubleness, and in form.

One can hardly imagine some of these to be forms of the common blue Hepatica, so much darker are they in shade of colour. There are a few shades in what we call the "peach"-coloured double, one here being more of a mauve than that ordinarily grown. *S. Arnott, Carsethorn, Dumfries.*

(*To be continued.*)

SPONTANEOUS HYBRIDS OF HARDY PLANTS.

(*Continued from p. 165.*)

An account of the hybrids of my garden would be incomplete unless I said something about those made by Narcissus. They are especially interesting, because it has been found that several so-called species of the genus may be imitated artificially by crossing two other species, and it has been suggested that these resulting species had their origin in the same crosses made in nature. But I have invariably found that varieties of Narcissus which I know to be hybrids, are either barren or produce inconstant flowers from seed, and that they mostly revert in one or two generations to the original parents. Mr. Alfred Tait some years ago sent me several accidental wild hybrids found by him amongst their parents near Oporto. All these were short-lived and barren. Another distinct wild hybrid is N. pseudo-narcissus var. muticus × N. juncifolius, found sparingly amongst its parents, near Gedre, in the Pyrenees. Of this hybrid, seventy bulbs were collected for me, and distributed by me in one season: the flowers were remarkably constant, but never produced a seed. Equally barren have been N. cyclamineus × N. triandrus, which have come accidentally in this garden. On the other hand, about the year 1886, I collected near Luchon, when in flower, several hundreds of the Narcissus called N. Bernardi, which is N. poeticus × N. pseudo-narcissus. These, in their native mountain pastures, are by no means uniform, varying much, both in the colour and shape of the flowers, but they have proved fertile, ripening seed in my garden in abundance. I made two or three successive sowings of this seed with curious results: a large proportion of the flowers came either simple N. pseudo-narcissus or simple N. poeticus, and of the remainder many were intermediate between N.

Bernardi and one or other of these parents, from either of which the flowers may have been fertilised in my garden.

In the first week of March I noticed in one of my warm borders, two perfect little hybrids, N. pseudo-narcissus minimus × N. cyclamineus, and shall carefully watch them for seed. I have more than once before found hybrids of N. cyclamineus with some larger form of N. pseudo-narcissus, and I think these seem likely to increase and multiply, though N. cyclamineus has a weak constitution here.

Another interesting Narcissus, apparently intermediate between N. juncifolius and N. triandrus, was sent to me ten years ago by Mr. Tait, who found it in the Sierra d'Estrella, and called it N. concolor. It is very dwarf, and has the strong scent characteristic of N. juncifolius. It has proved fertile, and I have raised three generations of seed, all with concolorous flowers intermediate between the supposed parents, N. triandrus × N. juncifolius, but not constant. It is dwarfer and less robust than the old variety of N. triandrus called pulchellus, which is probably also a hybrid. I have grown it in abundance for twenty years, and have never found a seed. It may be N. triandrus × N. rupicola, as it has the same scent of juncifolius.

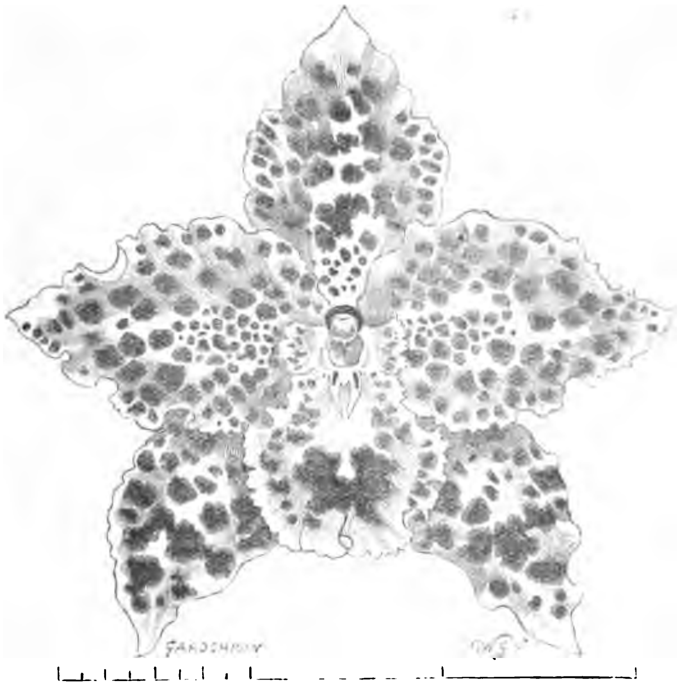

Fig. 61.—ODONTOGLOSSUM CRISPUM "DUKE OF YORK."

Shown by W. Thompson, Esq., Walton Grange, Stone.

For description of which, see "Orchid Committee" in Report of Royal Horticultural Society, in *Gardeners' Chronicle*, March 18, p. 174.

To pass on to hybrids of other Monocotyledons, it is now about four years since a growth of Lilium Martagon var. dalmaticum produced round it several hybrids with its neighbour L. Hansoni—a species on which I never have seen seed. These flowered with me a few weeks before the same hybrid was recorded and figured from another garden. I sent some of my flowers to my friend, Mr. G. F. Wilson, who at once recognised the parents of the hybrid. I may add that the capsules of this hybrid swelled, and produced seed, which my gardener says came up; but for the present I have lost sight of the box or pan in which they are The variety L. Martagon dalmaticum mixes in the border both with the type Martagon and its white variety, and the seed gets scattered about. White seedlings are few; others come true to the dark spotless purple variety; but some bear mixed flowers on the same spike, the dark vinous-purple of dalmaticum and the spotted pale purple of the type being often mixed in the same flower, and even in different halves of the same petal.

Scilla bifolia and Chionodoxa Luciliæ growing together in the same border hybridise freely, the result being very good; but I am not sure whether it is fertile. I have before stated that Scilla nutans seems to coalesce with S. hispanica, producing doubtful forms.

Orchid foliosa makes hybrids with O. maculata. I have for many years grown O. foliosa as a hardy plant. Some years ago, I noticed spotted leaves amongst them, but now that I have picked out many of these hybrids, I find plain leaves are as common in them as spotted. The flower-spike is longer, the flowers smaller, and the general characters and habit partakes of both parents. They make excellent border plants. O. maculata comes up spontaneously in such spots of the garden as it fancies, the seed being plentifully present in the soil. A favourite spot for it to come is the centre of a mass of rhizomes of German Iris. I may mention as a sign of the prevalence of Orchis maculata in the native soil, that, near the garden is a field which had been, for many years, ploughed land, but became full of this flower two years after it was laid down for pasture. In that case the roots may have been dormant in the soil, but I am sure that those in my garden came from seed. *C. Wolley Dod, Edge Hall.*

(To be continued.)

THE TWELVE BEST AUTUMN-FLOWERING CLEMATIS.

Most Clematises are pretty; in fact, it is hard to tell which to class as best with some of the colours. However, I think that Clematis growers will agree with me that the following dozen, which I will try to describe, are of the A 1 quality, both as to growing and flowering properties. Taking them alphabetically, we begin with :—

Anderson's Henryi, belonging to the lanuginosa section.—It is without doubt the best all-round single white. A good grower and free bloomer.

Alba magna, a lanuginosa.—It is the largest flowering variety in cultivation. A pure white, and a good grower.

Beauty of Worcester, a lanuginosa.—This is an indispensable variety with every one. The flowers come double and single, on the same stem. Colour a deep violet-purple. It is distinct from every other dark-coloured Clematis by having a pure white centre. The blooms, too, are either good singles or good doubles, never coming semi-double.

Jackmanni.—It is needless to describe this, the best known of all.

Jackmanni superba is darker in colour than the type. It is a good grower, and the flower is well formed.

Jackmanni alba (Smith's), is a very free-flowering single white. Its flower is smaller than A. Henryi, and has a dark chocolate-coloured anther.

Marie Lefebvre, a lanuginosa.—Colour a light mauve, large, single flower; the plant a good grower.

Madame Grange, a Jackmanni variety.—Colour crimson, tinted violet-red. The petals are very prettily crimped at the edges. It is a good grower.

Madame Edouard André is another form of Jackmanni, the colour a velvety-red. It is of a pleasing colour, and quite distinct from any other. The growth and blooms are free.

Mrs. George Jackman, a lanuginosa var., is a white single flower of middle size, invaluable for cut blooms.

Princess of Wales, also of the lanuginosa type; a deep blush-mauve. A good grower, and a large flower.

Star of India.—Colour a reddish violet-purple. A good grower, and a free bloomer.

This dozen of varieties are autumn-flowering, hence they will be suitable to plant near each other. There are others that are just as good, perhaps, as these in most ways. They are all pretty, but those I have described certainly comprise the cream of autumn-flowering varieties. *C. S. F. A., Waltham Cross.*

FLORISTS' FLOWERS

THE CHINESE PRIMROSE.

The development of the Chinese Primrose forms one of the most interesting and easily followed chapters in floriculture. For a long time we had only forms originating from those originally introduced in 1820. These were seedlings from plants cultivated by the Chinese from time immemorial. Nothing whatever was known of the wild stock whence these cultivated plants must have arisen. Then, some few years ago, the wild plant was discovered in the mountains of South-west China by Dr. Henry and by the Abbé Delavay, growing under conditions very different from those which obtain under cultivation. The early history of the plant, and the account of the discovery and introduction of the wild plant, have been alluded to in these columns on more than one occasion (see *Gardeners' Chronicle*, Jan. 26, 1889, p. 115), and illustrations have been given showing the original form, and that of some of the modern developments.

One great point of interest lies in the fact that all the forms now grown have originated by selection only; there has been no cross-breeding, and the wild form which Messrs. Sutton have in cultivation has, we believe, up to this time, not responded to the blandishments of the hybridiser. That it will do so sooner or later, we have no doubt.

The variations that have taken place have affected the size, colour, and doubling of the flower, the greater or less dilatation of the calyx, the fringing of the petal. The colour of the leaf-stalk, the form of the leaf, the fringing of its edge, have also been acquired, the habit of the plant has been altered, dense tufts of flowers are thrown up well above the leaves, and the ornamental character of the plant much enhanced. Whether any of these variations occur in Nature we do not yet know, as the plant so far has only been found growing under one set of conditions—on hot bare rock; but if the plant can sustain itself under other conditions, no doubt corresponding changes occur.

One of the greatest strides so far as change of habit is concerned has been effected by Messrs. Cannell in their pyramidal strain, of which The Lady was one of the first examples. Instead of a compact truss too lumpy to be artistic, we have an elegant, loosely branched pyramidal inflorescence, which satisfies the taste of many even more than the older forms. Messrs. Cannell are developing their strain by constant selection, and by intercrossing with the older type. The variety Lady Emily Dyke (see fig. 62) shows one of the newer developments of the pyramidalis type.

Is a yellow Chinese Primrose possible? and will it be an acquisition? When recently looking over the remarkable collection of this useful winter-flowering plant Messrs. Sutton & Sons have there, we were much interested in a batch of seedlings obtained from a cross by taking some pollen from a double crimson variety and placing it on a double Carnation-flaked flower. These double forms were more properly semi-double, each having a compact filbert centre of pistils rising from a base, and they are capable of seed-bearing. The first year's progeny was representative of the seed-bearing parent—white with slight flakes or pencillings of rose or crimson. The second year in seedlings from the preceding, the crimson tint predominated. The following year purple began to manifest itself, and the fourth year there was a great variety of tints—one might say everything but yellow. This serves to illustrate the difficulty often experienced in fixing the character of a desirable seedling obtained from a cross of this character, and it throws a little light upon the probable cause of sports seen in some flowers, the act of unmixing at some more or less remote stage of what was originally combined.

But if no yellow appeared from this cross, there were shades of blush-pink, lilac, pale-rose, deep rose, carmine, crimson, &c., with white; some of the tints of rose are very attractive. In some of these seedlings could be seen the passages to a more fully double character, and if this fulness increases, it will be interesting to know if sterility follows in its wake.

Still, hopes of eventually securing a distinct yellow Chinese Primrose, run high. Yellow has shown itself in some flowers where least expected, in the quilled Aster for certain, for though for years past we have known of a tint of sulphur among the white-quilled Asters, it was scarcely expected it would some day suffuse the whole flower—but it has done so. At Reading a successful cross has been effected between Primula floribunda and a garden form of P. sinensis; some of the seedlings are simple reproductions of the pollen parents, but some are of a decided intermediate character, showing quite a combination of foliage. Out of a large batch of these in bloom, we saw a few plants that seem to be markedly distinct in having stout erect leafage, thicker and diversely edged from that of the plants of the ordinary type, flowers diversely shaded, and, though from the same sowing, yet blooming three months later. True, the distinctions are few; but then, no one expects to find diversities to be pronounced hurriedly.

At one time the Chinese Primroses were confined to rosy-purple and white tints, and when there was no thought of keeping seeds of the two varieties apart; but if rosy-flowered Primulas were required it was enough to pick out the plants with tinted leaf-stems. Those with light leaf-stems would produce light flowers. All this is changed now; the purest white blossoms are found on plants with the darkest leaf-stalks, and there is scarcely a striped variety that is not associated with the same foliage. One of the newest developments in white single Primulas is that known as Royal White, a splendid form of black stem and leaves, the contrast being remarkable.

It is many years ago since what is known as the Fern-leaved type of foliage was first developed. The palmate form lengthened and narrowed, and forming a series of lobes at the sides, became known as the Fern-leafed variety. In the early days of its development the leaves were almost erect, and the leaf-stalks long; the latter has become shortened in time, and the leaves are nearly horizontal. They have become darkened, both in the case of the palmate and Fern-leaved types, deepening even to a rich bronzy hue. The leaves of both vary in form, but the type is maintained.

There is now also a mossy-leaved section, in which the leaf-margins are so finely fringed that they are quite mossy, hence the designation.

The range of colours in the flowers, once so limited, have now a wide range—from rich crimsons and scarlets, down to pure white. There are purple and rose shades in course of development, and I should not be in the least surprised if, some day, a true blue colour was reached through one of these. So far, our blue Primulas are pale violets tinted with lilac; and, having regard to the slow progress made in deepening the colour during the past ten years, it is doubtful if a real blue variety will be reached in this way. The deepest colour appears to be seen in the semi-double forms in the Reading collection.

We are not nearly at the end of the improvements in this popular flower. It is not necessary to go further in the size of the corollas, for they are quite large enough. It does seem that if size must be maintained, paucity of bloom will be an accomplishment. The value of the Chinese Primrose as a decorative-plant lies largely in its floriferousness and its succession of bloom. It is an invaluable winter-flowering plant, associating well with other subjects in bloom at that season of the year; and anything cultivators can do to enhance its usefulness will be gladly welcomed.

THE FLORIST'S AURICULA.

The fact that the present spring has brought an unusual demand for the named varieties of the florist's Auricula is a proof that interest in the beautiful and fascinating flower is manifesting itself; it is not often that named Auriculas are advertised for, but that is happening at the time of writing. The increase by means of offsets is slow, very slow indeed, in the case of some of the choice varieties. You cannot force the Auricula into growth to furnish stock, as in the case of some plants; and to attempt to do so spells ruin. They who want plants of a special variety must wait until the plant reaches a point when it will produce offsets. It is possible during May or June to expedite matters by beheading a plant whose main stem has become lanky, and by placing it at the side of a small pot of suitable soil and carefully looking after it, it will root while the trunk will produce stock. There is a certain amount of risk attending the process, but in capable hands it is generally successful. It frequently happens that a retarding spring follows a mild winter, and it would seem 1899 is to be no exception. So far March has been dull, foggy, and latterly cold; and vegetation, except in warm houses, makes but little headway. We are within a month of the Exhibition of the National Auricula Society, and in order to have the plants in bloom by that time some artificial warmth will be necessary. The Committee of the Society have no choice of date; they are bound by the fixture of the Royal Horticultural Society on April 18, and the show must take place. The misfortune is, that those who cultivate in a cold house without the aid of artificial heat can scarcely hope to have plants in bloom. To have plants in full flower by the date above named, the trusses should be well above the foliage by this time, as the named show varieties expand their corollas in a slow and stately manner, and especially the green-edged flowers. The Alpine varieties are earlier in this respect; they come on much more quickly, and expand their blossoms in much less time. In the face of such March weather it would have been better if the show had been announced for the first week in May.

The movement in the plants which took place during the milder weather which prevailed during the closing days of February, has become slow; the conditions of weather are decidedly retarding. The young growths being put forth are tender, and the sharp night frosts which have been experienced have a paralysing effect. Still, the time is one of supreme importance and interest to the cultivator. There is the riddle of this heavily-mealed foliage of some and the mealless deep green of others. No green-edged Auricula has mealed foliage, and but very few indeed of the grey edges; but among the white edges and the selfs they are numerous. It is when the grey edges, taking on more meal than their fellows of the same section, and nearly approach the white edges, that mealed foliage more or less is found. Meal is out of place on the green edges, both on corollas and leaves, except the light sprinkling which covers the solid white paste. What particular purpose the mealed foliage serves in the economy of nature is not clear to the grower. But the densely-mealed leaves of a white edge or a self-coloured flower is decidedly attractive, and specially pronounced when the plants are in the full flush of their summer growth.

Not only have modern cultivators dispensed with the old-time rich foods the fathers of Auricula culture advocated and employed, but they have also largely dispensed with top-dressing, which was formerly regarded as a fundamental element in spring culture. The former debilitated and destroyed many plants; the latter appears to be a needless process of irritation just at a time when the surface roots are active. Air, but no direct cold draughts, plenty of light and careful watering, are what the plant requires at this time of the year. Green-fly are active now; but fumigation with tobacco smoke or spirit vapour will soon rout them. Clean conditions about the plants are also necessary. Given these attentions, and healthy plants, then a successful blooming time may be confidently looked for. *R. D.*

NEW RHODODENDRONS.

THE garden of Henry Shilson, Esq., at Tremough, Penryn, Cornwall, contains one of the finest collections of Himalayan Rhododendrons known. Most of the plants are of enormous proportions, having been planted there more than forty years ago. Seedlings from these old plants have been raised, and freely distributed from Tremough, some of them showing undoubted evidences of hybrid origin. One of the best of these is R. Shilsoni ×, a hybrid between R. Thomsoni and R. barbatum. A large specimen of this has lately been presented to Kew, where it will shortly be in flower in the new Himalayan-house. Through the kindness of Mr. Gill, the gardener at Tremough, I have recently had an opportunity of seeing a collection of the flowers of some of the most remarkable of the Rhododendrons in flower in the open air there in February. Amongst them were typical R. arboreum, with large flowers of a rich blood-crimson colour; the varieties roseum and album, and several other forms of the same species. There were also flower-heads of R. Harrisii ×, which was named two years ago (see *Gardeners' Chronicle*, 1897, p. 418), and which is a hybrid between R. Thomsoni and R. arboreum; and the following new seedlings:—

R. Mrs. Henry Shilson.—This may be called a seedling form of R. arboreum. The leaves are silvery beneath; the head is large and compact, and consists of about twenty-five flowers, each 2 inches long and wide; the lobes revolute, and crisped; the colour white below, bright rose-pink above, with a few crimson spots inside, and blotches of crimson at the base.

R. William Shilson.—This is also a seedling form of R. arboreum, differing from that already described in having narrower leaves, which are dull rust-coloured below, with shorter flowers; also coloured white, with pink lobes, and a few spots on the tube inside, but lacking the blotches at the base.

R. Mrs. Richard Gill.—I take this to be a hybrid between R. arboreum and R. campanulatum. The leaves are shorter, and broader than in R. arboreum, and covered beneath with cream-coloured felt, as in R. campanulatum. The head consists of about thirty flowers, nearly 2 inches long and wide, pale lavender below, darkening to mauve in the lobes, and copiously spotted with deep maroon inside.

All three are first-rate early flowering Rhododendrons. *W. W.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By W. Strugnell, Gardener to the Right Hon. W. H. Long, Rood Ashton, Trowbridge.

Melons in Frames.—Much that applies to frame-Cucumbers holds good for the Melon: only the soil must be heavier and less rich—in fact, if the loam is of good quality it alone will suffice. It should be made firmer than for Cucumbers, and the bed should, when filled up, remain 4 inches higher at the spot where the plants are put out than the rest of the bed, this forming an important check on on canker in the Melon. Some varieties of Melon will carry three fruits, and others four, the number depending on the size of the fruit. The fruits should be about evenly distributed over each plant, and until rather more than the required number are well set and developing, pollination should be carried on daily. In the case of very heavy loam having to be used, lime-rubble, or lime which has been air-slaked, should be employed. Under no circumstances should liquid-manure be afforded Melon-plants before the fruits left for maturing are grown to half their size.

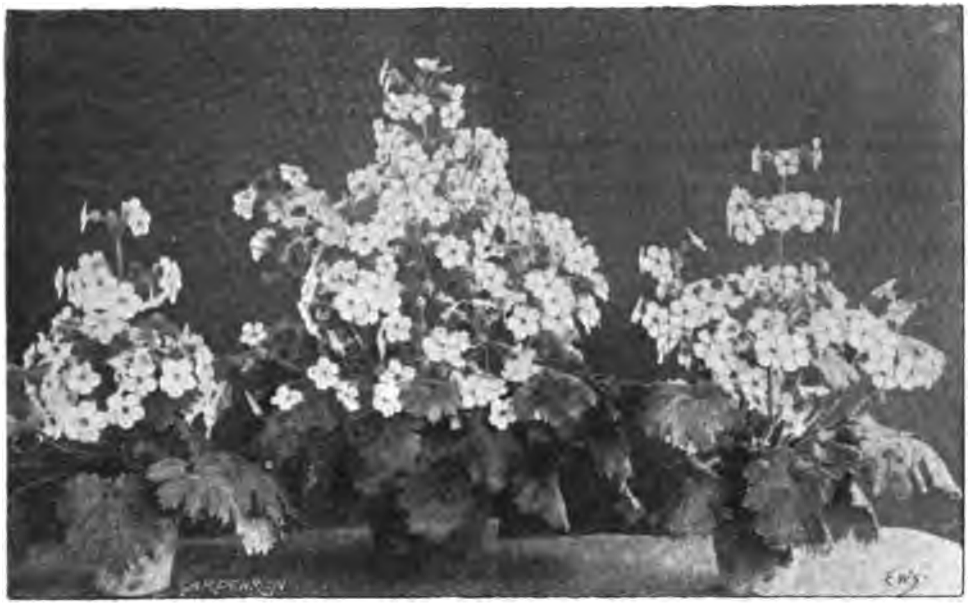

FIG. 62.—CHINESE PRIMULA, LADY EMILY DYKE, FROM H. CANNELL AND SONS (see p. 180).

Figs.—Permanent trees against the back walls of other fruit-houses are now in a more or less forward state, requiring attention in accordance with their actual condition, and if occupying positions in the earlier-started Peach-houses and vineries, they will have reached a stage requiring a general stopping of the leading shoots, or, at any rate, of those not required for extension. In this case, even, it is a much better practice to pinch, say, at 18 inches, rather than allow an unlimited extension of growth, because the latter course does not favour solidity of branch, and without this a regular and even crop does not usually follow. Where there is a tendency to produce long-jointed wood, afford clear water only to the border, and a frequent dusting of lime. Long-jointed branches often comes from overcrowding, the ample foliage of the Fig preventing the full influence of sunshine upon the stems. Upon trees started now, fruits will be ready from July onwards, and if strict attention be paid to early stopping, the fruits which develop upon the new growths will give a useful succession, the more so if the varieties Brown Turkey, White Marseilles, St. John's, and Negro Largo are employed. The removal of superfluous buds now will save much time later on, and the unnecessary waste of energy that such growth entails upon the trees. Fruit-bearing shoots may be relieved of the laterals from their point of issue; in other cases, it is well to allow one leaf beyond, so as to prevent the back buds from making premature growth.

Young Trees may still be planted for permanent use, and where provision was made some time since for propagating by heeling-in lateral prunings outdoors in a cool place, these may be prepared, and treated in exactly the same manner as advised recently for Vines. Another simple mode of propagating Figs is to first cut a 5-inch flower-pot through "lengthwise" with an old saw, and fixing this with wire to a stake and round a last year's branch, previously removing a narrow ring of bark, and afterwards filling the pot with turfy soil and leaf-mould. The ringing of the bark will facilitate rooting, and the pot should be fixed so that the soil will enclose the part where the bark is cut away. The soil should only be kept in a fairly moist state, or it will become sour and sodden before any roots take possession of it.

Vines.—The state of forwardness in the Muscat-house, will now admit of higher temperatures being maintained. While the Vines are flowering, it is advantageous to expose the shoots to all the sunlight possible, and this being so, the tying down of the laterals should only be done to an extent that will prevent injury to the tips from contact with the glass. Muscats should never be left to chance in regard to the pollination of their flowers, but they should be lightly brushed, or the hand drawn carefully over the bunch daily at about noon, paying particular attention to the points of the clusters, as these so often fail to set properly. In the early morning, before any moisture has been distributed over the floor, the pollen is readily distributed by the means above named, or by a brisk shaking of the Vines. Muscat Vines, in a later stage of growth will need to have the laterals pinched back to two or three joints from the bunch, and a selection of the best placed and most fruitful laterals seen to before the final reduction of superfluous shoots is made. Afford the necessary moisture to the roots of the Vines, either before or after the flowering period is passed, so that the house will not be unduly charged with humidity at that time. At the same time, do not allow the borders to become dry, nor suppress too severely the atmospheric moisture, or red-spider may get a foothold and more serious injury ensue. Sub-laterals, during the flowering time, may be allowed a little freedom, as a too rigid suppression of lateral growth is not favourable to a perfect set. Close the house as early in the afternoon as it is safe to do so, and keep the fires as low as practicable during the period of sunshine, and rouse them sufficiently early in the afternoon to prevent the temperature of the house declining below 70°. Ventilate carefully, and do not allow the sun to raise the temperature in the morning before a "chink" of air has been admitted. An excess of air is equally to be avoided. No hard-and-fast rules can be laid down as to time of opening or closing of a vinery, so much depending on the aspect of the house, and whether a lean-to or span-roofed. It is not a good practice to open the front ventilators after the Vines have started. The work of thinning should proceed when possible, but not until it can be readily ascertained which flowers are, and which are not perfectly set. In the absence of sufficient seeds, the berries will swell to the size of Peas only, and for this reason it is unadvisable to make too early a selection of the bunches to be retained. At this stage a surface-dressing of a specially prepared Vine-manure may be afforded in quantity, according to the kind used, previously loosening the surface with a digging-fork, so that the manure can be washed down to the roots the more easily. A good dressing applied now, will be sufficient until the stoning period has passed, provided the border has been well made, and it is fairly extensive. If the borders are small in area, and there are numerous roots, then more frequent applications of artificial or natural liquid manures will be necessary. Shallow borders which require water often, should be mulched; in other cases it is not so necessary. Much, too, will depend on the nature of the soil.

THE ORCHID HOUSES.

By W. H. Young, Orchid Grower to Sir Frederick Wigan, Bart., Clare Lawn, East Sheen.

Some species of Orchids needing Cool Treatment.—Amongst these are species which at the present season require more than ordinary care, and Odontoglossum nebulosum, a free-growing, but not always a sure-flowering plant, is one of them. Some of them will not be in a fit condition for re-potting or top-dressing, for the reason that their growth is made at no definite season; the greater number will, however, be pushing forth roots at the base of those young growths which have borne flowers. It is a rather difficult plant to secure in an orchid-pot, because of the fewness of its roots, which are thick and brittle, and seldom penetrate the compost far; but if the cultivator places peat and sphagnum-moss around the roots carefully, the plant may be firmly fixed in the compost. Excepting that it needs a longer and more thorough rest after the pseudo-bulbs have ceased to grow, its requirements are met by affording the same kind of treatment as that which is found to suit O. crispum, with rather more warmth. Odontoglossum Harryanum is another species that will need re-potting or surfacing, as the state of the materials indicates. O. Ure-Skinneri is rarely inactive; and other peculiarities are its mode of flowering, the shape, colour, and disposition of its blooms, and the length of time that elapses between the opening of the first and the last flower, sixty or more being produced in succession. The growths will now be about mid progress, with the flower-spikes emerging from between the leaves, consequently roots will soon appear. As this stage approaches, top-dressing or re-potting will be necessary. If the latter, use clean well-drained pots of sufficient diameter to admit of the extension of the rhizome during three or more years' growth, the base being brought up above the rim of the pot, so that the size of the pot used may not be excessive. The plants may be put into the Masdevallia-house, where the atmosphere is moister and warmer than in the Odontoglossum house. When in vigorous growth afford them plenty of water, and not letting them remain in a dry condition for any length of time.

Oncidiums of the crispum group, such as O. Marshallianum, O. Forbesii, O. curtum, O. prætextum, &c., now rooting freely, may be re-surfaced after picking out much of the decayed materials. Being usually suspended in the cool-house, a good supply of water is required in order to keep the materials in a healthy condition.

Oncidiums excavatum and aurosum need as much warmth as Miltonia vexillaria, and should any of the plants need re-potting, &c., the present is a suitable season for attending to these operations. Do not stint them of root-space or of drainage materials, and employ peat and sphagnum-moss in equal proportions. Afford water sparingly for a time to plants that have been overhauled, and also after growth has ceased for the season, but at other times root-moisture in considerable quantity is required.

Oncidium concolor thrives in baskets or pans suspended from the roof of the coolest house, if afforded plenty of water in the growing season, and a corresponding reduction in the winter.

THE FLOWER GARDEN.

By A. Chapman, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucester.
